

NON-ENGLISH SPEAKING POPULATION IN HAWAII

April 2016

Research and Economic Analysis Division

Department of Business, Economic Development and Tourism

STATE OF HAWAII

Executive Summary

This report examines the non-English speaking population, people aged 5 and older who speak a language other than English at home, in Hawaii based on the language use data collected by the U.S. Census Bureau. The report looks at the historical trends and status of language use at home in Hawaii, and explores demographic and socioeconomic characteristics of the non-English speaking population. It also identifies characteristics that were commonly associated with non-English speaking at home, and assesses the impacts of English proficiency on individuals' economic activities and earnings. Most statistics included in this report were based on the American Community Survey data collected for five years from 2010 to 2014.

Major findings in the report are:

- About one-in-four Hawaii residents aged 5 and older spoke a language other than English at home in the 2010-2014 period.
- The number of non-English speakers at home in Hawaii increased by 44 percent from 1980 to 2014. As the total population in Hawaii grew at a similar rate during the period, the proportion of non-English speakers to the total population remained about the same.
- Non-English language speaking at home was more prevalent in Honolulu County than in the neighbor island counties. The proportion of non-English speakers was highest in Honolulu County at 28 percent and lowest in Hawaii County at 19 percent.
- Ilocano, Tagalog, and Japanese were the top three most common non-English languages spoken at home in Hawaii. Speakers of these three languages made up about half of non-English speakers at home in Hawaii.
- The growth in the use of each language was not shared evenly among various languages over the last three decades. The two most outstanding trends were found in the use of Japanese and Ilocano. The Japanese speaking population decreased to 45,500 in the 2010-2014 period, which was a little over the half of its level in 1980. On the other hand, Ilocano speaking population in Hawaii almost tripled from 1980 to 2014.
- English proficiency of the non-English speaking population varied substantially by language. Among the top 10 most common non-English languages spoken at home in Hawaii, the German speaking population had the highest English proficiency with 84 percent of them speaking English very well, followed by the Hawaiian speaking population at 82 percent. The proportion of fluent English speakers was relatively low among Korean, Vietnamese, Chinese and Ilocano speaking population, with less than 40 percent of them speaking English very well.
- Compared with the adult population, the proportion of non-English speakers was lower and English proficiency was better in the 5 to 17 school-age children group. The popular language spoken by the school-age children were also different. Especially, the share of

Hawaiian speakers was noticeably bigger in the school-age children group than in the adult group.

- The most distinctive characteristic of the non-English speaking population from the English-only speaking population was their nativity. Of the non-English speakers at home in Hawaii, 63 percent were foreign born. Compared with the English-only speaking population, the non-English speakers in Hawaii had a gender structure with more female population, and an age distribution with higher shares of older age groups. The overall educational attainments of the non-English speakers were lower than that of the English-only speakers.
- A key determinant of a person's language use at home was the person's nativity. The chance of a foreign-born person to speak a language other than English at home was 84 percent.
- The chance to speak a non-English language at home also varied by age, education, and race. However, examining the relationship of these characteristics with nativity revealed that a certain characteristic group had a larger share of non-English speakers mainly because the group had many foreign-born people in the group.
- English proficiency had strong impacts on an individual's economic activities. Labor force participation rate of the non-English speakers who could not speak English well was about 15 percentage points lower than the rates for the English-only speakers and the non-English speakers who could speak English well. The rate difference with these groups was bigger at 33 percentage points for the non-English speakers who could not speak English at all.
- English proficiency also played a role in the selection of occupation. The occupational composition of the non-English speakers who could not speak English well showed a high concentration in two occupation groups: "Food preparation and serving" and "Building/grounds cleaning and maintenance". About one in two non-English speakers worked in one of these two occupations if they could not speak English well.
- Earning disparities among various English proficiency groups were evident. The median earnings of the non-English speakers were lower than that of the English-only speaking population for all English proficiency levels, and the earnings gap amplified as English proficiency decreased.
- The earning disparities among various English proficiency groups include both direct effects of English proficiency on earnings and indirect effects through other characteristics correlated with English proficiency. A multivariate regression analysis showed that the impacts of English proficiency on earnings were still significant even when all related factors were controlled. The regression results suggest that the earnings of non-English speakers can be 10 to 34 percent lower than that of the English-only speakers due to lack of English proficiency although they have the same amount of education and experience, are subject to the same race and gender, and work in similar occupations.

Introduction

Although most countries have their own official languages, people use various non-official languages at home. The latest edition of Ethnologue, the most comprehensive catalog of world languages, listed 7,097 living languages spoken worldwide. In the United States, the Census Bureau reported that at least 350 languages were spoken nationwide, and at least 130 languages were spoken in Hawaii homes in recent years.

Since language is a medium of communication that a person has to use to participate in any type of social and economic activity, failure to properly speak and understand the official language hinders a person's life in many ways. Language deficiency of residents also impedes efficient delivery of public services. For these reasons, in the United States, a federal executive order was signed in 2000, which required federal agencies to identify the need for services to those with limited English proficiency (LEP), and to develop and implement a system to provide meaningful access to language assistance services.

The effort to collect information on language use in the U.S. homes started much earlier in 1890 by including various questions on language use in decennial censuses. From 1980, the Census Bureau asked the following three questions in decennial censuses, which were taken over by the American Community Survey after 2000. 1) Does this person speak a language other than English at home? If yes, 2) What is the language? 3) How well does this person speak English?

This report examines the non-English speaking population, people aged 5 and older who speak a language other than English at home, in Hawaii based on the language use data collected by the U.S. Census Bureau. The report looks at the historical trends and status of language use at home in Hawaii, and explores demographic and socioeconomic characteristics of the non-English speakers at home. It also identifies the characteristics that were commonly associated with non-English speaking at home, and assesses the impacts of English proficiency on individuals' economic activities and earnings. Most statistics included in this report were based on the American Community Survey data collected for five years from 2010 to 2014. The statistics from the 1980, 1990, and 2000 decennial census were employed in addition to illustrate the historical trends in the overview section.

Information collected by decennial censuses and the American Community Survey are available to the public in two ways. One is to obtain the summary statistics from the Census Bureau's preset tabulations on various topics, and the other is to calculate our own statistics using public-use microdata samples of the survey. Each has its own pros and cons. While the former usually gives us basic statistics only on a topic, the statistics are often available for small geographical areas. The latter allows us to calculate our own statistics with full flexibility, but it comes at sacrifice of some geographical identification because detailed geographical information was not disclosed in microdata to protect confidentiality. This report used both sources. It should be noted that statistics from both sources were calculated based on samples and are therefore subject to measurement errors. Statistics from two sources can be slightly different because Census Bureau tables were based on the sample larger than the microdata sample available to the public.

Non-English Speakers: Overview

According to the American Community Survey data collected for five years from 2010 to 2014, around one-in-four people aged 5 and older during the period spoke a language other than English at home in Hawaii. Speaking a non-English language at home does not mean that the person cannot speak English. About half of the non-English speakers at home were fluent English speakers describing their English speaking ability as “very well”, while another 30 percent rated their English speaking ability as “well”. However, 19 percent of the non-English speakers in Hawaii, or about 62,000 people, spoke English “not well” or “not at all”. At the household level, 6.3 percent of total households in Hawaii, or about 28,400 households, had no one aged 14 and older who could speak English very well in the household.

Figure 1. Non-English speaking population in Hawaii

Source: U.S. Census Bureau, 2010-2014 ACS 5 year estimates, table B16005

Compared with the U.S. as a whole, speaking a non-English language at home was more prevalent in Hawaii. The share of non-English speakers was 4.4 percentage points higher and the share of limited English speaking households was 1.8 percentage points higher among Hawaii residents and households.¹ Considering the fact that Hawaii is the most ethnically diversified state in the nation with Asian alone population accounting for 38 percent of its total population, these differences of Hawaii figures from the U.S. averages might not be as large as we would have expected. A partial answer to this might be that Hawaii has a high proportion of multiracial population. As will be discussed later, the multiracial population is more likely to speak English at home as a common language. The percentage of multiracial population during this time period was 24 percent in Hawaii, 8 times as high as the corresponding figure of 3 percent in the U.S. as a whole.

¹ Limited English Speaking Household” is defined as “Household in which no member 14 years old and over speak only English or speaks a non-English language and speaks English “very well”.

Figure 2. Non-English speaking population: Hawaii vs. the U.S.

Source: U.S. Census Bureau, 2010-2014 ACS 5 year estimates, table B16005, S1602

Non-English speaking population in Hawaii increased gradually over time. The total number of non-English speakers at home grew from 229,000 in 1980 to 329,000 in the 2010-2014 period, an average 1.1 percent increase per year. Yet, the proportion of non-English speakers to total population remained about the same as they grew at about the same rate as total population. The percentage of those who spoke English "very well" among the non-English speakers also remained on a similar level in Hawaii for the 30-year period.

These trends in Hawaii contrast to what the U.S. as a whole experienced for the same period. The non-English speaking population in the U.S. nearly tripled since 1980, and its share in total population increased from 11 percent in 1980 to 21 percent in the 2010-2014 period. This is mostly related with the rapid increase in the number of legal or illegal immigrants in the U.S. during the period. On the contrary, although non-European immigration started much earlier in Hawaii, foreign immigration into Hawaii did not increase as fast as in many other states in the mainland during this time period.

Figure 3. Historical trends of non-English speaking population: Hawaii vs. the U.S.

Source: U.S. Census Bureau, 1980, 1990, and 2000 decennial census, and 2010-2014 ACS 5 year estimates

Non-English Speakers by County

Table 1 presents three basic measures of non-English speaking population by county. In all three measures, speaking a non-English language at home was more widespread in Honolulu County than in the neighbor island counties. In the 2010-2014 period, 28 percent of Honolulu residents aged 5 and older spoke languages other than English at home while the percentage was between 19 and 22 percent in the neighbor island counties. Among the neighbor island counties, the percentage was lowest in Hawaii County.

The ability to speak English of the non-English speakers also varied by county. The share of those speaking English “very well” in the total non-English speakers was 48 percent in Honolulu County. The share was higher in Hawaii County and Kauai County by 20 percentage points and 15 percentage points, respectively.

Table 1. Non-English speaking population in Hawaii: statewide and by county

	Statewide	By county			
		Honolulu County	Hawaii County	Kauai County	Maui County
Speaks other than English at home (% of population aged 5 and older)	25.3%	27.5%	18.5%	21.5%	21.1%
Speaks English less than “very well” (% of population aged 5 and older)	12.4%	14.4%	6.0%	8.0%	9.7%
Limited English speaking household* (% of total households)	6.3%	7.8%	2.7%	3.5%	3.0%

*“Limited English Speaking Household” is defined as “Household in which no member 14 years old and over speak only English or speaks a non-English language and speaks English “very well””.

Figure 4. Ability to speak English of non-English speakers in Hawaii: statewide and by county

Source: U.S. Census Bureau, 2010-2014 ACS 5 year estimates, table B16005

Non-English Speakers by Small Area

Basic statistics on the non-English speaking population are also available for areas smaller than counties from the American Community Survey. Table 2 presents census-designated places (CDP) in Hawaii where at least 30 percent of their residents aged 5 and older spoke non-English languages at home in the 2010-2014 period.² The places with the highest share of non-English speakers were Kaumakani CDP in Kauai County and Naalehu CDP in Hawaii County. Of their residents aged 5 and older, 56 percent in the places spoke non-English languages at home. Among places in Honolulu County, Waipahu CDP and Ewa Village CDP had many non-English speakers in the area with more than 40 percent of their resident aged 5 and older speaking non-English languages at home. Waipahu CDP was also marked for the highest share of people speaking English less than “very well” in its population. The same table for all CDPs in Hawaii is provided in Appendix 1 at the end of this report.

Table 2. Areas with a high share of non-English speaking population

Area	Number of Population aged 5 and older	Speaks a language other than English at home (% of population aged 5 and older)	Speaks English less than “very Well” (% of population aged 5 and older)
Kaumakani CDP, Kauai County	950	56.0 %	24.4 %
Naalehu CDP, Hawaii County	900	56.0 %	26.6 %
Waipahu CDP, Honolulu County	37,840	49.3 %	31.2 %
Ewa Villages CDP, Honolulu County	6,720	43.2 %	15.5 %
Eleele CDP, Kauai County	2,560	40.1 %	20.8 %
Hanamaulu CDP, Kauai County	4,160	39.5 %	19.1 %
Ewa Beach CDP, Honolulu County	13,120	38.4 %	22.4 %
Whitmore Village CDP, Honolulu County	4,820	38.0 %	21.5 %
Kahului CDP, Maui County	25,720	37.7 %	22.8 %
Urban Honolulu CDP, Honolulu County	326,930	36.5 %	21.3 %
Royal Kunia CDP, Honolulu County	13,800	35.7 %	19.5 %
Puhi CDP, Kauai County	3,410	35.3 %	14.7 %
Kahuku CDP, Honolulu County	2,200	33.8 %	16.0 %
Pahala CDP, Hawaii County	1,190	33.6 %	21.2 % *
West Loch Estate CDP, Honolulu County	5,760	32.2 %	17.4 %
Pahoa CDP, Hawaii County	790	31.0 %	13.5 % *
Halawa CDP, Honolulu County	13,630	30.5 %	17.0 %
Keaau CDP, Hawaii County	2,390	30.1 %	17.9 %
Ewa Gentry CDP, Honolulu County	20,800	30.0 %	15.1 %

*High sampling error associated with the estimate (Relative standard deviation is greater than 30%)

² CDP is a concentration of population identified by the U.S. Census Bureau for statistical purposes.

Detailed Languages Spoken at Home

With a distinct ethnic structure, language diversity in Hawaii was very different from the nationwide one. For the U.S. as a whole, Spanish was the most predominant non-English language spoken at home. More than 60 percent of the U.S. residents who reported that they spoke a language other than English at home were Spanish speakers. In Hawaii, the Spanish speakers accounted for a mere 8 percent of the total non-English speakers at home in the 2010-2014 period. Instead, Ilocano, Tagalog, and Japanese were the top three most common non-English languages spoken at home in Hawaii. Speakers of these three languages made up about half of the non-English speakers at home in Hawaii.

Figure 5. Languages other than English spoken at home: Hawaii vs. the U.S.

Source: National statistics: U.S. Census Bureau, ACS 2010-2014 5 year, table B16001, Hawaii statistics are estimates by DBDEDT based on Public Use Microdata Sample of the 2010-2014 5 year ACS
 *Chinese includes Mandarin, Cantonese and other Chinese languages

The non-English speakers in Hawaii increased by 44 percent for about the last three decades. However, the growth in the use of each language was not shared evenly among various languages. Figure 6 shows dynamics of language use at home in Hawaii for the eight most common non-English languages spoken at home. The two most outstanding trends were found in the use of Japanese and Ilocano. The Ilocano speakers almost tripled from 1980 to 2014 while the number of the Japanese speaking population showed a huge drop during the period. With about 80,000 people speaking the language at home in 1980, Japanese was previously the most common language spoken at home in Hawaii. The Japanese speaking population decreased to 45,500 in the 2010-2014 period, marking Japanese language the third common non-English language spoken at home in Hawaii next to Ilocano and Tagalog. The Tagalog speaking population showed a fast growth until 2000, but experienced a slight decrease between 2000 and 2014. On the contrary, the Ilocano speaking population accelerated its growth since 1990 and its fast growth continued until recent years.

Figure 6. Historic trends of non-English Languages spoken at home in Hawaii

Source: Estimates by DBEDT based on Public Use Microdata Sample of the 1980, 1990, 2000 Decennial Census and the 2010-2014 5 year ACS

*Chinese includes Mandarin, Cantonese and other Chinese languages

Table 3 presents common non-English languages spoken at home and the ability to speak English for each language group statewide and by county. The common non-English languages spoken at home varied across the state. Spoken by 18 percent of the non-English speakers at home in the county, Tagalog was the most common non-English language spoken at home in Honolulu County. On the other hand, Hawaiian was the most common non-English language spoken at home in Hawaii County. The Hawaiian speakers accounted for 16 percent of the total non-English speakers at home in the county. Unlike Honolulu and Hawaii County, the combined area of Kauai and Maui County showed a high concentration in one language.³ About one-in-three non-English speakers in the area was Ilocano speakers.

The ability to speak English varied substantially by language. Based on the statewide statistics, the German-speaking population had the highest English proficiency among the top ten common non-English languages with 84 percent of them speaking English “very well”, followed by Hawaiian speaking population at 82 percent, Spanish speaking population at 73 percent and Samoan speaking population at 62 percent. As will be discussed in more detail in the social and demographic profile section, the majority of Hawaiian, Samoan, and Spanish speaking population were native born, explaining their high levels of English proficiency regardless of speaking English at home or not. The proportion of the fluent English speakers (speaking English “very well”) was relatively low among Korean (31 percent), Vietnamese (33 percent), Chinese (36 percent), and Ilocano (39 percent) speaking population.

³ An area has to have at least 100,000 people to be separately reported in the Public Use Microdata Sample (PUMS). Therefore, Kauai County is combined with Maui County in the ACS PUMS data.

Table 3. Non-English languages spoken at home in Hawaii: statewide and by county

Language spoken at home	Number of persons aged 5 and older who spoke the language	Percentage in total non-English speaking population	Ability to speak English of the language speakers		
			“very well”	“well”	“not well” or “not at all”
Statewide					
All non-English languages	329,900	100.0%	50.8%	30.8%	18.4%
Ilocano	58,000	17.6%	39.4%	36.7%	23.9%

*Chinese includes Mandarin, Cantonese and other Chinese languages

Non-English Speakers in School Ages

Deficiency in English speaking poses a great challenge to non-English speaking students in progressing in school. For this reason, most schools in the U.S. provide special language programs to assist students with limited English proficiency. In order to help schools in Hawaii have better understanding of status and characteristics of non-English speaking students, this section provides statistics specifically on the non-English speakers in school ages.

Compared with the adult population, the share of non-English speakers at home was 7.5 percentage points lower in the 5 to 17 school-age children. English proficiency was also better in the school-age population. The share of those who spoke English fluently (“very well”) in the total school-age non-English speakers was 66 percent, 18 percentage points higher than in the adult non-English speakers. Unlike the adult non-English speakers, the majority of the non-English speakers in school ages were native born. Only one-in-four non-English speaking students in Hawaii was foreign born.

Figure 7. Non-English speakers in Hawaii: school-age children vs. adult population

Source: Estimates by DBDEDT based on Public Use Microdata Sample of the 2010-2014 5 year ACS

Table 4 presents the common non-English languages spoken at home by school-age children in Hawaii. The common languages spoken by the school-age children were somewhat different from the languages spoken by the adult group. Especially, the share of Hawaiian speakers was noticeably bigger in the school-age group than in the adult group. Spoken by 13 percent of the non-English speaking school-age children statewide, Hawaiian was as common as Japanese and Ilocano among the school-age children in Hawaii. In Hawaii County, the share of Hawaiian speakers in the non-English speaking children was as high as 30 percent. This is mainly because native Hawaiians have an age structure younger than most other races in Hawaii, which means more school-age children in its population than in other races. Conversely, Ilocano and Tagalog were less popular among the school-age children. Unlike Hawaiian speakers, these language groups had age distributions with less school-age children. Age distributions of various language groups are presented in Table 5 in the next section.

Table 4. Non-English languages spoken at home by school-age children: statewide and by county

Language spoken at home	Number of school-age children (aged 5-17) who speak the language	Percentage of total non-English speaking school-age children (aged 5-17)	Ability to speak English of the language speakers		
			“very well”	“well”	“not well” or “not at all”
Statewide					
All non-English languages	41,300	100.0%	66.4%	27.8%	5.8%
Hawaiian	5,200	12.7%	82.5%	15.6%	1.8%
Japanese	5,200	12.5%	70.2%	27.6%	2.1%
Ilocano	5,000	12.1%	66.0%	29.0%	5.0%
Tagalog	4,100	10.0%	58.1%	33.8%	8.1%

Social and Demographic Profile of Non-English Speakers

The most distinctive characteristic of the non-English speaking population from the English-only speaking population was their nativity. Of the non-English speaking population in Hawaii, 63 percent were foreign born. In the Census Bureau’s definition, the foreign-born population includes anyone who is not a U.S. citizen at birth, including those who have become U.S. citizens through naturalization. It is not surprising to find that foreign-born people tend to continue to use their mother tongues at home after they moved to the United States. Perhaps the more interesting fact is that 37 percent of the non-English speakers in Hawaii were native born, U.S. citizen at birth. This is not something that is uniquely found in Hawaii though. Nationwide, the share of the native-born in the total non-English speakers at home was 44 percent, 7 percentage points higher than the Hawaii figure.

Figure 8. Social and demographic profile of non-English speakers in Hawaii: comparison with English-only speakers

Source: Estimates by DBDEDT based on Public Use Microdata Sample of the 2010-2014 5 year ACS

The age and gender composition were different between two groups, but not significantly different. Compared with the English-only speaking population, the non-English speaking population had a gender structure with more female population. The non-English speaking

population had an age distribution with higher shares of older age groups. The share of people aged 35 and older was 9 percentage points higher in the non-English speaking population.

Table 5 presents the nativity and age distribution of the non-English speaking population for the ten most common non-English languages spoken at home in Hawaii. The majority of the Ilocano, Tagalog, Chinese, Korean, and Vietnamese speakers were foreign born. On the contrary, almost all of the Hawaiian speaking population were natives. Other language speakers with a relatively low share of foreign-born population include Samoan speakers (17 percent), Spanish speakers (29 percent) and Japanese speakers (44 percent).

The table also shows that age distribution of the non-English speakers varied greatly by language spoken. This is because a language is likely to be spoken by certain race(s) and each race group has quite different fertility, life expectancy, and consequently different age distribution. If a large proportion of the language speakers were foreign born, the immigration trend in the past also plays a role in explaining the current age structure of the language speakers.

The Hawaiian speakers had a younger age structure with a much bigger share of the school-age children group. In contrast, the age distribution of Japanese speakers skewed greatly toward older ages. Of the Japanese speakers in Hawaii, 75 percent were 35 years old or older. This is not only because Japanese have a higher life expectancy in general, but also because Japanese have a long immigration history in Hawaii. Meanwhile, most languages with many foreign-born people among its speakers, such as Ilocano, Tagalog, Korean, Vietnamese, and Chinese, exhibited an age distribution with high concentration in the upper working ages (35-64).

Table 5. Nativity and age distribution of non-English speakers in Hawaii for the top ten most common non-English languages spoken at home in Hawaii

Language spoken at home	Percentage of foreign-born persons among the language speakers	Age distribution of the language speakers			
		5-17	18-34	35-64	65&over

Who Tends to Speak a Non-English Language at Home?

The previous section illustrated demographic and social profiles of the non-English speakers at home in Hawaii. This section attempts to identify characteristics that have played important roles in determining language use at home. According to the data from the American Community Survey, nativity appears to be the key determinant of language use at home. In the 2010-2014 period, 13 percent of total U.S. residents and 18 percent of Hawaii residents were foreign born. Among the foreign born and aged 5 and older population in Hawaii, only 16 percent spoke English at home. The rest 84 percent spoke languages other than English, probably their mother tongues, at home.

The strong relationship between nativity and language use at home is well reflected in the scatter chart of 151 places in Hawaii on the right. Each dot in the chart represents a place with the percentage of foreign-born population in the area on the X axis and the percentage of non-English speakers in the area on the Y axis. With only some exceptions, places with a large foreign-born population tended to have a large non-English speaking population.

The chance to speak a non-English language at home also varied by age, education, and race. People in older ages and people with less education were more likely to speak a non-English language at home. The difference was also significant across various races. In general, the chance to speak a non-English language at home was higher in single race groups than in mixed race groups. Among the single race groups, the chance to speak a non-English language at home was high in Vietnamese alone (86.1 percent), Korean alone (73.2 percent), and Samoan alone (70.1 percent) population whereas the chance was low in White alone (9.4 percent), African American alone (10.1 percent), Native Hawaiian alone (10.9 percent), and Japanese alone (20.1 percent) population.

However, the relationship of these characteristics with nativity in Table 6 reveals that a certain characteristic group had a larger share of non-English speakers mainly because the group had a many foreign-born people in the group. For instance, speaking a non-English language at home was more prevalent in the age group 65 and over, and in the education group with less than a

Figure 9. Language use of population aged 5 and older in Hawaii by nativity

high school diploma compared with other age or education groups. Table 6 tells us that this is because the share of foreign-born population was higher in those groups than in other age and education groups.

Nativity also explains a great deal of differences in language use across various races. The fact that 74 percent of the Vietnamese alone population in Hawaii were foreign born while only 12 percent of the Japanese alone population were foreign born explains the much higher share of non-English speakers in the Vietnamese alone population than in the Japanese alone population.

Table 6. Non-English speaking at home in Hawaii by age, education, and race

	Percentage of non-English speakers at home	Percentage of foreign-born population
Age group		
5-17	19.1%	6.3%
18-34	22.8%	14.6%
35-64	27.6%	24.4%

If nativity is one of the major determinants of language use at home, would the "Years of residence in the U.S." and "Age at entry to the U.S." affect the foreign-born population's language use at home and proficiency to speak English?

Table 7 shows that both the chance for a foreign-born person to speak English at home and English proficiency of a foreign-born non-English speaker increased with the foreign-born person's years of residence in the U.S. The chance to speak a non-English language at home was 89 percent for a foreign-born person who had been living in the U.S. for less than 5 years. The chance decreased slightly to 82 percent if the foreign-born person had been living in the U.S. for more than 20 years. English proficiency of the foreign-born non-English speakers also improved with the years of residence in the U.S., but only modestly.

The relationship between the age at entry to the U.S. and language use of a foreign-born person at home was much stronger. The chance to speak a non-English language at home was over 86 percent if a foreign-born person moved to the U.S. after age 10. The chance decreased to 55 percent if the person moved to the U.S. before age 5. English proficiency of a foreign-born non-English speaker was also strongly related with the person's age at entry to the U.S. Among the foreign-born population who spoke a non-English language at home, the percentage of those speaking English "very well" was as high as 64 percent if the person moved to the U.S. before age 5. For those who moved to the U.S. after age 35, the percentage of those speaking English "very well" dropped to 20 percent.

Table 7. Language use and English proficiency of foreign-born population in Hawaii

	Percentage of non-English speakers	English Proficiency of the foreign-born non-English Speakers		
		"very well"	"well"	"not well" or "not at all"
Foreign-born population with years of residence in the U.S.				
Less than 5 years	88.7%	30.4%	39.0%	30.6%
5-10 years	88.1%	33.9%	37.7%	28.4%
11-20 years	86.5%	37.3%	38.2%	24.4%
Over 20 years	81.5%	41.3%	33.0%	25.7%
Foreign-born population who entered to the U.S. at age				
Under 5 years	55.1%	64.0%	27.4%	8.6%
5-10 years old	76.1%	61.2%	32.6%	6.2%
11-17 years old	86.7%	45.5%	41.1%	13.4%
18-34 years old	87.5%	38.2%	38.8%	23.0%
35 years and older	91.4%	19.5%	29.7%	50.8%

Economic Activities of Non-English Speakers

Since proper communication skill is an important element of economic activities, English proficiency affects a person’s economic activities in various ways. It may affect a person’s decision on whether to participate in the labor market or not, and once in the labor market the selection of occupation and economic sector may be limited by the person's English proficiency level.

Figure 11 shows how the labor force participation varied by English proficiency for Hawaii residents aged 16 and over. The labor force participation rate of the non-English speaking population in Hawaii was not significantly different from that of the English-only speaking population as long as the non-English speakers could speak English at least "well". However, the rate was much lower if the non-English speakers could not speak English "well". Especially, the labor force participation rate for those speaking English "not at all" was only about half of the rate for those speaking English at least "well". It certainly indicates that the inability to speak English has posed a major barrier to a person's doing any kind of economic activity.

Figure 11. Labor force participation rates of Hawaii residents aged 16 & older by English proficiency

Source: Estimates by DBDEDT based on Public Use Microdata Sample of the 2010-2014 5 year ACS

English proficiency also mattered in the selection of occupation and industry sector. In general, the occupational composition of the non-English speakers who could speak English at least “well” was not much different from that of the English-only speaking population. If the non-English speakers could not speak English well, however, the structure was very different, showing a high concentration in two occupation groups: “Food Preparation and Serving” and “Building/Grounds Cleaning and Maintenance”. In fact, about one in two non-English speakers worked in one of these two occupations if they could not speak English well.

Table 8. Occupations of non-English speakers aged 16 and older in Hawaii by English proficiency

Non-English speaking population who speak English “very well” or “well”		Non-English speaking population who speak English less than “well”	
Occupation	Share	Occupation	Share
Office and Administrative Support	12.2%	Food Preparation and Serving	23.7%
Sales and Related	12.0%	Building/Grounds Cleaning & Maintenance	21.6%
Building/Grounds Cleaning & Maintenance	10.0%	Sales and Related	9.5%
Food Preparation & Serving	9.8%	Transportation and Material Moving	7.0%
Management	8.1%	Production	7.0%
Transportation and Material Moving	5.4%	Office & Administrative Support	5.3%
Education, Training, and Library	5.3%	Construction and Extraction	4.3%
Other Occupations	37.3%	Other Occupations	21.6%

Source: Estimates by DBDEDT based on Public Use Microdata Sample of the 2010-2014 5 year ACS

Table 9 shows the industry sectors where the non-English speakers in Hawaii worked in the 2010-2014 period. “Retail Trade” and “Health Care and Social Assistance” sector were the two most common industry sectors for the non-English speakers who could speak English “very well” or “well”. However, about a quarter of non-English speakers worked in “Food Services” sector if they could not speak English well.

Table 9. Industries where non-English speakers aged 16 and older in Hawaii worked by English proficiency

Non-English speaking population who speak English “very well” or “well”		Non-English speaking population who speak English less than “well”	
Industry	Share	Industry	Share
Retail Trade	12.9%	Food Services	23.7%
Health Care and Social Assistance	12.0%	Accommodation	11.3%
Information/Finance/Real Estate/Professional	10.9%	Retail Trade	10.0%
Food Services	9.9%	Management and Administrative (incl. landscape and building services)	9.6%

Impacts of English Proficiency on Earnings

The ability to speak English would affect workers’ productivity and consequently affect workers’ earnings. It is especially likely in the fields where good communication skills are required. Figure 12 shows the median earnings by English proficiency for persons age 25 and over in Hawaii who worked full time during the reference period of the survey.⁴ Earnings include wages or salary and self-employment income, but does not include other incomes such as interest, dividends, social security income, and public assistance income. Earning disparities among various English proficiency groups were evident. The median earnings of the non-English speakers were lower than that of the English-only speaking population for all English proficiency levels, and the earning gap amplified as English proficiency decreased.

Figure 12. Median earnings of full-time workers in Hawaii by English proficiency

Source: Estimates by DBDEDT based on Public Use Microdata Sample of the 2010-2014 5 year ACS

However, deficiency in English proficiency should not be interpreted as the cause for the full amount of the earning gaps among different English proficiency groups. The earning gaps include both direct effects of English proficiency on earnings and indirect effects through other characteristics correlated with English proficiency. For example, people with lack of English proficiency may be associated with certain characteristics, such as lower level of education, certain race or gender, which caused lower earnings. It is also likely that people with lack of English proficiency had limited access to high-paid occupations and had to work in low-paid occupations.

Multiple regression analysis allows us to separate the indirect effects from the direct effects by looking at the impact of English proficiency when all other things being equal or held constant (*ceteris paribus*). Since it requires some technical discussions, only major findings as to the impacts of English proficiency on earnings are summarized in Figure 13 while a detailed regression model and results are presented in Appendix 3 at the end of this report.

⁴ Full time workers were defined here as those who worked for at least 40 hours per week and 50 weeks per year during the reference period.

Figure 13 shows the estimated percent differences of the earnings of the non-English speakers from the earnings of the English-only speakers for four different levels of English proficiency. If no other factor other than English proficiency were controlled, the earnings of the non-English speakers were 16 to 75 percent lower than that of the English-only speakers, which include both direct and indirect effects of English proficiency on earnings as in the median earning comparison in Figure 12. The earning gaps reduced to 16 to 46 percent when education and years of experience were controlled, in other words when indirect effects of English proficiency through its correlation with education and experience were excluded. The earning gaps further decreased if more factors such as gender, race and occupation were controlled in addition to education and experience. However, the impacts of English proficiency on earnings were still significant even when all related factors were controlled. The regression results suggest that the earnings of the non-English speakers can be 10 to 34 percent lower than that of the English-only speakers due to lack of English proficiency although they have same amount of education and experience, are subject to same race and gender, and work in similar occupations.

Figure 13. Estimated impacts of English proficiency on earnings of non-English speakers in Hawaii after controlling for other factors

APPENDIX 3

Impacts of English Proficiency on Earnings (Regression Analysis)

Impacts of English Proficiency on Earnings (Regression Analysis)

The ability to speak English is a key determinant of workers' productivity in the United States, and consequently affects workers' earnings. Figure 12 in the main text showed the median earnings by English proficiency for full time workers in Hawaii. Earning disparities among various English proficiency groups in the figure, however, include both direct effects of English proficiency on earnings and indirect effects through other factors correlated with English proficiency.

In order to separate the indirect effects from the direct effects, multivariate regression analysis were conducted using Public Use Microdata Sample from the 2010-2014 American Community Survey 5 year data. The impacts of English proficiency on earnings were estimated for population aged 25 and older who worked full time during the reference period of the survey using the following earning equation.⁵

$$\ln Y_i = \alpha + \beta X_i + \varepsilon_i$$

where $\ln Y$ is natural logarithm of earnings and X captures various factors that may influence earnings.

Earnings (Y) includes wages or salary and self-employment income, but does not include other incomes such as interest, dividends, social security income, and public assistance income.

X includes the following variables:

- English proficiency: categorical variable (base category: English-only speaking population)
- Educational attainment: categorical variable (base category: less than high school diploma)
- Experience and its square term to capture its non-linear relationship with earnings
(Since there is no direct measure available for experience, a workers' years of labor market experience was approximated by subtracting years of education plus 6 from the worker's age)
- Gender: categorical variable (base category: male)
- Race: categorical variable (base category: White alone)
- Occupation: categorical variable (base category: management)

Since the equation is in semi-logarithm, the estimated coefficient of a factor can be interpreted as the percentage change in earnings with one-unit change in the factor when all other things are held constant.

⁵ Full time workers were defined here as those who worked for at least 40 hours per week and 50 weeks per year during the reference period.

In order to demonstrate how controlling for other factors that are possibly correlated with English proficiency affects the estimated coefficients of the English proficiency variable, the regression was done in three specifications. Model 1 includes only English proficiency variable as an independent variable. In this model, the estimated coefficients of English proficiency would include not only the effects of English proficiency on earnings but also the effects of other variables correlated with English proficiency on earnings. Model 2 includes the two most significant factors in earning determination, education and experience, in addition to English proficiency as an independent variable. Compared to Model 1, the effects of English proficiency on earnings through its correlation with education and experience would be excluded from the estimated coefficients of English proficiency. Finally, Model 3 includes all other factors that may influence earnings.

Table A3-1 on the next page lists the estimated coefficients and t-values of the earning equation for the three model specifications. All estimated coefficients were statistically significant at a very small p-value.

If no other factor other than English proficiency were controlled, the earnings of the non-English speakers were 16 to 75 percent lower than that of the English-only speakers, which includes both direct and indirect effects of English proficiency on earnings as in the median earning comparison in Figure 12 on page 18 of the main text. The earning gaps reduced to 16 to 46 percent when education and years of experience were controlled, in other words when indirect effects of English proficiency through its correlation with education and experience were excluded. The earning gaps further decreased if more factors such as gender, race and occupation were controlled in addition to education and experience. However, the impacts of English proficiency on earnings were still significant even when all related factors were controlled. The regression results suggest that the earnings of the non-English speakers can be 10 to 34 percent lower than that of the English-only speakers due to lack of English proficiency although they have the same amount of education and experience, are subject to the same race and gender, and work in similar occupations.

Table A3-1. Estimated results of earning equation

Dependent variable : ln (Earning)						
Independent variables	Model 1		Model 2		Model 3	
	Coef.	t-value	Coef.	t-value	Coef.	t-value
Language (base: English only)						
Speak English “very well”	-0.16	-53.13	-0.16	-54.54	-0.10	-37.24
Speak English “well”	-0.36	-96.19	-0.26	-74.65	-0.15	-42.98
Speak English “not well”	-0.48	-84.73	-0.26	-45.86	-0.12	-22.47
Speak English “not at all”	-0.75	-41.60	-0.46	-26.90	-0.34	-20.76
Years of experience (YEX)			0.02	87.36	0.02	96.73
