lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *Mosquito populations in East Maui threaten rare native species, as well as human populations. Stagnant pools along diverted streams have been breeding grounds.*

Response 7: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled "Modeling" of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 18, 2019 5:56:07 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Cathy O'Leary Carey

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas

Dear Cathy O'Leary Cary:

Thank you for comments dated October 18th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Sunday, October 6, 2019 6:24:25 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Christi Dillon
175 Forest Ridge Rd Mooresville, NC 28117-6519

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.

Sincerely,
Christi Dillon

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 19, 2019 8:58:38 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Christi Dillon

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Christi Dillon:

Thank you for comments dated October 6th, 2019, October 9th, 2019 and October 19th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI’s West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko‘olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types

of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for

2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR. It is unlikely that the removal of the Hanawī NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poeciliid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poeciliid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poeciliid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the

10238-04
Letter to Christi Dillon

continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Christina Williams:

Thank you for comments dated October 2nd, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Christopher Seymour:

Thank you for comments dated October 3rd, 2019 and October 8th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Monday, November 4, 2019 9:26:58 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Claire Ackland

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Claire Ackland:

Thank you for comments dated November 4th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Crystal Hart:

Thank you for comments dated October 2nd, 2019 and October 8th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Bleckinger:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas

Dear Mr. O'Brien:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Smith:

Thank you for comments dated October 11, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 7:07:15 AM

Dear Mr. Matsukawa,

It's quite clear to me the DEIS does not address all of the concerns related to East Maui streams. There are many points to be made. Here are just a couple.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 19, 2019 4:22:48 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Daviann McClurg
621 Morris Ave Larned, KS 67550-2803

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. McClurg:

Thank you for comments dated October 3, 2019, October 19, 2019, and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *It's quite clear to me the DEIS does not address all of the concerns related to East Maui streams. There are many points to be made. Here are just a couple.*

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

Response 1: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System

to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 2: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 2: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 3: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 3: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management

(CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered

factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 4: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 4: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow

are: Kapā‘ula, Pa‘akea, Pua‘aka‘a, Puohokamoa, Ha‘ipua‘ena, Nua‘ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 5: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 5: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up

20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the "No Action" alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative. Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 6: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 6: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the

Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 7: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 7: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum

available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 8: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 8: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native

species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 9: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 9: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 10: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 10: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR. It is unlikely that the removal of the Hanawī NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 11: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 11: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled "Modeling" of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Comment 12: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to Makai.*

Response 12: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access

roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The

10238-04

Letter to Ms. Daviann McClurg

Page 14 of 14

September 3, 2021

available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Perreira:

Thank you for comments dated October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration,

potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Horan:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Mader:

Thank you for comments dated October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Denise Lytle

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas

Dear Ms. Lytle:

Thank you for comments dated October 3, 2019, October 9, 2019, and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 2: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That

authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 3: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 3: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands

designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Romesburg:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Ethridge:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct

September 3, 2021

System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 5:48:27 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Diane Kent

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Kent:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200, Section 18. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Elaine Becker:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

10238-04
Letter to Elaine Becker
Page 3 of 3
September 3, 2021

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Elaine Benjamin:

Thank you for comments dated October 3, 2019, October 8, 2019 and October 19, 2019, regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to Elaine Benjamin
Page 3 of 3
September 3, 2021

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Elisa Plauche

Thank you for comments dated October 9, 2019, October 14, 2019, and October 28, 2019, regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to Elisa Plauche
Page 3 of 3
September 3, 2021

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Elizabeth Watts:

Thank you for comments dated October 11, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to Elizabeth Watts
Page 3 of 3
September 3, 2021

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 18, 2019 5:47:24 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Emily Garland

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Emily Garland:

Thank you for comments dated October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas

Dear Eric Micha'el Leventhal:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through

several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Erik Schreiner:

Thank you for comments dated November 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

10238-04
Letter to Erik Schreiner
Page 3 of 3
September 3, 2021

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 10, 2019 7:35:57 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Erika Lechuga DiSalvo

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Erika Lechuga DiSalvo:

Thank you for comments dated October 10, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through

several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānuī, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear G Roy:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to G Roy
Page 3 of 3
September 3, 2021

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Gail Roberts:

Thank you for comments dated October 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to Gail Roberts

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Gary Goetz:

Thank you for comments dated October 3, 2019 and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to Gary Goetz
Page 3 of 3

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Hekayat Hajjafari:

Thank you for comments dated December 27, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to Hekayat Hajjafari
Page 3 of 3
September 3, 2021

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Tuesday, November 12, 2019 2:21:06 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui or for any other reasons, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Ivan Kekahuna

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ivan Kekahuna:

Thank you for comments dated November 12, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jacqui Skill:

Thank you for comments dated October 8, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear James DiMunno:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

10238-04
Letter to James DiMunno
Page 3 of 3
September 3, 2021

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 4:21:55 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Jamie Green

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jamie Green:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Javier Mendez:

Thank you for comments dated October 2, 2019, October 8, 2019, October 19, 2019 and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to Javier Mendez
Page 3 of 3
September 3, 2021

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jennifer Hayes:

Thank you for comments dated October 17, 2019 and October 20, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jennifer Valentine:

Thank you for comments dated October 2, 2019, October 21, 2019 and November 3, 2019, regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to Jennifer Valentine
Page 3 of 3
September 3, 2021

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Date: Wednesday, October 16, 2019 8:43:49 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jhalani Aweau:

Thank you for comments dated October 16, 2019, October 19, 2019, November 2, 2019 and November 6, 2019, regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to Jhalani Aweau
Page 3 of 3
September 3, 2021

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jim Head:

Thank you for comments dated October 2, 2019 and November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, October 9, 2019 7:13:12 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.

The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Joan Heartfield PhD

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Joan Heartfield PhD:

Thank you for comments dated October 3, 2019 and October 9, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui

communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units

in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy"

where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is

within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poeciliid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poeciliid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poeciliid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex

mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, November 2, 2019 11:22:25 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui.

Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Joann Koch

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Joann Koch:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to Joann Koch
Page 3 of 3
September 3, 2021

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Jody Gibson

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jody Gibson:

Thank you for comments dated October 3, 2019, October 19, 2019 and November 2, 2019, regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to Jody Gibson
Page 3 of 3
September 3, 2021

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear John Oda:

Thank you for comments dated October 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through

several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04
Letter to Jon Krueger
Page 3 of 3
September 3, 2021

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Date: Wednesday, October 2, 2019 5:33:30 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Jonathan Boyne

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 4:29:26 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.

The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease.

These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jonathan Boyne:

Thank you for comments dated October 2, 2019, October 8, 2019, October 14, 2019, October 18, 2019 and November 1, 2019, regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui

communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units

in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy"

where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is

within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poeciliid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poeciliid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poeciliid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support

10238-04
Letter to Jonathan Boyne
Page **10** of **10**
September 3, 2021

the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Keʻanae, Honomanū and Huelo License Areas

Dear Joyce Shiffrin:

Thank you for comments dated October 3rd, 2019 and October 19th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawaiʻi Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Julia Landress:

Thank you for comments dated November 1st, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 5:07:28 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Julie Ford

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Julie Ford:

Thank you for comments dated October 3rd2019, October 8th 2019 and November 1st 2019, regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, November 2, 2019 8:32:11 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Karen Winslow

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Karen Winslow:

Thank you for comments dated November 2nd, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Katherine Leahy:

Thank you for comments dated November 1st, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 5, 2019 6:50:30 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

-- The DEIS assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussion about how non-diverted streams would benefit East Maui ecosystems and communities.

-- The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather, except to say that it's estimated all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream-life habitat and impact thousands of local residents.

-- The DEIS does not sufficiently analyze the threat and damage caused to native aquatic species by the diversions.

-- The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and function of the watershed lands.

-- The DEIS should give in depth review of and support for shorter-term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

-- The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

-- The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.

East Maui's communities have waited over 20 years for an EIS that discusses the real impacts of the longtime East Maui stream diversions. The DEIS should comprehensively address the harm the diversions have caused to the East Maui watershed

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Smith:

Thank you for comments dated October 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200, Section 18. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: -- *The DEIS assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussion about how non-diverted streams would benefit East Maui ecosystems and communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI’s West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko‘olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 4: -- *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather, except to say that it's estimated all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream-life habitat and impact thousands of local residents.*

Response 4: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is

actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 5: -- *The DEIS does not sufficiently analyze the threat and damage caused to native aquatic species by the diversions.*

Response 5: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not

an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 6: -- *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and function of the watershed lands.*

Response 6: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 7: -- *The DEIS should give in depth review of and support for shorter-term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 7: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years.

Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 8: -- *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 8: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity

of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 9: -- *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 9: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled "Modeling" of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poeciliid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poeciliid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poeciliid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that

anecdotal observations made by Trutta staff members support the continued presence of *Culex* mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Comment 10: *East Maui's communities have waited over 20 years for an EIS that discusses the real impacts of the longtime East Maui stream diversions. The DEIS should comprehensively address the harm the diversions have caused to the East Maui watershed*

Response 10: We acknowledge your comments. Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion

impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Sunday, November 3, 2019 3:36:27 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS does not discuss public hiking in the report.

It does not include consequences of diverting streams and the effects on the animals.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Kathy Olavarri

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Kathy Olavarri:

Thank you for comments dated November 3rd, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *It does not include consequences of diverting Streams and the effects on the animals.*

Response 2: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

parative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 3: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 3: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR. It is unlikely that the removal of the Hanawī NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, November 2, 2019 6:44:57 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Katrina Shortridge

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Katrina Shortridge:

Thank you for comments dated November 2nd, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 6:31:22 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Kirsten Lear

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Keʻanae, Honomanū and Huelo License Areas

Dear Kirsten Lear:

Thank you for comments dated October 3rd, 2019 and October 18th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawaiʻi Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration,

potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the "No Action" alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the

trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawā NAR from

the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-61 to 4-62.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poeciliid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poeciliid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poeciliid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 10, 2019 4:46:49 AM

Dear Mr. Matsukawa,

The proposal to further divert streams should be thrown out.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands. The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies. Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely, Korynn Grenert

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. Water should not be held in the monopolising hands of a private company like Alexander and Baldwin.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely, Korynn Grenert

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Keʻanae, Honomanū and Huelo License Areas

Dear Korynn Grenert:

Thank you for comments dated October 10th, 2019 and November 2nd, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawaiʻi Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The proposal to further divert streams should be thrown out.*

Response 1: We acknowledge your comments.

Comment 2: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 2: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is

actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 3: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 3: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSheP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable

into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 4: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 4: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 5: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 5: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided,

however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 6: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 6: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui

(specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 4:38:31 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Kristin Gillette

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Kristin Gillette:

Thank you for comments dated November 1st, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not

needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Kristina Lamons:

Thank you for comments dated October 3rd, 2019 and November 1st, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not

needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Kū Kahakalau, PhD:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui. On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through

several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

10238-04

Letter to Kū Kahakalau, PhD

Page 3

September 3, 2021

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear L.M.:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

10238-04
Letter to L.M.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Levitt:

Thank you for comments dated October 3, 2019 and October 9, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Amick:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

10238-04
Letter to Ms. Lauren Amick

September 3, 2021

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, October 9, 2019 9:43:20 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Lauren Murdock

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Murdock:

Thank you for comments dated October 9, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Ms. Lauren Murdock
Page 3
September 3, 2021

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Richie:

Thank you for comments dated November 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Ross:

Thank you for comments dated October 3, 2019 and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Ms. Lilli Ross
Page 3
September 3, 2021

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Somera:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Gherardi:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

10238-04
Letter to Ms. Lisa Gherardi
Page 3
September 3, 2021

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Liza H.:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Ms. Liza H.

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that it's estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents, nor does it analyze sufficiently, the threat and damage the diversions have caused to native aquatic species.

Also the DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
LONNA RICHMOND

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Richmond:

Thank you for comments dated October 2, 2019 and October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 2: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 3: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 3: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable

10238-04
Letter to Ms. Lonna Richmond
Page 5
September 3, 2021

watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 9:03:10 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Lorenz Steininger

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Steininger:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

10238-04
Letter to Mr. Lorenz Steininger
Page 3
September 3, 2021

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Feiteira:

Thank you for comments dated October 9, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 17, 2019 10:52:32 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.

The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Lucas Costner

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Costner:

Thank you for comments dated October 17, 2019 and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate.

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly

identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSheP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action

alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of

developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is

within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the potential to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid

fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 10, 2019 10:43:15 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Lurline Bettencourt

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Bettencourt:

Thank you for comments dated October 10, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Ms. Lurline Bettencourt
Page 3
September 3, 2021

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Lynne C.:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Ms. Lynne C.
Page 3
September 3, 2021

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Date: Tuesday, October 8, 2019 2:33:57 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Maka O Kalani Miinihan

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Keʻanae, Honomanū and Huelo License Areas

Dear Maka O Kalani Miinihan:

Thank you for comments dated October 8, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawaiʻi Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Gordon:

Thank you for comments dated November 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Asteinza:

Thank you for comments dated October 3, 2019, October 19, 2019, and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Michl:

Thank you for comments dated October 2, 2019 and November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Blandford:

Thank you for comments dated November 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 7:33:58 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.

The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Mark Reback

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Reback:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be

issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate.

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not

an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-

36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity

of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the potential to result in

increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled "Modeling" of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be

10238-04
Letter to Mr. Mark Reback
Page 11
September 3, 2021

limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Sunday, November 10, 2019 4:13:31 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. Stop from causing any more harm to the East Maui watershed.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
MARY LOU ZEIS

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Zeis:

Thank you for comments dated November 10, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. Stop from causing any more harm to the East Maui watershed.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, November 2, 2019 9:56:23 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Masters:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate.

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly

identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSheP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action

alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of

developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol

to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access.

For these reasons, the EIS states that a reduction in the License Area has the potential to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex

10238-04
Letter to Ms. Mary Masters
Page 11
September 3, 2021

mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Redish:

Thank you for comments dated October 2, 2019, October 9, 2019, and November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Park:

Thank you for comments dated October 16, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

10238-04
Letter to Ms. Melanie Park

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 12, 2019 5:01:21 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Melia Leslie

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Leslie:

Thank you for comments dated October 12, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Heithaus:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Bondoc:

Thank you for comments dated October 2, 2019 and November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, November 7, 2019 7:46:00 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Michael Donohoe

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Donohue:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Henderson:

Thank you for comments dated October 2, 2019 and October 8, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Tomczyszyn:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 6:56:28 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Michael White

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. White:

Thank you for comments dated October 3, 2019 and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 4:20:40 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Mikki Chalker

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mikki Chalker:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate.

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly

identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSheP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action

alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of

developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the

Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the potential to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid

10238-04
Letter to Mikki Chalker
Page 11
September 3, 2021

fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 18, 2019 8:15:01 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Myrtle Sue Cross

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Cross:

Thank you for comments dated October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Cohn:

Thank you for comments dated October 3, 2019 and October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Ms. Nancy Cohn
Page 3

Date: Wednesday, October 9, 2019 5:45:46 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Nanea Lo

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Lo:

Thank you for comments dated October 2, 2019, October 9, 2019, October 19, 2019, and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. The wai (water) is life for our people.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Van Leekwijck:

Thank you for comments dated October 3, 2019, October 9, 2019, and October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Date: Wednesday, October 2, 2019 6:06:27 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Neil Quarles

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Quarles:

Thank you for comments dated October 2, 2019 and October 25, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Ahia:

Thank you for comments dated October 10, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Blair:

Thank you for comments dated October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Dion:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Cullen:

Thank you for comments dated October 17, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Mr. Paul Cullen

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 5:42:27 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and affect thousands of local residents. The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Philip Ratcliff

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Ratcliff:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the "No Action" alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate.

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is

actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-61 to 4-67.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note

that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the

IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, November 2, 2019 11:23:14 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Rachel Wolf

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Wolf:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Nolin:

Thank you for comments dated October 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Mr. Rapiell Nolin

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Zahra:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Mr. Raymond Zahra
Page 3
September 3, 2021

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 5, 2019 3:37:43 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. Invasive plants and animals are hurting the health and the function of the watershed lands. These are public lands that people should be allowed to reasonably access. Stagnant pools along diverted streams are breeding grounds for mosquitoes that have carried Dengue fever virus to East Maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Rebecca Reynolds

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 19, 2019 4:55:11 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Wouldn't discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities be beneficial?

How will the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather be restored? Do we really want to decimate 85% of native streamlife habitat and impact thousands of local residents by creating diversions?

Shouldn't there be a sufficient analysis of the threat and damage the diversions have caused to native aquatic species?

Shouldn't any plan or funding to manage the invasive species in the lower state lands they lease be included? These invasive plants and animals are hurting the health and the function of the watershed lands.

Shouldn't an in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies be discussed?

Shouldn't options for more public hiking access to public lands in the proposed lease area be discussed without every hiker needing to get permission from EMI? After all, these ARE public lands that people should be allowed to reasonably access.

Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Rebecca Reynolds

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Reynolds:

Thank you for comments dated October 5, 2019 and October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *Wouldn't discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities be beneficial?*

Response 2: The Draft EIS discusses options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the "No Action" alternative whereby no Water Lease would be

issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate.

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *How will the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather be restored? Do we really want to decimate 85% of native streamlife habitat and impact thousands of local residents by creating diversions?*

Response 3: The Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Comment 4: *Shouldn't there be a sufficient analysis of the threat and damage the diversions have caused to native aquatic species?*

Response 4: We respectfully believe that the Draft EIS sufficiently analyzes the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented

are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *Shouldn't any plan or funding to manage the invasive species in the lower state lands they lease be included? These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *Shouldn't an in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies be discussed?*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *Shouldn't options for more public hiking access to public lands in the proposed lease area be discussed without every hiker needing to get permission from EMI? After all, these ARE public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR. It is unlikely that the removal of the Hanawī NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the potential to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.*

Response 8: With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito

habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, October 2, 2019 5:34:38 PM

Dear Mr. Matsukawa,

I strongly oppose Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you.

Sincerely,
Richard Booth

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Booth:

Thank you for comments dated October 2, 2019 and November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I strongly oppose Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Mr. Richard Booth
Page 3
September 3, 2021

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Kite:

Thank you for comments dated October 2, 2019 and November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Mr. Richard Kite
Page 3
September 3, 2021

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Masterson:

Thank you for comments dated October 2, 2019, October 8, 2019 and November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not

10238-04
Letter to Mr. Rik Masterson
Page 3
September 3, 2021

needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Tuesday, October 8, 2019 5:28:16 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,

Robert Quartero

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Quartero:

Thank you for comments dated October 8, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Robin Voorhies:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Bogin:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Pratt:

Thank you for comments dated October 22, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Monday, November 4, 2019 8:29:42 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
S. Nam

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear S. Nam:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

10238-04
Letter to S. Nam

September 3, 2021

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 7:26:37 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition.". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.

The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Sandra Remilien

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Remilien:

Thank you for comments dated October 3, 2019 and October 21, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate.

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly

identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSheP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action

alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of

developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the

Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the potential to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled "Modeling" of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poeciliid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poeciliid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poeciliid

fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 12, 2019 11:27:58 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Sarah Naone

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Naone:

Thank you for comments dated October 12, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Shannon Keifner:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, October 2, 2019 7:29:29 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Shawn Shafer

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Shafer:

Thank you for comments dated October 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Sophia Janssen:

Thank you for comments dated October 29, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 9:30:27 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Stacey Jones

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Stacey Jones:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Wiggers:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Babbitt:

Thank you for comments dated October 3, 2019 and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Monday, November 4, 2019 12:36:33 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Susan Head

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Head:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Lettieri:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Ms. Tammy Lettieri
Page 3

Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Iovino:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 2:31:53 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.

The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Terrie Williams

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Terrie Williams:

Thank you for comments dated October 3, 2019, October 9, 2019, and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that

were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the

MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS,

draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate.

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft

EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSheP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the

remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority

to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR. It is unlikely that the removal of the Hanawī NAR from the License

Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the potential to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled "Modeling" of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have

10238-04
Letter to Terrie Williams
Page 11
September 3, 2021

continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 5, 2019 5:12:01 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. Maui is a treasure that I love, having visited many times since the early 80s and compelled to help protect.

-The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

-The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

-The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.

-The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease.

These invasive plants and animals are hurting the health and the function of the watershed lands.

-The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

-The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

-The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.

Diverting streams is bad environmental policy and bad business.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,

Terry Deegan

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Terry Deegan:

Thank you for comments dated October 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. Maui is a treasure that I love, having visited many times since the early 80s and compelled to help protect.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate.

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly

identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not

an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years.

Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity

of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR. It is unlikely that the removal of the Hanawī NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the potential to result in

increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled "Modeling" of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poeciliid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poeciliid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poeciliid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that

10238-04
Letter to Terry Deegan
Page 11
September 3, 2021

anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 4:42:08 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Terry Tedesco

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Terry Tedesco:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Haverfield:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Ms. Tiffany Haverfield
Page 3
September 3, 2021

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 5, 2019 5:29:59 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Tracy Ouellette

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Tracy Ouellette:

Thank you for comments dated October 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Baggs:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 3:32:28 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.

The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Batty:

Thank you for comments dated October, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate.

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly

identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSheP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action

alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of

developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the

Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the potential to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid

10238-04
Letter to Mr. Vernon Batty
Page 11
September 3, 2021

fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Sunday, October 13, 2019 4:47:33 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Vince Saures

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Saures:

Thank you for comments dated October 13, 2019 and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Mr. Vince Saures
Page 3
September 3, 2021

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, November 2, 2019 11:41:59 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Wendy Oakes

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Oakes:

Thank you for comments dated November, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

10238-04
Letter to Ms. Wendy Oakes
Page 3
September 3, 2021

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, November 7, 2019 9:59:21 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Yvette Celiz

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Celiz:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 2: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 3: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 3: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-

36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 4: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 4: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown in pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and

more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown in pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the potential to result in increased

10238-04
Letter to Ms. Yvette Celiz
Page 7
September 3, 2021

impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, October 2, 2019 6:34:05 PM

Dear Mr. Matsukawa,

Friends,

As a resident of East Maui I would like to see minimum stream flow standard set for all streams. Dry stream beds breed mosquitos in stagnate standing water. One can also feel the difference when the streams are flowing, when it is as it should be. The land out here is alive. That is until entire stream flows are diverted. With proper planning, crop choices, additional storage and conservative use, there should be enough water for both living streams and agriculture. Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Alan Bradbury

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Bradbury:

Thank you for comments dated October 10, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *As a resident of East Maui I would like to see minimum stream flow standard set for all streams. Dry stream beds breed mosquitos in stagnate standing water.*

Response 1: With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased

streamflow. First, in addition to breeding in streams, the *Culex* mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the *Culex* mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for *Culex* mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the *Culex* mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of *Culex* mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i

Comment 2: *One can also feel the difference when the streams are flowing, when it is as it should be. The land out here is alive. That is until entire stream flows are diverted.*

Response 2: We acknowledge your comments. Please note that the environmental impacts of the potential Water Lease are discussed throughout Chapter 4 of the EIS.

Comment 3: *With proper planning, crop choices, additional storage and conservative use, there should be enough water for both living streams and agriculture.*

Response 3: We acknowledge your comments. The CWRM D&O was issued in June 2018 and included the A&B diversified agriculture plan. Mahi Pono did not purchase the Central Maui agricultural fields from A&B until December 2018, which was after the issuance of the CWRM D&O. The Mahi Pono farm plan is not anticipated to have a decrease in water demand over the years, though at full build-out, it will require significantly less water than utilized when sugarcane was cultivated on these same lands. So while there is a total decrease in water demand over historical sugar operations, as with any new and growing farm operation, the water demand of the Mahi Pono farm plan is expected to increase over the years until full build-out. Moreover, if more water were to become available in the future, Mahi Pono intends to plant additional crops

in areas that are currently planned to be unirrigated pasture due to the lack of enough water to fully irrigate all 30,000 acres of land.

Comment 4: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 4: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian

right (CWRM D&O, COL 131). Various streams within the License Area have low biological ratings and do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā‘ula, Pa‘akea, Pua‘aka‘a, Puohokamoa, Ha‘ipua‘ena, Nua‘ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: RE: Alexander and Baldwin's Draft EIS
Date: Thursday, October 3, 2019 2:33:12 PM

Dear Mr. Matsukawa,

As I consider the DEIS insufficient, both in terms of threat and damage analysis and invasive species management, I am writing to urge serious revision. I am writing in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for the opportunity to submit comments on this Draft EIS and for doing all you can to encourage the proper stewardship of this region.

Sincerely,
Aleks Kosowicz

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Aleks Kosowicz:

Thank you for comments dated October 3, 2019 and October 8, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

October 3, 2019:

Comment 1: *As I consider the DEIS insufficient, both in terms of threat and damage analysis and invasive species management, I am writing to urge serious revision.*

Response 1: We respectfully disagree with your comment that the Draft EIS is insufficient. Please note that the Draft EIS fully complied with all relevant requirements, including the content requirements set forth in §11-200-16 and 11-200-17, and the Draft EIS even includes a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement. The Draft EIS meets the necessary content requirements and for that reason we disagree with your comment that the Draft EIS does not disclose sufficient information about the anticipated impacts of the Proposed Action, alternatives to the Proposed Action, and feasible measures that might be taken to mitigate potential impacts, sufficient to allow informed decision making.

With regards to invasive species management, it is noted in Appendix C that that low-elevation portions of the License Area are already highly impacted by invasive plants. However, it is noted in Appendix C that high-elevation portions of the License Area are predominately dominated by native species and is very likely to contain habitat for several endangered or threatened species. Impacts related to flora and fauna as a result of the Proposed Action are discussed in Section 4.4 of the EIS. Please note that Section 4.4.1 and Section 4.4.2 have been revised in the Final EIS based on comments received on the Draft EIS to further outline the existing conditions of the License Area and more accurately reflect targeted mitigation measures based on feedback provided by the DLNR and USFWS. See pages 4-121 to 4-124. Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

As discussed in Section 2.1 of the Draft EIS, A&B was a founding member of the East Maui Watershed Partnership (EMWP), which was the first watershed partnership in the State of Hawai'i and which served as a model for other watershed partnerships throughout the State. The lands under the jurisdiction of the East Maui Watershed Partnership span over 100,000 acres which includes the entire License Area. The License Area is actively managed by the multiple agencies and organizations, including EMWP, Maui Invasive Species Committee (MISC), DLNR, etc., in partnership with EMI. EMI continues to work with MISC by reporting sighting of invasive weeds and coordinating access in these areas, which are well below the 3,000' level. EMI personnel also monitor the License Area for signs of feral ungulates.

Comment 2: *I am writing in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 2: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that

are set at connectivity flow are: Kapā‘ula, Pa‘akea, Pua‘aka‘a, Puohokamoa, Ha‘ipua‘ena, Nua‘ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 3: *Thank you for the opportunity to submit comments on this Draft EIS and for doing all you can to encourage the proper stewardship of this region.*

Response 3: We acknowledge your comments. With regards to your comment about proper stewardship, please note as discussed in Response #1 above, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as

Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

October 8, 2019:

Comment 4: *I am very concerned by the state of our natural world, and I ask that you please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 4: As discussed in Response #2 above, please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important

Subject: Comments Mahi Pono /Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, November 6, 2019 12:55:11 PM

Dear Mr. Matsukawa,

Aloha! Thank you for your time because this is such an important issue. I live and swim alongside several streams in Huelo. No more diversions please! It is so horrible when the beds are dry and stagnant. What a travesty that happened in Wailuku where all the thousands of fish died.

Also I heard that Mahi Poni uses roundup to spray near the rivers to control weeds? Is this true? Monsanto which just sold to Bayer lost several millions of dollar lawsuits because it is a proven this is a dangerous substance. This should concern all of us, since many family and friends swim in the waters. Our streams should not be diverted for any kind of agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. I heard they are growing almonds which take huge amounts of water, what is the gallons per nut ratio? Please print. We need small farms growing real food, but more we need our river alive with fish and for Kalo.

Mahalo, for this opportunity to submit comments on this Draft EIS. Sincerely, Miss Amy Chang and Parents

Sincerely,
Amy Chant

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Chang:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200, Section 18. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Aloha! Thank you for your time because this is such an important issue. I live and swim alongside several streams in Huelo. No more diversions please !*

It is so horrible when the beds are dry and stagnant. What a travesty that happened in Wailuku Roger where all the thousands of fish died.

Response 1: We acknowledge your comments and understand that you are a resident in Huelo. Regarding your comments about stream bed being dry and stagnant, impacts to stream flow and stream life as a result of diversions were assessed in the Draft EIS Section 4.2.1. The HSHEP model was used to quantify the impacts of flow restoration on native stream animal habitat to help decision-makers determine an appropriate balance between instream and offstream water uses. The mauka to maikai connection is integral to the design of the HSHEP model in estimating the impacts of stream diversions on native species habitat. Impacts to stream habitats and native amphidromous stream species, are analyzed in Section 4.2.1 and Appendix A of the EIS.

Moreover, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-61.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Comment 2: *Also I heard that Mahi Poni uses roundup to spray near the rivers to control weeds? Is this true? Monsanto Which just sold to Bauer lost several millions of dollar lawsuits because it is a Proven this is a dangerous Substance. This should concern all of us, since many family and friends swim in the waters.*

Response 2: Regarding your comment about pesticide use, as discussed in Section 4.12 pesticide use is regulated by both State and Federal law. The use of these chemicals is compliant with all laws regulating pesticide use, and certified commercial applicators are utilized as required. Act 45 which was passed by the 2018 Hawai'i Legislature and effective on January 1, 2019 required that all Certified Applicators of Restricted Use Pesticides (RUP) submit a report of the RUP that were applied each year. This report as well as any other report required by law is publicly available from the respective government entity. The State of Hawai'i DOA's Pesticide Branch also provides regulatory oversight over EMI's pesticide use. In accordance with this oversight, records of pesticide use must be kept and made available to the Pesticide Branch upon request at any time. It is also noted that since January 2020 EMI committed to discontinuing use of Round-Up. This information has been included in the Final EIS as shown on page 4-271.

Comment 3: *Our streams should not be diverted for any kind of agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 3: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 4: *I heard they are growing almonds which take huge amounts of water, what is the gallons per nut ratio? Please print. We need small farms growing real food, but more we need our river Alive with fish and for Kalo.*

Response 4: Please note that the Mahi Pono farm plan is discussed in detail in Section 2.1.4 of the Draft EIS. Specifically, Section 2.1.4 of the Draft EIS states:

- *That total amount of water will be delivered to approximately 30,000 acres. Of those 30,000 acres:*
 - *Approximately 15,950 acres would be used for farming, including 12,850 acres for orchard crops and 3,100 acres for other crops.*
 - *Approximately 13,800 acres would be used for pasture, of which about 4,700 acres would be irrigated.*
 - *Approximately 250 acres would be used for green energy, such as a solar farm.*

Moreover, Table 2-1 of the Draft EIS (Table 2-2 in the Final EIS) provide daily water demands for each crop category. With regards to your question, please note that Mahi Pono intends to grow mac nuts, not almonds.

With regards to your comment about fish, as noted in Response #1 above, impacts to stream flow and stream life as a result of diversions were assessed in the Draft EIS Section 4.2.1. The HSHEP model was used to quantify the impacts of flow restoration on native stream animal habitat to help decision-makers determine an appropriate balance between instream and offstream water uses. The mauka to maikai connection is integral to the design of the HSHEP model in estimating the impacts of stream diversions on native species habitat. Impacts to stream habitats and native amphidromous stream species, are analyzed in Section 4.2.1 and Appendix A of the EIS.

With regards to coastal environments, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls

and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 along with their overlap with streams determined with the method used by Trutta as shown on page 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the

HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.
