Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the

existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Regarding taro farmers, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi‘ina‘au, Palauhulu, Waiokamilo, Wailuānui, ‘Ōhi‘a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM’s intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo‘i. The CWRM’s approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu‘u, Ka‘aiea, ‘O‘opuola, Puehu, Nāili‘ilihaele, Kailua, Hanahana, Hoalua, Waipi‘o, Mokupapa and Ho‘olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown in pages 1-19 to 1-23 of the Final EIS. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration status); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe‘e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo‘i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in the included pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms

irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 2: *There are five freshwater fishes native to Hawaii which are *Stenogobius hawaiiensis*, *Eleotris sandwicensis*, *Awaous guamensia*, *Sicyopterus stimpsoni*, and *Lentipes concolor* (endemic to Hawaii). Every one of them have record low numbers and are threatened because they have no way of getting past and through all of the number of diversions in these streams and the reduced water flows from these diversions and dams also limit larvae from reaching the ocean and recruiting back into streams. All of the EMI channelization leads to a decrease in riparian vegetation that causes a loss of shelter and erosion control and this needs to be addressed. I don't see any where in the DEIS that shows a plan for: Improving altered or diverted streams by modifying or removing gratings or diversions to allow for in stream passage of fish; Restoring riparian vegetation to help decrease in stream heating and reduce sediment loads; Removal of alien species; Creating pools infrequently dewatered stretches to provide safe usable habitat between flows; Ensuring adequate In stream flow and biological integrity of riparian areas; any work to clean streams with significant pollution; And any progress towards the development of a GIS database that make this information web-accessible.*

Response 2: Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered.

Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83 of the Final EIS.

Potential impacts from the abandonment of structures and equipment as it relates to native stream habitat was assessed and discussed in Appendix A, the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report.

The work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows.

The CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. CWRM ordered in relevant part (see CWRM D&O at p. 269):

- I. It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.*
- J. This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process*
- K. The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.*

CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

However, please note that generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best. The presence of cement or wood near or partially within the stream channel is not inherently bad for stream animals.

Conversely, meeting the instream flow standard at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the water flowing into the diversion and back to the stream from another location in the diversion ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

The two primary conditions where diversion structures could impact native stream species are structures where diversion and ditch water still comingle or structures that create a barrier to upstream migration. A diversion structure could also impact native stream animals as they move upstream if it creates an unnatural barrier. If no wetted pathway exists, upstream passage will be stopped.

Altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns.

In summary, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts.

The above is discussed in more detail in Section 4.2.1 of the Final EIS as shown pages 4-61 to 4-67.

Comment 3: *Also as an avid hiker I have witnessed many stagnant pools full of mosquito larvae caused by these diversions not allowing the flow. This is a concern because it is a major public health issue that needs to be addressed as the Dengue, Chikungunya, and Zika virus diseases are transmitted via the mosquitoes found here in Hawaii. We just had an outbreak of Dengue here on Maui and this is a major concern for me and many others living here.*

Response 3: We acknowledge your comments. With respect to your comment about mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown in pages 4-58 to 4-61, pages 4-126 to 4-127, and pages 4-130 to 4-131

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasiatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Comment 4: *Also as a hiker, there is limited public hiking access to the public lands with out needing to get permission from EMI. If it is public lands, I should have access to these public lands, this is not addressed in the DEIS.*

Response 4: Please note that Public Access has been regulated, in partnership with the Department of Land and Natural Resources, by EMI for decades. EMI assumes liability for unlawful access into the License Area, thus restricting access protects EMI. Public access to the License Area, including the Forest Reserve lands, is currently limited to permitted access by hunting groups and hiking clubs as discussed in Section 4.8 of the EIS. Access to the Ko‘olau Forest Reserve Hunting Units, which include portions of the Huelo, Honomanū, Ke‘anae, and Nāhiku License Areas, is managed by the Department of Land and Natural Resources (DLNR) Division of Forestry and Wildlife. In order to hunt in these areas, hunters must first obtain a license from the DLNR and an EMI Permit/Waiver. Access to the hunting units is managed by EMI through eight existing access roads. Hunters are permitted to enter the areas by vehicle but must traverse most areas by foot. Hiking is also a permitted recreational use within the License Area and is limited to hiking clubs. Hiking access requires a Hiking Waiver form EMI.

Access to the License Area is limited for the safety of entrants. For hunters, hunting grounds are limited to one hunting party per hunting area, as regulated by the DLNR. The hiking groups that currently access the License Area, Sierra Club Maui Group and Mauna Ala Hiking Club, enter the License Area by foot and are guided by a club hiking expert with a manageable number of people, however, access is not limited to these two clubs. Any hiking clubs wishing to access the License Area must follow the same procedures. However, limiting access to the License Area also limits potential impacts to historic properties and natural resources

Increased public access has the potential to pose a greater impact to historic properties and the environment, especially if public access is unmanaged. Recently, concerns for these impacts have prompted visitor limitations to the culturally significant Hā‘ena State Park on the north shore of Kaua‘i. Potential impacts from unmanaged access could include looting and “rock-robbing” of surface and subsurface historic properties, littering, harvesting of archaeologically associated flora such as *ti* (*Cordyline fruticosa*), trampling or erosion from pedestrian/vehicular access, and unpermitted ground disturbance. Significant impacts to historic properties as a result of unmanaged access have been documented elsewhere in the State.

Moreover, Section 3.2.2.2 of the EIS, “Modified Lease Area”, discusses what is needed to provide appropriate buffers to ensure public safety and the security of the system to allow for more public access into the License Area.

Moreover, please note that EMI's understanding is that the most popular access points to the Ko‘olau Forest Reserve are [believed to be] owned by EMI. Therefore, EMI assumes liability for those access points. Thus, restricting access to the general public through areas that are owned by EMI/A&B is necessary.

Comment 5: *The DEIS should also discuss shorter term lease options of way less than 30 years! That to me is insane as there are so many uncertainties of the future of rainfall especially with the climate crisis upon us and all the heat waves, droughts and fires we have been experiencing!*

Response 5: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural

operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80 of the Final EIS, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Regarding climate change, climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown in the pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Comment 6: *Lastly, there needs to be an option in the EIS for no diverted streams! I do not see this option and for this being an EIS, it really must be considered. As a resident and concerned biologist, I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.*

Response 6: Please note that while this is not discussed in the EIS, the EIS does discuss the No Action alternative whereby the Water Lease is not issued. The No Action alternative assessed in Section 3.3 EIS assumes that if no Water Lease were issued, the EMI Aqueduct System could continue to divert approximately 30% of the water available from the Collection Area, plus approximately 4.37 mgd from the privately owned lands between Honopou Stream and Māliko Gulch. That is because the rights under the 1938 Agreement are independent of the Proposed Action under consideration in this EIS. Moreover, impacts of the No Action alternative are discussed in Section 3.4 of the EIS (Comparative Evaluation of Reasonable Alternatives) against different environmental resource categories.

Comment 7: *Please accept these comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Be aware that many many many of us feel Enough is Enough, we will not be tolerating this any longer. Please know there will be a very strong stance against the privatization of public waters in a way that you have never seen before! The people are rising and you, as the informed scientists who created this DEIS, know what is the healthiest route for the land, the streams, the creatures, the plants, and the entire ecosystem, which ultimately affect the people. Your conscience will no longer allow you to cater to the big corporations such as A&B and Mahi Pono. East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. Thank you for this opportunity to submit comments on this Draft EIS.*

Response 7: We acknowledge your comments. We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities,

and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: EIS

Dear Mr. Hirokawa,

I am deeply disturbed by the parameters of this EIS granting water rights for Mahi Pono. The irony is not lost on the people of Hawai'i; there is nothing pono about this. Rather, what it seeks is to continue the colonial, extractive legacy of large corporations coming into Hawai'i, usurping land and water resources, with no regard for anything other than profits.

But people are stronger than profits. We have seen countless examples of this resiliency in Hawai'i, most recently on top of Mauna Wakea, where we are resisting corporate greed and land desecration atop one of the most sacred sights in indigenous tradition. Make no mistake, we will continue the fight.

I strongly oppose this measure and will be out fighting with the rest of our lāhui against this. No water leases for Mahi Pono, let the streams run free!

Sincerely,
La'akea Kaufman

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas

Dear La'akea Kaufman:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am deeply disturbed by the parameters of this EIS granting water rights for Mahi Pono. The irony is not lost on the people of Hawai'i; there is nothing pono about this. Rather, what it seeks is to continue the colonial, extractive legacy of large corporations coming into Hawai'i, usurping land and water resources, with no regard for anything other than profits.*

Response 1: We acknowledge your comments. Please note that the EIS does not grant anything for Mahi Pono or the Applicant. The EIS is an environmental disclosure document that assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 2: *But people are stronger than profits. We have seen countless examples of this resiliency in Hawai'i, most recently on top of Mauna Wakea, where we are resisting corporate*

greed and land desecration atop one of the most sacred sights in indigenous tradition. Make no mistake, we will continue the fight.

Response 2: We acknowledge your comments. However, please note that the ongoing issues at Maunakea is not within the scope of this EIS. As noted in Response #1 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

With regards to traditional practices and cultural resources, the CIA acknowledges that the Proposed Action may impact Native Hawaiian cultural resources and practices and provides for several recommendations to mitigate those impacts. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to ‘ōpae, ‘o‘opu, pūpūlo‘i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe‘e, Puohokamoa, Ha‘ipua‘ena, Honopou (Puniawa Tributary), Punala‘u (Kōlea and Ulunui Tributaries), Honomanū, Nua‘ailua, Pi‘ina‘au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili‘ula, Pa‘akea, Kapā‘ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua‘aka‘a Tributary, and Waia‘aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo‘i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro

farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe‘e, Puohokamoa, Ha‘ipua‘ena, Punala‘u (Kōlea and Ulunui Tributaries), Honomanū, Nua‘ailua, Pi‘ina‘au, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili‘ula, Pua‘aka‘a, Pa‘akea, Waia‘aka, Kapā‘ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, pages 4-239 to 4-252 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for

cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all constitutionally protected traditional and customary rights.

Comment 3: *I strongly oppose this measure and will be out fighting with the rest of our lāhui against this. No water leases for Mahi Pono, let the streams run free!*

Response 3: Your comments that you strongly oppose the Proposed Action are acknowledged.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC’s website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Please accept my comments on the Draft EIS on the proposed EMI 30 year lease.

I care very deeply about this proposed lease of the public water because I am a land owner with frontage along Honopou Stream. TMK 2-9-001-010-0000

The Draft EIS needs to address my following concerns.

The DEIS needs to address in engineering terms, with supporting calculations, the anticipated unintended consequences of restoring the Honopou and other designated streams to 100% flow.

The State Bridge on State Land that crosses the Honopou Stream will frequently go completely under water during a rainy period, particularly when a freshet empties its contents on the region.

The Bridge is sitting on dry stacked blue rock. The State refuses to maintain the Bridge!

An even more pressing concern is the capability of the tunnel beneath the Hana Highway at Honopou to carry all of the stream flow under flood conditions. I direct your attention to the Right of Way map, Hana Belt Road, Federal Aid Project No 32A which illustrates a subterranean tunnel but offers no dimensions or support calculations as to its carrying capacity. The tunnel, during my past 50 years in the neighborhood, frequently clogs with debris and vegetation that severely impacts the tunnels carrying capacity. Frequently mauka homeowners are denied access to their homes when the tunnel clogs and stream water backs up into the valley.

In the early 1940's, when the Hana Belt Road was designed and built, EMI was already diverting millions of gallons per day from the Honopou Stream. If the highway design team did not account for the already diverted water when they designed the tunnel it maybe that the tunnel cannot handle the Honopou Stream restored to full flow!

The DEIS must include an engineering analysis of the water carrying capacity of the tunnel under the Hana Belt Road at Honopou.

The DEIS must include an engineering analysis of the risk to the Honopou Bridge when it is subjected to total immersion and fast moving stream flows.

The DEIS must include a survey of stream frontage lots, and loi that serve taro growers to identify all unintended consequences of restoring the Honopou Stream to full flow.

Altho my concerns are local and personal, these same demands should extend to the entire lease area to mitigate unintended consequences.

Earl:

You will find this interesting. I've highlighted the event for Honopou Stream.

6,000 cuf³/sec, plus whatever water was drawn off in the Ditches ~~could~~ may overwhelm the tunnel passing under the Hana Hwy @ Honopou.

HAWAII Floods and Droughts

See page 3.
+ 5

Hawaii's climate is relatively warm year round. The annual temperature ranges from about 51 to 93 degrees Fahrenheit except at high altitudes, where it is cooler. The trade winds, which blow from the northeast, have a cooling effect on the islands. The trade winds and the mountains are the most important factors affecting Hawaii's climate; together, they create an orographic effect that furnishes Hawaii with its abundance of freshwater from precipitation. The orographic effects result in almost three times as much rainfall over the islands as over the ocean. The principal moisture delivery patterns are shown in figure 1.

The annual rainfall of 70 inches supplies nearly 8 trillion gallons of water per year to Hawaii. Although most of this rainfall is produced orographically, major storms also are substantial contributors.

Flooding in Hawaii is caused by major storms or by tsunamis. The worst flood, in terms of lives lost, was caused by the tsunami of April 1, 1946. Throughout the State (Territory at that time), 157 deaths were reported. Of those deaths, 121 were on the island of Hawaii. Estimated damage was \$25 million.

The greatest rainfall rate on record was 38 inches in 24 hours during the storm that caused the flood of January 24-25, 1956, at Kilauea, Kauai (fig. 2). During the storm, 12 inches fell within 1 hour, and the total rainfall was 43.5 inches. One person drowned in the flood.

The largest recorded statewide property damage was caused by Hurricane Iwa and the resulting flood of November 23, 1982. Total estimated damage was \$308 million, mostly on the islands of Kauai and Oahu.

Although the world's wettest locality is in Hawaii, droughts can occur. The areas most affected by droughts are those that normally are dry and depend on winter rains and those that do not have a ground-water supply or a water supply from another area. Local

areas most affected by droughts are on the islands of Hawaii and Maui.

The State's water resources are managed and developed by the Department of Land and Natural Resources through the Division of Water Resources Management (formerly the Division of Water and Land Development) and by the Board and Departments of Water Supply of local governments. The Department of Health administers regulations for the protection of Hawaii's ground and surface water and coastal seawater.

GENERAL CLIMATOLOGY

Trade winds are the most dominant feature controlling the circulation of air across the Hawaiian Islands. The trade winds blow from the northeast and represent the outflow of air from the great Pacific anticyclone that is commonly located northeast of the Hawaiian Islands.

The combination of trade winds and mountainous topography has a significant effect on the climate of the islands. From May through September, the trade winds are prevalent 80-95 percent of the time. From October through April, the frequency decreases to 50-80 percent. During this period, moisture may come from the northwest or south (fig. 1). The warmer period of May through September and the cooler period of October through April constitute the two seasons of the year.

The trade winds, although dominant and persistent, especially during the warmer season, are not the only factor in the climatic setting of Hawaii. Land and sea breezes, upslope and downslope winds, and major storms also are types of air movement that affect the climate.

In areas of tall mountains, which are physical barriers that block the trade winds, land and sea breezes are dominant. In addition, the diurnal cycle consists of upslope winds during the day and downslope winds during the night, especially on the slopes of tall mountains.

Major storm systems, which commonly occur from October to April, can affect all parts of the islands. Major storms generally number from none to six in any given year and may differ substantially in severity from year to year. These storms bring intense rains, sometimes accompanied by strong winds.

The four types of major storms that affect the Hawaiian climate are frontal systems, combination of frontal and upper level low-pressure systems, upper level low-pressure systems, and tropical storms or hurricanes. When frontal systems pass through the islands, which happens rarely, it is generally during the cooler sea-

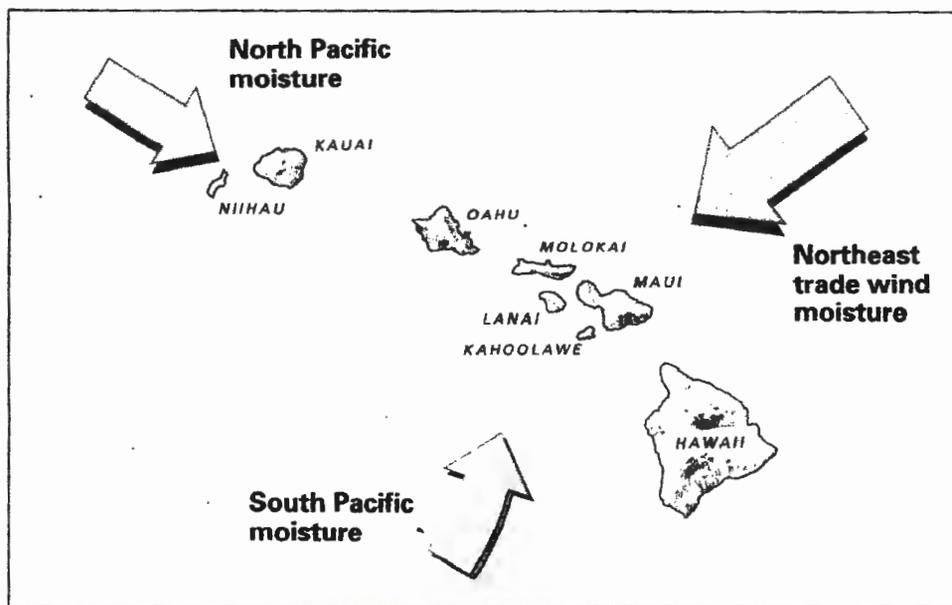

Figure 1. Principal sources and patterns of delivery of moisture into Hawaii. Size of arrow implies relative contribution of moisture from source shown. (Source: Data from Douglas R. Clark and Andrea Lage, Wisconsin Geological and Natural History Survey.)

Seventy inches of annual rainfall is equivalent to about 8 trillion gallons of water per year, or about 17 times the State's annual water use of 460 billion gallons (U.S. Geological Survey, 1990). Seemingly, the Hawaiian Islands would not have a water-supply problem with so much rainfall. However, rainfall totals cannot be related directly to water supply because water is lost (before consumption) through evaporation, transpiration, and runoff. Another important factor is the uneven distribution of rainfall with respect to location and time.

The gradient in annual rainfall is steep in many areas of the islands. In many places, the gradient exceeds 25 inches for each mile traversed along a straight line (Blumenstock and Price, 1967).

At altitudes below 2,000 feet, where most of the population lives, most rain falls in the cooler season. An exception is at Kona, on the Island of Hawaii, where average rainfall is greater during the warmer season. Rainfall is more frequent and of greater intensity during the night or early morning than during the day. Rainfall is more variable during the cooler season than during the warmer season. When winter storms are absent, total rainfall in the cooler season is substantially less because winter storms contribute appreciably to rainfall totals.

Two climatic conditions that affect Hawaii's weather are the El Niño and the Southern Oscillation. El Niño and the Southern Oscillation are oceanic and atmospheric components, respectively, of large-scale oceanic-atmospheric interactions in the Pacific Ocean (Enfield, 1989). Initially, El Niño was the name given to the warm ocean current that periodically develops off the coast of Peru and Ecuador, usually around the Christmas season. Today, the name is used to identify the warming of the ocean surface that extends far westward from the South American coast along the equator. The Southern Oscillation refers to the periodic changes in atmospheric pressure between the eastern and western sides of the South Pacific Ocean that reflect the large-scale exchange of air between these regions. El Niño and the Southern Oscillation are so closely related that this type of large-scale event is commonly referred to as El Niño/Southern Oscillation (ENSO).

Additional studies are needed to understand clearly the pronounced effect ENSO has on Hawaiian rainfall, as well as global weather. ENSO is the only large-scale phenomenon of long duration that, when it occurs, can be used to predict the rainfall for the upcoming year with a large probability of success.

MAJOR FLOODS AND DROUGHTS

Most major floods and droughts described herein are those that had significant recurrence intervals—greater than 25 years for floods and greater than 10 years for droughts; other floods are included because they are known to have been major events even though the actual severity is unknown. Major floods and droughts are listed chronologically in table 1; rivers and cities are shown in figure 2. To depict floods (fig. 3) and droughts (fig. 4) in Hawaii, nine streamflow-gaging stations were selected from the statewide network. Of these, three were used to depict floods, three were used to depict droughts, and three were used to depict both floods and droughts. The gaging stations were selected on the basis of areal coverage, length of record, and representation of hydrologic conditions in their respective areas. Streamflow data are collected, stored, and reported by water year (a water year is the 12-month period from October 1 through September 30 and is identified by the calendar year in which it ends).

FLOODS

Floods occur nearly every year on one or more streams in Hawaii. The areal extent and severity of major floods are shown on

the maps in figure 3. Also shown are graphs of annual peak discharges for the six selected streamflow-gaging stations. The graphs illustrate the typical year-to-year variability of peak discharge in streams.

One of the most severe and destructive floods of record in Hawaii was in the Iao Valley on the Island of Maui on January 14, 1916. The peak discharge was estimated to be 17,000 cubic feet per second in Iao Stream. Thirteen deaths were reported, and about 50–75 homes were destroyed. Estimated damage was \$600,000 (Hawaii Division of Water and Land Development, 1983a).

On November 18, 1930 (water year 1931), Kalihi Stream near Honolulu on Oahu (fig. 3, site 3) and Honopou Stream near Huelo on Maui (fig. 3, site 5) had record peak discharges with a recurrence interval of greater than 100 years. On Oahu, 11 deaths were reported in the Kalihi Valley, and damage was estimated at \$125,000 (Hawaii Division of Water and Land Development, 1983a). On Maui, roads and bridges were destroyed, and pineapple fields were damaged; damage was estimated to be \$50,000 (Hawaii Division of Water and Land Development, 1983a).

The devastating flood of February 27, 1935, was produced by a storm that crossed Oahu from the northwest with accompanying thunder, lightning, and hail. Rainfall reported in the Wahiawa area was 20 inches within 24 hours. Ten people drowned, and several houses were destroyed. Damage was estimated at \$700,000 (Hawaii Division of Water and Land Development, 1983a).

The flood of August 11–12, 1940, occurred on the "Big Island" of Hawaii. On August 11, the Wailuku River at Piihonua (fig. 3, site 6) had a record peak flow with a recurrence interval of greater than 100 years. Only a few bridges were damaged. Estimated damage was \$50,000 (Hawaii Division of Water and Land Development, 1983a).

Tsunamis (seismic sea waves) can cause devastating floods. A tsunami is a series of waves that travels at tremendous speeds and is caused by submarine earthquakes or seismic disturbances. The flood of April 1, 1946, which was caused by a tsunami, resulted in 157 deaths in the Hawaiian Islands. The "Big Island" experienced the greatest impact of the flood with 121 deaths reported. Total estimated damage was \$25 million (Hawaii Division of Water and Land Development, 1983a).

Intense rainfall on Kauai—19.8 inches in about 14 hours in one location—resulted in a damaging flood on November 11–12, 1955 (water year 1956). The East Branch of the North Fork Wailua River near Lihue (fig. 3, site 2) had a record peak flow on November 12 with a recurrence interval of greater than 100 years. Estimated damage for the flood was \$100,000 (Hawaii Division of Water and Land Development, 1983a).

The greatest rainfall intensity on record in Hawaii was about 38 inches in 24 hours during the storm of January 24–25, 1956, at Kilauea, Kauai. During the storm, 12 inches of rain fell within 1 hour, and total rainfall was 43.5 inches (Blumenstock and Price, 1967). Although no gaging stations were located in the drainage basin to record the peak flows, record peak flows were reported at nearby gaging stations on Anahola Stream and Kapaa Stream. One motorist drowned when a car was swept off the highway. The highway bridge at Moloaa was washed out; as a result, northern Kauai was temporarily isolated from the rest of the island. Most of the damage was to agricultural land.

The flood of March 9, 1957, was caused by a tsunami. Three deaths were reported, and damage totaled \$3.3 million (Hawaii Division of Water and Land Development, 1983a).

Although tropical cyclones pass close to the Hawaiian Islands, only one hurricane has passed directly over an island. A weakened hurricane, Hurricane Dot, passed over Kauai on August 4, 1959, resulting in a flood that caused \$11.5 million in damage (Hawaii Division of Water and Land Development, 1983a).

The second worst flood on record caused by a tsunami occurred on May 22, 1960. As during the tsunami-related flood of 1946,

the "Big Island" experienced the greatest impact, with 61 deaths reported. Damage throughout the State totaled about \$26 million (Hawaii Division of Water and Land Development, 1983a).

On April 15, 1963, the South Fork Wailua River near Lihue (fig. 3, site 1) on Kauai had a record peak flow with a recurrence interval exceeding 100 years. The storm that caused this flood also caused flooding and death on Oahu. Two soldiers drowned in a swollen stream in the mountains. Several homes on Oahu were damaged, and a subdivision near Kaneohe was declared a major disaster area by State and Federal Governments. Estimated damage was \$492,000 on Kauai and \$1.7 million on Oahu (Hawaii Division of Water and Land Development, 1983a).

Two people were swept to their deaths on February 4, 1965, when a stream near Kaneohe overtopped its banks. On Molokai, the Halawa Stream near Halawa (fig. 3, site 4) had a record peak flow with a recurrence interval exceeding 100 years. Estimated damage was \$593,000 on Oahu and \$36,000 on Molokai (Hawaii Division of Water and Land Development, 1983a).

The flood created by Hurricane Iwa on November 23, 1982 (water year 1983), caused severe damage and flooding on the southern coast of Kauai and lesser damage and flooding on the western coast of Oahu. Hurricane Iwa was weakening as it passed 30 miles west of Kauai, but it still caused the greatest property damage on record for a single flood. Damage, mainly on Kauai and Oahu, totaled \$308 million (Hawaii Division of Water and Land Development, 1983a).

Table 1. Chronology of major and other memorable floods and droughts in Hawaii, 1916-88

[Recurrence interval: The average interval of time within which streamflow will be greater than a particular value for floods or less than a particular value for droughts. Symbol: >, greater than. Sources: Recurrence intervals calculated from U.S. Geological Survey data; other information from U.S. Geological Survey, State and local reports, and newspapers]

Flood or drought	Date	Area affected (fig. 2)	Recurrence interval (years)	Remarks
Flood	Jan. 14, 1916	Island of Maui (Iao Valley)	Unknown	Deaths, 13; damage, \$800,000.
Flood	Jan. 16, 1921	Island of Oahu	Unknown	Deaths, 4; damage, \$250,000.
Flood	Nov. 18, 1930	Island of Oahu (Kalihi, Moanalua, and Halawa Valleys); Island of Maui (Honopou Stream).	>100	Deaths, 11 in Kalihi Valley; damage, \$125,000 on Oahu and \$50,000 on Maui.
Flood	Feb. 27, 1935	Island of Oahu	Unknown	Several houses washed away. Deaths, 10; damage, \$700,000.
Drought	1938-47	Statewide	10 to >50	Record drought on Kauai, Oahu, and Hawaii.
Flood	Aug. 11-12, 1940	Island of Hawaii (Wailuku River)	100	Damage, \$50,000.
Flood	Apr. 1, 1946	Statewide	Unknown	Tsunami. Deaths, 157; damage, \$25 million.
Flood	Feb. 7, 1949	Islands of Kauai and Oahu	>25	Damage, \$700,000.
Flood	Nov. 27-28, 1954	Islands of Kauai and Oahu	Unknown	Deaths, 2 on Oahu; damage, \$560,000 on Kauai and \$750,000 on Oahu.
Flood	Nov. 11-12, 1955	Island of Kauai (East Branch of North Fork Wailua River).	>100	Rainfall of 19.8 inches in 14 hours at Kilauea. Damage, \$100,000.
Flood	Jan. 24-25, 1956	Kilauea, Kauai	Unknown	Greatest rainfall intensity on record, 38 inches in 24 hours; one death.
Flood	Mar. 9, 1957	Statewide	Unknown	Tsunami. Deaths, 3; damage, \$3.3 million. Declared disaster area by State and Federal Governments.
Flood	Aug. 4, 1959	Island of Kauai	Unknown	Hurricane Dot. Damage, \$11.5 million. Declared disaster area by State and Federal Governments.
Flood	May 22, 1960	Statewide	Unknown	Tsunami. Deaths, 61; damage, \$26 million. Declared disaster area by State and Federal Governments.
Flood	Apr. 15, 1963	Islands of Kauai (South Fork Wailua River) and Oahu.	>100	Several homes damaged by flash flood. Deaths, 2; damage, \$2.2 million.
Flood	Jan. 23, 1965	Island of Maui (Palikoa Stream)	>100	Damage, \$4,000.
Flood	Feb. 4, 1965	Islands of Oahu and Molokai (Halawa Stream).	>100	Deaths, 2; damage, \$593,000 on Oahu and \$36,000 on Molokai.
Flood	May 2, 1965	Honolulu, Oahu	Unknown	One person injured. Damage, \$100,000.
Flood	Jan. 11, 1967	Waimea, Hawaii	Unknown	Damage, \$25,000.
Flood	Feb. 1, 1969	Island of Oahu	Unknown	Damage, \$705,000.
Drought	1970-79	Islands of Kauai, Oahu, Molokai, and Maui.	10 to >50	Worst drought in more than 70 years on Molokai and Maui.
Flood	Nov. 29, 1976	Island of Hawaii	Unknown	Tsunami and earthquake. Damage, \$3.11 million.
Flood	Feb. 17-22, 1979	Island of Hawaii	Unknown	Two persons injured; 250 families evacuated. Businesses, houses, and sugar crops damaged. Damage, \$6 million. Declared major disaster area by State and Federal Governments.
Flood	Nov. 15-18, 1979	Island of Hawaii	Unknown	Northern, eastern, and southern sections affected. Damage, \$3.75 million. Declared major disaster area by State.
Flood	Jan. 6-14, 1980	Statewide	Unknown	High winds and surf, intense rains. Damage, \$42.6 million.
Flood	Oct. 28, 1981	Island of Oahu (Waiawa Stream).	Unknown	Sixty-two people evacuated. Damage, \$786,000. Declared major disaster area by State.
Flood	Nov. 23, 1982	Statewide	Unknown	Hurricane Iwa. Damage, \$308 million mainly on islands of Kauai and Oahu.
Drought	1983-88	Statewide	10 to >25	Second most severe in history on some islands.

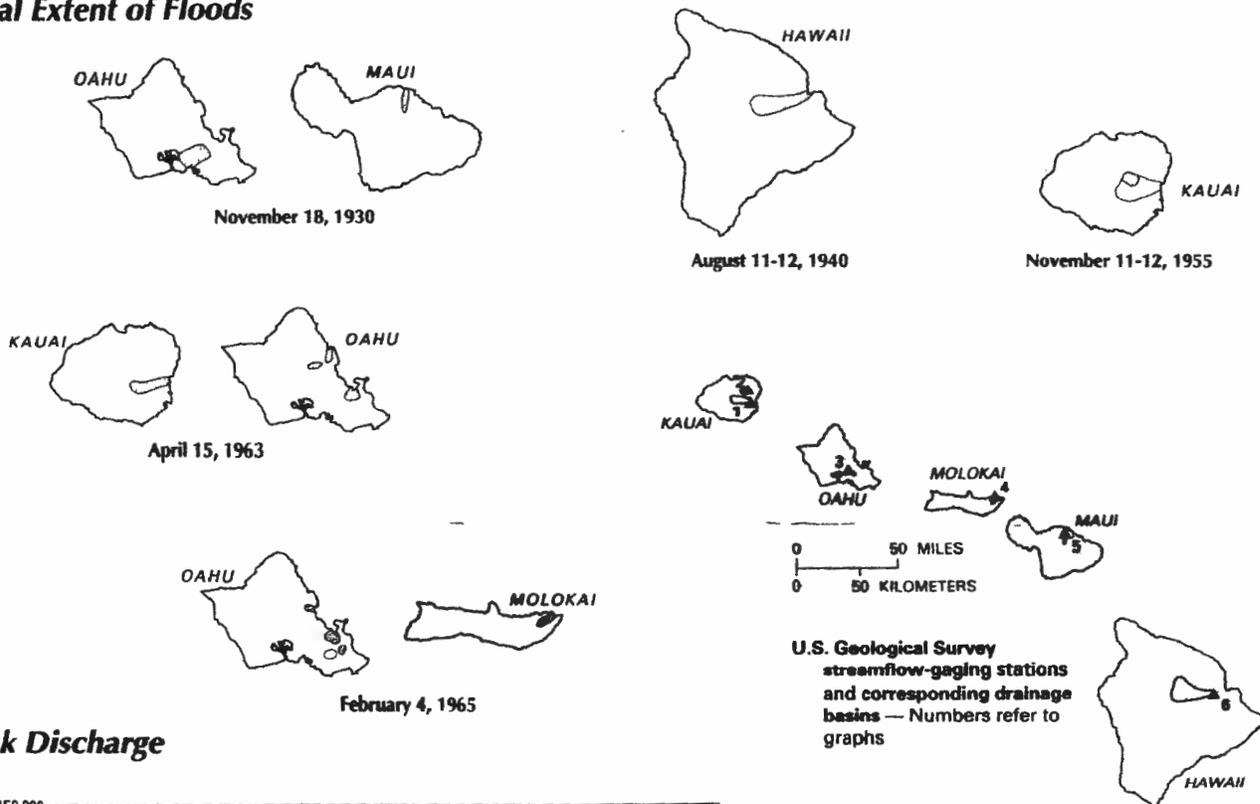

Most of the drainage basins in Hawaii are less than 10 mi² (square miles), and many are less than 5 mi², especially on the islands of Molokai and Oahu. Storms that produce intense rainfall over most or all of the drainage area of small basins can cause runoff having large unit discharges (discharge per square mile of drainage area) due to the small contributing drainage area. Some gaging stations on streams having less than 1.0 mi² of contributing drainage area have recorded unit discharges of greater than 5,000 cubic feet per second per square mile. Small-basin floods such as these can be devastating, but the damage is confined to a small area.

Floods can occur anywhere in the State. When population and property are unaffected, limited attention is given to an event. When people and property are affected, human safety and minimization of property damage are of most importance. The islands have experienced death and destruction as a result of floods. However, because of the small drainage basins and the effective management practices of State and local officials, the impacts have not been as great as those experienced by other States.

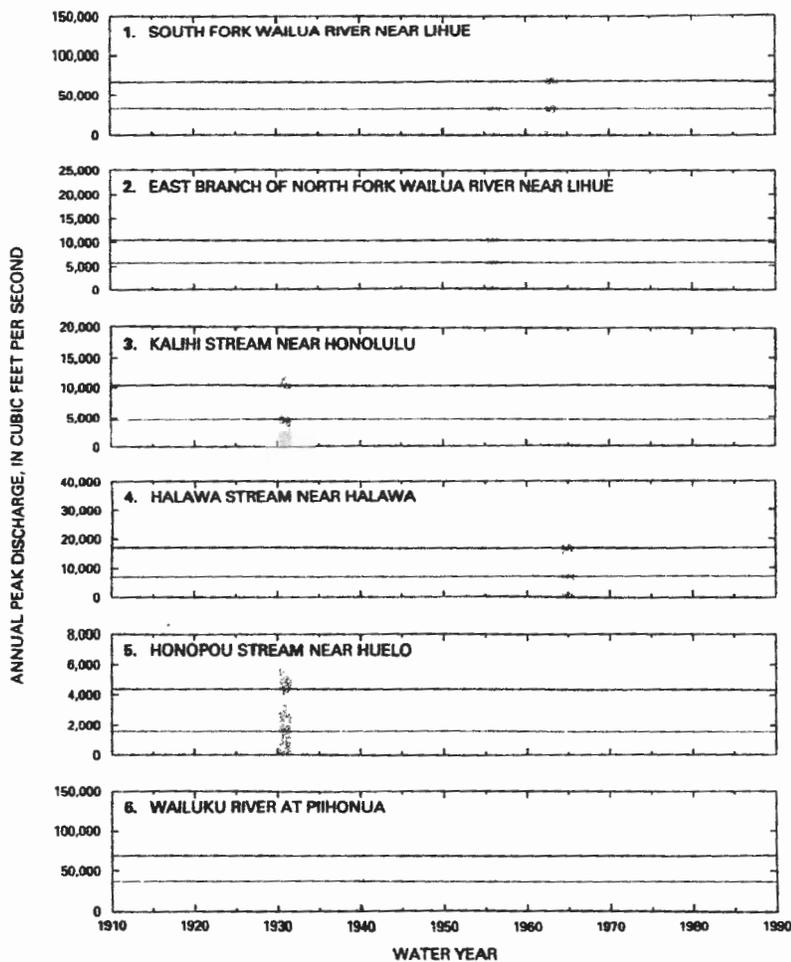

DROUGHTS

Droughts in the Hawaiian Islands can be defined as periods when rainfall is substantially less than normal and human activity is impaired. The climatic setting that produces droughts in Hawaii is

the combined absence of winter storms and rain-bearing trade-wind clouds for an extended time.

The areas most affected by droughts are those that normally are dry and depend on winter rains and those that receive little rain from the trade winds. Also greatly affected are the areas that have no ground-water supply or water supply from another area. Even locations having a ground-water supply are affected when the supply reaches a critically low level and water-use restrictions are implemented.

The islands affected by three major droughts and the severity of those droughts are shown on the maps in figure 4. The graphs show the annual departures from average streamflow for six gaging stations; several consecutive years of predominantly less than average streamflow indicate drought.

The most severe drought to affect the Hawaiian Islands since streamflow recordkeeping began extended from the late 1930's through most of the 1940's, and the effects were felt on all of the main islands (fig. 4). The drought had a recurrence interval of greater than 50 years except on Molokai, where it had a recurrence interval of about 10 years. ~~Kauai was the first island for which~~ streamflow records indicate less than average flow caused by the drought. Gages on Kawaikoi Stream near Waimea and on the East Branch of North Fork Wailua River near Lihue (fig. 4, sites 1 and 2) recorded less than average streamflow beginning in August 1938. By the early 1940's, the drought had spread to Oahu (site 3), Molokai (site 4), Maui (site 5), and the island of Hawaii (site 6). The drought ended statewide in 1947.

During the 1970's, Molokai and Maui experienced a severe drought that had a recurrence interval of greater than 50 years. The graphs for Halawa Stream near Halawa on Molokai and Honokokau Stream near Honokokau on Maui (fig. 4, sites 4 and 5) illustrate the long duration of this drought. The drought was the most severe on those islands since recordkeeping began in the 1910's. Kauai and Oahu also were affected by the 1970-79 drought, although the drought was less intense on those islands. Streamflow on the island of Hawaii was little affected by this drought as indicated by the annual departure graph for the Wailuku River at Pihoonua (fig. 4, site 6).

A moderate to severe drought affected the entire State from 1983 to 1986. Although not as intense on some islands as either the 1938-47 or the 1970-79 drought, nor as long, this drought caused cumulative streamflow deficits at some gaging stations that rank second for the period of record. The drought recurrence intervals calculated from the streamflow deficits ranged from about 10 to more than 25 years, depending on locality. Of the six gaging stations for which records are shown in figure 4, the recurrence interval was greatest (about 35 years) at the East Branch of the North Fork Wailua River near Lihue, Kauai (site 2).

Although Hawaii has experienced severe droughts, the most detrimental effects usually have been confined to limited areas. Physiography, land use, and location of ground-water sources can determine which areas are most affected by a drought and how severely. Hawaii and Maui usually are the islands most affected by droughts because each has ranches and cultivated areas where ground-water sources have not been developed. Thus, during drought, water has to be imported for the survival of animals and plants.

WATER MANAGEMENT

The Department of Land and Natural Resources, through the Division of Water Resources Management, administers the State's programs in water-resources management and development. Programs include data collection and appraisal of ground- and surface-water resources, climatology, flood prevention and control, administration of regulations, and long-range planning.

A comprehensive cooperative program between the Division of Water Resources Management and the U.S. Geological Survey provides much of the data and analyses essential to the effective management of the State's critical water resources. The State Water Code authorizes the Department of Land and Natural Resources to regulate ground and surface waters, to administer a permit system to divert water, and to require reporting of water use.

The effective management of water resources has required the cooperation and coordination of Federal, State, and local governments. The efforts of these agencies, in addition to the cooperation of private industry and the public, have helped to prevent contamination and excessive ground-water withdrawals. Adherence to land-use regulations has lessened the damage caused by floods.

The water-resources-management plans and regulations in the Hawaii State Water Resources Functional Plan are evaluated periodically. Future water-resources development and flood-control projects will be regulated according to these guidelines.

The State Department of Health administers regulations for the protection of ground and surface water and coastal seawater. These regulations are stringently enforced to preserve water quality and prevent pollution.

Flood-Plain Management.—In 1961, the State legislature designated the Department of Land and Natural Resources as the State flood-control agency. The Division of Water Resources Management has the responsibility within the Department to coordinate the activities of Federal, State, county, and local governments and to develop and establish flood-control planning and water-conservation measures for the State.

The U.S. Geological Survey has provided the surface-water information needed for flood-control projects sponsored by State and local governments. Where necessary to implement flood-control measures, construction was completed by the U.S. Army Corps of Engineers. Flood-plain management and development of flood-insurance-rate maps have been accomplished with the guidance of the Federal Emergency Management Agency.

Flood-Warning Systems.—During emergencies, the State Civil Defense Agency coordinates the activities of all organizations within the State. The role of that agency in flood control is to plan for and respond to flood disasters.

The National Weather Service and the Pacific Tsunami Warning Center report potential flood threats to the State Civil Defense Agency. The information is verified, and the potential effect of the threat is evaluated. If a threat to public safety and property arises, warnings are transmitted to the public through the press, radio, and television.

Water-Use Management During Droughts.—The Department of Land and Natural Resources and county governments manage water use during droughts. Voluntary restraints and conservation practices have been emphasized by these agencies. Mandatory restrictions are rarely needed. Analysis of water-level data from ground-water monitoring wells and pumping wells has been effective in providing early warnings of the need for conservation. Pumpage allocations have been imposed on much of the island of Oahu to maintain a balanced water budget and to prevent seawater intrusion in wells completed in coastal-plain aquifers.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Young:

Thank you for two comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Letter #1

Comment 1: *I care very deeply about this proposed lease of the public water because I am a land owner with frontage along Honopou Stream. TMK 2-9-001-010-0000*

Response 1: We acknowledge your comments and understand that you are a land owner along Honopou Stream.

Comment 2: *The Draft EIS needs to address my following concerns.*

The DEIS needs to address in engineering terms, with supporting calculations, the anticipated unintended consequences of restoring the Honopou and other designated streams to 100% flow.

The State Bridge on State Land that crosses the Honopou Stream will frequently go completely under water during a rainy period, particularly when a freshet empties its contents on the region.

The Bridge is sitting on dry stacked blue rock. The State refuses to maintain the Bridge!

Response 2: We acknowledge your comments and concerns related to bridge that crosses Honopou Stream. Regarding your comment that the EIS needs to address in engineering term, with supporting calculations, of the impacts of restoring Honopou Stream, please note that this is outside the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

However, please note that bridge design standards utilize rainfall recurrence intervals for 10, 50, and 100-year storm recurrence intervals for hydraulic analysis and design of the bridge and its ability to pass required storm flows within streams. The storm recurrence intervals are much higher than IIFS volumes required within Honopou Stream and any of the other streams with ordered restoration of flows. Restoration of normal daily stream flows is only a very small percentage of the total flow during these storm flow conditions that cause damage or flooding.

Comment 3: *An even more pressing concern is the capability of the tunnel beneath the Hana Highway at Honopou to carry all of the stream flow under flood conditions. I direct your attention to the Right of Way map, Hana Belt Road, Federal Aid Project No 32A which illustrates a subterranean tunnel but offers no dimensions or support calculations as to its carrying capacity.*

Response 3: We acknowledge your comments. As noted in Response #2 above, bridge design standards utilize rainfall recurrence intervals for 10, 50, and 100-year storm recurrence intervals for hydraulic analysis and design of the bridge and its ability to pass required storm flows within streams. The storm recurrence intervals are much higher than IIFS volumes required within Honopou Stream and any of the other streams with ordered restoration of flows. Restoration of normal daily stream flows is only a very small percentage of the total flow during these storm flow conditions that cause damage or flooding.

Comment 4: *The tunnel, during my past 50 years in the neighborhood, frequently clogs with debris and vegetation that severely impacts the tunnels carrying capacity. Frequently mauka homeowners are denied access to their homes when the tunnel clogs and stream water backs up into the valley.*

Response 4: We acknowledge your comments and understand that you have witnessed frequent clogs with debris and vegetation of the tunnel underneath the bridge that crosses Honopou Stream. However, please note that as discussed in Section 4.3.3 of the Draft EIS:

According to the FEMA Flood Insurance Rate Maps (FIRM), the License Area is predominantly designated as Zone “X”, “Areas determined to be outside the 0.2% annual chance floodplain.” (See Figure 4-28) A number of adjacent parcels along the makai edge of the License Area lie in areas designated as Zone “A”, “Areas subject to inundation by the 1-percent-annual-chance flood event generally determined using approximate methodologies.” However, flooding in East Maui generally caused by freshets...

...In general, the Proposed Action will maintain existing conditions, in compliance with the CWRM D&O and any reservations in favor of the DHHL. No significant impacts on flooding or tsunami in East Maui are anticipated.

Hence, no impacts as a result of the Proposed Action are anticipated.

Comment 5: *In the early 1940's, when the Hana Belt Road was designed and built, EMI was already diverting millions of gallons per day from the Honopou Stream. If the highway design team did not account for the already diverted water when they designed the tunnel it maybe that the tunnel cannot handle the Honopou Stream restored to full flow!*

Response 5: As noted in Response #2 above, bridge design standards utilize rainfall recurrence intervals for 10, 50, and 100-year storm recurrence intervals for hydraulic analysis and design of the bridge and its ability to pass required storm flows within streams. The storm recurrence intervals are much higher than IIFS volumes required within Honopou Stream and any of the other streams with ordered restoration of flows. Restoration of normal daily stream flows is only a very small percentage of the total flow during these storm flow conditions that cause damage or flooding.

Comment 6: *The DEIS must include an engineering analysis of the water carrying capacity of the tunnel under the Hana Belt Road at Honopou.*

The DEIS must include an engineering analysis of the risk to the Honopou Bridge when it is subjected to total immersion and fast moving stream flows.

Response 6: As noted in Response #2 above, please note that this is outside the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 7: *The DEIS must include a survey of stream frontage lots, and loi that serve taro growers to identify all unintended consequences of restoring the Honopou Stream to full flow.*

Altho my concerns are local and personal, these same demands should extend to the entire lease area to mitigate unintended consequences.

Response 7: We acknowledge your comments. However, please note that it is not within the scope of the EIS to survey all stream frontage lots and lo‘i that serve kalo farmers. As noted in Response #2 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Letter #2

Comment 8: *You will find this interesting. I've highlighted the event for Honopou Stream.*

6,000 cu ft/sec, plus whatever water was drawn off in the ditches may overwhelm the tunnel passing water under the Hana Hwy @ Honopou.

Response 8: We acknowledge your comments. Please note that the quote you highlighted in your letter states that, "...*Honopou Stream near Huelo on Maui (fig.3, site 3) had record peak discharges with a recurrence interval of greater than 100 years.*" Hence, as noted in Response #2 above bridge design standards utilize rainfall recurrence intervals for 10, 50, and 100-year storm recurrence intervals for hydraulic analysis and design of the bridge and its ability to pass required storm flows within streams. The storm recurrence intervals are much higher than IIFS volumes required within Honopou Stream and any of the other streams with ordered restoration

of flows. Restoration of normal daily stream flows is only a very small percentage of the total flow during these storm flow conditions that cause damage or flooding.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Alexander and Baldwin's Draft Environmental Impact Statement Comments

Dear Mr. Matsukawa,

I am a lineal descendant of Puakea and Pa'akea ahupua'a in Nahiku, Maui, and I oppose Alexander and Baldwin's proposal to further divert the streams of East Maui. My 'ohana owns the ahupua'a of Puakea and Pa'akea through Land Commission Award 209 to Stephen Grant. The lands passed down the family line to my great great great grandparents Anna Loika Alo and Boniface Achong who lived, farmed, fished, and raised their family on the land. My great grandmother Maria Victoria (Nena) Li Won, who passed just a couple years ago, was raised by her grandparents Anna and Boniface on this 'aina as a young child. Our 'ohana still owns the makai portion of Pa'akea ahupua'a from Hana Highway to the ocean, but East Maui Irrigation asserts ownership over the mauka portion of Pa'akea ahupua'a and the entirety of Puakea ahupua'a. These lands claimed by East Maui Irrigation now have water diversions running through them, which divert the vast amounts of water that would otherwise flow makai in Waia'aka, Puakea, and Pa'akea Streams.

The old maps name the stream and gulch at the Eastern boundary of Pa'akea ahupua'a as "Waiaaka", the stream and gulch between Pa'akea and Puakea ahupua'a as "Paakea", and the stream and gulch at the Western boundary of Puakea ahupua'a as "Puakea". Pa'akea ahupua'a also includes Pali Spring. My family is still tied to these lands, and our family's presence on the lands remains through the crops planted along the stream, and the now towering ti leaf, banana trees, and mango trees planted over 100 years ago. 'Ohia, 'uluhe, and hapu'u ferns still blanket much of these lands, with native plants 'ekaha, palapalai, pala'a, and 'ie'ie still present. 'O'opu, hihiwai, and 'opae are still in the streams here. We still spend time on the property as a family (I visited last year with cousins), and many in my family have favorite childhood memories of camping on this land and catching 'opae in the stream and fish for dinner. To honor my kupuna (some of whom are buried on this land) and retain our connection and kuleana to this family land, my cousins and I hope to reopen lo'i, gardens, and care for the streams.

Comments on Puakea Stream: The Draft EIS states, "The Draft Environmental Impact Statement identifies 37 streams within the License Area; Puakea Stream was not recognized by CWRM but is a stream within the License Area that is diverted by the EMI Aqueduct System." Puakea Stream is a vital part of the Nahiku ecosystem and cultural heritage. Its flow is diminished due to mauka EMI diversions, and it also needs to have streamflow restored.

Comments on Pa'akea Stream: The Draft EIS states, "Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohakamoā, Ha'ipua'ena, Nua'ailua, Waia'aka and Hanawī. None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147)." I would like to restore our lo'i and grow taro along Pa'akea Stream, Puakea Stream, and Waia'aka Stream if the stream flow increases enough to make taro cultivation viable. Again, our family sustained themselves entirely on this land, eating, drinking, and gathering from the streams and ocean which was also nourished by the freshwater from the streams. Reviving this land to once again grow food is possible, but we need the water to return the land to productivity.

There is already so much water being diverted from East Maui Streams. If the State allows even more water to be diverted, our traditional customary practices cannot be perpetuated, and our native species (in particular 'o'opu, hihiwai, and 'opae) which remain in the streams of Puakea, Pa'akea, Waia'aka and others will be put at immediate risk. Stream flow is already low. Please do not allow increased diversions, and help us all to achieve cool clean and connected streamflow from mauka to makai.

Sincerely,
Laura Kaakua

Aloha,

I am a lineal descendant of Puakea and Pa'akea ahupua'a in Nahiku, Maui, and am providing comments in my personal rather than professional capacity. I oppose Alexander and Baldwin's proposal to further divert the streams of East Maui. My 'ohana owns the ahupua'a of Puakea and Pa'akea through Land Commission Award 209 to Stephen Grant. The lands passed down the family line to my great great great grandparents Anna Loika Alo and Boniface Achong who lived, farmed, fished, and raised their family on the land. My great grandmother Maria Victoria (Nena) Li Won, who passed just a couple years ago, was raised by her grandparents Anna and Boniface on this 'aina as a young child. Our 'ohana still owns the makai portion of Pa'akea ahupua'a from Hana Highway to the ocean, but East Maui Irrigation asserts ownership over the mauka portion of Pa'akea ahupua'a and the entirety of Puakea ahupua'a. These lands claimed by East Maui Irrigation now have water diversions running through them, which divert the vast amounts of water that would otherwise flow makai in Waia'aka, Puakea, and Pa'akea Streams.

The old maps name the stream and gulch at the Eastern boundary of Pa'akea ahupua'a as "Waiaaka", the stream and gulch between Pa'akea and Puakea ahupua'a as "Paakea", and the stream and gulch at the Western boundary of Puakea ahupua'a as "Puakea". Pa'akea ahupua'a also includes Pali Spring. My family is still tied to these lands, and our family's presence on the lands remains through the crops planted along the stream, and the now towering ti leaf, banana trees, and mango trees planted over 100 years ago. 'Ohia, 'uluhe, and hapu'u ferns still blanket much of these lands, with native plants 'ekaha, palapalai, pala'a, and 'ie'ie still present. 'O'opu, hihiwai, and 'opae are still in the streams here. We still spend time on the property as a family (I visited last year with cousins), and many in my family have favorite childhood memories of camping on this land and catching 'opae in the stream and fish for dinner. To honor my kupuna (some of whom are buried on this land) and retain our connection and kuleana to this family land, my cousins and I hope to reopen lo'i, gardens, and care for the streams.

Comments on Puakea Stream: The Draft EIS states, "The Draft Environmental Impact Statement identifies 37 streams within the License Area; Puakea Stream was not recognized by CWRM but is a stream within the License Area that is diverted by the EMI Aqueduct System." Puakea Stream is a vital part of the Nahiku ecosystem and cultural heritage. Its flow is diminished due to mauka EMI diversions, and it also needs to have streamflow restored.

Comments on Pa'akea Stream: The Draft EIS states, "Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohakamoā, Ha'ipua'ena, Nua'ailua, Waia'aka and Hanawī. None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147)." I would like to restore our lo'i and grow taro along Pa'akea Stream, Puakea Stream, and Waia'aka Stream if the stream flow increases enough to make taro cultivation viable. Again, our family sustained themselves entirely on this land, eating, drinking, and gathering from the streams and ocean which was also nourished by the freshwater from the streams. Reviving this land to once again grow food is possible, but we need the water to return the land to productivity.

There is already so much water being diverted from East Maui Streams. If the State allows even more water to be diverted, our traditional customary practices cannot be perpetuated, and our native species (in particular 'o'opu,

hihiwai, and 'opae) which remain in the streams of Puakea, Pa'akea, Waia'aka and others will be put at immediate risk. Stream flow is already low. Please do not allow increased diversions, and help us all to achieve connected streamflow from mauka to makai.

Mahalo,
Laura Kaakua

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Kaakua:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am a lineal descendant of Puakea and Pa‘akea ahupua‘a in Nahiku, Maui, and I oppose Alexander and Baldwin’s proposal to further divert the streams of East Maui. My ‘ohana owns the ahupua‘a of Puakea and Pa‘akea through Land Commission Award 209 to Stephen Grant. The lands passed down the family line to my great great great grandparents Anna Loika Alo and Boniface Achong who lived, farmed, fished, and raised their family on the land. My great grandmother Maria Victoria (Nena) Li Won, who passed just a couple years ago, was raised by her grandparents Anna and Boniface on this ‘āina as a young child. Our ‘ohana still owns the makai portion of Pa‘akea ahupua‘a from Hana Highway to the ocean, but East Maui Irrigation asserts ownership over the mauka portion of Pa‘akea ahupua‘a and the entirety of Puakea ahupua‘a. These lands claimed by East Maui Irrigation now have water diversions running through them, which divert the vast amounts of water that would otherwise flow makai in Waia‘aka, Puakea, and Pa‘akea Streams.*

Response 1: We acknowledge your comments and understand that you are a land owner within the Pa‘akea ahupua‘a. Please note that Pa‘akea Stream was one of the streams subject to the CWRM D&O which was categorized as a connectivity stream. Hence, Pa‘akea Stream will see restored flows as discussed in Section 1.3.4 of the Draft EIS.

Comment 2: *The old maps name the stream and gulch at the Eastern boundary of Pa‘akea ahupua‘a as "Waiaaka", the stream and gulch between Pa‘akea and Puakea ahupua‘a as "Paakea", and the stream and gulch at the Western boundary of Puakea ahupua‘a as "Puakea". Pa‘akea ahupua‘a also includes Pali Spring. My family is still tied to these lands, and our family’s presence on the lands remains through the crops planted along the stream, and the now towering ti leaf, banana trees, and mango trees planted over 100 years ago. ‘Ohia, ‘uluhe, and hapu‘u ferns still blanket much of these lands, with native plants ‘ekaha, palapalai, pala‘ā, and ‘ie‘ie still present. ‘O‘opu, hihiwai, and ‘opae are still in the streams here. We still spend time on the property as a family (I visited last year with cousins), and many in my family have favorite childhood memories of camping on this land and catching ‘opae in the stream and fish for dinner. To honor my kupuna (some of whom are buried on this land) and retain our connection and kuleana to this family land, my cousins and I hope to reopen lo‘i, gardens, and care for the streams.*

Comments on Puakea Stream: The Draft EIS states, "The Draft Environmental Impact Statement identifies 37 streams within the License Area; Puakea Stream was not recognized by CWRM but is a stream within the License Area that is diverted by the EMI Aqueduct System." Puakea Stream is a vital part of the Nahiku ecosystem and cultural heritage. Its flow is diminished due to mauka EMI diversions, and it also needs to have streamflow restored.

Response 2: We acknowledge your comments. With regards to Puakea Stream, please note that Puakea Stream was assumed to be an individual stream in the Draft EIS. However, it has since been determined that Puakea is in fact a tributary to Pa‘akea Stream, which as noted in Response #1 has been restored as a connectivity stream, as shown on page 1-5 of the Final EIS.

Comment 3: *Comments on Pa‘akea Stream: The Draft EIS states, "Streams that are set at connectivity flow are: Kapā‘ula, Pa‘akea, Pua‘aka‘a, Puohakamoā, Ha‘ipua‘ena, Nua‘ailua, Waia‘aka and Hanawī. None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147)." I would like to restore our lo‘i and grow taro along Pa‘akea Stream, Puakea Stream, and Waia‘aka Stream if the stream flow increases enough to make taro cultivation viable. Again, our family sustained themselves entirely on this land, eating, drinking, and gathering from the streams and ocean which was also nourished by the freshwater from the streams. Reviving this land to once again grow food is possible, but we need the water to return the land to productivity.*

Response 3: We acknowledge your comments. Please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed

Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for taro were identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on pages 1-19 to 1-23. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration statuts); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in the included pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 4: *There is already so much water being diverted from East Maui Streams. If the State allows even more water to be diverted, our traditional customary practices cannot be perpetuated, and our native species (in particular ‘o‘opu, hihiwai, and ‘opae) which remain in the streams of Puakea, Pa‘akea, Waia‘aka and others will be put at immediate risk. Stream flow is already low. Please do not allow increased diversions, and help us all to achieve cool clean and connected streamflow from mauka to makai.*

Response 4: Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to ‘ōpae, ‘o‘opu, pūpūlo‘i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail);

Neritinu graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the

Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, see pages 4-239 to 4-252 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the

10238-04
Letter to Ms. Laura Kaakua
Page 7 of 7
September 3, 2021

Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

The HSHEP model used in Trutta Environmental Solutions' report (Appendix A), it clearly and directly addresses the impacts of streamflow diversion on the native amphidromous stream species (including opae, 'o'opu and hīhīwai). Due to an increase in streamflow under the Proposed Action when compared to historical diversion rates, opae, 'o'opu and hīhīwai are anticipated to have an increase in HU. However, these HU will slightly decrease from current conditions as more water is gradually diverted as the Mahi Pono farm plan develops to full build-out as outlined in Section 4.2.1 of the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Lea Giddens:

Thank you for comments dated September 29, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am against the water lease from Nahiku, Ke'anae, Honomanu and Huelo area. The water should be used for agriculture in those areas and not be diverted for A&B or any other developers use. I truly don't trust them*

Response 1: We acknowledge your comments and understand that you are in opposition of the Proposed Action.

With regards to your comment that the water should be used for agriculture in East Maui, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic

challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement

Dear Mr. Matsukawa,

Regarding Alexander and Baldwin's Draft EIS, its long past time to take care of the aina which requires flowing water in its streams to support diminishing native wildlife and the people of this land.

Let's look to replenishing the water sheds rather than diverting more water to a corporation that has monopolized water resources for at least 100 years, and open more EMI areas to public access.

The devastating effects of A & B's reign on the environment and cultural practitioners should be mitigated rather than continued and expanded.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Linda Andersen

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Andersen:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Regarding Alexander and Baldwin’s Draft EIS, its long past time to take care of the aina which requires flowing water In its streams to support diminishing native wildlife and the people of this land.*

Let's look to replenishing the water sheds rather than diverting more water to a corporation that has monopolized water resources for at least 100 years, and open more EMI areas to public access.

Response 1: We acknowledge your comments. Please note that the HSHEP model was used to quantify the impacts of flow restoration on native stream animal habitat to determine an appropriate balance between instream and offstream water uses. The proposed lease scenarios in the EIS (Proposed Action and the No Action Alternative) both mitigate rather than expand stream diversions and their impacts. Impacts to stream habitats and native amphidromous stream species, are analyzed in Section 4.2.1 and Appendix A of the EIS.

Impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B of the EIS. Please note that the primary focus of the survey conducted for East Maui

Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83 of the Final EIS.

Impacts to terrestrial flora and fauna, including threatened and endangered species, are analyzed in Section 4.4 and Appendix C of the EIS. Specifically, as it relates to invasive species, it is noted in Appendix C that low-elevation portions of the License Area are already highly impacted by invasive plants. However, it is noted in Appendix C that high-elevation portions of the License Area are predominately dominated by native species and is very likely to contain habitat for several endangered or threatened species. Impacts related to flora and fauna as a result of the Proposed Action are discussed in Section 4.4 of the EIS. Please note that Section 4.4.1 and Section 4.4.2 have been revised in the Final EIS based on comments received on the Draft EIS to further outline the existing conditions of the License Area and more accurately reflect targeted mitigation measures based on feedback provided by the DLNR and USFWS. See pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS.

Comment 2: *The devastating effects of A & B's reign on the environment and cultural practitioners should be mitigated rather than continued and expanded.*

Response 2: Regarding your comment about the devastating effects of A&B's reign on the environment, please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the

Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown in pages 4-331 to 4-336.

With regards to cultural impacts, the CIA acknowledges that the Proposed Action may impact Native Hawaiian cultural resources and practices and provides for several recommendations to mitigate those impacts. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waiānu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waiānu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula,

Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, see pages 4-239 to 4-252 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would

keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all constitutionally protected traditional and customary rights.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC’s website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: RE: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke`ānea, Honomanū and Huelo License Areas

To: Ian Hirokawa, State of Hawai`i Board of Land & Natural Resources
Earl Matsukawa, Wilson Okamoto Corporation

Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanū, and Huelo License Areas

From: Lorraine Zane, Maui resident for 44yrs, retired RN, wife, and mother of 2.

Not extending the 45-day period for public comment on a document that is 2,700 pages is unreasonable, considering a public trust resource request is being made. The request of a permit to guarantee water for 30 years at a time when global warming and other environmental concerns are at the forefront does not take into consideration stewardship for Maui's natural resources and public concerns that should not be controlled by private entities. For this very reason, this comment period should have been extended.

The Final EIS should contain information that can adequately address these questions and concerns:

Why weren't the alternatives (if the 30-year lease is denied) outlined in the Draft EIS evaluated more thoroughly? Why not evaluate possible benefits also, rather than focusing on possible negatives? A Water Lease with Different Terms could evaluate a Systematic Yearly Reduction to incentivize best water use practices.

The Final EIS should include a more thorough examination and evaluation of alternative actions.

The Final EIS should include an analysis of the applicant's currently owned wells that could be used for their agricultural irrigation, and if they have been properly maintained, and water assets properly distributed by the current leasees.

Variations in their crop types, the land being utilized and future water demands are uncertain.

The Final EIS should address potential impacts on this lease if water needs increase/decrease or if the economic viability of the applicant cannot be sustainable by forecasted agricultural practices.

This subject Draft EIS contains no assurances that current streamflow standards will be monitored for compliance; Currently, 10 E. Maui streams have not been "restored".

The Final EIS should contain information regarding these 10 streams and their impacts on/contributions to, the water delivery system.

Freshwater interface with the ocean at the muliwai is one of the most plentiful areas for fish and plantlife that comprise much of the food we include in our diets.

For the health and productivity of our fisheries and nearshore gathering areas, the Final EIS should include an evaluation and examination of the possible impacts of this 30-year lease on our fisheries and nearshore gathering areas.

Appendix D, Historical Structure Assessment of the subject Draft EIS is inadequate, as it is stated that the report “is less an inventory, and more a reference/typology guide for irrigation systems and their components”. No real data concerning non-evaporative loss throughout the delivery system is addresses, to help calculate true use, loss and recharge.

The Final EIS should include a proper structure assessment that involves evaluating the viability of these structures that will be part of the daily water delivery system. The report should not just be a research article or guideline.

Final EIS should include that all of the above concerns have been addressed and that all the residents of Maui County have a way to approve or disapprove a proposal that effects all citizens of Maui County so profoundly. REMEMBER:

OLA I KA WAI

Sincerely,

Lorraine C. Zane

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Zane:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Not extending the 45-day period for public comment on a document that is 2,700 pages is unreasonable, considering a public trust resource request is being made. The request of a permit to guarantee water for 30 years at a time when global warming and other environmental concerns are at the forefront does not take into consideration stewardship for Maui’s natural resources and public concerns that should not be controlled by private entities. For this very reason, this comment period should have been extended.*

Response 1: We acknowledge your comments noting for a time extension to allow for additional public comment. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai‘i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 2: *The Final EIS should contain information that can adequately address these questions and concerns:*

Why weren't the alternatives (if the 30-year lease is denied) outlined in the Draft EIS evaluated more thoroughly? Why not evaluate possible benefits also, rather than focusing on possible negatives? A Water Lease with Different Terms could evaluate a Systematic Yearly Reduction to incentivize best water use practices. The Final EIS should include a more thorough examination and evaluation of alternative actions.

Response 2: HRS § 343-2 defines "environmental impact statement" as "an informational document prepared in compliance with the rules adopted under section 343-6 and which discloses the environmental effects of a proposed action, effects of a proposed action on the economic welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects." The Draft EIS discloses the environmental effects of the proposed Water Lease, and the impacts of the proposed Water Lease on the economic welfare, social welfare, and cultural practices of the community and State, as well as the effects of the economic activities arising out of the proposed Water Lease, and presents measures to minimize adverse effects, and also presents alternatives to the Water Lease and the environmental effects of those alternatives. Moreover, the Draft EIS was prepared in compliance with the relevant rules, including HAR § 11-200-16 and 11-200-17, and the Draft EIS includes a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement.

Specifically, Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were well-discussed, but ultimately not assessed to the same degree as (a) through (d). Additionally, Chapter 3 acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible for the reasons discussed in Chapter 3. Moreover, based on comments received on the Draft EIS, the alternatives analysis in Chapter 3 has been further expanded within the spectrum of alternatives presented in the Draft EIS. See pages 3-2 to 3-19 of the Final EIS. However, please note that the alternatives that were fully analyzed are those that were deemed reasonable to achieve the objectives of the Proposed Action, as per HAR § 11-200-17(f).

With regards to the Alternative Lease Duration, Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 3: *The Final EIS should include an analysis of the applicant's currently owned wells that could be used for their agricultural irrigation, and if they have been properly maintained, and water assets properly distributed by the current leasees.*

Response 3: Regarding the use of well water, Draft EIS Section 2.1.4 (Central Maui Field System) explains:

In addition to the surface water imported from the EMI Aqueduct System to the Central Maui field irrigation system, the irrigation infrastructure includes fifteen brackish water wells that can supplement surface water to approximately 17,200 acres of the plantation at the lower elevations (CWRM D&O, FOF 738). These brackish wells extract groundwater from the subsurface aquifers lying beneath the agricultural lands, and which are cyclically dependent on recharge derived from the irrigation of the overlying lands by water from the EMI Aqueduct System. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water. Groundwater, however, can be delivered to 7,000 acres at higher elevations via a shared pipeline that served as a penstock line for a hydroelectric unit (CWRM D&O, FOF 739).

Draft EIS Figure 2-5 (Central Maui Infrastructure Map) identifies the wells in the Central Maui agricultural fields. However, please note that Section 2.1.4 has been revised in the Final EIS to more accurately describe the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono, and clarifies that only 10 of the 15 wells are on Mahi Pono lands and thus available for use by Mahi Pono, as shown in pages 2-24 to 2-25 of Final EIS.

The reference to 15 brackish wells was derived from the CWRM D&O, FOF 738, as that was the number of brackish wells that A&B utilized during its sugar cane operations. However, one of the 15 wells referred to, State Well No. 5128-002, does not serve the Central Maui agricultural fields and four of the other brackish wells are on lands that are not owned by Mahi Pono. As such, Mahi Pono has access to only 10 such wells. Draft EIS Figure 2-5 has been revised, as shown in the included pages 2-24 of the Final EIS, to more accurately depict the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono to support its farm plan for the Central Maui agricultural fields.

Moreover, please see the table below, which has been added to Section 4.2.2 of the Final EIS as shown in page 4-75.

State Well No.	TMK Number	Installed Pump Capacity (MGD)	Typical Range of Chlorides (MG/L) from 2003 through 2014 ¹	CWRM Delineated Aquifer System
4825-001	(2) 3-8-004:001	20.448	225 to 350	Pā‘ia
5226-002	(2) 3-8-006:001	24.048	350 to 550	Kahului
5224-002	(2) 3-8-003:004	15.120	350 to 550	Pā‘ia
5323-001	(2) 3-8-001:006	20.016	No data	Pā‘ia
5424-001	(2) 3-8-001:007	5.760	400 to 700	Pā‘ia
5522-001	(2) 2-5-005:021	8.640	350 to 525	Pā‘ia
5422-001	(2) 2-5-005:054	10.080	350 to 525	Pā‘ia
5422-002	(2) 2-5-005:020	11.664	325 to 475	Pā‘ia
5321-001	(2) 2-5-005:019	30.240	400 to 1600	Pā‘ia
5520-001	(2) 2-7-004:032	10.080	900 to 1600	Ha‘ikū

Please note that the salinity levels fluctuate and therefore a range was provided.

Comment 4: *Variations in their crop types, the land being utilized and future water demands are uncertain.*

Response 4: Please note that Mahi Pono’s farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e. orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community. The calculations of future water requirements (year 2030) are presented in Table 3 of Appendix I, “East Maui Water Lease: Agricultural and Related Economic Impacts”. The per-acre water requirements used in the calculations are based on published crop studies, farming experience with specific crops, and evapotranspiration rates for Central Maui.

Comment 5: *The Final EIS should address potential impacts on this lease if water needs increase/decrease or if the economic viability of the applicant cannot be sustainable by forecasted agricultural practices.*

Response 5: Section 3.2.1 states:

¹ There is limited salinity data prior to 2003 and after December 2014, surface water for irrigation use rapidly declined as A&B ramped down operations prior to closing in 2016.

The BLNR cannot authorize a lease that allows the use of more water than can be diverted under the CWRM D&O. However, the BLNR could elect to issue a water lease that authorizes the use of a lesser amount of water. Projections of the amount of government water available from the License Area at Honopou stream after taking into account the CWRM D&O, is approximately 87.95 mgd. This amount would be subject to further reduction in accordance with the DHHL reservation once called upon for use by the DHHL. The CWRM estimated that the amount of water potentially available after implementation of the CWRM D&O might be enough for about 90% of the irrigation needs for the approximately 23,000 IAL lands in Central Maui (although it is not clear if the CWRM D&O took into account the future DHHL reservation). However, there are approximately 30,000 agricultural acres in Central Maui (largely, but not exclusively, IAL lands), and Mahi Pono has expressed an intention to farm as much of that land as possible.

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. Under the Reduced Water Volume alternative, depending on the amount of water authorized under the Water Lease, the MDWS may receive no water from the Wailoa Ditch or some amount up to 7.1 mgd. The greater the reduction in the amount authorized under the Water Lease, proportionally less water will be available to the MDWS.

If more or less water were to be required than is planned, then the Mahi Pono farm plan would be adjusted so that the demand for water is limited to the available supply. In practice, this would mean a transfer of acreage between crop farming and unirrigated pasture. If this were to result in a 1% change in crop acreage, then most economic impacts would change by about 1%. This occurs because crop farming dominates the economic impacts, far exceeding the impacts provided by cattle grazing.

As stated in Appendix I the Mahi Pono Farm Plan

... will evolve over time based on a number of factors, including the available supply of surface water, experience which will be gained on crops that grow well in Central Maui, crops that are profitable, the size of the market for profitable crops, etc.

Another factor would be possible changes in per-acre water requirements.

Comment 6: *This subject Draft EIS contains no assurances that current streamflow standards will be monitored for compliance; Currently, 10 E. Maui streams have not been “restored”.*

Response 6: The work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows. Regarding streamflow enforcement, the current East Maui water revocable permits specify that quarterly reports to the BLNR are required. These reports are mandated to include a statement of compliance with the IIFS and identify the total amount of water being diverted from License Area measured at Honopou. It is expected, and the EIS takes into account, that compliance with the IIFS requirements under the CWRM D&O will also be required under the Proposed Action. In compliance with the CWRM D&O streamflow requirements, EMI has adjusted certain movable portions of gates to ensure that streamflow below the gates complies with the IIFS requirements. Compliance with the CWRM D&O IIFS requirements is always subject to CWRM staff verification.

Comment 7: *The Final EIS should contain information regarding these 10 streams and their impacts on/contributions to, the water delivery system.*

Response 7: Your comment is unclear. Please note that the 10 streams we assume that you are referring to are the 10 streams ordered to be fully restored which means they can no longer be diverted by the EMI Aqueduct System. Hence, they will not be contributing to the EMI Aqueduct System.

Comment 8: *Freshwater interface with the ocean at the muliwai is one of the most plentiful areas for fish and plantlife that comprise much of the food we include in our diets. For the health and productivity of our fisheries and nearshore gathering areas, the Final EIS should include an evaluation and examination of the possible impacts of this 30-year lease on our fisheries and nearshore gathering areas.*

Response 8: We acknowledge your comments. Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur

in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included

in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83 of the Final EIS.

Comment 9: *Appendix D, Historical Structure Assessment of the subject Draft EIS is inadequate, as it is stated that the report “is less an inventory, and more a reference/typology guide for irrigation systems and their components”. No real data concerning non-evaporative loss throughout the delivery system is addresses, to help calculate true use, loss and recharge.*

Response 9: We respectfully disagree as this was not within the scope of that document. The scope of the Historical Structure Assessment was to determine the historical architectural significance of the EMI Aqueduct System and its various structures. We assume that your comment relates to the physical condition of the EMI Aqueduct System. In this regard, the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System.

Comment 10: *The Final EIS should include a proper structure assessment that involves evaluating the viability of these structures that will be part of the daily water delivery system. The report should not just be a research article or guideline.*

Response 10: As noted in Response #9 above, , the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System. It should be noted Mahi Pono expects to invest over \$20 million to increase the efficiency of its Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to Section 2.1.4 of the Final EIS as shown in page 2-25.

Comment 11: *Final EIS should include that all of the above concerns have been addressed and that all the residents of Maui County have a way to approve or disapprove a proposal that affects all citizens of Maui County so profoundly. REMEMBER:OLA I KA WAI*

Response 11: We acknowledge your comments and please note that we provided you with detailed responses to each of your points above. With regards to your comment about a way to approve or disapprove a proposal, please note that an EIS is an environmental disclosure document and does not authorize any decision.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.² Should you wish to request a copy of the Final EIS or portions thereof, please

² Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

To: ian.c.hiokawa@hawaii.gov; Public Comment
Subject: Comments on DEIS proposed by A&B/EMI

To Mr. Earl Matsukawa,

Aloha and Mahalo for taking your time to accept my comments on the Draft EIS for the Proposed Water Lease for the Nahiku, Keanae, Honomanu, and Huelo License Areas.

I am a Native Hawaiian Haiku resident who gathers from East Maui and am concerned that no one is taking care of much of the watershed.

The Draft EIS needs to include the following information:

A discussion on methods restoring the 13 streams in the Honopou to Kailua area, where my ohana and others live, farm, and gather.

All that is said is that it's estimated that all of the water will be diverted from the streams 60% of the time. The DEIS needs to discuss the impacts of continuing those diversions which will decimate 85% of native stream life habitat and negatively impact thousands of local residents. The EIS also needs to include a full archaeological survey since there are many unrecorded archaeological sites in the lease area that could be affected by resumed diversions.

I am humbly asking that the DEIS include this very important information. Mahalo for the opportunity to submit comments on this Draft EIS.

Aloha,

Maile Magalianes, resident of Haiku, Maui.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Magalianes:

Thank you for your two comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200, Section 18. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Aloha and Mahalo for taking your time to accept my comments on the Draft EIS for the Proposed Water Lease for the Nahiku, Keanae, Honomanu, and Huelo License Areas.*

I am a Native Hawaiian Haiku resident who gathers from East Maui and am concerned that no one is taking care of much of the watershed.

Response 1: We acknowledge your comments and understand that you are a Native Hawaiian resident that gathers from the East Maui region. With regards to your comment that you are concerned that no one is taking care of the watershed, A&B was a founding member of the East Maui Watershed Partnership (EMWP), which was the first watershed partnership in the State of Hawai‘i and which served as a model for other watershed partnerships throughout the State. The lands under the jurisdiction of the East Maui Watershed Partnership span over 100,000 acres which includes the entire License Area. The License Area is actively managed by the multiple agencies and organizations, including EMWP, Maui Invasive Species Committee (MISC), DLNR, etc., in partnership with EMI.

EMI continues to work with MISC by reporting sighting of invasive weeds and coordinating access in these areas, which are well below the 3,000' level. EMI personnel also monitor the License Area for signs of feral ungulates.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

Comment 2: *The Draft EIS needs to include the following information:*

A discussion on methods restoring the 13 streams in the Honopou to Kailua area, where my ohana and others live, farm, and gather.

All that is said is that it's estimated that all of the water will be diverted from the streams 60% of the time. The DEIS needs to discuss the impacts of continuing those diversions which will decimate 85% of native stream life habitat and negatively impact thousands of local residents.

Response 2: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided in pages 4-61 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 3: *The EIS also needs to include a full archaeological survey since there are many unrecorded archaeological sites in the lease area that could be affected by resumed diversions.*

Response 3: We respectfully disagree with your comment that an archeological survey is required for the Proposed Action. Please note that correspondence from SHPD dated January 27,

2017 and October 6, 2017 are appended to Draft EIS Appendix E (Archaeological Literature Review and Field Inspection), confirming SHPD's position on this issue. Issuance of the Water Lease is not anticipated to affect any historic property, aviation artifacts, or burial site.

As discussed in Draft EIS Section 4.5 (Historic and Archaeological Resources) the Proposed Action does not involve any new construction or significant ground disturbance within undisturbed areas within the License Area. The Proposed Action continues the use of the EMI Aqueduct System for the transport of surface water, and allows the lessee or its permittees, to maintain and repair existing access roads and trails long-used as part of the EMI Aqueduct System. As discussed in the Section 2.1.2 of the Final EIS as shown on page 2-7, under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System. Moreover, this was explained to SHPD as discussed in the Archaeological Literature Review and Field Inspection provided as Appendix E of the EIS (“Additional information regarding the proposed Water Lease was provided to the SHPD including the understanding that the proposed Water Lease will not involve any significant ground disturbance

Comment 4: *I am humbly asking that the DEIS include this very important information. Mahalo for the opportunity to submit comments on this Draft EIS.*

Response 4: We appreciate your participation in this EIS process. Please note that we have provided you detailed responses above to each of your points.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

To: Public Comment; ian.c.hirokawa@hawaii.gov
Subject: Oppose (DEIS for) 30 Year Water Lease

I oppose granting a *thirty year lease*.

The rate of change, social and environmental, in our modern world is exponentially faster than that experienced in the past. The internet did not exist 30 years ago nor did iPhones and a host of other technologies and devices. More importantly, the effects of climate change are upon us, impacting our world in ways poorly understood just a decade ago. This rate of change is outstripping humanity's ability to react to the many existential forces now upon us. California wild fires are an immediate and dramatic example of this.

Against this you are being asked to approve *a thirty year lease with no performance deliverables* even though water is held in public trust by the State for the benefit of the people of Hawaii, not private corporations. Given this, a long term lease of precious water resources is, on its face, not in the best interests of the people and should be denied.

Clearly, the response to the request for a long term lease should favor a

- short term lease (5 years, for example),
- clearly defined and objectively measurable performance deliverables, and
- periodic lessee accountability.

Additionally, recognizing that corporation/partnership owners can and do change, stops must be in place to terminate any lease in the event of a material change of ownership.

Recommendation:

- (1) Put Applicants on a short leash;
- (2) Set clear and objectively measurable criteria to gauge whether any lease should be cancelled or extended beyond the initial term or any subsequent term(s) or extension(s);
- (3) Insert self-executing cancelation clauses should the lessee fail to perform; and
- (4) Include a cancellation clause in the event lessee ownership materially changes, whether through sale, merger, acquisition or change in internal stockholders/partner ownership.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Hyde:

Thank you for comments dated November 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I oppose granting a thirty year lease.*

Response 1: We acknowledge your comments and understand that you are opposed to the Proposed Action.

Comment 2: *The rate of change, social and environmental, in our modern world is exponentially faster than that experienced in the past. The internet did not exist 30 years ago nor did iPhones and a host of other technologies and devices. More importantly, the effects of climate change are upon us, impacting our world in ways poorly understood just a decade ago. This rate of change is outstripping humanity’s ability to react to the many existential forces now upon us. California wild fires are an immediate and dramatic example of this.*

Response 2: We acknowledge your comments. Climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai‘i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding

during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown in the pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Comment 3: *Against this you are being asked to approve a thirty year lease with no performance deliverables even though water is held in public trust by the State for the benefit of the people of Hawaii, not private corporations. Given this, a long term lease of precious water resources is, on its face, not in the best interests of the people and should be denied.*

Response 3: Regarding your comment about the Public Trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown in pages 1-25 to 1-27.

Comment 4: *Clearly, the response to the request for a long term lease should favor a*

- *short term lease (5 years, for example),*
- *clearly defined and objectively measurable performance deliverables, and*
- *periodic lessee accountability.*

Additionally, recognizing that corporation/partnership owners can and do change, stops must be in place to terminate any lease in the event of a material change of ownership.

Response 4: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus,

macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

With regard to performance deliverables, please note that the terms and conditions of the Water Lease are at the discretion of the BLNR. If the BLNR should make performance deliverables as a part of the terms and conditions of the Water Lease, the lessee will comply.

With regards to your comment about change in ownership, The Draft EIS considered alternative ownership / management of the EMI Aqueduct System as discussed in Section 3.1.2 of the Draft EIS contemplates alternative ownership of the EMI Aqueduct System. Also as discussed above, that section of the EIS has been further modified based on the County's TIG Report which was prepared after publication of the Draft EIS as shown in the pages 3-19 to 3-20 of the Final EIS. However, please note that the alternatives that were fully analyzed are those that were deemed reasonable as per HAR § 11-200-17(f). The EMI Aqueduct System is owned by EMI and is not for sale or lease. The EMI Aqueduct System runs through both EMI-owned land and State-owned land. Through a water lease process, the BLNR does not have legal authority to require EMI to allow others to enter upon its lands or use the EMI Aqueduct System, and it would be impossible to operate the EMI Aqueduct System without access to the system in its entirety. As discussed in Response #29 above, the EMI Aqueduct System is owned by EMI, however, the EIS acknowledges that the some of the lands underlying the EMI Aqueduct System are owned by the State. Pursuant to the 1938 Agreement, the Territory of Hawai'i (now the State) granted perpetual easements to EMI for the placement of the EMI Aqueduct System. Therefore, it is unreasonable to assess the comparative impacts of alternatives that seem highly speculative if not outright impossible, such as the EMI Aqueduct System being managed by a public irrigation district, partnership of agencies, or otherwise. Hence, to assess alternative ownership at this point is too speculative and unreasonable.

Comment 5: *Recommendation:*

(1) Put Applicants on a short leash;

(2) Set clear and objectively measurable criteria to gauge whether any lease should be cancelled or extended beyond the initial term or any subsequent term(s) or extension(s);

(3) Insert self-executing cancelation clauses should the lessee fail to perform; and

(4) Include a cancellation clause in the event lessee ownership materially changes, whether through sale, merger, acquisition or change in internal stockholders/partner ownership.

Response 5: We acknowledge your comments. As noted in Response #4 above, the terms and conditions of the Water Lease are at the discretion of the BLNR. If the BLNR should make these recommendations as a part of the terms and conditions of the Water Lease, the lessee will comply.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: DEIS

This email is my contribution to raise questions within this DEIS that are of concern to the general public of Maui, HI. I am writing my concerns and welcome your responses to my concerns.

Please re-issue another 45 day comment period to allow our community the time to read, understand and ask all questions about an issue that will affect Maui for years to come. This is not an issue to be taken lightly or decided quickly.

1. How many workers will be hired by Mahi Pono to work the land?
 2. Will these workers be hired from the Maui community or brought in from other places?
 3. How will the housing be handled for the workers if they are brought in from another place to work the fields?
 4. Will the workers be unionized to protect them from insufficient pay and unfair worker rights?
 5. The DEIS states that the Central Valley is the best land for growing crops. It turns out that the lands in the Central Valley have only grown sugarcane. How do you see these lands being fit to grow a myriad of crops that are needed to supply food for the residents and visitors to Maui?
 6. In actuality, the upcountry areas of farmland have excellent soils and have grown and, still grow a diverse amount of crops such as onions, cabbage, lettuce, tomatoes, pumpkins, kalo, breadfruit, citrus, avocado, lychee, persimmons, mulberries, coffee, macadamia nuts, yacon, cassava, etc. Why are these lands not mentioned as exceptional growing areas?
 7. How will you prevent the pollution created by 'Phantom Dust'?
- There has been much conversation about the techniques being used right now on the lands below Hali'imaile where the land is continually being tilled and is creating phantom dust, almost daily. This is a potential problem in our future if proper farming practices such as cover crops aren't added to the farm plan. Although, at this time, Hawaii doesn't have a law to prohibit or regulate this dust, there is already concern amongst the community.

The so-called "dust rule" regulates farm dust, which is mixed with things like dirt and dried cornstalk bits and is technically considered pollution by the U.S. EPA. The agency does limit how much of this particle pollution can be in the air, but just two states—Arizona and California—require farmers to take some dust control measures.

8. Is Roundup being sprayed along the ditches? If so, this is unacceptable since the water would be continually contaminated by a product that now has over 40,000 lawsuits that claim people have been poisoned by Roundup and now have cancer.
9. What safe plans have been made to keep our ditches clear of debris, weeds and any pathogens that could be flowing through them from dead animals?
10. How will the ditch water be filtered to add another layer of safe water to be used on our crops?
11. What will Mahi Pono be legally allowed to do with the water? Will they be able to sell the water to construction/developers.
12. How would the language read to protect our water supply from being sold to bottlers or other entities that would undermine the community water supply?

Again, please reissue another 45 day comment period to continue this potentially life-altering lease.

Sincerely,

Marta Greenleaf

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Greenleaf:

Thank you for comments dated November 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *This email is my contribution to raise questions within this DEIS that are of concern to the general public of Maui, HI.*

I am writing my concerns and welcome your responses to my concerns.

Please re-issue another 45 day comment period to allow our community the time to read, understand and ask all questions about an issue that will affect Maui for years to come. This is not an issue to be taken lightly or decided quickly.

Response 1: We acknowledge your comments noting for a time extension to allow for additional public comment. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai‘i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 2: *How many workers will be hired by Mahi Pono to work the land?*

Response 2: At full operations of the Mahi Pono farm plan, currently estimated to occur around 2030, an estimated 790 farming and crop-processing jobs will be provided in Central Maui (direct jobs) (about 160 more jobs than provided by HC&S sugar operations in 2006). As explained in Section 4.7.4:

The increase in employment would be gradual, with most jobs filled by former sugarcane workers, skilled workers from Maui and other islands, recent graduates of agricultural-schools and colleges, and unskilled workers who would receive on-the-job training.

Approximately an additional 227 indirect jobs on Maui will be generated by the purchase of goods and services, for a total exceeding 1,000 new jobs on Maui. Hiring workers will be spread out over a number of years as fields are planted, orchards mature, processing facilities are built, etc. Assuming 10 years to reach full operations, direct employment on Maui will increase by an average of about 80 jobs per year, while total direct and indirect jobs will increase by an average of about 100 jobs per year. The latter figure is less than 8% of the 1,270 annual job increase projected for the years 2020 to 2030 by the State for the County of Maui (DBEDT, "Population and Economic Projections for the State of Hawai'i to 2045, June 2018).

In its first 18 months of existence Mahi Pono had hired over 200 workers, all of whom were living on Maui when hired. They were attracted by the type of work, wages and benefits.

Based on past hiring, nearly all future employees are expected to come from Maui. Also, at least in the near-term, attracting workers should be easier than in the recent past because of the long-term adverse economic effects of COVID-19 on tourism and Maui's economy. It may take years to rebuild the economy, and the Mahi Pono farm plan will contribute significantly to this rebuilding.

Comment 3: *Will these workers be hired from the Maui community or brought in from other places?*

Response 3: As noted in Response #2 above, based on past hiring, nearly all future employees are expected to come from Maui. However, few off island workers are expected to be absorbed in Maui communities.

Comment 4: *How will the housing be handled for the workers if they are brought in from another place to work the fields?*

Response 4: Since most farm workers are expected to come from Maui, few homes will be required for workers new to the island. See Response #2 above. In any case, Mahi Pono will pay wages and provide benefits sufficient to attract and retain workers. Under the circumstances, these wages should be sufficient for workers to obtain housing.

Comment 5: *Will the workers be unionized to protect them from insufficient pay and unfair worker rights?*

Response 5: Farm employers will include Mahi Pono and a number of farm and ranch tenants. Agricultural crops and activities will include community farms, orchards, tropical fruits, row and annual crops, energy crops, and ranching. Historically, unionized agricultural workers in Hawai'i were employed primarily by the sugar and pineapple companies.

As discussed in response to your comment above, Mahi Pono will pay wages and provide benefits sufficient to attract and retain workers. It is recognized that some workers could join a union.

Comment 6: *The DEIS states that the Central Valley is the best land for growing crops. It turns out that the lands in the Central Valley have only grown sugarcane. How do you see these lands being fit to grow a myriad of crops that are needed to supply food for the residents and visitors to Maui?*

Response 6: As summarized in Section 4.7.4 of the Draft EIS and Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts):

Central Maui has some of the best agricultural conditions in the State for farming, including a large area in a compact configuration, high-quality soils, high solar radiation, a location near markets and shipping terminals, and potentially ample water at low delivery costs (assuming a new Water Lease with a reasonable use fee), and for lessees rents that will be comparatively low.

The basis for this finding is given in Subsection 5 of Appendix I of the Draft EIS, along with Figures 4 to 12 in Appendix I of the Draft EIS.

Moreover, as discussed in Section 5 of Appendix I and Section 4.7.4 of the Draft EIS, the overwhelming majority of the Central Maui agricultural fields (approximately 80%) are rated by

the UH Land Study Bureau (LSB) as having the highest Overall Productivity Rating of "A" (on a scale of "A" to "E" with "E" being the lowest soil rating), and a little over 11% has a "B" rating. In other words, about 27,567 acres (90.9%) are high-quality lands rated A or B. The Agricultural Lands of Importance to the State of Hawai'i (ALISH) Classification System, developed and compiled in 1977 by the State Department of Agriculture with assistance from the U.S. Department of Agriculture - Natural Resources Conservation Service (NRCS), and the College of Tropical Agriculture, University of Hawai'i. Approximately 25,669 acres of the Central Maui agricultural fields are classified under the ALISH system as "Prime", which means "agricultural land which is land that is best suited for the production of crops because of its ability to sustain high yields with relatively little input and with the least damage to the environment." Also, as discussed in Section 5.1.4 of the EIS and Section 5 of Appendix I, approximately 22,000 of the 30,000 acres of agricultural fields in Central Maui are designated as Important Agricultural Lands (IAL). Under Article XI, Section 3, of the Constitution of Hawai'i, the State is required to conserve and protect agricultural lands, promote diversified agriculture, increase agricultural self-sufficiency and assure the availability of agriculturally suitable lands. HRS Chapter, 205, § 205-41 through § 205-52, provides for the designation of IAL. As stated in HRS Chapter 205: "*The objective for the identification of important agricultural lands is to identify and plan for the maintenance of a strategic agricultural land resource base that can support a diversity of agricultural activities and opportunities that expand agricultural income and job opportunities and increase agricultural self-sufficiency for current and future generations.*" IAL designation facilitates the long-term dedication of lands for future agricultural use so long as there is a sufficient supply of water to allow for profitable farming.

However, the EIS and the associated technical studies do not claim that only Central Maui has the substantial potential to grow useful food crops for Maui's future. As discussed in Section 2.1 of the Draft EIS, the scope of this EIS is to assess the Proposed Action which is, "*...to enable the Board of Land and Natural Resources (BLNR)-awarded lessee the right, privilege and authority to enter and go upon State-owned lands for the purposes of developing, diverting, transporting and using government-owned waters. The requested Water Lease would allow the use of government-owned waters from the License Area (approximately 33,000 acres which includes lands within Nāhiku, Ke'anae, Honomanū, and Huelo) through the East Maui Irrigation Company, LLC (EMI) Aqueduct System. Use of that surface water would allow the continued provision of water to enable approximately 30,000 acres of farmland in Central Maui to remain in agriculture.*" Hence, the EIS assesses the action of obtaining a Water Lease and diverting water from East Maui. With regards to agriculture, under the Proposed Action, a major portion of the diverted water from East Maui would be used to irrigate the agricultural fields in Central Maui to continue to transition to diversified agriculture.

Comment 7: *In actuality, the upcountry areas of farmland have excellent soils and have grown and, still grow a diverse amount of crops such as onions, cabbage, lettuce, tomatoes, pumpkins, kalo, breadfruit, citrus, avocado, lychee, persimmons, mulberries, coffee, macadamia nuts, yacon, cassava, etc. Why are these lands not mentioned as exceptional growing areas?*

Response 7: Please note that the agricultural conditions of Upcountry Maui are assessed in Section 4.7.4 and Appendix I of the Draft EIS, and are summarized as follows:

Upcountry Maui has lands that are suitable for farming, but the general conditions are not as good as those in Central Maui. The farms are small and scattered, solar radiation is less, farms are farther from markets and shipping terminals, water is limited and expensive, ...

Although many crops can be grown and are grown in Upcountry Maui, the major limitation is water. Even if the supply of water to Upcountry Maui could be increased significantly with more surface water from the EMI Aqueduct System, the County's water system would require major modifications since it is designed to deliver potable water to homes, businesses and small farms. Except for the Kula Agricultural Park, the Upcountry Maui Water System is not designed to deliver large volumes of non-potable water to farms. If the supply of surface water were to be increased and the existing distribution system were to be used, then the surface water would have to be treated to potable standards, and the capacity of the distribution system would have to be increased. Alternatively, a separate distribution system for non-potable would have to be developed. Both alternatives would be prohibitively expensive. Before water could be diverted to Upcountry Maui, the modified distribution system would have to be proposed, designed, subjected to environmental studies, approved, financed and built.

Comment 8: *How will you prevent the pollution created by 'Phantom Dust'?*

Response 8: Please note that we are not certain what 'Phantom Dust' is, however, please note that the Mahi Pono farm team follows Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion and, thus, runoff associated with their current farming activities. As Mahi Pono incrementally increases the amount of farmed acreage over time and crops are planted (particularly the permanent orchard crops), ground disturbance will again be limited, as appropriate and consistent with farming BMPs.

Comment 9: *There has been much conversation about the techniques being used right now on the lands below Hali'imaile where the land is continually being tilled and is creating phantom dust, almost daily. This is a potential problem in our future if proper farming practices such as cover crops aren't added to the farm plan. Although, at this time, Hawaii doesn't have a law to prohibit or regulate this dust, there is already concern amongst the community.*

Response 9: Please note that Hali'imaile is in the Upcountry Maui and Mahi Pono does not have any agricultural fields in Upcountry Maui. Hence, any agricultural activities occurring outside the Central Maui agricultural fields are outside the scope of this EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS.

With regards to your comment about the State of Hawai'i does not have a law to regulate this dust, as noted in Response #8 above, we are not certain what 'Phantom Dust' is. However, please note that the State of Hawai'i does regulate Fugitive Dust pursuant to Hawai'i Administrative Rules, Section 11-60.1-33.

Comment 10: *The so-called "dust rule" regulates farm dust, which is mixed with things like dirt and dried cornstalk bits and is technically considered pollution by the U.S. EPA. The agency does limit how much of this particle pollution can be in the air, but just two states—Arizona and California—require farmers to take some dust control measures.*

Response 10: We acknowledge your comments. As noted in Responses #8 and #9 above, please note that the Mahi Pono farm team follows Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion and, thus, runoff associated with their current farming activities. As Mahi Pono incrementally increases the amount of farmed acreage over time and crops are planted (particularly the permanent orchard crops), ground disturbance will again be limited, as appropriate and consistent with farming BMPs. Moreover, please note that the State of Hawai'i does regulate Fugitive Dust pursuant to Hawai'i Administrative Rules, Section 11-60.1-33.

Comment 11: *Is Roundup being sprayed along the ditches? If so, this is unacceptable since the water would be continually contaminated by a product that now has over 40,000 lawsuits that claim people have been poisoned by Roundup and now have cancer.*

Response 11: Regarding your comment about pesticide use, as discussed in Section 4.12 pesticide use is regulated by both State and Federal law. The use of these chemicals is compliant with all laws regulating pesticide use, and certified commercial applicators are utilized as required. Act 45 which was passed by the 2018 Hawai'i Legislature and effective on January 1, 2019 required that all Certified Applicators of Restricted Use Pesticides (RUP) submit a report of the RUP that were applied each year. This report as well as any other report required by law is publicly available from the respective government entity. The State of Hawai'i DOA's Pesticide Branch also provides regulatory oversight over EMI's pesticide use. In accordance with this oversight, records of pesticide use must be kept and made available to the Pesticide Branch upon request at any time. It is also noted that since January 2020 EMI committed to discontinuing use of Round-Up. This information has been included in the Final EIS as shown in pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations.

Comment 12: *What safe plans have been made to keep our ditches clear of debris, weeds and any pathogens that could be flowing through them from dead animals?*

Response 12: As discussed in the Section 2.1.2 of the Final EIS as shown in page 2-7, under the Proposed Action, "maintenance and repair" involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System.

Moreover, EMI has established a number of standard operating procedures to address the clean-up of trash and debris within the License Area. Besides recognizing unnecessary debris in the field during routine maintenance tasks, EMI has conducted specific identification and removal operations of debris that has been observed from previous field work. EMI also has in place a practice of removing any equipment and excess materials it brings into the License Area to perform work on the EMI Aqueduct System as soon as the job(s) is completed.

Comment 13: *How will the ditch water be filtered to add another layer of safe water to be used on our crops?*

Response 13: Please note that non-potable water can be applied to agricultural food crops and does not need to go through a treatment process.

Comment 14: *What will Mahi Pono be legally allowed to do with the water? Will they be able to sell the water to construction/developers.*

Response 14: Under the Proposed Action, other than the water provided to the County of Maui, the water from the State Water Lease will be limited to use for agricultural purposes. The terms of the State Water Lease are expected to limit the use of the East Maui water to agricultural activities by Mahi Pono and its farm tenants. The charge for the water to farm tenants will be based on the delivery cost.

Comment 15: *How would the language read to protect our water supply from being sold to bottlers or other entities that would undermine the community water supply?*

Response 15: None of the water will be sold to bottlers or other entities that could undermine the community water supply. As explained in Response #14 above, the terms of the Water Lease from the State are expected to limit the use of the water to agricultural activities.

Comment 16: *Again, please reissue another 45 day comment period to continue this potentially life-altering lease.*

Response 16: As noted in Response #1 above, the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai‘i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC’s website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: response to the Proposed Lease (water Lease) for the Nahiku, Ke'anae, Honomanu, and Huelo License Areas Draft EIS
Attachments: response to the proposed lease - Executive Summary.docx

Attached are some of my concerns for the EIS listed.

With warmest aloha,
Dr. Mary
Maui County Resident
2430 S Kihei Road
8088750178

Concerns about the document: Lease of the Water Rights for the Nahiku, Ke'anae, Honomanu', and Huelo License Areas. Draft EIS Executive Summary the original complete document of over 2000 pages is too long to be read and responded to prior to the deadline given.

1. Considering the recent questions about the raise in water levels, increased global warming and the accelerated timetable for these two environmental concerns, it does not seem prudent at this time to grant a 30 year lease to Maui County water rights. Important issues concerning the use of our ground water and drinkable water may arise in the next few years which could change the premise that most of this document is based upon.
2. You speak in the document of these water rights going to auction, yet the entire document refers to Mahi Pono, have they already won the auction for these water rights?
3. The document talks about Mahi Pono (the assumed auction winner) will guide their farm plan by BMP- the document mentions non gmo crops and growing food for local consumption. It does not mention, planting draught tolerant, low water requirement crops. It does not mention planting trees as a windbreak to reduce soil temperature and soil drying effect.
4. Mahi Pono is an organization which has no track record here on Maui for farming on a tropical Island. Again it is not prudent to provide a company like Mahi Pono (the assumed auction winner) a 30 year lease, when there is no information concerning how effective the company will be in the farming business. Central Maui farmlands are in a high wind, low rainfall, draught labeled area. Crops grown in this area, unlike sugar cane, would require a total different planting and watering protocol. This is not evident in the executive summary.
5. The summary indicates that Maui Pono will create some 790 jobs, considering that Maui currently has less than 1% unemployment, where will this increase workforce come from. If the farming company plans to bring workers into Maui, they should be aware that Maui is in a housing crisis. There are estimated to be a 1500 unit deficit in affordable housing on Maui currently. If the farming company plans to create 790 jobs, and many of these jobs will be filled by off island non residents, where will they live? Assuming the pay roll for these jobs would require the bulk of those hired needing affordable housing, where would these local workers live?
6. The Summary states that 2.550 Maui residents will be supported by this farming. Based on the information given in 5 how did you arrive at this number of Maui residents supported?
7. The summary mentioned a total of 350 indirect jobs, will these jobs provide a minimum wage and benefits to those in this group and again where will these workers find housing to live with their families?
8. There are many abbreviations which are not identified in the summary.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Dr. Trotto:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Concerns about the document: Lease of the Water Rights for the Nahiku, Ke‘anae, Honomanu’, and Huelo License Areas. Draft EIS Executive Summary the original complete document of over 2000 pages is too long to be read and responded to prior to the deadline given.*

Response 1: We respectfully disagree with your comment that the Draft EIS is excessively long. The Proposed Action implicates complex substantive issues with long histories. The EMI Aqueduct System has been diverting East Maui stream water for over a century as discussed in Section 1.3.2 of the Draft EIS. A&B's request that the Board of Land and Natural Resources (BLNR) offer a long-term (30-year) water lease at public auction was made on May 14, 2001 and has yet to be acted upon due to a series of regulatory and legal challenges. The proceedings before the Commission on Water Resource Management (CWRM) started in 2001 and only concluded in June 2018. In May 2001, Native Hawaiian Legal Corporation (NHLC) filed 27 petitions to amend the interim instream flow standards (IIFS) for numerous streams within the License Area on behalf of Nā Moku ‘Aupuni ‘O Ko‘olau Hui (Nā Moku), Beatrice Kepani Kekahuna, Marjorie Walleit, and Elizabeth Lehua Lapenia (IIFS petitions). The IIFS proceedings concluded 17 years later, in June 2018, with CWRM's issuance of its Findings of

Fact, Conclusion of Law and Decision and Order in CCH-MA13-01 (CWRM D&O). The Draft EIS addresses this historical perspective, as required under HAR § 11-200-17.

We also note that the actual text of the Draft EIS is approximately 560 pages, which includes numerous graphics, and there are a total of thirteen appendices, nine of which were completed by technical consultants. We also note that over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M). The Applicant made every reasonable effort to convey information through the Draft EIS in a manner that is accurate, thorough, and appropriately concise in order to provide the public with an opportunity to fairly analyze the potential impacts of the Proposed Action.

Regarding your comment about the deadline given, please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai'i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 2: *Considering the recent questions about the raise in water levels, increased global warming and the accelerated timetable for these two environmental concerns, it does not seem prudent at this time to grant a 30 year lease to Maui County water rights. Important issues concerning the use of our ground water and drinkable water may arise in the next few years which could change the premise that most of this document is based upon.*

Response 2: We acknowledge your comments. Climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural

Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown in the pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

With regards to groundwater, according to the 2019 USGS publication titled, "Estimated Groundwater Recharge from a Water-Budget Model Incorporating Selected Climate Projections, Island of Maui, Hawai'i" states that between 2015 and 2035, it is expected that the demand for potable water from the County of Maui County Department of Water Supply (MDWS) will increase 45% from 33.5 million gallons per day (mgd) to 48.5 mgd. However, the report does not go into the breakdown of aquifer use and future demand and what aquifers will be the most affected by the projected increase in demand. The USGS report only identifies certain aquifer sectors and aquifer systems that will experience either increases or decreases due to climate projections. In the scenarios presented in the USGS report, the aquifer systems in the Ko'olau Aquifer Sector are projected to see some of the largest increases in recharge, whereas aquifer systems in the Central Aquifer Sector are projected to see decreases in recharge due to changes in rainfall patterns from future climate change trends. However, please note that under the Proposed Action, surface water is diverted from the East Maui License Area (which lies largely over the Ke'anae, Waikamoi and Honopou aquifers in the Ko'olau Aquifer Sector (See EIS Figure 4-17), to the Central Maui agricultural fields, which largely lie over the Pā'ia Aquifer in the Central Aquifer Sector (See EIS Figure 4-18). As detailed in Section 4.2.2 of the EIS, the groundwater pumpage within the Ko'olau Aquifer Sector is far below the Sustainable Yield (SY). This section of the EIS also addresses the anticipated impacts to the Central Aquifer Sector from the conveyance of East Maui surface water to Central Maui for irrigation purposes. Section 4.2.2 of the EIS has been updated to reflect your comment regarding the USGS report, as shown in page 4-71 for East Maui and page 4-76 for Central Maui.

Comment 3: *You speak in the document of these water rights going to auction, yet the entire document refers to Mahi Pono, have they already won the auction for these water rights?*

Response 3: Please note that the Water Lease has not been issued nor has it gone forward to public auction. The EIS was prepared to support the application for the issuance of a long-term Water Lease for the purpose of developing, diverting, transporting and use of the State's East Maui waters through the EMI Aqueduct System for the uses described in the EIS. The EIS also contemplates the environmental effects of variations on the Proposed Action, including scenarios where the amount of water permitted for the Water Lease is insufficient to supply Central Maui and Upcountry Maui. Thus, the EIS analyzes proposed uses of the water, but is not necessarily tied to a specific applicant although Section 1.3.3 of the Draft EIS explains how A&B, on May 14, 2001, requested that the State offer at public auction a long-term water lease under HRS § 171-58 for the, "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. Hence, any party who intends to use the water in a manner consistent with the EIS analysis could, presumably, use the EIS to support a bid on the Water Lease at public auction.

Comment 4: *The document talks about Mahi Pono (the assumed auction winner) will guide their farm plan by BMP- the document mentions non gmo crops and growing food for local consumption. It does not mention, planting draught tolerant, low water requirement crops. It does not mention planting trees as a windbreak to reduce soil temperature and soil drying effect.*

Response 4: The EIS explains that at full operation (which is anticipated by 2030), the Mahi Pono farm plan will utilize approximately 30,000 acres in Central Maui. Section 2.1.4 of the Draft EIS state:

- *That total amount of water will be delivered to approximately 30,000 acres. Of those 30,000 acres:*
 - *Approximately 15,950 acres would be used for farming, including 12,850 acres for orchard crops and 3,100 acres for other crops.*
 - *Approximately 13,800 acres would be used for pasture, of which about 4,700 acres would be irrigated.*
 - *Approximately 250 acres would be used for green energy, such as a solar farm.*

Because there is insufficient surface water to support the entire farm plan, brackish groundwater will also be used. . .

This farm plan would consist of the following:

- *Approximately 20,650 acres of irrigated farm land, including 12,850 of orchard crops, 600 acres of tropical fruit, 1,200 acres of row and annual crops, in addition to a community garden and limited non-GMO energy crops.*

- *Approximately 13,800 acres of cattle pasture, comprised of 4,700 acres of irrigated pasture, and 9,100 acres of unirrigated pasture. This should fit the proposed model of grass-finishing on irrigated pasture. The unirrigated acreage is less than 10,000 acres, which helps ensure that the entire area devoted to unirrigated pasture will remain productive.*

However, please note that Table 2-1 of the Draft EIS (Table 2-2 of the Final EIS) that was incorporated into Section 2.1.4 has been updated with more precise water usage numbers as shown in page 2-29.

With regards to best management practices, the Mahi Pono farm team, as well as its lessees, follow Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in the use of chemicals, and controlling dust and erosion and runoff associated with their farming activities. As it relates to agricultural chemicals for diversified agriculture, usage would be in strict compliance with federal regulations and Mahi Pono will exercise due care to prevent the release of fuels, lubricants and other hazardous materials. Mahi Pono intends to use a limited amount of fertilizers and pesticides in accordance with all laws and regulations and only on an as-needed basis. In addition, as mentioned above, since January 2020, Mahi Pono has also committed to foregoing the use of Round-Up and other glyphosate-based products within the Central Maui agricultural fields.

As Mahi Pono incrementally increases the amount of farmed acreage over time and crops are planted (particularly the permanent orchard crops), ground disturbance will be again be limited, as appropriate and consistent with farming BMPs. Towards this end, as noted in Response #2 above, Mahi Pono has implemented several water saving strategies for the Central Maui agricultural fields and continues to evaluate additional methods, some of which are consistent with the specific measures you recited. Mahi Pono water saving strategies include the following:

- Planting windbreaks in the fields.
- Incorporating significant uses of weed mat along plant lines, which will reduce evapotranspiration and erosion.
- Mowing rather than plowing inter-rows to preserve organic matter and keep cover to prevent soil erosion.
- Operating within the terms of a Conservation Plan from NRCS, which includes swales and diversions for erosion protection,
- Practicing rotational grazing of livestock.
- Planting permanent tree crops that will develop canopies that will assist with soil moisture retention and reduce evapotranspiration.

With regard to your comment about draught tolerant crops, please note that many can be grown in Hawai'i, but relatively few can be grown at a scale and cost that compete with low-cost volume producers on the mainland, Mexico and elsewhere. For many crops, the Hawai'i market is too small for economies of scale, and shipping costs and delivery times are a disadvantage for exports. The Mahi Pono farm plan includes those crops judged to be the most promising for commercial success, but excluding GMO crops. Also, water requirements for these crops are typical for Hawai'i. However, the crops requiring high-volumes of water, such as kalo, will not be grown in Central Maui. Please note that Mahi Pono's farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e. orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community.

Comment 5: *Mahi Pono is an organization which has no track record here on Maui for farming on a tropical Island. Again it is not prudent to provide a company like Mahi Pono (the assumed auction winner) a 30 year lease, when there is no information concerning how effective the company will be in the farming business. Central Maui farmlands are in a high wind, low rainfall, draught labeled area. Crops grown in this area, unlike sugar cane, would require a total different planting and watering protocol. This is not evident in the executive summary.*

Response 5: It is acknowledged that Mahi Pono is new entity that has just been recently formed with the goal of operating a large diversified agriculture farm in Hawai'i. However, in its first 18 months of existence, Mahi Pono has hired over 200 120 workers from Maui, most of whom have farm experience on the island. In addition, Mahi Pono's management also has significant experience cultivating diverse crops on more than 100,000 acres on the continental U.S. Also, the company has established market channels, and substantial financial resources." Moreover, Mahi Pono has been successfully expanding their agricultural operations in Central Maui since they purchased the former sugarcane land.

Please note that The Mahi Pono farm plan is discussed not only in the Executive Summary, but in detail in Section 2.1.4. and Section 4.7.4, as well as Appendix I (Subsection 8.a (pp. 34 to 36) of the PEP Report, with details provided in Table 2, Section 2.a (p. T-2)). Water requirements for 2030 are discussed in Subsection 9.a (pp. 39 and 40) of Appendix I, with details provided in Table 3, Section 3.a (p. T-4) of Appendix I. This table includes average daily per-acre water requirements by crop. Production figures are discussed in Subsection 10.a (pp. 42 to 45), with details provided in Table 4, Section 4.a (p. T-7) of Appendix I.

To the extent economically feasible, Mahi Pono will grow food crops for the Hawai'i market, thereby reducing food imports. At full development of their farm plan, local sales by Mahi Pono and its farm tenants are expected comprise 65% of total sales, with exports at 35%. Local sales are preferred over exports because it increases the food sustainability of the State while also saving on overseas shipping costs. Both local sales and exports are beneficial to Hawai'i: local sales that displace imports reduce the financial drain on the State as a whole, while exports generate income for the State.

The farm plan will evolve over time based on a number of factors, including the available supply of surface water, experience which will be gained on crops that grow well in Central Maui, crops that are profitable, the size of the market for profitable crops, etc.

Regarding your comment questioning the viability of farming in the Central Maui fields owned by Mahi Pono, as summarized in Section 4.7.4 of the Draft EIS and Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts):

Central Maui has some of the best agricultural conditions in the State for farming, including a large area in a compact configuration, high-quality soils, high solar radiation, a location near markets and shipping terminals, and potentially ample water at low delivery costs (assuming a new Water Lease with a reasonable use fee), and for lessees rents that will be comparatively low.

The basis for this finding is given in Subsection 5 of Appendix I of the Draft EIS, along with Figures 4 to 12 in Appendix I of the Draft EIS.

Moreover, as discussed in Section 5 of Appendix I and Section 4.7.4 of the Draft EIS, the overwhelming majority of the Central Maui agricultural fields (approximately 80%) are rated by the UH Land Study Bureau (LSB) as having the highest Overall Productivity Rating of "A" (on a scale of "A" to "E" with "E" being the lowest soil rating), and a little over 11% has a "B" rating. In other words, about 27,567 acres (90.9%) are high-quality lands rated A or B. The Agricultural Lands of Importance to the State of Hawai'i (ALISH) Classification System, developed and compiled in 1977 by the State Department of Agriculture with assistance from the U.S. Department of Agriculture - Natural Resources Conservation Service (NRCS), and the College of Tropical Agriculture, University of Hawai'i. Approximately 25,669 acres of the Central Maui agricultural fields are classified under the ALISH system as "Prime", which means "agricultural land which is land that is best suited for the production of crops because of its ability to sustain high yields with relatively little input and with the least damage to the environment." Also, as discussed in Section 5.1.4 of the EIS and Section 5 of Appendix I, approximately 22,000 of the 30,000 acres of

agricultural fields in Central Maui are designated as Important Agricultural Lands (IAL). Under Article XI, Section 3, of the Constitution of Hawai‘i, the State is required to conserve and protect agricultural lands, promote diversified agriculture, increase agricultural self-sufficiency and assure the availability of agriculturally suitable lands. HRS Chapter, 205, § 205-41 through § 205-52, provides for the designation of IAL. As stated in HRS Chapter 205: “*The objective for the identification of important agricultural lands is to identify and plan for the maintenance of a strategic agricultural land resource base that can support a diversity of agricultural activities and opportunities that expand agricultural income and job opportunities and increase agricultural self-sufficiency for current and future generations.*” IAL designation facilitates the long-term dedication of lands for future agricultural use so long as there is a sufficient supply of water to allow for profitable farming.

However, the EIS and the associated technical studies do not claim that only Central Maui has the substantial potential to grow useful food crops for Maui’s future. As discussed in Section 2.1 of the Draft EIS, the scope of this EIS is to assess the Proposed Action which is, “*...to enable the Board of Land and Natural Resources (BLNR)-awarded lessee the right, privilege and authority to enter and go upon State-owned lands for the purposes of developing, diverting, transporting and using government-owned waters. The requested Water Lease would allow the use of government-owned waters from the License Area (approximately 33,000 acres which includes lands within Nāhiku, Ke‘anae, Honomanū, and Huelo) through the East Maui Irrigation Company, LLC (EMI) Aqueduct System. Use of that surface water would allow the continued provision of water to enable approximately 30,000 acres of farmland in Central Maui to remain in agriculture.*” Hence, the EIS assesses the action of obtaining a Water Lease and diverting water from East Maui. With regards to agriculture, under the Proposed Action, a major portion of the diverted water from East Maui would be used to irrigate the agricultural fields in Central Maui to continue to transition to diversified agriculture.

Comment 6: *The summary indicates that Maui Pono will create some 790 jobs, considering that Maui currently has less than 1% unemployment, where will this increase workforce come from. If the farming company plans to bring workers into Maui, they should be aware that Maui is in a housing crisis. There are estimated to be a 1500 unit deficit in affordable housing on Maui currently. If the farming company plans to create 790 jobs, and many of these jobs will be filled by off island non residents, where will they live? Assuming the pay roll for these jobs would require the bulk of those hired needing affordable housing, where would these local workers live?*

Response 6: At full operations of the Mahi Pono Farm Plan, currently estimated to occur around 2030, an estimated 790 farming and crop-processing jobs will be provided in Central Maui

(direct jobs) (about 160 more jobs than provided by HC&S sugar operations in 2006). As explained in Section 4.7.4 of the Draft EIS:

The increase in employment would be gradual, with most jobs filled by former sugarcane workers, skilled workers from Maui and other islands, recent graduates of agricultural-schools and colleges, and unskilled workers who would receive on-the-job training.

Approximately an additional about 230 indirect jobs on Maui will be generated by the purchase of goods and services, for a total exceeding 1,000 new jobs on Maui (PEP Report, Table 5). Hiring workers will be spread out over a number of years as fields are planted, orchards mature, processing facilities are built, etc. Assuming 10 years to reach full operations, direct employment on Maui will increase by an average of about 80 jobs per year, while total direct and indirect jobs will increase by an average of about 100 jobs per year. The latter figure is less than 8% of the 1,270 annual job increase projected for the years 2020 to 2030 by the State for the County of Maui (DBEDT, "Population and Economic Projections for the State of Hawai'i to 2045, June 2018).

Based on past hirings, nearly all future employees are expected to come from Maui. Also, at this time, attracting workers should be easier than in the recent past because of the long-term adverse economic effects of COVID-19 on tourism and Maui's economy. It may take years to rebuild the economy, and the Mahi Pono Farm plan will contribute significantly to this rebuilding.

Since most farm workers are expected to come from Maui, few homes will be required for workers new to the island. In any case, Mahi Pono will pay wages and provide benefits sufficient to attract and retain workers. Under the circumstances, these wages should be sufficient for workers to obtain housing.

COVID-19 could cause a change in Maui's housing market, including a weaker demand for homes during the economic recovery, an increased supply of available homes, and more affordable homes. With a weaker economy, there will be fewer residents moving to Maui seeking jobs and housing. Some residents will leave the island to find jobs elsewhere. Because of fewer visitors, some owners of resort condominiums will rent their units to residents instead of visitors. Under these economic circumstances, home prices and rents may decline.

Comment 7: *The Summary states that 2,550 Maui residents will be supported by this farming. Based on the information given in 5 how did you arrive at this number of Maui residents supported?*

Response 7: At full operations, the direct plus indirect jobs provided by farming activity in Central Maui is projected to support about 2,550 residents Statewide, of which about 2,290 of them would be on Maui. The calculations—which are based on county residents-to-jobs ratios—are shown in Appendix I, Table 5. (Section 5.a., p. T-11.)

Comment 8: *The summary mentioned a total of 350 indirect jobs, will these jobs provide a minimum wage and benefits to those in this group and again where will these workers find housing to live with their families?*

Response 8: At full operations, the indirect jobs provided by farming activity in Central Maui is projected to be about 350 jobs, with 230 jobs on Maui and 120 jobs on O‘ahu. The annual increase in indirect employment on Maui is expected to be about 23 jobs (230 jobs ÷ 10-year development period).

These jobs will be distributed throughout the economy and will range from unskilled to highly skilled jobs. For Maui workers, their average pay is expected to be similar that for the island.

As is the case with the direct jobs on Maui, most of the indirect jobs are expected to be filled by workers from Maui, although a small number of them could be new to the island. Given this small number and their expected pay, the housing market should be able to accommodate them.

Comment 9: *There are many abbreviations which are not identified in the summary.*

Response 9: Please note that the acronym is also provided in the "List of Acronyms Used" that follows the Table of Contents in both the Draft EIS and the Final EIS and has been updated to include any missed acronyms.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Public Comments/questions on Maui Water DEIS

Hi,

I am a concerned east Maui resident with large questions outstanding about management about east maui streams:

1) How did you go about investigating the impacts of stream diversions on east Maui communities and their cultural practices, especially Huelo, Keanae, and Nahiku? Why did you conclude there would be no impacts to these areas cultural practices, habitat, and social welfare, when in fact these communities are deeply affected by stream diversions? Did you have community meetings in these places and if not, why? How will you plan on accurately representing the true community impact of your diversions in the final EIS?

2) If, after your diversions begin, there is evidence of East Maui communities being harmed by said diversions, what recourse do we have under the Public Trust Doctrine?

3) How do you plan to accurately report the amount of water you are taking from East Maui, and be accountable to projections needed for farming in central Maui? How do you plan to use accurate reporting technology to give real and believable usage numbers to the water council (unlike A&B)? Accountability was a major problem under A&B's management of the water supply, and I believe real time, or near real time reporting, of water usage should be a prerequisite to beginning diversions. It's the 21st century... this technology should not be hard to implement.

4) If your usage of public water resources is found to be overwhelmingly not beneficial to the public of Maui, I.e. you violate the Public Trust Doctrine, what is the process for returning the rights of the water back to the people/state of Hawai'i?

I look forward to hearing answers to my concerns.

Best,
Matt McDonald

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. McDonald:

Thank you for comments dated November 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns, which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am a concerned east Maui resident with large questions outstanding about management about east maui streams:*

How did you go about investigating the impacts of stream diversions on east Maui communities and their cultural practices, especially Huelo, Keanae, and Nahiku? Why did you conclude there would be no impacts to these areas cultural practices, habitat, and social welfare, when in fact these communities are deeply affected by stream diversions? Did you have community meetings in these places and if not, why? How will you plan on accurately representing the true community impact of your diversions in the final EIS?

Response 1: Please note that stream diversion impacts on native stream habitats and aquatic species were investigated by Trutta Environmental Solutions included in the EIS as Appendix A using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model which is summarized in Section 4.2.1 of the Draft EIS. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the

number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown in pages 4-61 to 4-62 of the Final EIS. The above excerpt and the updated text in pages 4-61 to 4-62 of the Final EIS present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See pages 4-61 to 4-62 of the Final EIS. Moreover, it should be noted that many cultural resources, including but not limited to 'o'opu, hīhīwai, and 'opae were included in this model.

As it relates to cultural impacts, please note that the EIS did not conclude that there would be no impacts. Rather, the CIA acknowledges that the Proposed Action may impact Native Hawaiian cultural resources and practices and provides for several recommendations to mitigate those impacts. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include:

Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6 pages 4-239 to 4-252. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

The socio-economic impacts of the Proposed Action are addressed at length in Section 4.7 of the Draft EIS, and in further detail in Appendices G through I (Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report). Draft EIS

Section 4.7 has subsections addressing impacts to populations and impacts (Section 4.7.1), impacts to social characteristics (Section 4.7.2), impacts to the economy and other fiscal considerations (4.7.3), and impacts to the agricultural economy. (4.7.4). The potential socio-economic impacts of the alternatives to the Proposed Action considered by the Draft EIS are analyzed in Section 3.4.11 (Social Characteristics), 3.4.12 (Economic and Fiscal Resources), and 3.4.13 (Agricultural and Related Economic Resources). The Draft EIS thoroughly addressed cumulative socio-economic impacts in Section 4.17. That discussion has been further supplemented by updates in the Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report as shown in pages 4-331 to 4-336.

Regarding your comment about community meetings, following publication of the EISPN for the Proposed Action, two voluntary public scoping meetings were held to notify and initiate consultation with the community for the preparation of a Chapter 343, HRS, EIS. This process is discussed in Chapter 9. The purpose of this outreach process was to inform and obtain input from the community on relevant issues or concerns that should be considered in the preparation of the EIS documentation for the Proposed Action. Moreover, Earthplan, in conjunction with the Social Impact Assessment conducted several focus group meetings as summarized in Section 4.7.2 and Appendix G of the EIS.

We also note that over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M). The Applicant made every reasonable effort to convey information through the Draft EIS in a manner that is accurate, thorough, and appropriately concise in order to provide the public with an opportunity to fairly analyze the potential impacts of the Proposed Action.

Comment 2: *If, after your diversions begin, there is evidence of East Maui communities being harmed by said diversions, what recourse do we have under the Public Trust Doctrine?*

Response 2: Your comments are unclear. As noted in Response #1 above, the socio-economic impacts of the Proposed Action are addressed at length in Section 4.7 of the Draft EIS, and in further detail in Appendices G through I (Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report). Draft EIS Section 4.7 has subsections addressing impacts to populations and impacts (Section 4.7.1), impacts to social characteristics (Section 4.7.2), impacts to the economy and other fiscal considerations (4.7.3), and impacts to the agricultural economy. (4.7.4). The potential socio-economic impacts of the alternatives to the Proposed Action considered by the Draft EIS are analyzed in Section 3.4.11 (Social Characteristics), 3.4.12 (Economic and Fiscal Resources), and 3.4.13 (Agricultural and Related Economic Resources). The Draft EIS thoroughly addressed cumulative socio-economic impacts in Section 4.17. That discussion has been further supplemented by updates in the Social

Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report as shown in pages 4-331 to 4-336.

With regards to the Public Trust Doctrine, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown in pages 1-25 to 1-27.

Comment 3: *How do you plan to accurately report the amount of water you are taking from East Maui, and be accountable to projections needed for farming in central Maui?*

Response 3: Please note that reports submitted to State agencies are considered public records that may be requested pursuant to the Uniform Information Practices Act, HRS Chapter 92F. Reporting to State agencies is required under the water Revocable Permits and under the CWRM D&O, and similar reporting requirements may be required under the Water Lease. As discussed in Sections 2.1.4, 4.2.1, and 4.6 of the Final EIS, the CWRM D&O requires EMI to report on changes in stream diversions and ditch settings as irrigation requirements increase. EMI also maintains a system of optical encoders with float tape and data loggers within the EMI Aqueduct System. The information obtained is reported to CWRM on a monthly basis.

Comment 4: *How do you plan to use accurate reporting technology to give real and believable usage numbers to the water council (unlike A&B)? Accountability was a major problem under A&B's management of the water supply, and I believe real time, or near real time reporting, of water usage should be a prerequisite to beginning diversions. It's the 21st century... this technology should not be hard to implement.*

Response 4: EMI has gauges located in several locations across the License Area. These gauges measure the flow in the ditches only. It is not feasible to measure flow in the streams, as there are limited areas that contain the necessary control points to accurately measure streamflow. Similarly, it is not feasible to provide total diversion amounts by a particular portion of the proposed License Area, i.e. diversions amounts only from Huelo, diversion amounts only from Nahiku, etc. The USGS used to have gauges at each of the License Area boundaries. Those gauges were not on individual streams, they were in the ditches at each license area boundary.

However, due to USGS cost cutting, several of those gauges were removed. It is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gages to wash away. EMI has never conducted stream gauging as that lays within the expertise the CWRM and the USGS. As noted in the CWRM D&O, the measurements EMI take are at Honopou Stream and Maliko Gulch, however, for the purpose of measuring the aggregate flow from entire License Area, the Honopou Stream measurement reading was used.

Moreover, the work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

With regards to your comment about technology it should be noted Mahi Pono expects to invest over \$20 million to increase the efficiency of its Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to Section 2.1.4 of the Final EIS as shown in page 2-25.

Comment 5: *If your usage of public water resources is found to be overwhelmingly not beneficial to the public of Maui, I.e. you violate the Public Trust Doctrine, what is the process for returning the rights of the water back to the people/state of Hawai'i?*

Response 5: Please note that this is a speculative comment and outside the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'ānae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the

10238-04
Letter to Mr. Matthew McDonald
Page 8 of 8
September 3, 2021

potential Water Lease are included through Chapter 4 of the EIS. However, we assume that a similar process to the 2018 CWRM D&O would need to commence.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on the Draft EIS for East Maui Water Lease

Dear Mr. Hirokawa and Mr. Matsukawa,

My name is Mavis Medeiros and I am writing to you regarding the above subject, "comments on the draft eis for East Maui water lease. My family and I have lived in Hana (born and raised) most of our lives. When we were young, our parents taught us to gather food from Makapipi, Waiohue and Kuhiwa. My Dad was an Oliveira and they were born and raised in Nahiku. My Mom was a Hoopai and she was born and raised mostly in Honokalani, but also at Ulaino in Hana. Being that both of them were from Koolau Moku, you can understand why we would go to those places for fresh opae, hihwai and fish for o'opu and other pole fishing food from the ocean at Waiohue and Ulaino. You can imagine how distraught my Mom and Dad were when we'd go to their favorite gathering places (late 60's, early 70's) and there was no water or so little, there wasn't enough to feed the whole family and Tutu's too. We had 10 mouths to feed back then. Hana has suffered greatly from A & B and EMI's blatant abuse diverting our water across horizontal paths to get it to "the other side" and not necessarily because people needed water. It was to feed a water hungry crop called sugar cane and also so A&B could satisfy their water needs for development, because A&B quickly became perhaps the largest Developer on Maui. Sugar cane didn't make a whole lot of money and in the recent years before closing, actually lost millions. So truly, what was the water for? Even after closing down for several years, A&B wouldn't give up the water. Why?

Today, Mahi Pono, via A&B is claiming to need the water for the lands they bought from A&B, some 30-40,000 acres depending what article you're reading. Mahi Pono does not have a large need for water yet and can use what water is available to them. We know A&B has wells with over 125,000,000 gallons of water available. Too salty you say, then desalinate it. That would probably be cheaper than repairing the diversions and tunnels in East Maui. Besides that, Mahi Pono said early on when they first came that they had sufficient water for their farmlands and don't need any more from East Maui and was prepared to decommission the diversions. Please explain why all of a sudden Mahi Pono needs water from us. I say us because we are the public and we have a right to the water. Why the sudden change? We are also aware that A&B is promised \$62,000,000., if they can keep the water diversions for future use. Very confusing, to say the least, or not. There is definitely a huge motive if that is the case.

Please also address my following concerns taken out of the D-Eis book. I hope you understand that most of us did not have enough time to read the whole 2,700 plus page booklet and we need more time to correctly address the draft eis and ask that you extend the time for “comment period.” The 3 (three) books just arrived in Hana a few weeks ago. My comments are mostly or all about East Maui area/waters.

- 2.1 Proposed Action – Understood the streams that were restored will still be restored, but we are concerned about the overage and about other streams not currently being diverted. What are your plans for that?
I also didn't see a watershed plan as mentioned in 2.1. What is the plan?
- 2.1.1 Department of Hawaiian Home Lands – Did you know that Hana and Keanae are planning on opening up their DHHL lands soon? What are your plans for that? Hana and Keanae have many young families needing housing and have moved away or live with their Parents or Grandparents, along with their Parents and kids.
- 3 – 3.4 Just convenience words to be able to say we considered other alternatives, but it won't work. Why won't other sources of water work? We hear that A&B has millions of gallons stored away, use it. Dams should be removed and if still awarded, downscaled to a minimum. The water in the pictures from book 2 clearly illustrate that the water in those dams are stagnant, showing that holding it back is not helping the river, its food supply and the seafood where the river enters the ocean.
- 3.4.5 Coastal Waters – Hana is living proof that since the 10 streams were released, more fish has been available to eat. Where there used to be only a few times a year when the community have been able to enjoy “hukilau” catching and taking off akule from the nets, feeding families abundantly. The past couple years, there has been many “hukilau” and families are able to take home 10-15 fish per person helping remove the fish from the nets. You can ask most lineal descendants this question. How did you do your studies that the returning waters has done more harm than good?
- 3.4.11 Social Characteristics – Which residents exactly said (because it sounds like the whole East Maui did) said they were concerned about the physical condition of the EMI Aqueduct system & hope that Mahi Pono's ownership would lead to improved stewardship of the system? Most people I know have heard Mahi Pono's wishes to decommission the system.
- 3.4.12 & 3.4.13 – What is meant by No significant differences to the economic and fiscal impacts are expected within East Maui? And No significant differences to the agricultural activities and related economic benefits are expected within East Maui? There are many acreages available to grow kalo or leko. The water should be diverted to Hana where the weather is more suitable for farming and not too much water is needed and can return to the ocean, as nature planned.
- 3.4.14 Recreational Resources – If the license area were reduced to make more of the State land open to the public that could potentially have a beneficial impact on the availability of recreational resources in East Maui. Are you serious? How would that be beneficial exactly? We have the worst record of native/endemic plants, birds disappearing and more invasive plants in recent years than ever. How did you come up with such an assinine statement?
- 3.4.15 Visual Resources – Every single time we pass one of the dry or mostly dry (trickle) streams, us Kanaka Maoli feel like crying because it's not normal. How can you say the proposed action are not expected to have significant impact on the visual resources in the

License area? Just the sight of no water and invasive trees and plants growing in them hurts. Every single time we drive past it, deep in our na'au because it's not normal. That plus the fact that we know that the wai food and kai food are not being fed, therefore not feeding the people. What makes you feel like this will not impact us?

- 4. State owned land are crown lands that was given to his people by Kamehameha or kept for his families. The water is not to be taken and the public ignored. WE should come first. The water is for the public, not a corporation to make money?
- 4.6 – Cultural Resource and Practices: If you had truly searched the Archives, Museums, UH Manoa, the mahele database and OHA, then you know many of the water rights were deeded to Hawaiians from the Great Mahele of King Kamehameha III. What did you find when you did your research re water rights? There is also no mention of the impacts this has to Hana. It has a very significant impact on Hana people too. Who did you find that King Kamehameha III gave the water rights in Koolau to?
- 4.7.4 – Agricultural Economy: Shows no impacts. I think that future impacts to East Maui should also be calculated. Many more of the young generation are beginning to farm and enjoy taro farming, even Hana students and adults are beginning to plant kalo. How can you ask for a 30 year lease showing no impacts to the future of Hana or Keanae/Wailua? Young college grads are returning and realizing that “sustainability is the way to go.” Water is necessary for that to happen.
- 4.10 – Impacts and Mitigation Measures: If the current owner of the EMI diversions, ditches and tunnels (A&B) are anything like the past owners of the diversions, ditches and tunnels (A&B), the record of maintenance on the current and past system is very inadequate. Much water leaks out of the ditches & tunnels and the state of disrepair is embarrassing. How can you say you will maintain and repair the system? We drive past it almost every week or two and can see with our own eyes the state of disrepair it's in. A serious plan for this would be necessary, but only with a 5 year lease, if at all.
- 4.12 – Hazardous Materials: Hazardous/toxic waste is defined as based on their ignitability, corrosiveness, reactivity and toxicity. The potential impacts hazardous materials and waste have on human health and the environment are largely dependent upon their types, quantities, toxicities and management practices.

East Maui – EMI Personnel use federally regulated herbicides to maintain the trails and access roads used for the maintenance of the EMI Aqueduct system. The proposed system will maintain existing maintenance protocols. No significant impacts on or from hazardous materials in the region are anticipated as the proposed action does not involve any of the use of hazardous materials, except for the continued use of herbicides in compliance with state and federal regulations in connection with the continued maintenance of the EMI Aqueduct system.

It is common knowledge that round up is/was the choice herbicide used by EMI in the past. If you have been paying any attention, Monsanto and other Big Ag Corporations are being sued by thousands of people who have suffered or knows someone who's suffered with cancer especially, but other diseases like asthma, allergies and eczema are other diseases caused by this one herbicide/pesticide. Saying that it's FDA or EPA approved doesn't help the many men who have worked and died working for EMI. No warnings were given of its potential danger. This is still being sprayed today. In the past recent months, twice I have taken pictures of the areas around

the streams and going up the EMI roads to the upper regions of diversions/dams, etc. I will try and include them with this letter/email, but if my phone doesn't allow it, I will send it tomorrow. Please explain how you will protect future employees from the hazardous use of round up or any chemicals that are dangerous to humans. Also, can you provide a report of how many men have passed after many years of using these chemicals could help any future or current employees know how dangerous working these fields are or can be working for EMI. We were personal friends with at least two of the young men who passed away from cancer after working for EMI for many years, but hear there were more.

We are not against farming to feed Maui nui, other islands then exporting away from there on out. We are against the horrible history of A&B & EMI and the damage done to East Maui. There is no reason why water should be diverted when there is no true farm plan, no plan to keep the food here and hardly any plants in the ground. We should never agree to a lease for 30 years either. We hope you take this letter into consideration and do some serious homework before even reapplying or making the final EIS.

Sincerely,

Mavis I. Medeiros,
Lineal Descendant, East Maui

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Oliveira-Medeiros:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *East Maui would like an extension on the time period due to book/s being 2700 plus Pages & not enough time to read it all & give a good response.*

Response 1: Please note that there is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comments were received during the statutory comment period.

Comment 2: *My name is Mavis Medeiros and I am writing to you regarding the above subject, “comments on the draft eis for East Maui water lease. My family and I have lived in Hana (born and raised) most of our lives. When we were young, our parents taught us to gather food from Makapipi, Waiohue and Kuhiwa. My Dad was an Oliveira and they were born and raised in Nahiku. My Mom was a Hoopai and she was born and raised mostly in Honokalani, but also at Ulaino in Hana. Being that both of them were from Koolau Moku, you can understand why we would go to those places for fresh opae, hihiwai and fish for o’opu and other pole fishing food from the ocean at Waiohue and Ulaino.*

You can imagine how distraught my Mom and Dad were when we'd go to their favorite gathering places (late 60's, early 70's) and there was no water or so little, there wasn't enough to feed the whole family and Tutu's too. We had 10 mouths to feed back then. Hana has suffered greatly from A & B and EMI's blatant abuse diverting our water across horizontal paths to get it to "the other side" and not necessarily because people needed water. It was to feed a water hungry crop called sugar cane and also so A&B could satisfy their water needs for development, because A&B quickly became perhaps the largest Developer on Maui. Sugar cane didn't make a whole lot of money and in the recent years before closing, actually lost millions. So truly, what was the water for? Even after closing down for several years, A&B wouldn't give up the water. Why?

Response 2: Regarding your comment about being taught to gather food from Makapipi, Waiohue, and Kuhiwa streams, please note the following: Under the Commission on Water Resources Management Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O), both Makapipi stream and Waiohue stream have been ordered for full restoration of flow. In other words, the EMI Aqueduct System will no longer be permitted to divert water from those two streams. As for Kuhiwa stream, this stream has never been diverted by the EMI Aqueduct System because it is located beyond the eastern end of the system. The area of Ulanio is also located much farther east of the EMI Aqueduct System.

Regarding your comment about going to the above aforementioned places to gather opae, hīhīwai, and 'o'opu, please note that Appendix A and Section 4.2.1 of the Draft EIS presented the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model which was used to quantify the impacts of flow restoration on native stream animal habitat including opae, hīhīwai, and 'o'opu. The above aforementioned streams that were once diverted by the EMI Aqueduct System will see an increase in habitat for these stream species as they were ordered to be fully restored.

Your comment about not being able to get food from these streams in the 1960s and 1970s is acknowledged. Although Kuhiwa stream has never been diverted by the EMI Aqueduct System and, therefore, is beyond the scope of this EIS, we acknowledge that CWRM's rationale for ordering full natural flow at Makapipi was based on the desire to allow that stream to support significant kalo cultivation. See CWRM D&O at iv. Whereas, for Waiohue, CWRM ordered a return of full flow as a habitat reference stream. See CWRM D&O at v. Please note that the diversified agricultural plan proposed by Mahi Pono will use far less water than was used by HC&S for sugarcane operations. As discussed in Section 1.3.2 of the Draft EIS, the EMI Aqueduct System diverted water mainly to support the sugarcane operations in Central Maui starting in the late 1800s, through 2016. However, over the course of the past several decades, the users of the EMI Aqueduct System have grown to include non-potable water

service for agricultural uses at the Kula Agricultural Park (KAP) as well as potable water service through the County of Maui Department of Water Supply (MDWS) to domestic and agricultural users in Upcountry Maui and limited historic uses, including water for pasture, livestock, non-profit irrigation and fire suppression at/around the Pu'unēnē Mill area, including for non-profits and a federal post office, as well as for related uses around the County's Central Maui landfill (quarry, composting, and C&D landfill for purposes such as restrooms, dust control).

As discussed in Section 2.1.2 of the Draft EIS, the long-term average delivery (up until 1986 when the first return of water was made to East Maui streams) by the EMI Aqueduct System was approximately 165 million gallons per day (mgd) (CWRM D&O, FOF 519) before any use of the water by the MDWS or HC&S. The median flow for more recent flow deliveries (between 1987 and 2006) were approximately 135.58 mgd at Honopou Stream and 146.64 mgd at Māliko Gulch. In contrast, the amount of water to be diverted under the Proposed Action is estimated to be 92.32 mgd before any use of water by the MDWS or Mahi Pono, which is considerably less than was diverted during sugarcane farming. Your comment about A&B engaging in development seems misplaced in the context of this EIS. The water that was diverted in the past, and more importantly the water that would be diverted should the Water Lease be issued, would be used for the purposes identified in the EIS and pursuant to the conditions of the Water Lease; not to facilitate real estate development by A&B.

You asked why after closing sugar operations (which at its peak provided over 1,000 jobs to Maui residents), A&B "wouldn't give up the water." Irrigation water from the East Maui streams delivered through the EMI Aqueduct System is key to keeping agricultural lands in Central Maui in agricultural use for the future, which is the desired goal of the Maui community as articulated in its General and Community Plans. As discussed in EIS Section 1.1, water was needed to support sugarcane farming by HC&S through December 2016, at which point HC&S then began pursuing diversified agricultural uses for the former sugarcane fields in Central Maui. However, in December 2018 Mahi Pono acquired those Central Maui agricultural fields with a commitment to use them for diversified agriculture and has since taken action to plant new crops and begin the implementation of its diversified agriculture plan, as discussed in the EIS.

Comment 3: *Today, Mahi Pono, via A&B is claiming to need the water for the lands they bought from A&B, some 30-40,000 acres depending what article you're reading. Mahi Pono does not have a large need for water yet and can use what water is available to them. We know A&B has wells with over 125,000,000 gallons of water available. Too salty you say, then desalinate it. That would probably be cheaper than repairing the diversions and tunnels in East Maui.*

Response 3: Please note that that as of October 2020, an average of 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System for use in Central and Upcountry Maui. This updated information has been added to Section 2.1.4 of the Final EIS as shown in pages 2-30 and 2-32. Moreover, as of November 2020, Mahi Pono projected that by the end of the calendar year 2021, it could be cultivating the following within Central Maui: (a) 4,920 acres in orchard crops, including lemons, limes, oranges, avocados, coffee, macadamia nuts; (b) 633 acres in row crops; (c) 102 acres in tropical fruits; and (d) 12,000 acres in cattle operations. Based upon the planned estimates, Mahi Pono projected that its total water needs from the East Maui watershed/streams over the course of 2021 would be approximately 32.3 mgd as discussed depicted in Table 2-3 in Section 2.1.4 of the Final EIS and shown in pages 2-30 and 2-32. Hence, the continued use of East Maui surface water is essential for the implementation of the full Mahi Pono farm plan, which, should the Water Lease be issued, is expected to occur in 2030. However, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

Please note that the EIS is clear that the full buildout of the Mahi Pono farm plan covers approximately 30,000 acres of agricultural fields in Central Maui. Under such a scenario, with the Water Lease issued in the amounts authorized under the CWRM D&O, Mahi Pono would irrigate the Central Maui agricultural fields with East Maui surface water and also with some brackish groundwater from Central Maui as described in Section 2.1.4 of the EIS and as shown in Table 2-1 of the Draft EIS which has been revised in the Final EIS as shown on page 2-29 to correct for rounding errors.

Your comment that "A&B has wells with over 125,000,000 gallons of water available" is acknowledged. However you did not identify any source for this information and it is not consistent with any information we have regarding wells that supply the Central Maui agricultural fields. That amount does not match the amount of groundwater available to Mahi Pono from its brackish water wells that supply the Central Maui fields.

As discussed in Section 4.2.2 of the Draft EIS, the agricultural fields within Central Maui are within the MDWS Central Aquifer Sector which includes four aquifer systems: Pā'ia, Kahului, Kama'ole, and Makawao aquifers. The Central Maui agricultural fields overlie the Pā'ia and Kahului aquifers, for which the sustainable yields (SY) are 7 and 1 mgd, respectively. SY calculations, however, do not account for water transfers into an aquifer, either above ground or subterranean, including surface water conveyed to the Central Maui Aquifer Sector from the Ko'olau Aquifer Sector for irrigation by the EMI Aqueduct System. During sugarcane operations, the combined pumping capacity of A&B's 15 brackish water wells was

approximately 228 mgd of brackish water, but the true instantaneous pumping capacity of the wells – the most that can be pumped over 3 to 5 days – was 115 mgd during sugar cultivation, after which sump levels started to decline. From 1986 to 2013, A&B pumped an average of 71 mgd from the brackish water wells; during the 2008-to-2013 period, these wells delivered about 70 mgd of brackish groundwater to the lower-elevation fields. This was a suitable source of water for sugarcane during droughts because sugarcane can tolerate periodic use of water with higher salinity levels. However, please note that Section 2.1.4 of the Final EIS regarding the description of the brackish groundwater wells that serve the Central Maui Field Irrigation System has been revised to accurately reflect the number of wells that Mahi Pono has access to for the irrigation of its Central Maui agricultural fields, which is 10 wells, as shown on page 2-25. The pumping capacity of the 10 brackish water wells available to Mahi Pono for use to irrigate its Central Maui agricultural lands is 156 mgd of brackish water.

Moreover, with respect to the Mahi Pono farm plan, because of salinity and the salt tolerance of diversified agricultural crops, which are less salt-tolerant than sugarcane, the use of brackish water on the lower fields is assumed to be limited to about 30% of the total water applied. In total, combining the upper and lower fields, the overall water split across all 30,000 acres would be approximately 80% surface water and 20% brackish groundwater water as the upper fields cannot be irrigated with brackish water. If insufficient water is available from the EMI Aqueduct System, then crop farming will have to be reduced no matter how much brackish water was available. Thus, we disagree with your statement that the brackish wells are part of a ‘reliable system’ as its utility and availability are tied to the amount of water available from the East Maui streams via the EMI Aqueduct System. The sustainable yield of the underlying aquifers as well as the quality of water are uncertain in light of the fact that significantly less recharge from imported East Maui surface waters will occur. Historically, the sustainable pumping capacity of these wells was highly dependent on irrigation recharge and the positive benefits to the underlying aquifers.

With respect to your comment encouraging desalinization of the existing Mahi Pono brackish water wells, please note that Chapter 3 of the Final EIS has been updated to include Section 3.1.1.4 which analyzes the option of desalinization and its environmental impacts, as shown on pages 3-14 to 3-19 of the Final EIS. As shown in the discussion in pages 3-14 to 3-19 of the Final EIS, desalinization of the existing Mahi Pono brackish water wells would yield approximately half the amount of brackish water, about 50 mgd. Furthermore, desalinization is not a cheaper option than diverting surface water resources and has other negative environmental impacts such as impacts to regional hydrologic, geologic, and biological resources. Hydrological resources would be assumed to experience the greatest impacts due to withdrawals and injections greatly influencing the regional water sources. Highly in-depth hydrogeological study will need to be done within the area of the proposed injection wells due to the fact that the injection wells must discharge the brine into a confined aquifer/space at least ¼ mile under any drinking water

aquifers so as not to contaminate any other freshwater sources. Due to the increased restrictions and preventative measures that are required under Class I injection wells (Class I is the type of injection well associated with industrial waste), there would not be a need for a “no-farming zone” since, under construction regulations for a Class I well, extreme preventative measures are required in order to prevent harmful water from infiltrating drinking water sources in the event of a spill/leakage. Additionally, the harmful discharge from the desalination plant will be pumped extremely deep underground, minimizing any effect to surrounding soils. Nevertheless, a buffer area between the injection wells and the agricultural lands would be recommended. Please also note that for operational purposes, the tunnels and diversions of the EMI Aqueduct System are not in need of significant repair as you state.

Comment 4: *Besides that, Mahi Pono said early on when they first came that they had sufficient water for their farmlands and don't need any more from East Maui and was prepared to decommission the diversions. Please explain why all of a sudden Mahi Pono needs water from us. I say us because we are the public and we have a right to the water. Why the sudden change? We are also aware that A&B is promised \$62,000,000., if they can keep the water diversions for future use. Very confusing, to say the least, or not. There is definitely a huge motive if that is the case.*

Response 4: Our understanding is that Mahi Pono has never stated that it had sufficient water for its farmlands without the East Maui water, nor has Mahi Pono stated that it would decommission the diversions in East Maui. As explained in Section 2.1 of the Draft EIS:

The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion...It will also allow the continued provision of water to approximately 30,000 acres of agricultural lands (formerly in sugarcane) in Central Maui.

The Water Lease will allow Mahi Pono to implement its farm plan to full buildout. As mentioned in Response #3, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

Regarding your comment that A&B is promised \$62,000,000 if the water diversions are kept for future use, you did not provide a source for your statement, but in any event it is not correct. To

the contrary, Mahi Pono would receive a \$62,000,000 rebate reflecting a reduction in land value should the land that it purchased from A&B not prove to be agriculturally productive as presumed due to the lack of sufficient water. Without the Water Lease, it is estimated that the maximum amount of surface water that would be available to be collected by the EMI Aqueduct System is approximately 30.76 mgd as stated in Section 3.3 of the Draft EIS versus approximately 92.32 mgd under the Proposed Action.

Comment 5: *Please also address my following concerns taken out of the D-Eis book. I hope you understand that most of us did not have enough time to read the whole 2,700 plus page booklet and we need more time to correctly address the draft eis and ask that you extend the time for "comment period." The 3 (three) books just arrived in Hana a few weeks ago. My comments are mostly or all about East Maui area/waters.*

Response 5: Regarding your comment about the Draft EIS being received by Hāna Public Library after publication, we originally sent one hard copy to the Wailuku Public Library as that is the most centralized location between East Maui, Upcountry Maui, and Central Maui. However, at the request of a County councilmember, two more hard copies were sent out; one to the Hāna Public Library and one to Maui County Council Office. Moreover, please note that pursuant to HAR § 11-200-21 a distribution list of reviewers needed to be approved by the State of Hawai'i Office of Environmental Quality Control (OEQC), which notified the reviewers of the availability of the Draft EIS. The distribution list included Federal, State, and County agencies, list of depositories, as well as organizations and individuals (who provided addresses) that participated in the early consultation and EIS Preparation Notice (EISPN) scoping meetings and commented on the EISPN. This list was provided as Table 9-2 in the Draft EIS. Hence, the Draft EIS was distributed in compliance with the required State process.

In response to your comment regarding extending the Draft EIS comment period, please see Response #1 above.

Comment 6: *2.1 Proposed Action – Understood the streams that were restored will still be restored, but we are concerned about the overage and about other streams not currently being diverted. What are your plans for that?*

Response 6: Your comments about "overage" and "other streams not currently being diverted" are unclear. As explained throughout the EIS, the Water Lease under the Proposed Action would be required to comply with the IIFS set for the streams in the License Area, including the IIFS set forth under the CWRM D&O. That includes adhering to the requirements to stop all diversions on the streams ordered for full restoration under the CWRM D&O. As discussed in Section 2.1 of the Draft EIS:

The CWRM D&O establishes a quantity of water that must remain in each stream at specified locations. The CWRM D&O ordered full stream restoration for 10 streams and partial flow restoration on 12 additional streams (Please refer to Section 1.3.4). Therefore, the maximum amount of water that can be awarded through the Water Lease is what is available for diversion after the CWRM D&O is implemented. This is the premise of the Proposed Action.

Hence, the Proposed Action will need to comply with the IIFS for all streams in the License Area before any surface water diversions can occur. For the streams within the License Area that were not subject to the CWRM D&O, it is assumed that they would continue to be diverted as they were in the past. However, as mentioned in Response #3, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

Comment 7: *I also didn't see a watershed plan as mentioned in 2.1. What is the plan?*

Response 7: As discussed in Section 2.1 of the Draft EIS, Hawai'i Revised Statutes (HRS) § 171-58(e) requires a watershed management plan in connection with a water lease. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the Board of Land and Natural Resources (BLNR) approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses identifying priority outcomes essential to maintain or restore biological integrity of the watershed. The goals of watershed management plans are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

Comment 8: *2.1.1 Department of Hawaiian Home Lands – Did you know that Hana and Keanae are planning on opening up their DHHL lands soon? What are your plans for that? Hana and Keanae have many young families needing housing and have moved away or live with their Parents or Grandparents, along with their Parents and kids.*

Response 8: The Draft EIS acknowledged the Department of Hawaiian Home Lands' (DHHL) plans in Ke'anae and the fact that DHHL has the right to seek a reservation of water. Section 2.1.1 of the Draft EIS states that:

The DHHL has previously secured from the CWRM the following reservations of groundwater:

- 3,000 gpd for Ke'anae-Wailuānui
- 813,000 gpd for Kēōkea-Waiohuli
- 1,734,000 gpd for Pulehunui

Non-potable water needs for the DHHL's lands in Ke'anae-Wailuānui amount to 6,868,000 gpd. Although the DHHL holds a reservation for 3,000 gpd of potable water for this area for development over the next 20 years, another 7,000 gpd of potable water may be required for longer-term development. Thus, a potential reservation for this area amounts to 6,875,000 gpd. Ke'anae is fed by Pi'ina'au and Palauhulu Streams; Wailuānui is fed by Wailuānui and Waiokomilo Streams. These four streams are, or will soon be, fully restored. The proposed Water Lease, therefore, would not be affected by such reservations of water for the DHHL.

DHHL lands in Hāna should not be impacted by the proposed Water Lease as the EMI Aqueduct System does not divert streams in the Hāna area nor is it able to service Hāna. Makapipi Stream marks the furthestmost eastern stream diverted by the EMI Aqueduct System and the furthestmost eastern end of the EMI Aqueduct System.

Specific information regarding the DHHL future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of

the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd as shown on pages 2-4 to 2-7. As explained in pages 2-4 to 2-7 of the Final EIS, the DHHL water reservation process involves several steps before a reservation amount is formally identified. The first step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following adoption of the Beneficiary Consultation Report and an authorization to the Chairman to seek a reservation of water by CWRM, CWRM could act on a reservation request related to a proposed lease. As explained in Section 2.1.1 of the Draft EIS, DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B/EMI, Mahi Pono, the DLNR's Land Division, and DHHL staff and consultants. The results of the Beneficiary Consultation were presented to the HHC on May 30, 2019, as agenda item G-2. The motion passed by the HHC to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation request was approved by the HHC related to the EMI Aqueduct System for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

Section 2.1.1 of the Draft EIS stated, with respect to the DHHL reservation, that "*Until that reservation is physically claimed, however, it will be available for use by the lessee.*" That statement has been clarified in the Final EIS as shown on pages 2-4 to 2-7, as it is uncertain whether the DHHL reservation amount would be available to the lessee until such time as it is needed by DHHL. Such temporary uses of the DHHL reservation water are not addressed under HRS § 171-58. We further acknowledge that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessor and the DHHL would be necessary to allow any temporary use of water reserved for DHHL.

Comment 9: 3 – 3.4 *Just convenience words to be able to say we considered other alternatives, but it won't work. Why won't other sources of water work? We hear that A&B has millions of gallons stored away, use it. Dams should be removed and if still awarded, downscaled to a minimum. The water in the pictures from book 2 clearly illustrate that the water in those dams*

are stagnant, showing that holding it back is not helping the river, its food supply and the seafood where the river enters the ocean.

Response 9: Regarding alternatives considered in the EIS, HAR § 11-200-17(f) states:

The draft EIS shall describe ...alternatives which could attain the objectives of the proposed action, regardless of cost, in sufficient detail to explain why they were rejected. The section shall include a rigorous exploration and objective evaluation of the environmental impacts of all such alternative actions...

As discussed in Section 1.2 of the Draft EIS:

In general, the objectives of the issuance of the Proposed Action (Water Lease) are:

- *Preserve and maintain the EMI Aqueduct System, including its access roads*
- *Continue to meet domestic and agricultural water demands in Upcountry Maui*
- *Continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses)*
- *Continue to serve community water demands in Nāhiku*

The Draft EIS in Chapter 3 included a rigorous evaluation of potential alternative sources or methods of acquiring water that could potentially replace or supplement surface waters from East Maui to meet the stated objectives of the Proposed Action. Specifically, Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that had been raised in scoping, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were well-discussed, but ultimately not assessed to the same degree as (a) through (d). Additionally, Chapter 3 acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible for the reasons discussed in Chapter 3. Moreover, based on comments received on the Draft EIS, the alternate/supplemental water alternatives analysis in Chapter 3 has been further expanded within the spectrum of alternatives presented in the Draft EIS. See pages 3-2 to 3-19 of the Final EIS.

Your comment alleging A&B has "millions of gallons stored away" lacks specificity and is therefore unclear and lacks relevance to the EIS. We assume you are again referring to the amount you referenced in Comment #3 (125,000,000 gallons) and we direct you to Response #3. Furthermore, the Draft EIS considered the Added Storage Alternative as described in Section 3.1.1.3 of the EIS. Please note, however, that while storage allows for the opportunity to supplement water from reservoirs into the ditches during low flow or low rainfall periods, storage is not a replacement water source. See pages 3-11 to 3-14 of the Final EIS.

Regarding your comment recommending the removal or downsizing of dams, most of them have not had water diverted into them since the closure of sugar in 2016. Even historically, the reservoirs are not full for a majority of the year. Furthermore, the reservoirs within the Central Maui agricultural fields are used more to transport and distribute water among the fields and not so much for storage purposes. Accordingly, there will be minimal benefit to the streams from removing or downsizing the dams since only a small amount of water is being routed to the dams at present and historically.

We cannot determine what pictures within "book 2" you are referring to. Volume 2 of the Draft EIS contains technical studies provided as Appendices A through I, and therefore contains numerous figures and photographs. However, in response to your comment about water being stagnant and not helping the river, food supply, or seafood, Section 4.2.1 generally recognizes that the impounding of water can create habitats for mosquito species, as well as negative impacts on native stream species reducing available habitat.

Comment 10: *3.4.5 Coastal Waters – Hana is living proof that since the 10 streams were released, more fish has been available to eat. Where there used to be only a few times a year when the community have been able to enjoy "hukilau" catching and taking off akule from the nets, feeding families abundantly. The past couple years, there has been many "hukilau" and families are able to take home 10-15 fish per person helping remove the fish from the nets. You can ask most lineal descendants this question. How did you do your studies that the returning waters has done more harm than good?*

Response 10: It is not clear what you mean by 10 streams released in Hāna. None of the streams to be diverted under the Proposed Action or historically diverted by the EMI Aqueduct System are within the Hāna region.

Your comment that akule have returned to the Hāna area since some East Maui streams were restored is acknowledged, but a causal relationship is unlikely since, as stated above, none of the restored streams are within the Hāna region. A stream and ocean water chemistry assessment

was conducted by Sea Engineering, Inc. (SE) and Marine Research Consultants, Inc. (MRC) in 2018 (See Appendix B). The study concluded that the effects of stream water on marine waters is minor in these habitats, due to the physical processes associated with a relatively small input of stream water to the vastly larger ocean environment with continual wave energy and intense mixing. Thus, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species.

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species (‘O‘opu naniha (*Stenogobius hawaiiensis*), ‘O‘opu akupa (*Eleotris sandvicensis*) and ‘Ōpae ‘oeha‘a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi‘ina‘au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa‘akea will have connectivity flow restoration, while ‘O‘opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi‘ina‘au Stream) have estuarine reaches, four of which were noted by Trutta’s HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR’s methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83.

Regarding your comment that the studies concluded that returning waters has done more harm than good, please note that there are no statements within any of the technical studies or the Draft EIS asserting that *“that the returning waters has done more harm than good”*. The collected data presented in EIS Appendix B (East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry) and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

Comment 11: *3.4.11 Social Characteristics – Which residents exactly said (because it sounds like the whole East Maui did) said they were concerned about the physical condition of the EMI Aqueduct system & hope that Mahi Pono's ownership would lead to improved stewardship of the system? Most people I know have heard Mahi Pono's wishes to decommission the system.*

Response 11: The Social Impact Assessment (SIA) provided as EIS Appendix G and summarized in Section 4.7.2 of the Draft EIS, obtained input from several community members, many of whom have direct and long-term experience with the streams in East Maui. As discussed in Section 4 of the SIA, seven focus groups were convened in November 2018. Participants in these sessions included residents, farmers and ranchers, and people who are active in environment and sustainability efforts. These participants lived in Ke'anae, Wailuānuī, Huelo, Ha'ikū, Kula, Makawao and Pukalani. Specifically, Section 4.2.4.5 of the SIA included in the Final EIS discusses the community concerns related the EMI Aqueduct System conditions brought up in the November 2018 focus group meetings. Participants noted that the EMI Aqueduct System is in poor condition and loses substantial water, which increases the amount of water needed for agricultural operations. It should be noted, however, that the EMI Aqueduct System is extremely efficient and does not lose water. For clarification, it is within the Central Maui Field Irrigation System that there are some irrigation system losses. Those losses have been

estimated to be approximately 22.7% during the time of sugar cultivation.

Relating to the physical condition of the EMI Aqueduct System, EMI has established a number of standard operating procedures to address the clean-up of trash and debris within the License Area. Besides recognizing unnecessary debris in the field during routine maintenance tasks, EMI has conducted specific identification and removal operations of debris that has been observed from previous field work. EMI also has in place a practice of removing any equipment and excess materials it brings into the License Area to perform work on the EMI Aqueduct System as soon as the job(s) is completed.

Regarding your comment about decommissioning the system, EMI, the owner of the EMI Aqueduct System, has no intention of decommissioning the EMI Aqueduct System, which serves several important purposes as discussed in EIS Chapter 2. Water delivered through the EMI Aqueduct System will be key to vibrant diversified agriculture in Central Maui and a healthy Upcountry Maui community.

Comment 12: *3.4.12 & 3.4.13 – What is meant by No significant differences to the economic and fiscal impacts are expected within East Maui? And No significant differences to the agricultural activities and related economic benefits are expected within East Maui? There are many acreages available to grow kalo or leko. The water should be diverted to Hana where the weather is more suitable for farming and not too much water is needed and can return to the ocean, as nature planned.*

Response 12: Regarding your question related to the economic and fiscal impacts of East Maui relating to the Proposed Action, the impacts are not considered to be significant as the region is largely rural and there is little to no commercial development within the East Maui communities. Any economic and fiscal impacts are directly tied to taro farming and other agriculture. Please note that the discussion in Section 4.7.3.2 of the Final EIS has been updated as shown on pages 4-277 to 4-279 based on the updated work conducted for Appendix I.

For the analysis presented in Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts (Updated December 2020) of the Final EIS, taro farms in East Maui (from Honopou to Nāhiku), including use of water from streams not subject to the CWRM D&O, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. This acreage is assumed for the Proposed

Action and all associated alternatives since nearly all potential new taro cultivation is assumed to draw water from fully restored taro streams which will have the same flows under all alternatives. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in pages 4-288 to 4-293. As discussed in Section 4.7.4 of the EIS, at its peak, taro production in Hawai‘i was thought to cover approximately 20,000 acres. By 1900, taro production Hawai‘i decreased to about 1,280 acres, and by 1966, only 400 acres were farmed. As of 2015, land in crops were estimated at about 340 acres. According to the Agricultural Land Use Maps (ALUM), the East Maui communities had about 105.5 gross acres in taro in 1980, including about 96.3 acres in Ke‘anae and Wailua, and 9.3 acres in Hūelo. By 2015, the acreage in taro had fallen to about 34.2 acres in taro, and only about 30 gross acres in taro by the end of 2017.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu‘u, Ka‘aiea, ‘O‘opuola, Puehu, Nāili‘ilihaele, Kailua, Hanahana, Hoalua, Waipi‘o, Mokupapa and Ho‘olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown in pages 1-19 to 1-23. The CWRM did, however, address and order in the Huelo portion of the License Area where these 12 streams are located: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration statuts); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamo Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe‘e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo‘i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Regarding your comment that water should be diverted to Hāna, please note that there is no diversion system in place to transport water from the License Area to Hāna. The ditches within the License Area stop at Makapipi Stream and do not extend to Hāna. Moreover, the Proposed Action does not include developing a new ditch system to deliver water to farms in Hāna as it would not achieve the goals and objectives of the Proposed Action as discussed in Section 1.2 of the EIS and Response #9 above.

Comment 13: *3.4.14 Recreational Resources – If the license area were reduced to make more of the State land open to the public that could potentially have a beneficial impact on the availability of recreational resources in East Maui. Are you serious? How would that be beneficial exactly? We have the worst record of native/endemic plants, birds disappearing and more invasive plants in recent years than ever. How did you come up with such an asinine statement?*

Response 13: We acknowledge that you think it is asinine to allow greater public access into the State-owned License Area. However, the Division of Forestry and Wildlife (DOFAW) of the Department of Land and Natural Resources has advocated for greater public access. A copy of DOFAW's comment letters dated February 20, 2016 and November 6, 2019 are included in Appendices M and N respectively. The proposed License Area as described in the Draft EIS is approximately 33,000 acres within the Ko'olau Forest Reserve and the Hanawā Natural Area Reserve (NAR). A new condition included in the 2020 and 2021 water revocable permits required the removal of the Hanawā NAR from the revocable permit area, and calls for A&B to continue discussions with DOFAW to identify additional forest reserve lands to be removed from the License Area. The Hanawā NAR consists of approximately 7,500 acres and is further discussed in Section 1.3.1 of the Final EIS as shown on page 1-2. It should be noted that no portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the revocable permit area will result in additional public access because the NAR rules restrict public access. However, this may not be true for other areas that DOFAW may want the BLNR to withdraw from the License Area going forward.

Section 3.2.2.2 of the Draft EIS discusses the “Modified Lease Area” alternative that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Moreover, impacts of the Modified Lease Area alternative are discussed in Section 3.4 of the EIS (Comparative Evaluation of Reasonable Alternatives) against different environmental resource categories. In summary, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation

by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access to areas that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown in pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust general discussion regarding impacts to the areas that would allow for more public access. The comparative analysis is provided in Section 3.4 and Table 3-2 has been added to the Final EIS as shown in pages 3-49 to 3-80.

From a recreational perspective and standpoint, should the License Area allow more public access, this could allow more recreational activities (e.g., hiking, hunting, etc.) to occur within the License Area resulting in a beneficial impact for recreational resources and users. However, your concerns about invasive species and flora and fauna impacts are acknowledged, and similar concerns were presented in the EIS based upon the analysis of the biological consultants who prepared studies for the EIS. As discussed in EIS Section 3.2.2.2 and further in Section 3.4, as shown on pages 3-21 to 3-24, allowing more public access into the License Area, could increase adverse environmental impacts through the introduction and spreading of invasive species and damage to historic resources.

Comment 14: *3.4.15 Visual Resources – Every single time we pass one of the dry or mostly dry (trickle) streams, us Kanaka Maoli feel like crying because it's not normal. How can you say the proposed action are not expected to have significant impact on the visual resources in the License area? Just the sight of no water and invasive trees and plants growing in them hurts. Every single time we drive past it, deep in our na'au because it's not normal. That plus the fact that we know that the wai food and kai food are not being fed, therefore not feeding the people. What makes you feel like this will not impact us?*

Response 14: As discussed throughout the Draft EIS, as well as Section 4.9 relating to Visual Resources, the EIS baseline for assessment must also consider the historical context, where visual impacts will be far less than the impacts than were present during the years of sugarcane

operations when vastly more water was diverted from East Maui as discussed in Response #2. Specifically, Section 4.9 of the Draft EIS states:

The Proposed Action is limited to the issuance of the Water Lease for the subject License Area, which would enable the lessee to continue operation of the EMI Aqueduct System that has been in operation for over a century. The Proposed Action continues the use of the system for the transport of surface water, and allows the lessee or its permittees, to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System. In general, the Proposed Action will maintain existing conditions, in compliance with the CWRM D&O and any reservations in favor of the DHHL. No significant impacts on visual resources in the region are anticipated because no new construction or land alteration is planned for the License Area. However, in the short-term, measuring from the current time, where diversions are lower due to the lack of agricultural activity in Central Maui, against the time when Mahi Pono's diversified agriculture needs begin to use the maximum amount of water permitted, there will be a decrease in stream flows and waterfalls that can be viewed along Hāna Highway. However, this expected decrease from the current baseline must be considered in a historical context as well: the impacts to such visual resources under the Proposed Action will be far less than the impacts over the years of sugarcane operations when vastly more water was diverted from East Maui than is planned under the Proposed Action.

Hence, under the Proposed Action, compared to past diversion rates, there is expected to be significantly more water within the East Maui streams. Thus, there is not expected to be a significant impact on visual resources. It is also noted in EIS Section 3.4.15 that views from Hāna Highway were formally recognized as significant from as early as the year 2000 (when President Clinton designated the Hāna Millennium Legacy Trail), when stream diversions were significantly greater than will be the case under the Proposed Action. However, please note that Section 4.9 of the Final EIS has been expanded to further discuss scenic vistas, cascading waterfalls, and stream flow as shown in pages 4-311 to 4-312.

Comment 15: *4. State owned land are crown lands that was given to his people by Kamehameha or kept for his families. The water is not to be taken and the public ignored. WE should come first. The water is for the public, not a corporation to make money?*

Response 15: The Proposed Action contemplates that the BLNR will exercise its statutory authority under HRS § 171-58(c) to issue a Water Lease for the uses described in the EIS. It is our understanding that there is no exception to BLNR's authority to enter in such leases where

the land in question was formerly held as Crown Lands by the Kingdom of Hawai‘i. We acknowledge that the Proposed Action, the issuance of a 30-year Water Lease by BLNR, requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai‘i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. Please note that Section 1.5 has been added to the Final EIS discusses the Public Trust Doctrine as it relates to the Proposed Action as shown in pages 1-25 to 1-27.

Moreover, as described in the EIS, the Proposed Action would supply water not only for diversified agriculture in Central Maui, but also continue the provision of water for certain historical and industrial uses in Central Maui and to the MDWS for use in Upcountry Maui and the Kula Agricultural Park, as well as allow for the continued delivery of water to the Nāhiku Community by MDWS, which draws water sourced directly from EMI owned land through the Nāhiku Tunnel.

Comment 16: *4.6 – Cultural Resource and Practices: If you had truly searched the Archives, Museums, UH Manoa, the mahele database and OHA, then you know many of the water rights were deeded to Hawaiians from the Great Mahele of King Kamehameha III. What did you find when you did your research re water rights? There is also no mention of the impacts this has to Hana. It has a very significant impact on Hana people too. Who did you find that King Kamehameha III gave the water rights in Koolau to?*

Response 16: We understand your reference to “water rights deeded to Hawaiians from the Great Mahele” and giving “water rights in Koolau” to be references to “appurtenant rights” as determined by the Hawai‘i Supreme Court to be the rights to the use of water “appurtenant” to and utilized by certain parcels of land at the time of their original conversion into fee simple land, when title was confirmed by Land Commission Award (LCA) and title conveyed by the issuance of a Royal Patent. *See Reppun v. Board of Water Supply*, 65 Hawai‘i 531, 551, 656 P. 2d 57, 71 (1982). These rights cannot be severed from the parcels to which they are “appurtenant.” *Id.*

The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior water licenses issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State*

in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights...as well as other statutorily or judicially recognized interests relating to the right to withdraw water. . . .” It is expected that the lessee under the Water Lease would be subject to similar requirements and would therefore not impair appurtenant water rights.

With regard to the East Maui streams in the License Area covered by the CWRM D&O, the uses of water by those who registered diversions claiming “appurtenant”, or “kuleana” rights were analyzed in detail separately with regard to each stream. In addition, the Cultural Impact Assessment (Appendix F to the Draft EIS) conducted for the proposed Water Lease, recites the history of the LCAs and attaches Tables 4, 5, 6 and 7 listing LCA’s in proximity to the entire License Area. It also summarizes the comments of those contacted regarding the potential impacts on their uses and practices in the proximity of the License Area. Please note that in response to comments received on the Draft EIS, the Cultural Impact Assessment (CIA) (Appendix F to the EIS) has been updated to reflect supplemental information obtained through additional outreach completed by Cultural Survey Hawai’i (CSH) to those who raised comments on the CIA. Section 4.6 of the Final EIS has been updated to include the additional information gathered in the CIA.

Regarding your comment asking about impacts to Hāna, no streams within Hāna are diverted by the EMI Aqueduct System as discussed in Responses #10 and #12 above.

Comment 17: *4.7.4 – Agricultural Economy: Shows no impacts. I think that future impacts to East Maui should also be calculated. Many more of the young generation are beginning to farm and enjoy taro farming, even Hana students and adults are beginning to plant kalo. How can you ask for a 30 year lease showing no impacts to the future of Hana or Keanae/Wailua? Young college grads are returning and realizing that “sustainability is the way to go.” Water is necessary for that to happen.*

Response 17: As discussed in Section 1.3.4 of the Draft EIS, the CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi’ina’au, Palauhulu, Waiokamilo, Wailuānui, ‘Ōhi’a/Waianu, Kualani/Hāmau,¹ and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the

¹ Although this stream continues to be referred to as “Kualani”, it is in fact the easternmost tributary of Waiokamilo Stream and now known as “East Waiokamilo Stream.” Kualani Stream is below the EMI Aqueduct System and has never been diverted (CWRM D&O, FOF 62,184,186).

CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

Moreover, as discussed in Response #12 above, taro farms in East Maui (from Honopou to Nāhiku), including use of water from streams not subject to the CWRM D&O, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā, and would rely primarily on the taro streams ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. This acreage is assumed for the Proposed Action and all associated alternatives since nearly all potential new taro cultivation is assumed to draw water from fully restored taro streams which will have the same flows under all alternatives. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch as the CWRM D&O "will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ..." (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in the included pages 4-288 to 4-293.

Comment 18: *4.10 – Impacts and Mitigation Measures: If the current owner of the EMI diversions, ditches and tunnels (A&B) are anything like the past owners of the diversions, ditches and tunnels (A&B), the record of maintenance on the current and past system is very inadequate. Much water leaks out of the ditches & tunnels and the state of disrepair is embarrassing. How can you say you will maintain and repair the system? We drive past it almost every week or two and can see with our own eyes the state of disrepair it's in. A serious plan for this would be necessary, but only with a 5 year lease, if at all.*

Response 18: We disagree with your assertion that the EMI Aqueduct System is in disrepair. EMI staff continually performs maintenance activities along the EMI Aqueduct System to ensure system upkeep and will continue to do so as a part of the Proposed Action. Moreover, as discussed in Response #11 above, EMI has established standard operating procedures to address the clean-up of trash and debris during the course of its activities. Please note that the EMI

Aqueduct System efficiently delivers water – pursuant to a study conducted by the United States Geological Survey (USGS), the EMI Aqueduct System likely does not lose water on a net basis – to the Central Maui Field Irrigation System on the Mahi Pono farm in the Central Maui agricultural fields. The official location of this delivery point is at the western side of Māliko Gulch.

In addition to the EMI staff's performance of continuous maintenance activities on the EMI Aqueduct System, please note that EMI staff is also working on projects related to diversion removals and improvements as mandated by the CWRM D&O. These diversion structure removal and modification projects are not related to meeting IIFS stream flow requirements – which are already being met – or increasing the efficiency of the system (which again, is already very efficient per the USGS study that is described in Section 2.1.2 of the EIS).

Comment 19: *4.12 – Hazardous Materials: Hazardous/toxic waste is defined as based on their ignitability, corrosiveness, reactivity and toxicity. The potential impacts hazardous materials and waste have on human health and the environment are largely dependent upon their types, quantities, toxicities and management practices.*

East Maui – EMI Personnel use federally regulated herbicides to maintain the trails and access roads used for the maintenance of the EMI Aqueduct system. The proposed system will maintain existing maintenance protocols. No significant impacts on or from hazardous materials in the region are anticipated as the proposed action does not involve any of the use of hazardous materials, except for the continued use of herbicides in compliance with state and federal regulations in connection with the continued maintenance of the EMI Aqueduct system.

It is common knowledge that round up is/was the choice herbicide used by EMI in the past. If you have been paying any attention, Monsanto and other Big Ag Corporations are being sued by thousands of people who have suffered or knows someone who's suffered with cancer especially, but other diseases like asthma, allergies and eczema are other diseases caused by this one herbicide/pesticide. Saying that it's FDA or EPA approved doesn't help the many men who have worked and died working for EMI. No warnings were given of its potential danger. This is still being sprayed today. In the past recent months, twice I have taken pictures of the areas around the streams and going up the EMI roads to the upper regions of diversions/dams, etc. I will try and include them with this letter/email, but if my phone doesn't allow it, I will send it tomorrow. Please explain how you will protect future employees from the hazardous use of round up or any chemicals that are dangerous to humans. Also, can you provide a report of how many men have passed after many years of using these chemicals could help any future or current employees know how dangerous working these fields are or can be working for EMI. We were personal

friends with at least two of the young men who passed away from cancer after working for EMI for many years, but hear there were more.

Response 19: We did not receive any pictures from you associated with this comment letter. Regarding your comment about Round-Up usage, EMI, has committed to discontinuing its use of Round-Up. This commitment has been in effect since January 2020, and this is now documented in Section 4.12 of the Final EIS. See pages 4-317 of the Final EIS for East Maui relating to EMI operations and 4-318 of the Final EIS for Central Maui relating to Mahi Pono operations. It is also noted that since January 2020 Mahi Pono also committed to discontinuing use of Round-Up, as well as other glyphosate-based herbicides.

With respect to other pesticides, as discussed in EIS Section 4.12 all herbicide and pesticide usage will be used in compliance with their labels and with all State and Federal regulations in connection with the continued maintenance of the EMI Aqueduct System and the agricultural fields in Central Maui.

Your comment alleging deaths of EMI employees due to pesticide exposure lacks specificity. Research into such matters is outside the scope of the EIS, which is to assess the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are discussed throughout Chapter 4 of the EIS. Nevertheless, EMI has confirmed it is not aware of any former employees who have passed way as a direct result of the use of Round-Up in the maintenance of the EMI Aqueduct System.

Comment 20: *We are not against farming to feed Maui nui, other islands then exporting away from there on out. We are against the horrible history of A&B & EMI and the damage done to East Maui. There is no reason why water should be diverted when there is no true farm plan, no plan to keep the food here and hardly any plants in the ground. We should never agree to a lease for 30 years either. We hope you take this letter into consideration and do some serious homework before even reapplying or making the final EIS.*

Response 20: We acknowledge your comments. The Mahi Pono farm plan was included in the Draft EIS and included details on what types of crops are expected to be planted and the estimated acreage and water needed for the farm plan. Section 2.1.4 of the Draft EIS describes the Mahi Pono farm plan and estimated water usage. That discussion has been updated with

some clarifications and to address rounding errors. Below please see the updated language in page 2-29 of the Final EIS.

However, please note that Mahi Pono's farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation. All of these things must be considered when developing an evolving and feasible diversified agricultural plan for Central Maui.

In response to your comment about keeping the food produced through the farm plan here, as noted in the EIS, at full implementation of the Mahi Pono farm plan, it is estimated that 65% of the farming revenue will be derived from sales within Hawai'i and 35% will come from exports. As noted in Section 4.7.4 of the EIS, the Hawai'i market is too small to use all of the farm products expected to be produced on the Central Maui agricultural fields, so some export is necessary.

Regarding your comment about never agreeing to a 30-year lease, please note that an alternative duration for the subject Water Lease is discussed and evaluated within Section 3.2.2.1 of the Draft EIS and throughout Section 3.4 of the Draft EIS. The Applicant requested that the BLNR consider the issuance of a long-term (30-year) water lease. However, it is acknowledged that the BLNR has the authority to offer a water lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. As discussed in Section 3.2.2.1 of the Draft EIS:

Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

Moreover, as discussed in Section 4 of Appendix I of the Draft EIS (East Maui Water Lease: Agricultural and Related Economic Impacts), and as summarized in EIS Section 2.1.5, a long-term Water Lease is important for the viability of diversified agriculture in Central Maui:

An estimated 10 years will be required for Mahi Pono and lessees to remove volunteer (i.e., rogue) sugarcane and weeds from 30,000 acres, amend soils, install

field improvements (e.g., irrigation systems, fencing, etc.), build warehouses and other structures), and plant crops.”

In addition, about 5 years or more will be required for avocado, citrus and coffee trees to reach full maturity, and 12 years or more for macadamia nuts. After reaching maturity, macadamia nuts trees will provide yields for 35 years or more, citrus and coffee for 50 years or more, and avocado for over 100 years.

In order for Mahi Pono and other farmers to justify the very substantial investment in a 30,000-acre farm, a long-term water lease will be required. A short-term lease would derail development of the Mahi Pono Farm Plan—or any long term agricultural use of the Central Maui fields including any plan to convert the Central Maui lands to diversified agriculture—because of the risk of not being able to farm for a long enough period to recover their planned investment.

Consequently, a shorter lease term would not be feasible nor conducive to achieving the objectives of the Proposed Action as set forth in Section 1.2 of the Draft EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.² Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

² Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: A&B/Mahi Pono's temporary water permits

We are disappointed that the Board of Land & Natural Resources approved A&B/Mahi Pono's four revocable permits to continue diverting water from East Maui's streams. This is not right or fair.

The stream diversions have harmed the people of East Maui community who rely on this water.

The [Draft Environmental Impact Statement](#) does not cover:

- how to restore the 13 streams in the Honopou to Kailua area and its communities affected. The water diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.
- the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams are breeding grounds for mosquitoes that carry Dengue fever virus to East Maui residents.

Who will take responsibility and the liability for this damage?

Please reconsider this decision.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Gach:

Thank you for comments dated October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *We are disappointed that the Board of Land & Natural Resources approved A&B/Mahi Pono’s four revocable permits to continue diverting water from East Maui’s streams. This is not right or fair.*

Response 1: We acknowledge your comments with regards to the revocable permits that the BLNR have approved. However, please note that it is not within scope to assess the decision regarding the most recent revocable permits. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 2: *The stream diversions have harmed the people of East Maui community who rely on this water.*

The [Draft Environmental Impact Statement](#) does not cover:

— *how to restore the 13 streams in the Honopou to Kailua area and its communities affected. The water diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 2: With regards to your comment that the stream diversions have harmed the people of the East Maui community, please note that the Draft EIS contains a robust discussion about social and community impacts based upon work done by Earthplan as documented in the SIA (EIS Appendix G) and summarized in Section 4.7.2 of the EIS.

You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-61 to 4-67.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 3: — *the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams are breeding grounds for mosquitoes that carry Dengue fever virus to East Maui residents.*

Response 3: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-61.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets

will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Comment 4: *Who will take responsibility and the liability for this damage?*

Please reconsider this decision.

Response 4: Your comment about who will take responsibility and liability for this damage is unclear therefore we cannot provide you with a specific response.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Serious concerns about Alexander and Baldwin's Draft Environmental Impact Statement

Dear Mr. Matsukawa,

I am a past resident of Maui (Haiku, Paia and Makawao) who pays close attention to water issues on the island and is tentatively planning a return within two years.

I ask you to please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. With other members of the Sierra Club and concerned citizens of Maui, I believe enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. For the good of the whole island, this is the only sensible approach.

My first objection concerns the impact to native stream life habitat and local residents. Shouldn't this be a number one priority? The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where many people live, farm, and gather. It says only that it is estimated that all of the water will be diverted from the streams 60% of the time! Estimates say the diversions will decimate 85% of native stream life habitat and impact thousands of local residents. This is shameful: The land and its people should be the first considerations, it seems to me.

A second objection is that the DEIS merely assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition." This avoids addressing the far healthier and holistic option of how it would benefit East Maui ecosystems and East Maui communities to have NO diverted streams. I simply cannot understand the rationale unless profit for A & B is the primary consideration. If so, it seems terribly selfish and short-sighted.

A third objection to the DEIS is the lack of an in-depth review of and support for shorter term lease options of less than 30 years. Who knows what uncertainties of future rainfall and water supplies lie ahead during these days of climate change? How on earth is the current long-term lease option a prudent one?

And where is a comprehensive analysis of the threat and damage the diversions have caused to native aquatic species?

Finally, the DEIS should discuss reasonable options for more PUBLIC hiking access to these PUBLIC lands in the proposed lease area without every hiker needed to get permission from EMI.

Thank you for this opportunity to submit comments on this Draft EIS. Please give serious consideration to the aforementioned omissions and do a better job of stewardship for the good of Maui.

Sincerely,
Michele Halligan

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Halligan:

Thank you for comments dated October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am a past resident of Maui (Haiku, Paia and Makawao) who pays close attention to water issues on the island and is tentatively planning a return within two years.*

I ask you to please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. With other members of the Sierra Club and concerned citizens of Maui, I believe enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. For the good of the whole island, this is the only sensible approach.

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring

the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the

noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *My first objection concerns the impact to native stream life habitat and local residents. Shouldn't this be a number one priority? The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where many people live, farm, and gather. It says only that it is estimated that all of the water will be diverted from the streams 60% of the time! Estimates say the diversions will decimate 85% of native stream life habitat and impact thousands of local residents. This is shameful: The land and its people should be the first considerations, it seems to me.*

Response 2: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the

License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided in pages 4-61 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Regarding impacts to local residents, the socio-economic impacts of the Proposed Action are addressed at length in Section 4.7 of the Draft EIS, and in further detail in Appendices G through I (Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report). Draft EIS Section 4.7 has subsections addressing impacts to populations and impacts (Section 4.7.1), impacts to social characteristics (Section 4.7.2), impacts to the economy and other fiscal considerations (4.7.3), and impacts to the agricultural economy. (4.7.4). The potential socio-economic impacts of the alternatives to the Proposed Action considered by the Draft EIS are analyzed in Section 3.4.11 (Social Characteristics), 3.4.12 (Economic and Fiscal Resources), and 3.4.13 (Agricultural and Related Economic Resources).

The Draft EIS thoroughly addressed cumulative socio-economic impacts in Section 4.17. That discussion has been further supplemented by updates in the Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report as shown on pages 4-331 to 4-336.

Comment 3: *A second objection is that the DEIS merely assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition.” This avoids addressing the far healthier and holistic option of how it would benefit East Maui ecosystems and East Maui communities to have NO diverted streams. I simply cannot understand the rationale unless profit for A & B is the primary consideration. If so, it seems terribly selfish and short-sighted.*

Response 3: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low

flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in Section 3.5 the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 4: *A third objection to the DEIS is the lack of an in-depth review of and support for shorter term lease options of less than 30 years. Who knows what uncertainties of future rainfall and water supplies lie ahead during these days of climate change? How on earth is the current long-term lease option a prudent one?*

Response 4: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the

lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80 of the Final EIS, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 5: *And where is a comprehensive analysis of the threat and damage the diversions have caused to native aquatic species?*

Response 5: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented

are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 6: *Finally, the DEIS should discuss reasonable options for more PUBLIC hiking access to these PUBLIC lands in the proposed lease area without every hiker needed to get permission from EMI.*

Response 6: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 of the Final EIS has been revised as shown in pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown in pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the

Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 7: *Thank you for this opportunity to submit comments on this Draft EIS. Please give serious consideration to the aforementioned omissions and do a better job of stewardship for the good of Maui.*

Response 7: We acknowledge your comments and provided you with detailed responses to your comments above. With regards to stewardship, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Mahi Pono proposed water lease

Please accept my comments on the draft EIS for the proposed Water Lease for the Nahiku, Ka'anae, Homomano & Hue'a License areas.

I am very concerned about this proposed lease of the public water because I am a resident that wants our open lands and streams restored back to their natural state where locals can, once again, bring back cultural traditions. Those streams in East Maui need - and deserve - to flow again, allowing for the fish and wildlife that once survived, to thrive again. To also allow farming practices, that have been lost or limited, to grow again. And I fear that the ocean water quality and wildlife will continue to deteriorate if we don't do something to care for it. I have spoken with locals in the areas where the streams were reopened who confirmed that fish and animals - the ecosystem - was restored. And where the natural runoff into the ocean helped revitalize the ocean habitat, allowing fisheries to be replenished.

So much of this island is being lost, little by little, to development and is il-planned. As a lover of Maui and it's natural resources. Please do the right thing and help support our natural beauty and ecosystem by not granting a 30 year license that will allow for continued degradation of Maui.

Sincerely,
Mike Ottman

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Ottman:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments on the draft EIS for the proposed Water Lease for the Nahiku, Ka'anae, Homomano & Hue'a License areas.*

I am very concerned about this proposed lease of the public water because I am a resident that wants our open lands and streams restored back to their natural state where locals can, once again, bring back cultural traditions.

Response 1: We acknowledge your comments and note that you are in opposition to the Proposed Action as you want to restore the streams back to their natural state. Please note that this has not existed for over a century. Please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts and used natural stream flow as a condition to measure impacts against. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the

number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown in pages 4-61 to 4-62. However, please note that this scenario is not expected to occur, even if the proposed Water Lease is not issued (the No Action alternative). The No Action alternative assessed in Section 3.3 EIS assumes that if no Water Lease were issued, the EMI Aqueduct System could continue to divert approximately 30% of the water available from the Collection Area, plus approximately 4.37 mgd from the privately owned lands between Honopou Stream and Māliko Gulch. That is because the rights under the 1938 Agreement are independent of the Proposed Action under consideration in this EIS. Moreover, a table of the comparative benefits and impacts has been added to summarize all the benefits and impacts from the Proposed Action and reasonable alternatives as shown in pages 3-49 to 3-80 of the Final EIS.

With regards to cultural traditions, Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau),

East Wailuāiki, West Wailuāiki, Pua‘aka‘a Tributary, and Waia‘aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo‘i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe‘e, Puohokamoa, Ha‘ipua‘ena, Punala‘u (Kōlea and Ulunui Tributaries), Honomanū, Nua‘ailua, Pi‘ina‘au, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili‘ula, Pua‘aka‘a, Pa‘akea, Waia‘aka, Kapā‘ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, enclosed as pages 4-239 to 4-252. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training,

inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all constitutionally protected traditional and customary rights.

Comment 2: *Those streams in East Maui need - and deserve - to flow again, allowing for the fish and wildlife that once survived, to thrive again.*

Response 2: We acknowledge your comments. As noted in the above excerpt regarding the HSHEP model and the updated text in pages 4-61 to 4-62 of the Final EIS present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU),

as defined by the HSheP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See pages 4-56 to 4-67 of the Final EIS.

Comment 3: *To also allow farming practices, that have been lost or limited, to grow again. And I fear that the ocean water quality and wildlife will continue to deteriorate if we don't do something to care for it.*

Response 3: Regarding your comment about farming practices that have been lost or limited, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for taro were identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu‘u, Ka‘aiea, ‘O‘opuola, Puehu, Nāili‘ilihaele, Kailua, Hanahana, Hoalua, Waipi‘o, Mokupapa and Ho‘olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on pages 1-19 to 1-23. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration status); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe‘e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo‘i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in the included pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro

farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

With regard to your comment about ocean water quality and wildlife, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species (‘O‘opu naniha (*Stenogobius hawaiiensis*), ‘O‘opu akupa (*Eleotris sandvicensis*) and ‘Ōpae ‘oeha‘a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi‘ina‘au, and Honomanū) are the most likely to have estuarine reaches and all three

of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in shown on the pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on the pages 4-78 to 4-83 of the Final EIS.

Comment 4: *I have spoken with locals in the areas where the streams were reopened who confirmed that fish and animals - the ecosystem - was restored. And where the natural runoff into the ocean helped revitalize the ocean habitat, allowing fisheries to be replenished.*

Response 4: Regarding your comment that increased flow since the cessation of sugarcane operations in Central Maui has resulted in increased water flow and stream life is acknowledged. Please note that many people at the EISPN public scoping meetings on February 22nd and 23rd, 2017 testified noting positive impacts seen from increased stream flow resulting from the

cessation of sugar operations, please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See page 4-168 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted. This is expected as it was discussed in Section 4.2.1 of the Draft EIS that the Proposed Action would increase the number of HU as compared to sugarcane operations. Please note that as of October 2020, an average of 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System. Hence it can be assumed that current water diversion rates from the License Area are comparable to the amount that would be diverted under the No Action alternative, which is estimated to be approximately 26.39 mgd. The HSHEP model estimated that approximately 79.8% of total HU would be available under the No Action alternative. However, please note that under the Proposed Action, the total HU would be less than projected under the No Action alternative.

Regarding your comment about fisheries, as noted in Response #3 above, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83.

Comment 5: *So much of this island is being lost, little by little, to development and is il-planned. As a lover of Maui and it's natural resources. Please do the right thing and help support our natural beauty and ecosystem by not granting a 30 year license that will allow for continued degradation of Maui.*

Response 5: We acknowledge your comments. Please note as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education.

10238-04
Letter to Mr. Mike Ottman
Page **10** of **10**
September 3, 2021

These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: A&B DEIS: 'a'ole nō!

Dear Mr. Matsukawa,

Thank you for reading this. After having read the DEIS, I, a lifelong resident of Maui, former resident of east maui, do hereby ask you to revoke this lease. 30 years is too long, the DEIS is very flawed, and as an island community, and as a world awakening, we need to change how we take advantage of water. Every stream needs to flow mauka to makai, thats the way it's always been and thats the way it needs to be. We need to prioritize all the life forms and life cycles that rely on mauka to makai flow. To allow streams to be fully diverted is to say those species and those biological relationships don't deserve to live or be in existence as they had done for thousands of years. Foolishly clever, greedy, ignorant men set up our current system of water abuse and it's time to rectify the situation. Please, consider our native species, the ecological benefits of restoring stream flow, the negative effects of stagnant flow, and the general ridiculous premise that man should get to prioritize our corporate endeavors over the right of life to exist in currently dry streams. We say no to a 30 year lease, and we say no to dry streams. Do not grant this lease. Mahalo nui!

Sincerely,
Nakota Crumbo

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Nakota Crumbo:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Thank you for reading this. After having read the DEIS, I, a lifelong resident of Maui, former resident of east maui, do hereby ask you to revoke this lease.*

Response 1: We acknowledge your comments. However, please note that the Draft EIS does not authorize anything. The EIS is an environmental disclosure document that assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 2: *30 years is too long, the DEIS is very flawed, and as an island community, and as a world awakening, we need to change how we take advantage of water.*

Response 2: We respectfully disagree that 30 years is too long. Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

We also respectfully disagree with your comment that the Draft EIS is flawed. The Draft EIS included a "Content Checklist" identifying each element under HAR § 11-200-17 and where within the text of the Draft EIS information on each particular element could be found. Please note that the Content Checklist has been updated based on updated discussions and additions added to the Final EIS as shown subsequently after the front cover.

Comment 3: *Every stream needs to flow mauka to makai, thats the way it's always been and thats the way it needs to be. We need to prioritize all the life forms and life cycles that rely on mauka to makai flow. To allow streams to be fully diverted is to say those species and those biological relationships don't deserve to live or be in existence as they had done for thousands of years.*

Response 3: We acknowledge your comments. It is generally known that flow from mountain to ocean can provide environmental benefits. Impacts to stream flow and stream life as a result of diversions were assessed in the Draft EIS Section 4.2.1. The HSHEP model was used to quantify the impacts of flow restoration on native stream animal habitat to help decision-makers determine an appropriate balance between instream and offstream water uses. The mauka to maikai connection is integral to the design of the HSHEP model in estimating the impacts of stream diversions on native species habitat. Impacts to stream habitats and native amphidromous stream species, are analyzed in Section 4.2.1 and Appendix A of the EIS.

Impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B of the EIS. Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on

pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat

based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83 of the Final EIS.

With regards to your comment about fully diverting streams, the 2018 CWRM D&O set IIFS for 24 of the 36 streams within License Area. Of those 24 streams, 10 streams were fully restored, while others were partially restored for either habitat restoration or mauka to makai connectivity as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4 of the Draft EIS states:

To set the IIFS, the CWRM grouped the streams into four broad categories with different objectives and management strategies: (i) conveyance of water to kalo growing areas for community use; (ii) water for streams with high biological value, (iii) water for streams that have barriers to biological or ecological improvements, and (iv) noninstream use of water for municipal and agricultural uses. (See Figure 1-3). The CWRM D&O significantly reduces the amount of water that can be diverted for offstream uses relative to the capacity and use of the EMI Aqueduct System when sugar was being cultivated. Ten streams were ordered to have no diversions at all (one of which, Waiokamilo, had stream flow fully restored in 2007) (referred to as “Fully Restored Streams” in Figure 1-3), 5 were required to return 64% of BFQ₅₀ in the stream at all times (referred to as “Habitat Streams” in Figure 1-3), and 7 were required to have 20% of BFQ⁵⁰ in the stream at all times (referred to as “Connectivity Streams” in Figure 1-3).

Hence, the streams will not be fully diverted as you allude to.

Comment 4: *Foolishly clever, greedy, ignorant men set up our current system of water abuse and it's time to rectify the situation.*

Response 4: Your comment regarding our current system of water abuse is unclear. However, please note that Section 1.3 of the EIS describes the historical context of the Proposed Action.

Comment 5: *Please, consider our native species, the ecological benefits of restoring stream flow, the negative effects of stagnant flow, and the general ridiculous premise that man should get to prioritize our corporate endeavors over the right of life to exist in currently dry streams. We say no to a 30 year lease, and we say no to dry streams. Do not grant this lease. Mahalo nui!*

Response 5: We acknowledge your comments. Please note that as discussed in Response #3 above, Impacts to stream flow and stream life as a result of diversions were assessed in the Draft EIS Section 4.2.1. The HSheP model was used to quantify the impacts of flow restoration on native stream animal habitat to help decision-makers determine an appropriate balance between

instream and offstream water uses. The mauka to maikai connection is integral to the design of the HSHEP model in estimating the impacts of stream diversions on native species habitat. Impacts to stream habitats and native amphidromous stream species, are analyzed in Section 4.2.1 and Appendix A of the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on DEIS for A&B/EMI Water Lease in East Maui

November 7, 2019

Mr. Earl Matsukawa
1907 S. Beretania Street, Suite 400 , Honolulu, HI 96826

Mr. Ian Hirokawa
1151 Punchbowl St.
Honolulu, HI 96813

Aloha Mr. Ian Hirokawa, and Mr. Earl Matsukawa:

Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) to Alexander & Baldwin and East Maui Irrigation (A&B/EMI) for Nahiku, Ke'anae, Honomanū, and Huelo

Mahalo for allowing me to share my thoughts about the stream diversions in East Maui. For the past 25 years I have hiked throughout the Hawaiian Islands to photograph the native plants, animals, and culture of our islands. I have seen firsthand how the East Maui watershed is remarkable for unique plant, insect, and snail species endemic to the area. With rainfall expected to decrease due to climate change, their survival is uncertain and insecure.

One of the little known facts about the Alexander and Baldwin families is that they directly contributed to the extinction of snails endemic to the Hawaiian Islands – species of Partulina snails found only on Maui. The Alexander and Baldwin families collected land snails by the tens of thousands for their beautiful shells. David Dwight Baldwin was a scientist who collected snails to extinction -- he has become a textbook case in ethics what not to do in science.

Sources [https://en.wikipedia.org/wiki/J. T. Gulick](https://en.wikipedia.org/wiki/J._T._Gulick)
[https://en.wikipedia.org/wiki/David Dwight Baldwin](https://en.wikipedia.org/wiki/David_Dwight_Baldwin)"

I am concerned that no one is taking care of the endangered species in Nahiku, Ke'anae, Honomanū, and Huelo. Surveys for endangered snails, damselflies, and other invertebrates have been inadequate given the large area and the rugged terrain. There are undoubtedly places where plants are sheltered from predators, and protected spots where rare snails or damselflies or other invertebrates make their home. There is also no discussion on habitat restoration for endangered species or the containment and removal of the invasive species that threaten them. The plan should address plan how endangered species will be cared for as rainfall continues to decrease over the Hawaiian Islands.

By taking excessive amounts of water from streams, Alexander and Baldwin has degraded the habitat for many species downstream. The Water Commission ordered stream flow to be restored to 21 streams. Many streams have large unneeded dam structures, basins, pipes and debris have been left in place, which interfere with native stream life. The DEIS stream life survey estimated 36% of migrating native stream life are “entrapped” by diversions. What are the plans for decommissioning and removing these unpermitted structures?

Another consequence of taking excessive water is the creation of stagnant pools along the length of diverted streams. These stagnant pools are breeding grounds for mosquitos that can carry dengue fever and other diseases and ill-effects. There are serious consequences on the people living in these communities. What are the plans for protecting the health and well-being of the people living in communities close by?

The EIS needs to discuss how the 13 streams in the Honopou to Kailua area will be restored, where many people live, farm, and hunt/gather. The plan estimates that all of the water will be diverted from the streams 60% of the time. The EIS needs to discuss the impacts of continuing these diversions, which will negatively impact native stream habitat and the local farming communities nearby.

One of the biggest questions I have is about how much will A&B/EMI pay for the use of the water? Under the State Constitution water is held in the public trust. How much will A&B/EMI pay the State of Hawaii for the use of public water?

The DEIS is an important document that impacts local communities and stream wildlife. A recent Supreme Court stated the State of Hawaii has a duty to malama aina – care for the land. I hope to see this carried out in East Maui. Thank you for this opportunity to comment on the DEIS.

Sincerely,

Nathan Yuen

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Yuen:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Mahalo for allowing me to share my thoughts about the stream diversions in East Maui. For the past 25 years I have hiked throughout the Hawaiian Islands to photograph the native plants, animals, and culture of our islands. I have seen firsthand how the East Maui watershed is remarkable for unique plant, insect, and snail species endemic to the area. With rainfall expected to decrease due to climate change, their survival is uncertain and insecure.*

Response 1: Please note that Appendix C and Section 4.4 of the Draft EIS described the terrestrial flora and fauna of the License Area in East Maui. Specifically, Section 4.4 of the Draft EIS states:

The License Area encompasses a major portion of the Ko‘olau Forest Reserve. A transect of the forested region from Pōhaku Palaha at the upper boundary of the License Area at the 8,105 foot elevation to the Hāna Highway near Kailua would identify the following plant communities: high elevation grassland; mesic native

shrubs; mesic 'ōhi'a forest; wet 'ōhi'a forest with native shrubs; tree ferns and matted ferns; wet sedge-rush-native shrubs with scattered 'ōhi'a ohia and other native trees; and mesic exotic trees with scattered planted stands of eucalyptus and paper bark (DLNR, 1986). The steeper valley slopes within the region are dominated by wet habitat matted ferns as well as native and exotic shrubs and scattered 'ōhi'a. Koa-'ōhi'a forests are found in two widely separated, mid-elevation locales, one above Honopou Stream, and the other adjacent to Hanawā Stream.

Moreover, added to the Section 4.4.1 of the Final EIS from the USFWS as shown on page 4-114 to 4-117, there are 43 listed plants that may occur or have final designated critical habitat within or near the vicinity of the License Area. Of those, it was determined that 18 species with designated critical habitat that fall within the License Area.

With regards to climate change, climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown on the pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Comment 2: *One of the little known facts about the Alexander and Baldwin families is that they directly contributed to the extinction of snails endemic to the Hawaiian Islands – species of Partulina snails found only on Maui. The Alexander and Baldwin families collected land snails by the tens of thousands for their beautiful shells. David Dwight Baldwin was a scientist who collected snails to extinction -- he has become a textbook case in ethics what not to do in science.*

Sources [https://en.wikipedia.org/wiki/J. T. Gulick](https://en.wikipedia.org/wiki/J._T._Gulick)

https://en.wikipedia.org/wiki/David_Dwight_Baldwin"

Response 2: Please note that we are unaware of the statements you make in Comment #2 above. However, please note that the history of the Alexander and Baldwin families is out of scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘ānae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 3: *I am concerned that no one is taking care of the endangered species in Nahiku, Ke'anae, Honomanū, and Huelo. Surveys for endangered snails, damselflies, and other invertebrates have been inadequate given the large area and the rugged terrain. There are undoubtedly places where plants are sheltered from predators, and protected spots where rare snails or damselflies or other invertebrates make their home.*

Response 3: We acknowledge your comments. Related to the flora and fauna resources, ground and aerial surveys were conducted in 2017 and 2018 by SWCA to field-verify vegetation types and species found during previous surveying and mapping efforts. It was determined that the HIGAP vegetation data layer produced by Gon et al. (2006) was highly representative of the vegetation found in the “Study Area.” Please note that the SWCA report, provided as EIS Appendix C, defined the “Study Area” as the collective License Area and the 30,000 acres of agricultural land that it referred to as the “Service Area.” The HIGAP mapping data was used to estimate species distributions and potential impacts for the entire 33,000-acre License Area. Threatened and endangered species were categorized by each species' potential to occur in each vegetation type based on habitat needs. Methods have been further clarified in Appendix C, as summarized in Section 4.4 of the Final EIS as shown on page 4-113.

Regarding damselfly species, please note as discussed in Section 4.4.2 of the Draft EIS:

Twelve invertebrates were observed during the surveys, consisting of the Blackburn's damselfly (Megalagrion blackburni), Hawaiian upland damselfly (Megalagrion hawaiiense), citrus swallowtail butterfly (Papilio xuthus), Monarch butterfly (Danaus plexippus), housefly (Musca domestica), smaller lantana butterfly (Strymon bazochii), mud dauber (Sceliphron caementarium), wandering glider (Pantala flavescens), green darner (Anax junius), Aedes mosquito (Aedes sp.), walking stick (Sipyloidea sipyilus), and witch moth (Ascalapha odorata). All these invertebrates are common in East Maui.

While the endangered damselfly species were not observed, damselfly species were observed during the survey conducted by SWCA. Moreover, it is acknowledged that other species of damselfly are known to, or may, occur within the License Area as indicated by Table 4-5 of the Draft EIS. However, please note that Table 4-5 of the Draft EIS (Table 4-10 in the Final EIS) has been revised to include the Blackburn's sphinx moth, which the United States Fish and Wildlife Service (USFWS) indicated may occur in the License Area. Moreover, during the field work conducted by Trutta in connection with the preparation of the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model, pictures of damselfly were captured and are included in Appendix A.

Please note that Section 4.4.1 and Section 4.4.2 have been revised in the Final EIS based on comments received on the Draft EIS to further outline the existing conditions of the License Area and more accurately reflect targeted mitigation measures based on feedback provided by the DLNR and USFWS. See pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS.

Comment 4: *There is also no discussion on habitat restoration for endangered species or the containment and removal of the invasive species that threaten them. The plan should address plan how endangered species will be cared for as rainfall continues to decrease over the Hawaiian Islands.*

Response 4: As discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been

updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Comment 5: *By taking excessive amounts of water from streams, Alexander and Baldwin has degraded the habitat for many species downstream.*

Response 5: Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the

Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

Comment 6: *The Water Commission ordered stream flow to be restored to 21 streams. Many streams have large unneeded dam structures, basins, pipes and debris have been left in place, which interfere with native stream life. The DEIS stream life survey estimated 36% of migrating native stream life are “entrapped” by diversions. What are the plans for decommissioning and removing these unpermitted structures?*

Response 6: On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi‘ina‘au, Wailuānui, Honomanū, Waikamoi, Nua‘ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā‘ula, Pa‘akea, Pua‘aka‘a, Puohokamoa, Ha‘ipua‘ena,

Nua‘ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

With regards to your comment about diversion structures, upon making the voluntary commitment to permanently restore the stream flows in the “taro streams”, EMI returned approximately 90-95% of the natural flow of the streams—all that could be done by adjusting (opening or closing) the diversion gates. The final 5-10% to achieve complete restoration requires modifications to diversions, essentially construction projects, thus triggering various permitting processes that continue to be pursued.

Potential impacts from the abandonment of structures and equipment as it relates to native stream habitat was assessed and discussed in Appendix A, the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report.

The work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows.

The CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. CWRM ordered in relevant part (see CWRM D&O at p. 269):

- I. It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.*
- J. This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process*
- K. The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.*

CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

However, please note that generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best. The presence of cement or wood near or partially within the stream channel is not inherently bad for stream animals. Conversely, meeting the instream flow standard at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the water flowing into the diversion and back to the stream from another location in the diversion

ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

The two primary conditions where diversion structures could impact native stream species are structures where diversion and ditch water still comingle or structures that create a barrier to upstream migration. A diversion structure could also impact native stream animals as they move upstream if it creates an unnatural barrier. If no wetted pathway exists, upstream passage will be stopped.

Altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns.

In summary, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts.

The above is discussed in more detail in Section 4.2.1 of the Final EIS as shown in pages 4-61 to 4-67.

With regards to your comment “The DEIS stream life survey estimated 36% of migrating native stream life are “entrapped” by diversions” we are unclear where that information came from. Nowhere in the EIS is that stated.

Comment 7: *Another consequence of taking excessive water is the creation of stagnant pools along the length of diverted streams. These stagnant pools are breeding grounds for mosquitos that can carry dengue fever and other diseases and ill-effects. There are serious consequences on the people living in these communities. What are the plans for protecting the health and well-being of the people living in communities close by?*

Response 7: We acknowledge your comments. With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of

the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown in pages 4-58 to 4-61, pages 4-126 to 4-127, and pages 4-130 to 4-131.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Mauistreams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Regarding your comment about protecting the health and well-being of the people, a watershed management plan will be developed prior to the issuance of the Water Lease. As stated in Section 2.1 of the Draft EIS:

The amount of water awarded by the Water Lease is subject to all applicable requirements under HRS § 171-58. HRS § 171-58(c), (d), and (e) articulate terms for the disposition of the Water Lease. HRS § 171-58(e) requires that any new lease of water rights "shall contain a covenant that requires the lessee and the department of land and natural resources to jointly develop and implement a watershed management plan. The board shall not approve any new lease of water

rights without the foregoing covenant or a watershed management plan."

Furthermore, as stated in Chapter 8 of the Draft EIS, "The content and parameters of a watershed management plan related to the proposed Water Lease are unresolved at this time, but will be resolved before the BLNR can issue the Water Lease."

Comment 8: *The EIS needs to discuss how the 13 streams in the Honopou to Kailua area will be restored, where many people live, farm, and hunt/gather. The plan estimates that all of the water will be diverted from the streams 60% of the time. The EIS needs to discuss the impacts of continuing these diversions, which will negatively impact native stream habitat and the local farming communities nearby.*

Response 8: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided in pages 4-61 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

With regards to local farming communities in East Maui, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income

by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Comment 9: *One of the biggest questions I have is about how much will A&B/EMI pay for the use of the water? Under the State Constitution water is held in the public trust. How much will A&B/EMI pay the State of Hawaii for the use of public water?*

Response 9: An appraisal to determine the fair market value of the Water Lease will be conducted prior to issuance of the Water Lease. The Department of Land and Natural Resources (DLNR), on behalf of the Board of Land and Natural Resources, will commission, or approve the commissioning of, the appraisal. The Economic and Fiscal Impact Study (Appendix H) prepared for the EIS calculates the Water Lease payment based on the equivalent per unit cost under the existing 2019 revocable permit. As discussed in Section 4.7.3 of the Draft EIS on page 4-150,

The revocable permit rent payment sent in November 2018 was \$230,964.24, which represents an increase from the rent that was historically paid. Assuming 16.8 mgd was diverted in 2019 from the License Area under the revocable permit, the rent rate would translate to \$0.038 per thousand gallons.”

However, Section 4.7.3 of the Final EIS has been updated with the approved rental rates in October 2019 as shown on pages 4-277 and 4-283.

With regards to the public trust, we note that surface water, being a public trust resource, means that the Proposed Action requires the BLNR, as the public trustee of the water sources proposed for Water Lease to comply with the State of Hawai'i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. The dual roles of the BLNR and its sister agency, the CWRM, as public trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still-pending contested case hearing on A&B's 2001 request that the BLNR issue the subject long-term Water Lease at public auction (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action as shown on pages 1-25 to 1-27.

Comment 10: *The DEIS is an important document that impacts local communities and stream wildlife. A recent Supreme Court stated the State of Hawaii has a duty to malama aina – care*

10238-04
Letter to Mr. Nathan Yuen
Page 14 of 14
September 3, 2021

for the land. I hope to see this carried out in East Maui. Thank you for this opportunity to comment on the DEIS.

Response 10: We acknowledge your comments and have provided you with detailed responses to each of your comments above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: DEIS

Aloha

My name is Olaf Behrendt

We have a little farm in Huelo, east Maui where we are working on a several acres foodforest.

We are very concerned about the DEIS provided to receive a lease from the Hawaiian Government.

The document does not address people's concerns about healthy fish and stream conditions or access to public lands for hunting, gathering or recreational use. It doesn't consider either to restore all streams to their natural flow. The proposed request for a lease of 30 years is absurd.

Farm practices have to adapt to climate, climate change and specific food needs of the population of Maui.

Our family opposes the draft fully.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Olaf Behrendt:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *We have a little farm in Huelo, east Maui where we working on a several acres food forest.*

We are very concerned about the DEIS provided to receive a lease from the Hawaiian Government.

Response 1: We acknowledge your comments and understand that you have a farm in Huelo and are concerned with the Proposed Action as noted in the comments below.

Comment 2: *The document does not address people’s concerns about healthy fish and stream conditions or access to public lands for hunting, gathering or recreational use.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not address people’s concerns related to fish and stream conditions and access to public land for hunting, gathering, and recreational use.

As it relates to fish and stream conditions, impacts to stream flow and stream life as a result of diversions were assessed in the Draft EIS Section 4.2.1. The HSHEP model was used to quantify the impacts of flow restoration on native stream animal habitat to help decision-makers determine an appropriate balance between instream and offstream water uses. The mauka to maikai connection is integral to the design of the HSHEP model in estimating the impacts of stream diversions on native species habitat. Impacts to stream habitats and native amphidromous stream species, are analyzed in Section 4.2.1 and Appendix A of the EIS.

Impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B of the EIS. Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on the pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on the pages 4-78 to 4-83 of the Final EIS.

With regards to public access, public access within portions of the License Area has been provided, as discussed in Section 4.8 of the Draft EIS, and it is expected either that public access will continue if the scope of the License Area remains the same, or, if the License Area is reduced, that public access within the former License Area lands will be dictated by a State

agency. However, please note that Section 4.8 of the Final EIS, has been revised as shown on pages 4-305 to 4-309 to include more recreational facilities and an accurate discussion regarding access into the License Area as it relates to recreational activities. Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access to areas that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding impacts to the areas that would allow for more public access. Moreover, impacts of the Modified Lease Area alternative are discussed in Section 3.4 of the EIS (Comparative Evaluation of Reasonable Alternatives) against different environmental resource categories.

With regards to documenting people's concerns, the Social Impact Assessment (SIA), as contained in Appendix G of the and summarized in Section 4.7.2 of the Draft EIS, obtained input from several community members, many of whom have direct and long-term experience with the streams in the subject area. As discussed in Section 4, Preliminary Community Issues, in the SIA contained in Appendix D, seven focus groups were convened in November 2018. Participants in these sessions included residents, farmers and ranchers, and people who are active in environment and sustainability efforts. These participants lived in Ke'anae, Wailuānui, Huelo, Ha'ikū, Kula, Makawao and Pukalani.

Concerns regarding healthy fish and stream conditions, and access for public lands for hunting and gathering were often passionately expressed in these meetings and interviews and are

presented and analyzed in Section 4 of the SIA and summarized in Section 4.7.2 of the Draft EIS.

Moreover, the Cultural Impact Assessment (CIA) as contained in Appendix F, obtained input from three interviewers, as well as numerous declarations made during the CWRM D&O proceedings. Also, Cultural Surveys Hawai'i, whom conducted the CIA, is conducting follow-up interviews with selected commenters of the Draft EIS to obtain more cultural information from those who have a connection with East Maui which will be included in the Final EIS.

We also note that over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M) which document people's concerns. Moreover, over 400 comments were received to the Draft EIS.

Comment 3: *It doesn't consider either to restore all streams to their natural flow. The proposed request for a lease of 30 years is absurd.*

Response 3: You are correct that none of the alternatives consider restoring all streams to their natural flow. The Draft EIS did discuss a No Action alternative which assumed that no Water Lease would be issued. or purposes of the No Action (i.e., no Water Lease) alternative, it is reasonable to assume that, in the absence of a Water Lease, EMI will, *at best*, be able to continue to divert the approximately 30% of water that is estimated to represent the average annual amount that originates on private lands within the 50,000-acre Collection Area as outlined by Appendix R-5 added to the Final EIS. Comparative impacts and benefits of the alternatives are discussed in Section 3.4 of the EIS. However, please note that Section 3.5 of the Final EIS includes a comparative table of the various alternatives and the associated impacts of each alternative as shown in pages 3-49 to 3-80.

With regards to your comment about the 30-year lease request, Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and

weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Comment 4: *Farm practices have to adapt to climate, climate change and specific food needs of the population of Maui.*

Response 4: We acknowledge your comments. The crops in Mahi Pono's farm plan were chosen with the goal of increasing Hawai'i's food independence while also meeting criteria for commercial viability and potential. Mahi Pono's farm plan is described in Section 2.1.4 of the EIS. Citrus, row crops, and cattle – all crops included in Mahi Pono's farm plan would accomplish this goal more effectively than the planting of dates, coconuts, plumeria, and neem. The per-acre water requirement for Mahi Pono's cattle ranching operation is expected to be significantly less than the per-acre water requirement typically associated with growing diversified row crops in Hawai'i. The per-acre water requirements for the various crops planned by Mahi Pono are shown Table 2-2 of the Final EIS based on the analysis in the Agricultural and Related Economic Impacts report attached as Appendix I to the EIS.

With regards to climate change, the EIS does include the most recent information regarding climate change within its analysis. As discussed in Section 4.3.1 of the Draft EIS:

Regular trade winds are key in driving the Hawai‘i’s hydrological cycle, generating rainfall which helps maintain Maui’s water supply. However, a recent study showed that Hawai‘i’s trade winds have decreased in frequency by approximately 30% over the past 37 years, from 291 days per year in 1973, to 210 days per year in 2009 (Garza et. al, 2012). The decrease in the trade winds could have serious implications for the Hawaiian Islands, including adversely impacting local agriculture, native ecosystems and endangered species, and the State’s limited freshwater supply.

Overall, the State of Hawai‘i is experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014)...

Climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. Such rainfall patterns increase the amount of stormwater runoff flowing through the region, including through the streams within the License Area that reach the shoreline. The expected climatic changes in precipitation patterns and streamflow will influence the quantities and concentration of stormwater runoff entering the nearshore environments and coastal waters, resulting in increased sedimentation, impacting coral reefs. However, because of the continuous wave energy in shore areas in East Maui, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species. (SE & MRC, 2019).

Hence, the EIS recognizes that the State of Hawai‘i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream

base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Comment 5: *Our family opposes the draft fully.*

Response 5: We acknowledge your comments and understand that you and your family is in opposition to the Proposed Action.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Maui student comments on East Maui water diversion DEIS

Aloha pumehana, please accept my comments and reject A&B's DEIS.

I care very deeply about this proposed lease of public water because of the environmental and social degradation that occurs with continued water diversions. This practice has posed severely negative consequences to the native aquatic ecosystem and people, primarily kanaka maoli, who depend on constant streamflow; these facts are not sufficiently addressed by the DEIS. This theft of water by A&B has been going on for far too long. We all know that water is a public trust, and this resource should be protected by our government for the benefit of all. But unfortunately, freshwater has been grossly mismanaged for over a century and this has posed irreversible outcomes for the landscape and people. This cannot continue at the expense of the livelihood of our East Maui community and the health of the ecosystem. Therefore, this DEIS should be rejected on several basis:

- A 30-year lease is unwarranted. The DEIS needs to address short term lease options (perhaps annually or biennially), due to uncertainties with rainfall, climate change, and future water supplies. One company should not have a 30-year monopoly on a resource that should be used for everyone. The fact that A&B has had more than 100 years of monopoly on East Maui waters is absolutely criminal. (While many East Maui 'ohana were displaced from their kuleana lands and many died waiting for restored streamflow.)
- The DEIS fails to use accurate scientific data to back-up their study. They only chose to use data on diverted streams as the baseline condition for the stream ecosystem. This is a false representation of what true stream conditions are really like. This allows A&B to avoid discussions of no diversions, and how the practice of not diverting the water would benefit the East Maui ecosystem and communities. This is an important point that needs to be addressed.
- This DEIS does not address how they will be restoring the 13 streams in the Honopou and Kailua area, where many people live, farm, gather, and depend on streamflow. All that is said is that they 'estimate' that all of the water will be diverted 60% of the time. This type of diversion will decimate native stream life and negatively impact thousands of local residents.
- The DEIS does not mention any plans or funding to manage invasive species in the lands they lease, these invasive species outcompete native ones and negatively impact the function of our watersheds. When watershed function is impaired, this affects other terrestrial species that of which East Maui has the endangered 'ope'ape'a (Hawaiian hoary bat), 59 endangered plants, 13 protected birds, and likely hundreds of endemic insects under threat.
- The DEIS does not discuss options for more public access for hiking, hunting, gathering, and cultural purposes. These are public lands and everyone should have reasonable access to these areas. Permission from EMI should not be necessary.
- The DEIS does not address the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams are breeding grounds for mosquitoes who carry diseases like dengue which has affected these community before.
- The DEIS does not sufficiently address protections for native species of 'o'oupu, 'opae, hihīwai, and hapawai whose population status are and most likely Endangered, Threatened, or Near Threatened. There is a lack of data regarding some of these unique species, and therefore there needs to be great care done before doing anything to alter their habitats.
- The DEIS does not address how stream diversions affect coastal fish, invertebrate, and algae populations, many of which the local residents have historically depended on for food or cultural purposes. The DEIS has not sufficiently analyzed the threat and damage the diversions have caused to the native aquatic ecosystem and local community of East Maui.

I humbly ask you to please reject this DEIS and allow A&B to address all of these critical issues. To the legislators who are involved in this process, please do the right thing. You have the power to show the people you represent that big money interests cannot buy your vote. Water is a public trust shared by ALL. The East Maui community and ecosystem has been through enough injustice, and it is time to change the course of history. We longer can blindly allow A&B to divert millions of gallons of water. We need to address the needs of our fragmented ecosystem and people FIRST!

Sincerely,

Paula Alcosoba

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Alcoseba:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200, Section 18. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Aloha pumehana, please accept my comments and reject A&B's DEIS.*

I care very deeply about this proposed lease of public water because of the environmental and social degradation that occurs with continued water diversions. This practice has posed severely negative consequences to the native aquatic ecosystem and people, primarily kanaka maoli, who depend on constant streamflow; these facts are not sufficiently addressed by the DEIS.

Response 1: We acknowledge your comments. Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the

impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe‘e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals’ habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

Specifically, with regards to the native stream aquatic impacts, please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown on pages 4-61 to 4-62 of the Final EIS. The above excerpt and the updated text on pages 4-61 to 4-62 of the Final EIS present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See on pages 4-61 to 4-62 of the Final EIS.

With regards to cultural impacts, Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o 'opu, pūpūlo 'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include:

Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, see pages 4-158 to 4-159 of the Final EIS. The CIA, and Section 4.6 of the EIS on pages 4-239 to 4-252, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Comment 2: *This theft of water by A&B has been going on for far too long. We all know that water is a public trust, and this resource should be protected by our government for the benefit of all. But unfortunately, freshwater has been grossly mismanaged for over a century and this*

has posed irreversible outcomes for the landscape and people. This cannot continue at the expense of the livelihood of our East Maui community and the health of the ecosystem.

Response 2: Regarding your comment about the Public Trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

With regards to irreversible outcomes for the landscape and people, as noted in Response #1 above, although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history

in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

Comment 3: *Therefore, this DEIS should be rejected on several basis:*

A 30-year lease is unwarranted. The DEIS needs to address short term lease options (perhaps annually or biennially), due to uncertainties with rainfall, climate change, and future water supplies. One company should not have a 30-year monopoly on a resource that should be used for everyone. The fact that A&B has had more than 100 years of monopoly on East Maui waters is absolutely criminal. (While many East Maui 'ohana were displaced from their kuleana lands and many died waiting for restored streamflow.)

Response 3: We acknowledge your comments. Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80 of the Final EIS, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

With regards to climate change, climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that

the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown on the pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Comment 4: *The DEIS fails to use accurate scientific data to back-up their study. They only chose to use data on diverted streams as the baseline condition for the stream ecosystem. This is a false representation of what true stream conditions are really like. This allows A&B to avoid discussions of no diversions, and how the practice of not diverting the water would benefit the East Maui ecosystem and communities. This is an important point that needs to be addressed.*

Response 4: We respectfully disagree with your comment that the EIS fails to use accurate scientific data. All of the technical studies used verified modeling and analysis. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the "No Action" alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the

Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 5: *This DEIS does not address how they will be restoring the 13 streams in the Honopou and Kailua area, where many people live, farm, gather, and depend on streamflow. All that is said is that they 'estimate' that all of the water will be diverted 60% of the time. This type of diversion will decimate native stream life and negatively impact thousands of local residents.*

Response 5: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS.

However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-61 to 4-67.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 6: *The DEIS does not mention any plans or funding to manage invasive species in the lands they lease, these invasive species outcompete native ones and negatively impact the function of our watersheds. When watershed function is impaired, this affects other terrestrial species that of which East Maui has the endangered 'ope'ape'a (Hawaiian hoary bat), 59 endangered plants, 13 protected birds, and likely hundreds of endemic insects under threat.*

Response 6: As discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

With regards to the list of endangered and endemic species that may occur within East Maui, please note that Section 4.4 provides a list of these species, which have been supplemented by the USFWS in the Final EIS as shown on pages 4-127 to 4-128.

Comment 7: *The DEIS does not discuss options for more public access for hiking, hunting, gathering, and cultural purposes. These are public lands and everyone should have reasonable access to these areas. Permission from EMI should not be necessary.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 of the Final EIS has been revised as shown on pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the "Modified Lease Area" alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation

by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS does not address the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams are breeding grounds for mosquitoes who carry diseases like dengue which has affected these community before.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-61.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai‘i.

Comment 9: *The DEIS does not sufficiently address protections for native species of ‘o‘oupu, ‘ōpae, hīhīwai, and hapawai whose population status are and most likely Endangered, Threatened, or Near Threatened. There is a lack of data regarding some of these unique species, and therefore there needs to be great care done before doing anything to alter their habitats.*

Response 9: The HSHEP model clearly demonstrates the link between stream diversion and native stream species habitat. The model quantifies changes to habitat, entrainment and barrier to passage to determine the impact of various management scenarios. There is extensive information associated with the native species of ‘o‘oupu, ‘ōpae, and hīhīwai for in the stream. The hapawai is primarily an estuarine species and little estuarine habitat exists in the steep East Maui streams. Currently none of the native species of ‘o‘oupu, ‘ōpae, hīhīwai, and hapawai are formally listed as Endangered or Threatened species. Additionally, all proposed actions will result in either no change in habitat conditions or improved habitat conditions, thus there is not threat of decreasing their current habitat conditions.

Comment 10: *The DEIS does not address how stream diversions affect coastal fish, invertebrate, and algae populations, many of which the local residents have historically depended on for food or cultural purposes. The DEIS has not sufficiently analyzed the threat and damage the diversions have caused to the native aquatic ecosystem and local community of East Maui.*

Response 10: Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on

pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the

combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83 of the Final EIS.

We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the

remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 11: *I humbly ask you to please reject this DEIS and allow A&B to address all of these critical issues. To the legislators who are involved in this process, please do the right thing. You have the power to show the people you represent that big money interests cannot buy your vote. Water is a public trust shared by ALL. The East Maui community and ecosystem has been through enough injustice, and it is time to change the course of history. We longer can blindly allow A&B to divert millions of gallons of water. We need to address the needs of our fragmented ecosystem and people FIRST!*

Response 11: We acknowledge your comments and have provided you with detailed responses to each of your comments above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Paul-David Burns
PO Box 901
Hāna, HI, 96713
(808) 264-0699

Aloha Mr Ian Horikawa and Mr. Earl Matsukawa,

I am writing to give my testimony concerning the long term lease requested by Mahi Pono. I have been a teacher and farmer in Hāna for the past 18 years and am married to a Native Hawaiian from Hāna. We have 6 children and one grandchild and have been very active members of our community in many ways. My wife being born and raised in Hāna has strong ties to the land and all the families that reside here.

There are several reasons why I know that it is a big mistake to give a long term lease to divert water from the streams of Hāna. One of my biggest concerns is the effect it has on the fisheries. Hāna was once known for an abundance of fish and that was something that the people could count on to keep their families alive during hard times. Diverting the water over the years had a profound effect on the entire fish ecosystems. Where the fresh water meets the ocean is known as the estuaries where fish come to breed. There are several reasons for this. For one the fresh water feeds the limu that brings in many herbivores fish. Secondly the rivers deposit millions of larvae from the 'opae, 'o'opu, hihiwai and prawns. For their lifecycle to continue they have to go to the ocean to hatch and later make their way back up the rivers to reach maturity. Well these larvae become food for many species of fish waiting for them at the river mouths. By the rivers not running the limu dies, the larvae don't make it so their species die and all of the fish that feed on them have to look elsewhere for food because that food source is no longer coming down. I recently interviewed Uncle Ed Wendt and asked him how the diverting of the rivers affected the fisheries and how has it changed since some of the rivers have returned the flow again. He told me that the rivers that were diverted turned black and dead at the river mouths. There were no fish to be found and mosquitoes were breeding and it was a health hazard. After one year of water being returned the limu had begun to grow and schools of many species can now be seen at the same river mouth that was completely dead a year earlier.

This is a huge concern and liability for the State to allow our fish to be sacrificed. This is literally a form of genocide because we cannot feed our families and are forced to buy the GMO poisoned food that is making us sick. The State is always talking about making rules to save our fish species but the real problem is the water diversions that are destroying the habitat of the fish. Securing our fisheries will ensure the survival of the human race in Hawai'i for generations to come. If there is a disaster and we cannot ship food than we have food security. The decision makers who live in Hawai'i need to look deep into their hearts and think about their own children and their future generations survival and not sell out for a quick profit. The karma and backlash of such an action is so great it will last for lifetimes.

I am a taro farmer and that is the other part of our food security. We need our waters to flow to plant taro in every ahupua'a so that every family has good healthy sustenance. It is our right guaranteed in the Constitution of Hawai'i to have water to sustain our families and that nobody is allowed to hurt the subsistence farmers of the land. This action would obviously break those laws in the constitution and all those who partake in this crime will need to be brought to justice and held accountable for their negligence and crimes against humanity.

Mahi'ai Pono needs to find crops that don't need to be watered, they need to re-plant a forest to bring back the rains so they don't depend on Hāna's water to make money. They are an outside corporation from a different country that will suck our wealth and leave us with nothing just like the sugar plantations did. They cannot be given this privilege which would deny us the people of this land and the ones that the Hawaiian trust is supposed to be benefitting. They are lucky to be here and need to figure out smart farming methods that don't need the kind of water they are asking for.

The difference now is that the people will not sit quietly like our ancestors did in the time of the sugar plantations. This is a generation of educated people that will stand and debate for as long as it takes to be heard and respected. We have aloha 'aina and that is such a mighty force that does not tire out and does not need money. This is our TMT in Maui and we will stand tirelessly just as those on Mauna Kea stand so if you are smart you will avoid this conflict by not awarding this water lease.

Mahalo for taking my testimony and please deeply consider what I am saying and be prepared for a fight that we will never give up because our life depends on it and the survival of our future generations do as well. This is for your future offspring as well so don't sell out for the money, do what is right for the people and the land and all the species that will die if the water is diverted.

Subject: Testimony for mahi'ai eis.

Paul-David Burns
PO Box 901
Hāna, HI, 96713
(808) 264-0699

Aloha Mr Ian Horikawa and Mr. Earl Matsukawa,

I am writing to give my testimony concerning the long term lease requested by Mahi Pono. I have been a teacher and farmer in Hāna for the past 18 years and am married to a Native Hawaiian from Hāna. We have 6 children and one grandchild and have been very active members of our community in many ways. My wife being born and raised in Hāna has strong ties to the land and all the families that reside here.

There are several reasons why I know that it is a big mistake to give a long term lease to divert water from the streams of Hāna. One of my biggest concerns is the effect it has on the fisheries. Hāna was once known for an abundance of fish and that was something that the people could count on to keep their families alive during hard times. Diverting the water over the years had a profound effect on the entire fish ecosystems. Where the fresh water meets the ocean is known as the estuaries where fish come to breed. There are several reasons for this. For one the fresh water feeds the limu that brings in many herbivores fish. Secondly the rivers deposit millions of larvae from the 'opae, 'o'opu, hihiwai and prawns. For their lifecycle to continue they have to go to the ocean to hatch and later make their way back up the rivers to reach maturity. Well these larvae become food for many species of fish waiting for them at the river mouths. By the rivers not running the limu dies, the larvae don't make it so their species die and all of the fish that feed on them have to look elsewhere for food because that food source is no longer coming down. I recently interviewed Uncle Ed Wendt and asked him how the diverting of the rivers affected the fisheries and how has it changed since some of the rivers have returned the flow again. He told me that the rivers that were diverted turned black and dead at the river mouths. There were no fish to be found and mosquitoes were breeding and it was a health hazard. After one year of water being returned the limu had begun to grow and schools of many species can now be seen at the same river mouth that was completely dead a year earlier.

This is a huge concern and liability for the State to allow our fish to be sacrificed. This is literally a form of genocide because we cannot feed our families and are forced to buy the GMO poisoned food that is making us sick. The State is always talking about making rules to save our fish species but the real problem is the water diversions that are destroying the habitat of the fish. Securing our fisheries will ensure the survival of the human race in Hawai'i for generations to come. If there is a disaster and we cannot ship food than we have food security. The decision makers who live in Hawai'i need to look deep into their hearts and think about their own children and their future generations survival and not sell out for a quick profit. The karma and backlash of such an action is so great it will last for lifetimes.

I am a taro farmer and that is the other part of our food security. We need our waters to flow to plant taro in every ahupua'a so that every family has good healthy sustenance. Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Burns:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am writing to give my testimony concerning the long term lease requested by Mahi Pono. I have been a teacher and farmer in Hāna for the past 18 years and am married to a Native Hawaiian from Hāna. We have 6 children and one grandchild and have been very active members of our community in many ways. My wife being born and raised in Hāna has strong ties to the land and all the families that reside here.*

Response 1: We acknowledge your comments and understand that you are a resident in Hāna.

Comment 2: *There are several reasons why I know that it is a big mistake to give a long term lease to divert water from the streams of Hāna. One of my biggest concerns is the effect it has on the fisheries. Hāna was once known for an abundance of fish and that was something that the people could count on to keep their families alive during hard times. Diverting the water over the years had a profound effect on the entire fish ecosystems. Where the fresh water meets the ocean is known as the estuaries where fish come to breed. There are several reasons for this. For one the fresh water feeds the limu that brings in many herbivores fish. Secondly the rivers deposit*

millions of larvae from the 'opae, 'o'opu, hihiwai and prawns. For their lifecycle to continue they have to go to the ocean to hatch and later make their way back up the rivers to reach maturity. Well these larvae become food for many species of fish waiting for them at the river mouths. By the rivers not running the limu dies, the larvae don't make it so their species die and all of the fish that feed on them have to look elsewhere for food because that food source is no longer coming down. I recently interviewed Uncle Ed Wendt and asked him how the diverting of the rivers affected the fisheries and how has it changed since some of the rivers have returned the flow again. He told me that the rivers that were diverted turned black and dead at the river mouths. There were no fish to be found and mosquitoes were breeding and it was a health hazard. After one year of water being returned the limu had begun to grow and schools of many species can now be seen at the same river mouth that was completely dead a year earlier.

Response 2: We acknowledge your comments. Please note that Hāna nearshore environments or streams should be impacted as the EMI Aqueduct System does not divert any streams in Hāna. However, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses

on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as pages 4-78 to 4-83 of the Final EIS.

Comment 3: *This is a huge concern and liability for the State to allow our fish to be sacrificed. This is literally a form of genocide because we cannot feed our families and are forced to buy the GMO poisoned food that is making us sick. The State is always talking about making rules to save our fish species but the real problem is the water diversions that are destroying the habitat of the fish. Securing our fisheries will ensure the survival of the human race in Hawai'i for generations to come. If there is a disaster and we cannot ship food than we have food security. The decision makers who live in Hawai'i need to look deep into their hearts and think about their own children and their future generations survival and not sell out for a quick profit. The karma and backlash of such an action is so great it will last for lifetimes.*

Response 3: As noted in Response #2 above, he collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83 of the Final EIS.

With regards to food security, As discussed in Section 2.1.4 of the EIS, the Mahi Pono farm plan will support food sustainability goals for the State. See also Section 5.2 of the EIS discussing how the Mahi Pono farm plan supports Governor Ige's Sustainability Initiative. Section 4.7.4 of the EIS further explains that at full operation, the Mahi Pono farm plan is anticipated to generate approximately 65% of total farm (crops and cattle) sales from within the State market and approximately 35% of total farm sales from exports. However, the Hawai'i market is too small to use all of the farm products expected to be produced on the Central Maui agricultural fields, and thus some export is necessary. Section 2.1.4 of the Final EIS has been revised to include additional information on Mahi Pono's farm plan, as shown on pages 2-28 to 2-32.

Comment 4: *I am a taro farmer and that is the other part of our food security. We need our waters to flow to plant taro in every ahupua'a so that every family has good healthy sustenance. It is our right guaranteed in the Constitution of Hawai'i to have water to sustain our families and that nobody is allowed to hurt the subsistence farmers of the land. This action would obviously break those laws in the constitution and all those who partake in this crime will need to be brought to justice and held accountable for their negligence and crimes against humanity.*

Response 4: Please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on pages 1-19 to 1-23. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration statuts); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be

minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 5: *Mahi‘ai Pono needs to find crops that don‘t need to be watered, they need to re-plant a forest to bring back the rains so they don‘t depend on Hāna‘s water to make money. They are an outside corporation from a different country that will suck our wealth and leave us with nothing just like the sugar plantations did. They cannot be given this privilege which would deny us the people of this land and the ones that the Hawaiian trust is supposed to be benefitting. They are lucky to be here and need to figure out smart farming methods that don‘t need the kind of water they are asking for.*

Response 5: As stated in Response #2 above, please note that Hāna nearshore environments or streams should be impacted as the EMI Aqueduct System does not divert any streams in Hāna. Please note that a factor in the Mahi Pono farm plan, as stated in the EIS, is to be sensitive to the

existing local farming community. "Mahi Pono does not want to displace local farmers by planting competing crops or artificially accelerating the ramp-up of operations, both of which could have the potential to drive local farmers out of the market." See EIS Section 2.1.4. We also note that focus group sessions held as part of the Social Impact Assessment (SIA) conducted for the EIS and provided as Appendix G to the EIS and summarized in Section 4.7.2 of the EIS, included considerations of impacts to local farming. As discussed in Section 4 of the SIA, seven focus groups were convened in November 2018. Participants in these sessions included residents, farmers and ranchers, and people who are active in environment and sustainability efforts. These participants lived in Ke‘anae, Wailuānui, Huelo, Ha‘ikū, Kula, Makawao and Pukalani. The participants of those focus groups are identified in Tables 7 through 13 of Appendix G. Table 8 of the SIA identifies the ranchers and farmers that participated in the focus groups, with additional farmers being identified in Table 10. The SIA, summarized in Section 4.7.2 of the EIS, obtained input from several community members, many of whom have direct and long-term experience with the streams in East Maui. In particular, Section 5.3.2.3 of the SIA entitled "Local Farmers and Ranchers" discusses the potential social impacts of the Proposed Action on local farmers and ranchers:

The effect of the proposed water lease on Maui-based farmers, rangers and flower growers will depend on whether they can participate in future diversified agriculture in Central Maui. Thus far, there has been discussion regarding setting aside land for local farmers and eventually creating support facilities and services intended to provide means to reduce costs for individual farms. Little or no mention has been made regarding including livestock farmers in Mahi Pono's farm plan.

For Upcountry Maui farmers in the current and 262-acre expansion of Kula Agricultural Park, the effect of the proposed action will depend on how much water they can receive if the water lease is granted. There is a current allocation for the Kula Agricultural Park and the 262-acre expansion.

For East Maui farmers, the proposed water lease would continue to divert water from streams not designated for full restoration, although some are mandated to have partial restoration to support the stream habitat. When active diversion resumes, it is expected that an overall decrease in stream flow will occur in East Maui when compared to current conditions, but there will be an overall increase in stream flow compared to when sugar was fully operational in Central Maui.

Table 8 of the SIA in the Final EIS summarizes the concerns identified by farmers and ranchers who participated in the focus groups.

The difference now is that the people will not sit quietly like our ancestors did in the time of the sugar plantations. This is a generation of educated people that will stand and debate for as long as it takes to be heard and respected. We have aloha 'aina and that is such a mighty force that does not tire out and does not need money. This is our TMT in Maui and we will stand tirelessly just as those on Mauna Kea stand so if you are smart you will avoid this conflict by not awarding this water lease.

With regards to your comment about planting the forest, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under Hawai'i Revised Statutes (HRS) § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses priority outcomes essential to maintain or restore biological integrity of the watershed. The goals of the watershed management are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Comment 6: *Mahalo for taking my testimony and please deeply consider what I am saying and be prepared for a fight that we will never give up because our life depends on it and the survival of our future generations do as well. This is for your future offspring as well so don't sell out for the money, do what is right for the people and the land and all the species that will die if the water is diverted.*

Response 6: We acknowledge your comments. Please note that we provided you with detailed responses to each of your comments above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

10238-04
Letter to Mr. Paul-David Burns

Subject: Comments on the Draft EIS for the Proposed Water Lease for the Nahiku, Ke'anae, Honomano, and Huela Licence areas

Please accept my comments on the Draft EIS for the Proposed Water Lease for the Nahiku, Ke'anae, Honomano, and Huela Licence areas.

I care very deeply about this proposed lease of public water because I am a long time concerned Maui resident who has hiked and explored and become quite familiar with the watershed lands of East Maui over a 30 year period. I am very concerned that no one is taking much care of the precious watershed lands of East Maui and I have noticed serious degradation of the watershed in the last number of years. I have tried to absorb as much of the Draft EIS as possible in recent days and I have several comments that I would like addressed.

1. **Right off in the Executive summary on page "v" the following statement is made; "At full implementation and operation, the Mahi Pono farm plan is projected to generate more than 338 pounds per year of crops, generating \$155.9 million per year in annual food sales and \$329.5 million per year in combined direct and indirect sales." This is probably a typo or Mahi Pono must have its eye on some kind of amazing medicinal crop which can generate \$155 million dollars out of 338 pounds per year. Anyway, to start off a Draft EIS without careful review indicates to me a "rush" and "carelessness".**

2. **Further along in the executive summary on page viii & ix the following statements are made regarding Mitigation Measures if construction materials are needed on the EMI ditch system; "Construction materials arriving from outside Maui should also be washed and/or visually inspected (as appropriate) for excessive debris, plant materials, and invasive or harmful non-native species (plants, amphibians, reptiles, and insects). When possible, any raw materials used in maintenance activities should be purchased from a local supplier on Maui to avoid introducing non-native species not present on the island. Inspection and cleaning activities should be conducted at a designated location. The inspector must be a qualified botanist/entomologist able to identify invasive species that are of concern relevant to the point of origin of the equipment, vehicle, or material." I am presently retired, but spent 24 years at Haleakala National Park, most of which working in the Facilities Management Division. During any construction or repair project we were very cognizant of the possibility of introduction of non-native species, be it plants or insects etc. through construction machinery and/or materials regardless of whether the source was from Maui or an outside source. Purchasing construction materials or using a trucking source from Maui is **NO** guarantee that you are not introducing non-native species. Even though many of the lands in the East Maui Watershed have been subject to introduced non native species, particularly at the lower elevations, this does not mean that we should let our guard down. We need to protect what remains of our native environment. A truck from the western side of Haiku could inadvertently introduce the Coqui Frog to the lands further East in the watershed. So I feel that a more pro-active stance on mitigation measures needs to be addressed. What will the lessee do in terms of pest and weed removal? I do not believe that EMI had an adequate staff to address this problem. Over the years I spent time volunteering with the EMI staff to try to eliminate or control some of the invasive species along the ditch system. I believe a more concerted effort needs to be taken along these lines to save and restore the resource that remains and not just "milk it" for the water.**

3. **In regards to section 3.2.2.1 addressing Alternative Lease Duration. I think that it is entirely appropriate for the State to offer a shorter = 5-year- lease rather than a longer 30 year lease. I think the argument that Mahi Pono needs a longer lease to secure funding is a flawed argument. If that were the case they would not have gone ahead with the purchase and land clearing that they have done. I would like to see them take some positive agricultural steps that will make a difference on Maui before committing to a long term lease. The water will still be there after 5 years. But I want to make sure Mahi Pono is going to be around. I feel this would be an appropriate alternative at this juncture.**

4., I did not see any comments in the Draft EIS involving pro-active fire prevention and suppression. Mention was made that there might be as many as 12,000 acres dedicated to orchards. Will there be some kind of provision to assist the County to protect against the possibility of fire?

5. A number of the alternatives seemed to be dismissed because of the "expense" involved. Alternatives such as using R-1 reclaimed waste water or of lining or utilizing existing reservoirs for water storage. I understand this reasoning, but it also makes me concerned about the responsible stewardship of the East Maui Irrigation ditch system. It is very old, and remarkably still kind of functioning to a degree, but it really is in need of upgrades. Many of the tunnels and open ditches are quite leaky. Would the new lessee be willing to upgrade the system by installing things like PVC transmission pipe in some ditches and tunnels so that water was not wasted. Would the State require the new lessee to provide some upgrades to the system and not just run it further into the ground.

6. And one final thought. The East Maui Irrigation System is a precious historical treasure. There are some bridges and structures along the ditch system that are 100 years old or more. They need protection and preservation and it needs to be done right. Will the State demand this level of protection and preservation?

I am asking that the Draft EIS include this important information. Thank you for this opportunity to submit comments.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Kafka:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I care very deeply about this proposed lease of public water because I am a long time concerned Maui resident who has hiked and explored and become quite familiar with the watershed lands of East Maui over a 30 year period. I am very concerned that no one is taking much care of the precious watershed lands of East Maui and I have noticed serious degradation of the watershed in the last number of years. I have tried to absorb as much of the Draft EIS as possible in recent days and I have several comments that I would like addressed.*

Response 1: We acknowledge your comments and understand that you are a long time resident of Maui. Regarding your comment that no one is taking care of the watersheds in East Maui, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under Hawai‘i Revised Statutes (HRS) § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has

been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses priority outcomes essential to maintain or restore biological integrity of the watershed. The goals of the watershed management are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Furthermore, as described in Section 2.1 of the EIS, A&B was a founding member of the East Maui Watershed Partnership (EMWP). Under the Proposed Action, it is anticipated that the Water Lease lessee will continue to pursue watershed management activities either through an existing watershed management plan or a newly developed watershed management plan or some combination of both. The existing EMWP Management Plan was prepared in July 2009 and amended in July 2018, attached to the EIS as Appendix O. The EMWP Management Plan describes the watershed resources such as water, cultural / physical resources, native flora and fauna, and recreational resources. The EMWP Management Plan identifies the watershed threats and management objectives for the East Maui Watershed.

Regarding your comment about the degradation of the watershed, although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepeʻe, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to

additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

Comment 2: *Right off in the Executive summary on page "v" the following statement is made; "At full implementation and operation, the Mahi Pono farm plan is projected to generate more than 338 pounds per year of crops, generating \$155.9 million per year in annual food sales and \$329.5 million per year in combined direct and indirect sales." This is probably a typo or Mahi Pono must have its eye on some kind of amazing medicinal crop which can generate \$155 million dollars out of 338 pounds per year. Anyway, to start off a Draft EIS without careful review indicates to me a "rush" and "carelessness".*

Response 2: The production figure in the Executive Summary of the Draft EIS should read 338 million pounds per year, not 338 pounds. This was a typo and has been corrected in the Final EIS, including the Executive Summary as shown on page xii.

However, please note that Section 4.7.3 and Section 4.7.4 of the Draft EIS correctly describes accurate information regarding the benefits of the Mahi Pono farm plan. At Section 4.7.3:

At full operations, the Mahi Pono farm plan will cause a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops. Annual sales are expected to reach \$155.9 million. The pastures would support a cattle herd of about 7,300 cow-and-calf animal units, produce over 4,300 calves per year, and generate revenues of about \$4.8 million per year. The solar farm would generate about 82,125 mW of electricity per year, with revenues of about \$8.2 million per year. Combined farm and energy revenues would reach \$168.9 million per year in direct sales (far exceeding the 2006 revenues from sugar production of \$101 million, and the \$116 million average for the 2008 to 2013 period).

And at Section 4.7.4:

At full development, the Mahi Pono farm plan would result in a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops.

Impacts related to agricultural economics are discussed in detail in Section 4.7.4 of the EIS based on findings in Appendix I. Please refer to Section 4.7.4 and Appendix I to see discussions regarding the numerous benefits anticipated as a result of the Proposed Action. In summary, at full build-out, the Mahi Pono farm plan is anticipated to produce a significant amount of crops for both local consumption and export generating significant beneficial economic and fiscal impacts, providing numerous direct and indirect jobs, State and County tax revenues, etc.

Comment 3: *Further along in the executive summary on page viii & ix the following statements are made regarding Mitigation Measures if construction materials are needed on the EMI ditch system; "Construction materials arriving from outside Maui should also be washed and/or visually inspected (as appropriate) for excessive debris, plant materials, and invasive or harmful non-native species (plants, amphibians, reptiles, and insects). When possible, any raw materials used in maintenance activities should be purchased from a local supplier on Maui to avoid introducing non-native species not present on the island. Inspection and cleaning activities should be conducted at a designated location. The inspector must be a qualified botanist/entomologist able to identify invasive species that are of concern relevant to the point of origin of the equipment, vehicle, or material." I am presently retired, but spent 24 years at Haleakala National Park, most of which working in the Facilities Management Division. During any construction or repair project we were very cognizant of the possibility of introduction of non-native species, be it plants or insects etc. through construction machinery and/or materials regardless of whether the source was from Maui or an outside source. Purchasing construction materials or using a trucking source from Maui is NO guarantee that you are not introducing non-native species. Even though many of the lands in the East Maui Watershed have been subject to introduced non native species, particularly at the lower elevations, this does not mean that we should let our guard down. We need to protect what remains of our native environment. A truck from the western side of Haiku could inadvertently introduce the Coqui Frog to the lands further East in the watershed. So I feel that a more pro-active stance on mitigation measures needs to be addressed.*

Response 3: We acknowledge your comments. Please note that Section 4.4.1 of the EIS also states:

To avoid the introduction or transport of new invasive plant species into more pristine portions of the License Area during EMI Aqueduct System maintenance activities, all equipment and vehicles arriving from outside the License Area should be washed and inspected prior to any maintenance activities on cliff sides, near waterfalls, and in other native species-dominated areas in the License Area. Such washing and inspecting should be done at a designated location.

Moreover, please note that the mitigation measures have been expanded on as recommended by the USFWS as shown on pages 4-121 to 4-124.

Specifically, as it relates to invasive species, it is noted in Appendix C that that low-elevation portions of the License Area are already highly impacted by invasive plants. However, it is noted in Appendix C that high-elevation portions of the License Area are predominately dominated by native species and is very likely to contain habitat for several endangered or threatened species. Impacts related to flora and fauna as a result of the Proposed Action are discussed in Section 4.4 of the EIS. Please note that Section 4.4.1 and Section 4.4.2 have been revised in the Final EIS based on comments received on the Draft EIS to further outline the existing conditions of the License Area and more accurately reflect targeted mitigation measures based on feedback provided by the DLNR and USFWS. See pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS.

Comment 4: *What will the lessee do in terms of pest and weed removal? I do not believe that EMI had an adequate staff to address this problem. Over the years I spent time volunteering with the EMI staff to try to eliminate or control some of the invasive species along the ditch system. I believe a more concerted effort needs to be taken along these lines to save and restore the resource that remains and not just "milk it" for the water.*

Response 4: EMI staff continually perform repair and maintenance activities the EMI Aqueduct System as necessary. As discussed in the Section 2.1.2 of the Final EIS as shown on page 2-7 under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment.

Moreover, the lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. It is recognized that Hawai'i's fresh water originates from the forest, which capture and absorb hundreds of inches of rain each year, allowing for slow infiltration and replenishment of our aquifers and streams. Based upon this understanding, the legislature added sub-section (e) to HRS § 171-58, requiring the incorporation of a watershed

management plan into all water lease agreements to help protect freshwater resources (surface and ground water). In addition to sustaining ground and surface water supplies, healthy forests reduce erosion by holding soil in place, improve water quality, and provide habitat for unique and endangered plants and animals. Focusing on watershed management plans that target mauka protection actions (fencing, removal of hooved animals from important watershed forests, invasive weed control, etc.) that benefit native forests is essential if water lessees are going to have a reliable long-term supply of fresh water. As discussed in Section 2.1 of the Draft EIS, HRS § 171-58 requires the BLNR to jointly develop and implement a watershed management plan with the lessee of any water lease.

Comment 5: *In regards to section 3.2.2.1 addressing Alternative Lease Duration. I think that it is entirely appropriate for the State to offer a shorter -= 5-year- lease rather than a longer 30 year lease. I think the argument that Mahi Pono needs a longer lease to secure funding is a flawed argument. If that were the case they would not have gone ahead with the purchase and land clearing that they have done. I would like to see them take some positive agricultural steps that will make a difference on Maui before committing to a long term lease. The water will still be there after 5 years. But I want to make sure Mahi Pono is going to be around. I feel this would be an appropriate alternative at this juncture.*

Response 5: We acknowledge your comments. Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a

return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Comment 6: *I did not see any comments in the Draft EIS involving pro-active fire prevention and suppression. Mention was made that there might be as many as 12,000 acres dedicated to orchards. Will there be some kind of provision to assist the County to protect against the possibility of fire?*

Response 6: As noted in the EIS, both under current conditions and under the proposed Water Lease, water use does and will continue to include water used for reservoirs and fire protection.

Comment 7: *A number of the alternatives seemed to be dismissed because of the "expense" involved. Alternatives such as using R-1 reclaimed waste water or of lining or utilizing existing reservoirs for water storage. I understand this reasoning, but it also makes me concerned about the responsible stewardship of the East Maui Irrigation ditch system. It is very old, and remarkably still kind of functioning to a degree, but it really is in need of upgrades. Many of the tunnels and open ditches are quite leaky. Would the new lessee be willing to upgrade the system by installing things like PVC transmission pipe in some ditches and tunnels so that water was not wasted. Would the State require the new lessee to provide some upgrades to the system and not just run it further into the ground.*

Response 7: The availability of the use of reclaimed water from the Wailuku-Kahului Wastewater Reuse Facility (WWRF) is discussed in Draft EIS Section 3.1.1.2 (Reclaimed Water), which provides an analysis of the feasibility of the use of reclaimed water from the Wailuku-Kahului WWRF to irrigate the Central Maui fields. As discussed, the recycled water alternative using existing R-2 water from the Kahului WWRF could be considered an alternative as supplemental source. However, R-2 water has limited useability on crops. County of Maui Department of Environmental Management (DEM) does not intend to send this R-2 water to the

Central Maui agricultural fields. Further consideration of this alternative has been included in Chapter 3 of the FEIS, which has also been supplemented with a discussion about the potential new reuse/effluent disposal facility in Central Maui to be located south-west of the Kahului WWRP that is being considered by the County Department of Environmental Management. See pages 3-9 to 3-11 of the Final EIS.

Please note that the terms and conditions of the Water Lease are at the discretion of the BLNR. With regards to the physical condition of the EMI Aqueduct System, the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System. We also note that Appendix D of the EIS provides a Historical Structure Assessment East Maui Aqueduct System prepared by Mason Architects to provide an assessment of the historical significance of the EMI Aqueduct System.

However, the Mahi Pono farm plan will make an efficient use of water. Mahi Pono expects to invest over \$20 million to increase the efficiency of its Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to Section 2.1.4 of the Final EIS as shown on page 2-25. It should also be noted that the amount of water diverted at any given time through the EMI Aqueduct System will be only what is needed to meet actual needs.

Comment 8: *And one final thought. The East Maui Irrigation System is a precious historical treasure. There are some bridges and structures along the ditch system that are 100 years old or more. They need protection and preservation and it needs to be done right. Will the State demand this level of protection and preservation?*

Response 8: Please note that the terms and conditions of the Water Lease are at the discretion of the BLNR. However, as noted in Response #7 above, Appendix D of the EIS provides a Historical Structure Assessment East Maui Aqueduct System prepared by Mason Architects to provide an assessment of the historical significance of the EMI Aqueduct System.

Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Rae Griffith:

Thank you for comments dated November 9, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200, Section 18. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my stated opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Corporate greed is destroying our nation. Must it destroy the clean water necessary for animals and humans on Maui too? We must be good stewards of the land- or we will be held accountable by our Creator.*

Response 1: We acknowledge your comments and understand that you are opposed to the Proposed Action. With regards to your comment about destroying clean water for animals and humans, please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform

decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe‘e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals’ habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

With regards to your comment about being good stewards, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and

implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

To: Ian.c.hirokawa@hawaii.gov; Public Comment
Subject: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanū, and Huelo License Areas

From: Fred D. Sharpe, P.O. Box 80080, Haiku, HI 96708

To: Ian Hirokawa, Earl Matsukawa

Aloha Mr. Hirokawa and Mr. Matsukawa

Please accept my comments on the subject DEIS.

I care deeply about this proposed lease of public water because I have been a resident of Maui since 1985.

I live by a stream in Huelo, that is supposed to be restored, but we have waited many years for this to happen. I depend on how the water flows and how it is maintained.

Many of my friends also live on streams in the Huelo area, but their streams were not part of the 2018 water commission decision.

These are Waipio, Mokupapa and Ho'olawa streams.

The DEIS does not include their water needs. They have farms. Some of my Hawaiian neighbors have to try to water their farms from streams that get dried up by diversions. They all exist. They just didn't go to the Water Commission.

The DEIS needs to look at the needs of the streams and the communities in the Huelo area that were not part of the Water Commission case that was decided in 2018. It can't reach a conclusion that all the remaining water in the streams can go to Central Maui.

I am a farmer and I witness the importance of this flow to help our fish populations and is vital

for their survival.

The DEIS says that East Maui doesn't have the right kind of conditions for significant fish to live in the ocean. This is not true. The EIS should have a study of the ocean fish in East Maui.

I am really concerned with how the watershed is taken care of.

The DEIS says that a 30 year lease will have no impact on the native plants and animals, but we don't see anyone taking care of the watershed around us for the last 30 years that A&B had leases. We see that there were impacts and the watersheds are struggling to fight back alien plants

I highly suggest to ONLY allow a short term lease option. We cannot know what will be happening 30 years from now.

I am a farmer with NO public water access. I depend on the rain and on the stream. Lately I have shifted my planting towards food security: ulu, jackfruit, and other staple food trees.

I have never used any pesticides in over 30 years. I take care of this land in an ecological, responsible, and organic way. I fear Mahi Pono will use harmful pesticides. The EIS does not say where they will or will not.

Time should be taken to evaluate the real needs and the environmental impact of Mahi Pono's request.

The EIS makes a lot of statements that are lacking any real proof. Like it says that all of East Maui has only 44 acres suitable to grow kalo and 35 acres for truck farms. Our valleys have much more land than that that could be farms and orchards, if there was water. Our East Maui lands used to feed thousands of people. The EIS can not decide that we already have all the water we need when people here suffer when its not enough rain.

I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.

Thank you for handling this request with all of the care that only you can give. Every decision

needs to be made with our keikis in mind and heart.

Sincerely,

Fred D. Sharpe

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Sharpe:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I care deeply about this proposed lease of public water because I have been a resident of Maui since 1985.*

I live by a stream in Huelo, that is supposed to be restored, but we have waited many years for this to happen. I depend on how the water flows and how it is maintained.

Many of my friends also live on streams in the Huelo area, but their streams were not part of the 2018 water commission decision.

These are Waipio, Mokupapa and Ho‘olawa streams.

Response 1: We acknowledge your comments and understand that you are a resident in Huelo. With regards to the streams mentioned in Comment #1 (Waipi‘o, Mokupapa, and Ho‘olawa), please note that as you mention, these streams were not subject to the 2018 CWRM D&O. Hence, they were not required to have stream restoration. Under the Proposed Action, these

streams are assumed to be diverted as they have been in the past by the EMI Aqueduct System. With respect to the Draft EIS, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts. As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area. These impacts are related to stream habitat, as there will be a reduction from natural flow conditions which can be mitigated by adjustments in diversions to minimize entrainment; terrestrial flora and fauna resources, as well as historic and archeological resources, from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; cultural resources and practices which can be mitigated by a myriad of recommendations proposed by Cultural Surveys Hawai‘i; and socio-economic characteristics which can be mitigated by further public outreach and consultation.

Comment 2: *The DEIS does not include their water needs. They have farms. Some of my Hawaiian neighbors have to try to water their farms from streams that get dried up by diversions. They all exist. They just didn't go to the Water Commission.*

Response 2: Please note that as discussed in Response #1 above, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, including the region in Huelo where streams were not restored.

With regards to your comments about farms, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on

the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Comment 3: *The DEIS needs to look at the needs of the streams and the communities in the Huelo area that were not part of the Water Commission case that was decided in 2018. It can't reach a conclusion that all the remaining water in the streams can go to Central Maui.*

Response 3: Please note that these streams were included in the overall analysis of the Proposed Action which entails diverting water from the License Area, including the Huelo region, for uses described in the EIS. As noted in Response #1 above, the non-petitioned streams that were not subject to the CWRM D&O are assumed to be diverted as they have been in the past by the EMI Aqueduct System.

However, while Mahi Pono's current farm plan assumes the full use of the water that can be diverted from East Maui streams after compliance with the CWRM D&O, the Reduced Water Volume alternative described in Chapter 3 of the EIS provides an assessment of the impacts of less water being made available for the Proposed Action, including Maui Pono farm plan in the Central Maui agricultural fields. Hence, should water be restored in these streams, it is assumed that scenario would fall under this alternative.

Comment 4: *I am a farmer and I witness the importance of this flow to help our fish populations and is vital for their survival.*

The DEIS says that East Maui doesn't have the right kind of conditions for significant fish to live in the ocean. This is not true. The EIS should have a study of the ocean fish in East Maui.

Response 4: Your comment about the Draft EIS stating that the East Maui has the wrong ocean conditions to have substantial fish populations is unclear. Nowhere is this stated in Appendix B or the Draft EIS. Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on the pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on the pages 4-78 to 4-83 of the Final EIS.

Comment 5: *I am really concerned with how the watershed is taken care of.*

The DEIS says that a 30 year lease will have no impact on the native plants and animals, but we don't see anyone taking care of the watershed around us for the last 30 years that A&B had

leases. We see that there were impacts and the watersheds are struggling to fight back alien plants

Response 5: With regards to your comment about how the watershed is taken care of, please note as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

With regards to your comment about no impacts on native plants and animals under the Proposed Action, in summary, the Proposed Action is not anticipated to have any significant impacts on the terrestrial flora and faunal resources. Section 6.3 of Appendix C in the Final EIS states that, *“The increased water flows in the streams would likely have very little impact on terrestrial flora and fauna.”* Hence, this statement refers to all existing flora and fauna within the License Area and is not limited to only native species. As discussed in Section 5.1.2.1 of Appendix C in the Draft EIS, the majority (60%) of the License Area is already composed of “Open / Closed ‘Ōhi‘a Forest,” which mainly constitutes the higher elevation areas where water is not diverted as shown by Figure A-2 of Appendix C. Moreover, the immediate area surrounding the EMI Aqueduct System tends to be composed of “alien forest” which consist of non-native species.

We acknowledge that an EIS must consider cumulative impacts, which means "the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions." HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision-making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream

diversions as proposed under the Water Lease. However, please note that streams in East Maui have been diverted for over a century and it is not scientifically possible to fully document impacts that first took place more than a century ago as pre-diversion data does not exist.

Section 4.4 of the EIS specifically addresses the impacts of the Proposed Action to flora and fauna resources within the License Area, including a discussion of the cumulative impacts. Appendix C (Terrestrial Flora and Fauna Technical Report) of the EIS that was prepared by SWCA included a survey of approximately 33,000 acres of land in East Maui referred to in the SWCA report as the License Area and approximately 30,000 acres of agricultural land in Central Maui that it referred to as the Service Area. These areas were collectively referred to as the Study Area throughout the SWCA report. This report is summarized in Section 4.4 of the EIS, which has been supplemented with a discussion on potential impacts on a watershed by watershed basis, using data produced by the HSHEP model and HIGAP data provided by the State, along with surveys conducted within the region as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS.

Comment 6: *I highly suggest to ONLY allow a short term lease option. We cannot know what will be happening 30 years from now.*

Response 6: We acknowledge your comments. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also pages 3-49 to 3-80 of the Final EIS, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *I am a farmer with NO public water access. I depend on the rain and on the stream. Lately I have shifted my planting towards food security: ulu, jackfruit, and other staple food trees.*

Response 7: We acknowledge your comment. We understand that many communities do not have access to the public water system. However, please note that this is under the purview of the MDWS, not EMI.

Comment 8: *I have never used any pesticides in over 30 years. I take care of this land in an ecological, responsible, and organic way. I fear Mahi Pono will use harmful pesticides. The EIS does not say where they will or will not.*

Response 8: Regarding your comment about pesticide use, as discussed in Section 4.12 pesticide use is regulated by both State and Federal law. The use of these chemicals is compliant with all laws regulating pesticide use, and certified commercial applicators are utilized as required. Act 45 which was passed by the 2018 Hawai'i Legislature and effective on January 1, 2019 required that all Certified Applicators of Restricted Use Pesticides (RUP) submit a report of the RUP that were applied each year. This report as well as any other report required by law is publicly

available from the respective government entity. The State of Hawai‘i DOA's Pesticide Branch also provides regulatory oversight over Mahi Pono’s pesticide use. In accordance with this oversight, records of pesticide use must be kept and made available to the Pesticide Branch upon request at any time. It is also noted that since January 2020 Mahi Pono committed to discontinuing use of Round-Up. This information has been included in the Final EIS as shown in pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations.

Comment 9: *Time should be taken to evaluate the real needs and the environmental impact of Mahi Pono’s request.*

Response 9: Please note that a substantial amount of time has been spent on evaluating and assessing the Proposed Action. BLNR determined that A&B was to prepare the EIS for the proposed Water Lease. As explained in Section 1.4 of the Draft EIS, in connection with A&B's May 2001 submittal to the BLNR requesting that the BLNR offer a long-term (30 year) water lease at public auction, A&B offered to perform the associated HRS, Chapter 343 environmental review. As part of the contested case hearing on the proposed Water Lease, NHLC, on behalf of Nā Moku, objected to A&B undertaking the environmental review process, and asserted that the BLNR was required to prepare conduct the environmental review. NHLC later orally withdrew its objection during oral arguments before the BLNR in May 2015. BLNR issued an order on April 14, 2016, directing A&B to scope the EIS, including the identification of the portions of the EIS that could proceed prior to the CWRM issuing a final IIFS decision, and those portions which could not. That scope was filed with the BLNR in June 2016. On July 8, 2016, the BLNR approved the scope and instructed that “A&B and EMI should proceed with the preparation of an environmental impact statement (EIS) in as expeditious manner as possible.” The EIS recites this history in Section 1.3.3 of the Draft EIS and recognizes that the Water Lease will be awarded by public auction. Hence, the EIS process has taken over five years.

Comment 10: *The EIS makes a lot of statements that are lacking any real proof. Like it says that all of East Maui has only 44 acres suitable to grow kalo and 35 acres for truck farms. Our valleys have much more land than that that could be farms and orchards, if there was water. Our East Maui lands used to feed thousands of people. The EIS can not decide that we already have all the water we need when people here suffer when its not enough rain.*

Response 10: As noted in Response #2 above, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely

primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Comment 11: *I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.*

Thank you for handling this request with all of the care that only you can give. Every decision needs to be made with our keikis in mind and heart.

Response 11: We acknowledge your comments. Please note that we provided you with detailed responses to each of your comments above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC’s website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

RE: Comments on the Draft EIS for East Maui Water Leases:

Dear Mr. Hirokawa & Mr. Matsukawa:

Although I currently reside in Texas, I was born and raised in Hāna and still have interest in family land there. I try hard to keep up with the goings on in Hāna and happened to be in Hāna from November 3 – November 10, 2019.

I've been aware that there has been an effort to acquire a longer water lease by A&B for some time, and that there was an impact statement being prepared, but had not yet heard that a draft had been submitted for review prior to my arrival in Hāna.

I am writing with some concerns I have regarding the Draft EIS. I received a copy to review on Monday November 4, 2019. Unfortunately, I only had a few days' time to review as much as possible and provide comment. You will find my concerns/comments listed below:

- **Review & Comment Period:** During the short time I had to review the extensive document it came to my attention that the Hāna community did not receive the document immediately. The shortened time frame they had left to review such a large document is **inadequate** for someone who would be reviewing the document on a full-time basis and as such is **completely unreasonable** for the community to have an opportunity to carefully review the entire contents of the document. I myself read quickly and have experience reading documents of this scale, and it took me over an hour and a half just to review the Executive Summary where I immediately identified verbiage that was concerning. As I'm sure you are both aware, most Hāna residents have to work more than 1 job, or are commuting to Central Maui, and on top of that live a subsistence lifestyle which

substantially reduces the amount of time they have to carefully review the entire document. Due to this fact, I am requesting on behalf of the Hāna community an extension to the review period conducive and accommodating to these circumstances. In the second to the last paragraph under the section **Mitigation Measures** on page x it is stated that *“The fundamental value that will help bring people to the same table is trust.”* In order for the community to start to trust this process it is required for A&B to put the first foot forward by providing total transparency and to accommodate the community in ways that may go beyond what is standard practice, or what minimums are required by applicable law. I concede to the Maui County Council to determine and provide to you what they believe is an adequate extension for the community to review the Draft EIS.

- **Executive Summary, Significant Beneficial and Adverse Impacts, Page v:** In the last paragraph in/on this section/page, there are financial projections represented:
 - **“At full implementation the Mahi Pono farm plan is projected to generate more than 338 pounds...”** – this appears to be a typo, as it is not feasible to generate the revenue represented with a production value of this amount.
 - **Central Maui Environmental Impacts of the Mahi Pono farm plan** – I was unable to find within the table of contents any discussion around projections (if any currently) or reference to an EIS for the farm plan itself. It seems to me that a 262-acre farm that is split between 7,000 – 12,000 head of cattle and crops would have a significant impact on the local environment in Central Maui. My concern is primarily for runoff or overspray of cow excrement and/or excrement/waste particulates, pesticides or fertilization into the ocean that could further negatively affect native fish species. Maui is an island, and any impact in Central Maui to the sea will have a direct impact on the entire island. Hāna relies heavily on fishing. Diversion of water from East Maui to Central Maui will already have an adverse effect on fish populations (i.e. spawning) that the community’s subsistence lifestyle relies on. I would not be in support for this project to move forward knowing that it would be the first “domino” to tip over and cause a cascade of negative impacts. An EIS for the Mahi Pono farm plan would be important information to have in order to fully weigh and be as responsible as possible by considering the impacts of issuing this water lease.
- **Executive Summary, Mitigation Measures, Page viii:** Verbiage throughout this section is concerning. The use of the word “should” in bullet points relating to how A&B intends to maintain the EMI Aqueduct System **needs to be replaced** with the word “will”. Referencing back to my first bullet point, establishing trust with the community rests solely in A&B’s hands. The verbiage in both the EIS and the lease (if issued) needs to hold A&B to the highest possible standards, and they should be willing to do so no matter the financial impact to A&B. As a for profit enterprise, this responsibility and the associated costs should be factored and held as a cost of doing business, and they should hold this responsibility with the same respect and stewardship that Hāna community does.

Mr. Ian Hirokawa
November 6, 2019
Page 3

My above comments/concerns represent just the Executive Summary (just a small *fraction*) of the 2,700-page Draft EIS. Based on the concerns I've outlined above, if I had been provided enough time to review the entire document, I have no doubt I would have identified many more areas of concern that I could have addressed. I ask that you provide an adequate extension to the review period so that the first step in establishing trust within the community can be achieved. Not only will this start the building of trust, it will also ensure that our unique and delicate Hawaiian ecosystem will be provided the appropriate level of consideration and respect required to ensure that all future generations will benefit from it.

Sincerely,

Rath Kaikala

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Rath Kaikala:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Although I currently reside in Texas, I was born and raised in Hāna and still have interest in family land there. I try hard to keep up with the goings on in Hāna and happened to be in Hāna from November 3 – November 10, 2019.*

I’ve been aware that there has been an effort to acquire a longer water lease by A&B for some time, and that there was an impact statement being prepared, but had not yet heard that a draft had been submitted for review prior to my arrival in Hāna.

I am writing with some concerns I have regarding the Draft EIS. I received a copy to review on Monday November 4, 2019. Unfortunately, I only had a few days’ time to review as much as possible and provide comment. You will find my concerns/comments listed below:

Response 1: We acknowledge your comments and understand that you are a former resident of Hāna. Please note that the Draft EIS was published on September 8, 2019 in *The Environmental Notice*. Please note that we have provided you with detailed responses to your comments below.

Comment 2: Review & Comment Period: *During the short time I had to review the extensive document it came to my attention that the Hāna community did not receive the document immediately. The shortened time frame they had left to review such a large document is inadequate for someone who would be reviewing the document on a full-time basis and as such is completely unreasonable for the community to have an opportunity to carefully review the entire contents of the document. I myself read quickly and have experience reading documents of this scale, and it took me over an hour and a half just to review the Executive Summary where I immediately identified verbiage that was concerning. As I'm sure you are both aware, most Hāna residents have to work more than 1 job, or are commuting to Central Maui, and on top of that live a subsistence lifestyle which substantially reduces the amount of time they have to carefully review the entire document. Due to this fact, I am requesting on behalf of the Hāna community an extension to the review period conducive and accommodating to these circumstances.*

Response 2: Please note that there is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comments were received during the statutory comment period.

Regarding your comment about the Draft EIS being received by Hāna Public Library after publication, we originally sent one hard copy to the Wailuku Public Library as that is the most centralized location between East Maui, Upcountry Maui, and Central Maui. However, at the request of a County councilmember, two more hard copies were sent out; one to the Hāna Public Library and one to Maui County Council Office. Moreover, please note that pursuant to HAR § 11-200-21 a distribution list of reviewers needed to be approved by the State of Hawai'i Office of Environmental Quality Control (OEQC), which notified the reviewers of the availability of the Draft EIS. The distribution list included Federal, State, and County agencies, list of depositories, as well as organizations and individuals (who provided addresses) that participated in the early consultation and EIS Preparation Notice (EISPN) scoping meetings and commented on the EISPN. This list was provided as Table 9-2 in the Draft EIS. Hence, the Draft EIS- was distributed in compliance with the required State process.

Comment 3: *In the second to the last paragraph under the section Mitigation Measures on page x it is stated that "The fundamental value that will help bring people to the same table is trust." In order for the community to start to trust this process it is required for A&B to put the first foot forward by providing total transparency and to accommodate the community in ways that may go beyond what is standard practice, or what minimums are required by applicable law. I concede to the Maui County Council to determine and provide to you what they believe is an adequate extension for the community to review the Draft EIS.*

Response 3: We acknowledge your comments. However, please note that the quote that you reference is in regards to the mitigation measures identified in the Social Impact Assessment (Appendix G) with regard to social cumulative impacts experiences by many stakeholders within the East Maui region. Moreover, as noted in Response #2 above, note that there is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comments were received during the statutory comment period.

Comment 4: *Executive Summary, Significant Beneficial and Adverse Impacts, Page v:* *In the last paragraph in/on this section/page, there are financial projections represented:*

- *“At full implementation the Mahi Pono farm plan is projected to generate more than 338 pounds...” – this appears to be a typo, as it is not feasible to generate the revenue represented with a production value of this amount.*

Response 4: The production figure in the Executive Summary of the Draft EIS should read 338 million pounds per year, not 338 pounds. This was a typo and has been corrected in the Final EIS, including the Executive Summary as shown on page xii.

However, please note that Section 4.7.3 and Section 4.7.4 of the Draft EIS correctly describes accurate information regarding the benefits of the Mahi Pono farm plan. At Section 4.7.3:

At full operations, the Mahi Pono farm plan will cause a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops. Annual sales are expected to reach \$155.9 million. The pastures would support a cattle herd of about 7,300 cow-and-calf animal units, produce over 4,300 calves per year, and generate revenues of about \$4.8 million per year. The solar farm would generate about 82,125 mW of electricity per year, with revenues of about \$8.2 million per year. Combined farm and energy revenues would reach \$168.9 million per year in direct sales (far exceeding the 2006 revenues from sugar production of \$101 million, and the \$116 million average for the 2008 to 2013 period).

And at Section 4.7.4:

At full development, the Mahi Pono farm plan would result in a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million

pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops.

Impacts related to agricultural economics are discussed in detail in Section 4.7.4 of the EIS based on findings in Appendix I. Please refer to Section 4.7.4 and Appendix I to see discussions regarding the numerous benefits anticipated as a result of the Proposed Action. In summary, at full build-out, the Mahi Pono farm plan is anticipated to produce a significant amount of crops for both local consumption and export generating significant beneficial economic and fiscal impacts, providing numerous direct and indirect jobs, State and County tax revenues, etc.

Comment 5: *Central Maui Environmental Impacts of the Mahi Pono farm plan – I was unable to find within the table of contents any discussion around projections (if any currently) or reference to an EIS for the farm plan itself. It seems to me that a 262-acre farm that is split between 7,000 – 12,000 head of cattle and crops would have a significant impact on the local environment in Central Maui.*

Response 5: Please note the Mahi Pono farm plan is described in detail in Section 2.1.4 of the Draft EIS, which provides projected water use of both surface and ground water. This section of the EIS has been updated to include a description of Mahi Pono's current uses of the Central Maui agricultural fields. Please see pages 2-30 and 2-32 of the Final EIS. The Central Maui agricultural fields proposed for diversified agricultural uses by Mahi Pono are comprised of approximately 30,000 acres, not 262 acres. The Proposed Action would result in the transition of approximately 30,000 acres of former sugarcane operation to a diversified agricultural operation.

Impacts of the Mahi Pono farm plan are addressed in Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), which provides a comprehensive description and impact analysis of the East Maui Lease Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts.

Comment 6: *My concern is primarily for runoff or overspray of cow excrement and/or excrement/waste particulates, pesticides or fertilization into the ocean that could further negatively affect native fish species. Maui is an island, and any impact in Central Maui to the sea will have a direct impact on the entire island. Hāna relies heavily on fishing. Diversion of water from East Maui to Central Maui will already have an adverse effect on fish populations (i.e. spawning) that the community's subsistence lifestyle relies on. I would not be in support for this project to move forward knowing that it would be the first "domino" to tip over and cause a cascade of negative impacts. An EIS for the Mahi Pono farm plan would be important information to have in order to fully weigh and be as responsible as possible by considering the impacts of issuing this water lease.*

Response 6: The Mahi Pono farm team follows Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion. Once crops are planted (particularly the permanent orchard crops), ground disturbance will be a limited, resulting in a further reduction of dust and erosion. Also, ranchers will rotate their cattle among paddocks to ensure that the pastures are not overgrazed and waste load do not exceed what the grasses can absorb. In addition, lease terms will require farm tenants to follow BMPs. Also, as noted in Response \$5 above, the environmental impacts of the Mahi Pono farm plan in Central Maui was assessed as described in Chapter 4.

Regarding your comment questioning whether the Water Lease could impact fish populations and subsistence lifestyles, . Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many

segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow

restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa‘akea) have connectivity flow restoration ordered. Pa‘akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83 of the Final EIS.

Your opposition to the Water Lease is acknowledged. Your comment letter and this response will be included in the Final EIS.

Comment 7: *Executive Summary, Mitigation Measures, Page viii: Verbiage throughout this section is concerning. The use of the word “should” in bullet points relating to how A&B intends to maintain the EMI Aqueduct System **needs to be replaced** with the word “will”. Referencing back to my first bullet point, establishing trust with the community rests solely in A&B’s hands. The verbiage in both the EIS and the lease (if issued) needs to hold A&B to the highest possible standards, and they should be willing to do so no matter the financial impact to A&B. As a for profit enterprise, this responsibility and the associated costs should be factored and held as a cost of doing business, and they should hold this responsibility with the same respect and stewardship that Hāna community does.*

Response 7: Your comments are unclear as you do not specifically reference any of the mitigation measures presented in the Executive Summary. However, please note that the EIS does not authorize or mandate any activity. The EIS is an environmental disclosure document that assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 8: *My above comments/concerns represent just the Executive Summary (just a small fraction) of the 2,700-page Draft EIS. Based on the concerns I’ve outlined above, if I had been provided enough time to review the entire document, I have no doubt I would have identified many more areas of concern that I could have addressed. I ask that you provide an adequate extension to the review period so that the first step in establishing trust within the community can be achieved. Not only will this start the building of trust, it will also ensure that our unique and*

10238-04
Letter to Rath Kaikala

September 3, 2021

delicate Hawaiian ecosystem will be provided the appropriate level of consideration and respect required to ensure that all future generations will benefit from it.

Response 8: We acknowledge your comments. Please note as discussed in Response #2 above, there is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comments were received during the statutory comment period.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Holtz:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please keep the water flowing for the kalo farmers and fishing rights of humans here on Maui. Please don’t make money from the big corporate off island companies.*

Response 1: We acknowledge your comments. With regards to kalo farming, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi‘ina‘au, Palauhulu, Waiokamilo, Wailuānui, ‘Ōhi‘a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM’s intent to regulate

where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for taro were identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on pages 1-19 to 1-22 of the Final EIS. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration status); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available

to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in the included pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

With regards to fishing, Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically

focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83 of the Final EIS.

September 3, 2021

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Draft EIS for the Proposed Lease (Water Lease) for license areas.

**Specifically the Nahiku, Ke'anae, Honumano, and Huelo License areas.

My comments are as follows:

I care about having a properly and inclusively executed DEIS/EIS because I am a concerned upcountry Maui resident, an experienced invasive species control person, and I am concerned the DEIS does not fully address these issues.

- The EIS needs to include a thorough and complete plan for Invasive/Non-Native species control. Without this information the watershed will continue to degrade. Reference Chapter 4, pages 94-96
- The EIS needs to be more succinct and correct about the effect on Upcountry water users, the information presented in the DEIS is incomplete and in a few cases misleading.

Thank you for the opportunity to submit comments on the Draft EIS.

Respectfully,
Robert L Cole
Pukalani, HI.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Cole:

Thank you for comments dated October 3, 2019 and November 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

October 3, 2019 Email

Comment 1: *I think the A&B draft is fine as it is, enough already we need the food security for the majority of the population. Move on.*

Response 1: We acknowledge your comments. With regards to food security, as discussed in Section 2.1.4 of the EIS, the Mahi Pono farm plan will support food sustainability goals for the State. See also Section 5.2 of the EIS discussing how the Mahi Pono farm plan supports Governor Ige's Sustainability Initiative. Section 4.7.4 of the EIS further explains that at full operation, the Mahi Pono farm plan is anticipated to generate approximately 65% of total farm (crops and cattle) sales from within the State market and approximately 35% of total farm sales from exports. However, the Hawai‘i market is too small to use all of the farm products expected to be produced on the Central Maui agricultural fields, and thus some export is necessary. Section 2.1.4 of the Final EIS has been revised to include additional information on Mahi Pono's farm plan, as shown on pages 2-28 to 2-32.

November 5, 2019 Email

Comment 2: ***Specifically the Nahiku, Ke'anae, Honumano, and Huelo License areas.*

My comments are as follows:

I care about having a properly and inclusively executed DEIS/EIS because I am a concerned upcountry Maui resident, an experienced invasive species control person, and I am concerned the DEIS does not fully address these issues.

Response 2: Your comment about having a properly and inclusively executed DEIS is unclear. The Draft EIS fully complied with all relevant requirements, including the content requirements set forth in §11-200-16 and 11-200-17, and the Draft EIS even includes a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement. The Draft EIS meets the necessary content requirements and for that reason we believe that it is a properly executed EIS. We also note that over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M). Moreover, over 400 comment were received in response to the Draft EIS. The Applicant made every reasonable effort to convey information through the Draft EIS in a manner that is accurate, thorough, and appropriately concise in order to provide the public with an opportunity to fairly analyze the potential impacts of the Proposed Action. Hence we also believe the EIS is inclusive.

With regards to your comment about invasive species, it is noted in Appendix C that that low-elevation portions of the License Area are already highly impacted by invasive plants. However, it is noted in Appendix C that high-elevation portions of the License Area are predominately dominated by native species and is very likely to contain habitat for several endangered or threatened species. Impacts related to flora and fauna as a result of the Proposed Action are discussed in Section 4.4 of the EIS. Please note that Section 4.4.1 and Section 4.4.2 have been revised in the Final EIS based on comments received on the Draft EIS to further outline the existing conditions of the License Area and more accurately reflect targeted mitigation measures based on feedback provided by the DLNR and USFWS. See pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the

time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Comment 3: *The EIS needs to include a thorough and complete plan for Invasive/Non-Native species control. Without this information the watershed will continue to degrade. Reference Chapter 4, pages 94-96*

Response 3: As noted in Response #2 above, Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Moreover, Appendix C of the Draft EIS specifically addresses the flora and fauna considerations of the Proposed Action and alternatives. To minimize the impacts to flora and fauna in the License Area, Section 7 of Appendix C identifies several avoidance and minimization measures, including measures to avoid the introduction of additional invasive species to the License Area, which is harmful to the watershed and to native flora which are also reflected in Section 4.4 of the EIS.

Comment 4: *The EIS needs to be more succinct and correct about the effect on Upcountry water users, the information presented in the DEIS is incomplete and in a few cases misleading.*

Response 4: Your comment that the information regarding Upcountry Maui water being misleading is unclear as you do not offer any specificity and therefore we cannot provide a specific response. However, Upcountry Maui water needs are predominantly supplied by surface water obtained outside of the License Area for a portion of the Upcountry Maui Water System, in the areas that are served by the Upper and Lower Kula Systems. These systems are supplied primarily by the Upper and Lower Waikamoi Flumes, respectively, and the waters are treated at the Piiholo and Olinda treatment facilities. As discussed in Section 2.1.3.1 of the Draft EIS, these systems are situated on private lands now owned by EMI and are operated and maintained by EMI staff. However, please note that this section mistakenly referred to Mahi Pono as the landowner of the land that the Upper and Lower Waikamoi Flumes are situated on. This has been corrected in the Final EIS as shown on page 2-13.

The source of water for these systems comes from land owned by EMI and the MDWS' right to access this source on a long-term basis is contingent upon the issuance of the Water Lease. As discussed in Section 3.3 of the Draft EIS:

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. As a consequence, domestic and agricultural water needs in Upcountry Maui would need to be met by alternative water sources that would need to be developed by the MDWS. At this point in time, it is unknown whether sufficient groundwater resources exist in Upcountry Maui to meet these water demands. It is anticipated that the development of alternative water-source infrastructure would be prohibitively expensive, and depending upon the specific sources, or combination of sources, could result in significant direct adverse impacts to the environment.

However, please note that the above discussion regarding the Upper and Lower Kula Systems have been supplemented with the additional figure as shown on page 2-16 which has been added to Section 2.1.3.1 of the Final EIS to accurately show which system is serving which community in Upcountry Maui.

As discussed in Section 2.1.3.1 of the Draft EIS, *“The Upcountry Maui Water System relies on three surface water sources, which accounts for approximately 80-90 percent (13 mgd) of water delivered through the Upcountry Maui Water System (CWRM D&O, FOF 799).”* In addition to the Upper and Lower Waikamoi flume sources, serving the Upper and Lower Kula Systems, there is the EMI Aqueduct System, which is the primary source for the Makawao System, which provides water via the Wailoa Ditch to the MDWS' Kamole-Weir Water Treatment Plant (WTP). As discussed in Section 2.1.3.1 of the Draft EIS, *“average daily use by the MDWS from*

the Wailoa Ditch is about 7.1 mgd, which includes water processed by the Kamole-Weir Water Treatment Plant (WTP) (discussed in further detail below) and non-potable water for the KAP, which receives water from Reservoir 40.” Reservoir 40 is sourced by the EMI Aqueduct System as well. This accounts for approximately more than half of the total surface water delivered to the entire Upcountry Maui Water System.

Moreover, the water delivered to the MDWS through Wailoa Ditch is an important back-up source for the Lower Kula and Upper Kula Systems during dry periods as the Wailoa Ditch is the more reliable of the three Upcountry surface water sources. Water is pumped uphill from the Kamole-Weir WTP to the Upper and Lower Kula systems during dry periods. Therefore, these systems also depend on the EMI Aqueduct System in crucial, drought times. Please note that Section 2.1.3.1 of the Final EIS has been supplemented to include this information as shown on pages 2-19 to 2-20.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

And Suzanne Case, Chairperson, Hawai'i DLNR

151 Punchbowl Street, Honolulu, Hawai'i 96813

Makawao, Hawaii November 7, 2019

I appreciate you allowing public comment on this Draft EIS. I am resident of Makawao and I am concerned about some aspects that have not been fully thought out in the EIS.

I ask that you consider and include answers to the following questions in the final EIS regarding a 30-year water lease to a private company.

- 1.I didn't feel the DEIS was adequate in explaining how Mahi Pono farming practices were going to protect our reefs.
- 2.I found the DEIS inadequate in explaining what is going to prevent a large rainfall from taking all of this bare ground into the ocean and destroying our reefs. (I understand the A&B had a permanent crop that mitigated this issue.)

3.The DEIS did not adequately explain how the public trust of water is being protected by giving a private company a lease for 30 years.

4.I'm concerned the DEIS is not taking into consideration the right of the Hawaiian people to receive remuneration for the sale or lease of the water from state lands.

Thank you

Robin Winn

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Robin Winn:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I appreciate you allowing public comment on this Draft EIS. I am resident of Makawao and I am concerned about some aspects that have not been fully thought out in the EIS.*

I ask that you consider and include answers to the following questions in the final EIS regarding a 30-year water lease to a private company.

Response 1: We acknowledge your comments and understand that you are a resident of Makawao. Please note that we provide you with detailed responses below to each one of your points.

Comment 2: *I didn't feel the DEIS was adequate in explaining how Mahi Pono farming practices were going to protect our reefs.*

Response 2: Please note that the Mahi Pono farm plan will follow best management practices as it relates to drainage to manage runoff from agricultural fields that are near coastal waters as explained in Section 4.2.4 of the Draft EIS. Please note that Section 4.2.4 of the EIS as shown on

page 4-87 that the Mahi Pono farm team follows best management practices approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion and, thus, runoff associated with their current farming activities.

Comment 3: *I found the DEIS inadequate in explaining what is going to prevent a large rainfall from taking all of this bare ground into the ocean and destroying our reefs. (I understand the A&B had a permanent crop that mitigated this issue.)*

Response 3: As noted in Response #2 above, the Mahi Pono farm plan will follow best management practices as it relates to drainage to manage runoff from agricultural fields that are near coastal waters as explained in Section 4.2.4 of the Draft EIS. Please note that Section 4.2.4 of the EIS as shown on page 4-87 that the Mahi Pono farm team follows best management practices approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion and, thus, runoff associated with their current farming activities. Moreover, please note that the Central Maui agricultural fields are located within a region that receives very little rainfall annually. Hence, the need to divert surface water from East Maui. Specifically, Section 4.3.1 states, "*Central Maui's climate is typical of Leeward coastal lowlands receiving little rainfall annually, and is relatively dry. The northeast areas receive more rain than the central and southern areas of Central Maui. The average annual rainfall ranges from less than 10 inches in the southern part of the isthmus to over 40 inches in the northeastern areas.*" Hence, large storms or rainfall events that would cause large amounts of earth to drain into the ocean are not likely to occur in Central Maui.

Comment 4: *The DEIS did not adequately explain how the public trust of water is being protected by giving a private company a lease for 30 years.*

Response 4: Regarding your comment about the Public Trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

Comment 5: *I'm concerned the DEIS is not taking into consideration the right of the Hawaiian people to receive remuneration for the sale or lease of the water from state lands.*

Response 5: Your comment about Hawaiian people receiving remuneration is unclear. However, please note the rental payments due under the Water Lease will be distributed into the State Special Land Development Fund (as is done for payments due on all the other leases and revocable permits in the State). The Office of Hawaiian Affairs (OHA) receives 20% of the revenue generated from each lease while the Department of Hawaiian Home Lands (DHHL) receives 30% of the revenue generated, as discussed in Section 4.7.3 of the EIS. However, please note that the State of Hawai'i Department of Land and Natural Resources (DLNR) administers the Fund, i.e., decides how to use the revenue generated.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: NO PRIVATIZATION OF WATER - THINK

Follow Up Flag: Follow up
Flag Status: Flagged

To whom it may concern, I am vehemently opposed to leasing water rights for 30 years, to a corporation, who profits from the water. Let the people of the community have the water to grow healthy food. Not only does the corporation profit, they also spray poison, which drifts in the air we breathe, runs off into the ocean we swim and fish in, and kills everything in its path. The poison they spray is known to cause cancer, allergies, cause auto-immune issues, infertility, eczema, and birth defects. Who in their right mind, would give our precious natural resources away, in exchange for being poisoned? Privatization of water is not only wrong, it is unsafe for the community, the environment and all natural resources.

Think about what you are doing for future generations. Stop putting profits over people.

Respectfully,

Sandra Toliver

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Toliver:

Thank you for comments dated October 24, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *To whom it may concern, I am vehemently opposed to leasing water rights for 30 years, to a corporation, who profits from the water.*

Response 1: We acknowledge your comments and understand that you are opposed to the Proposed Action.

Comment 2: *Let the people of the community have the water to grow healthy food. Not only does the corporation profit, they also spray poison, which drifts in the air we breathe, runs off into the ocean we swim and fish in, and kills everything in its path. The poison they spray is known to cause cancer, allergies, cause auto-immune issues, infertility, eczema, and birth defects. Who in their right mind, would give our precious natural resources away, in exchange for being poisoned? Privatization of water is not only wrong, it is unsafe for the community, the environment and all natural resources.*

Think about what you are doing for future generations. Stop putting profits over people.

Response 2: We acknowledge your comments. Your comment about let the people of the community have the water to grow healthy food is unclear. With regards to kalo farming, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on pages 1-19 to 1-23 of the Final EIS. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration statuts); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamo Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area,

including among other purposes, for restoration for lo‘i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result

in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Your comment about poison is unclear however, we assume that you are referring to pesticide and herbicide use. As discussed in Section 4.12 pesticide use is regulated by both State and Federal law. The use of these chemicals is compliant with all laws regulating pesticide use, and certified commercial applicators are utilized as required. Act 45 which was passed by the 2018 Hawai'i Legislature and effective on January 1, 2019 required that all Certified Applicators of Restricted Use Pesticides (RUP) submit a report of the RUP that were applied each year. This report as well as any other report required by law is publicly available from the respective government entity. The State of Hawai'i DOA's Pesticide Branch also provides regulatory oversight over EMI's pesticide use. In accordance with this oversight, records of pesticide use must be kept and made available to the Pesticide Branch upon request at any time. It is also noted that since January 2020 EMI committed to discontinuing use of Round-Up. This information has been included in the Final EIS as shown on pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement

Dear Mr. Matsukawa,

Please accept my comments regarding Alexander and Baldwin's proposal to further divert the streams of East Maui.

I work with an organization in Kipahulu that farms wetland taro, and fortunately we draw our water from a stream that is not diverted. I have great sympathy for the struggle of the farmers of the Koolau moku who have had to fight for decades just to get a basic level of water flowing in their streams to support their traditional farming practices. I support the farmers of East Maui where the water flows, first and foremost!

- 1) I object to the inadequate period of time given to review an extremely (and unnecessarily) long document and provide meaningful comments.
- 2) Priority must be given to in-stream flow values, including traditional taro farmers, and aquatic and marine life.
- 3) Healthy flow of fresh water into the ocean is vital for healthy nearshore ecosystems. Recent restoration of flow has resulted in noticeable increase in abundance and diversity of nearshore resources. This is a very important part of the purpose of restoring stream flows that is often overlooked and not given the attention it deserves.
- 4) No long-term (or even short-term) water lease should be given without a defined and specified farm plan detailing exactly what crops are being grown where, and how much water is needed for those crops. It is wrong to ask for or approve a huge quantity of water without a clear justification for the need.
- 5) 30 years is too long, period. Things change. Plans change. Climate is changing. 30 years is too long.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Scott Crawford

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Crawford:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments regarding Alexander and Baldwin’s proposal to further divert the streams of East Maui.*

I work with an organization in Kipahulu that farms wetland taro, and fortunately we draw our water from a stream that is not diverted. I have great sympathy for the struggle of the farmers of the Koolau moku who have had to fight for decades just to get a basic level of water flowing in their streams to support their traditional farming practices. I support the farmers of East Maui where the water flows, first and foremost!

Response 1: We acknowledge your comments and understand that you work with the Kipahulu organization that grows taro. With regards to your comments about taro farming, with regards to kalo farming, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on pages 1-13 to 1-24 of the Final EIS. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration statuts); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a

little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 2: *I object to the inadequate period of time given to review an extremely (and unnecessarily) long document and provide meaningful comments.*

Response 2: We acknowledge your comments noting for a time extension to allow for additional public comment. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai‘i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 3: *Priority must be given to in-stream flow values, including traditional taro farmers, and aquatic and marine life.*

Response 3: Regarding your comment that priority must be given to in-stream flow values, please note that water can only be diverted from the subject East Maui streams after compliance with the CWRM D&O under the Proposed Action and other alternatives.

Regarding traditional taro farmers, as noted in Response #1 above, For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Keʻanae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on the included pages 4-288 to 4-293.

Regarding aquatic and marine life, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no

estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have esturine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat

flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawā and Paʻakea) have connectivity flow restoration ordered. Paʻakea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83.

Comment 4: *Healthy flow of fresh water into the ocean is vital for healthy nearshore ecosystems. Recent restoration of flow has resulted in noticeable increase in abundance and diversity of nearshore resources. This is a very important part of the purpose of restoring stream flows that is often overlooked and not given the attention it deserves.*

Response 4: Regarding your comment about healthy flow of fresh water into the ocean, please note as discussed in Response #3 above, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species (ʻOʻopu naniha (*Stenogobius hawaiiensis*), ʻOʻopu akupa (*Eleotris sandvicensis*) and ʻŌpae ʻoehaʻa (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Piʻinaʻau, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Paʻakea will have connectivity flow restoration, while ʻOʻopuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

Comment 5: *No long-term (or even short-term) water lease should be given without a defined and specified farm plan detailing exactly what crops are being grown where, and how much*

water is needed for those crops. It is wrong to ask for or approve a huge quantity of water without a clear justification for the need.

Response 5: We acknowledge your comments. Please note that a detailed farm plan is provided in the Draft EIS. The Mahi Pono farm plan, provided in Table 2-1 of the Draft EIS lists the acreage that Mahi Pono proposes to irrigate under the Proposed Action as shown below:

Proposed Use	Acres	Gallon Per Acre a Day	Surface MGD	Ground water MGD	Total MGD	Annual MGD	% of Total
<i>Community Farm</i>	800	3,392	1.87	0.83	2.70	987	3.28%
<i>Orchards (citrus, mac nuts, beverage crops)</i>	12,850	5,089	53.39	12.04	65.43	23,883	79.48%
<i>Tropical Fruits</i>	600	4,999	2.07	0.87	2.94	1,073	3.57%
<i>Row and Annual Crops</i>	1,200	3,392	3.14	0.95	4.09	1,491	4.96%
<i>Energy Crops</i>	500	3,392	1.18	0.53	1.70	622	2.07%
<i>Pasture, irrigated</i>	4,700	1,161	4.20	1.25	5.46	1,992	6.63%
<i>Pasture, unirrigated</i>	9,100	0	0	0	0.00	0	0.00%
<i>Green Energy</i>	250	0	0	0	0.00	0	0.00%
TOTAL	30,000	2,744	65.86	16.47	82.33	30,047.77	100.00%

The Mahi Pono farm plan as shown above at full buildout provides water demands and what is proposed to be grown. However, as discussed in Section 2.1.4 of the Draft EIS that the Mahi Pono farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, which includes the DHHL water reservation.

Comment 6: *30 years is too long, period. Things change. Plans change. Climate is changing. 30 years is too long.*

Response 6: We acknowledge your comments. With regards to your comment about 30 years being too long, Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability." The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The

Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

With regards to your comment about climate change, Please note that the EIS includes the most recent information regarding climate change within its analysis. As discussed in Section 4.3.1 of the Draft EIS:

Regular trade winds are key in driving the Hawai'i's hydrological cycle, generating rainfall which helps maintain Maui's water supply. However, a recent study showed that Hawai'i's trade winds have decreased in frequency by approximately 30% over the past 37 years, from 291 days per year in 1973, to 210 days per year in 2009 (Garza et. al, 2012). The decrease in the trade winds could have serious implications for the Hawaiian Islands, including adversely

impacting local agriculture, native ecosystems and endangered species, and the State's limited freshwater supply.

Overall, the State of Hawai'i is experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014)...

Climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. Such rainfall patterns increase the amount of stormwater runoff flowing through the region, including through the streams within the License Area that reach the shoreline. The expected climatic changes in precipitation patterns and streamflow will influence the quantities and concentration of stormwater runoff entering the nearshore environments and coastal waters, resulting in increased sedimentation, impacting coral reefs. However, because of the continuous wave energy in shore areas in East Maui, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species. (SE & MRC, 2019).

Hence, the EIS recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall. Moreover, Section 4.3.1 of the Final EIS has been expanded to include information from the archeological literature review and field inspection (LRFI) report (Appendix E), the Cultural Impact Assessment (CIA) report (Appendix F), and the Terrestrial Flora and Fauna Technical Report (Appendix C) prepared for this EIS as shown in pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanū, and Huelo License Areas

Please accept my comments on the subject DEIS.

I am a landowner in East Maui and have DEEP CONCERN FOR THIS AREA THAT I HAVE USED FOR NEARLY 40 YEARS.

I have seen first hand the positive changes in stream health since the sugar shutdown.

An EIS needs to consider shorter term leases and in depth study of the ongoing health of the ecosystem when water is taken from the streams.

Weather changes, potential for less water in general are real concerns. I think the lease should be 5 to 10 years.

I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.

Aloha,
Scott Heller

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Heller:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments on the subject DEIS.*

I am a landowner in East Maui and have DEEP CONCERN FOR THIS AREA THAT I HAVE USED FOR NEARLY 40 YEARS.

Response 1: We acknowledge your comments and understand that you are a landowner in East Maui.

Comment 2: *I have seen first hand the positive changes in stream health since the sugar shutdown.*

Response 2: We acknowledge your comments. Please note that many people at the EISPN public scoping meetings on February 22nd and 23rd, 2017 testified noting positive impacts seen from increased stream flow resulting from the cessation of sugar operations, please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See page 4-168 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted. This

is expected as it was discussed in Section 4.2.1 of the Draft EIS that the Proposed Action would increase the number of HU as compared to sugarcane operations. Please note that that as of October 2020, an average of 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System. Hence it can be assumed that current water diversion rates from the License Area are comparable to the amount that would be diverted under the No Action alternative, which is estimated to be approximately 26.39 mgd. The HSHEP model estimated that approximately 79.8% of total habitat units (HU) would be available under the No Action alternative. However, please note that under the Proposed Action, the total HU would be less than projected under the No Action alternative.

Comment 3: *An EIS needs to consider shorter term leases and in depth study of the ongoing health of the ecosystem when water is taken from the streams.*

Response 3: We acknowledge your comments. Please note that the EIS did discuss alternative lease durations. Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-

using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

With regards to your comment about an in-depth study about impacts due to stream diversions, please note that the Draft EIS analyzes each reasonable alternative on stream flow in Section 3.4.3 and Section 4.2.1 of the Draft EIS. The combination of the lower and upper bounds used for the HSHEP model in Appendix A, provide the range at which we would expect changes to the diversions to fall within and provides a way to comparatively discuss different flow restoration scenarios as by definition the changes must fall somewhere between 100% diversion and 0% diversion.

The two scenarios presented in Appendix A of the Draft EIS, the Proposed Action compliant with the CWRM D&O (Trutta Environmental Solutions' 2018 IIFS scenario) and No Action Alternative (30% remaining flow diversion) are examples of how different flow restoration scenarios result in different amounts of habitat restored. The HSHEP model is used to quantify these differences based on flow restoration changes at specific diversions.

As discussed in Section 3.4.3 of the Draft EIS, the HSHEP model requires specific diversion conditions at each diversion. Applying the model to the Reduced Water Volume alternative would require information regarding where stream flows are proposed to be increased over the Proposed Action and the amounts. Given such information, the HSHEP model is able to readily calculate the number of remaining Habitat Units (HU) in any given scenario. The appendices contained within the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report (Appendix A of the EIS) provides the necessary data to form a scenario that the HSHEP model can use to analyze and quantify the changes that occur. Hence, the HSHEP model and the appendices within the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report provides data that can assist decision makers understand how impacts could change across different diversions scenarios.

Comment 4: *Weather changes, potential for less water in general are real concerns. I think the lease should be 5 to 10 years.*

Response 4: We acknowledge your comments. Please note with regards to climate change that the EIS includes the most recent information regarding climate change within its analysis. As discussed in Section 4.3.1 of the Draft EIS:

Regular trade winds are key in driving the Hawai‘i’s hydrological cycle, generating rainfall which helps maintain Maui’s water supply. However, a recent study showed that Hawai‘i’s trade winds have decreased in frequency by approximately 30% over the past 37 years, from 291 days per year in 1973, to 210 days per year in 2009 (Garza et. al, 2012). The decrease in the trade winds could have serious implications for the Hawaiian Islands, including adversely impacting local agriculture, native ecosystems and endangered species, and the State’s limited freshwater supply.

Overall, the State of Hawai‘i is experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014)...

Climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. Such rainfall patterns increase the amount of stormwater runoff flowing through the region, including through the streams within the License Area that reach the shoreline. The expected climatic changes in precipitation patterns and streamflow will influence the quantities and concentration of stormwater runoff entering the nearshore environments and coastal waters, resulting in increased sedimentation, impacting coral reefs. However, because of the continuous wave energy in shore areas in East Maui, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species. (SE & MRC, 2019).

Hence, the EIS recognizes that the State of Hawai‘i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall. Moreover, Section 4.3.1 of the Final EIS has been

expanded to include information from the archeological literature review and field inspection (LRFI) report (Appendix E), the Cultural Impact Assessment (CIA) report (Appendix F), and the Terrestrial Flora and Fauna Technical Report (Appendix C) prepared for this EIS as shown in pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

With regards to a shorter lease, as noted in Response #3 above, Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Comment 5: *I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.*

Response 5: We appreciate your participation in this EIS process. Please note that we have provided you with detailed responses to each of your comments above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

TO: Ian Hirokawa, Earl Matsukawa

FROM: SHARYN STONE

re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'aenae, Honomanu, and Huelo License Areas

"Aloha" Mr Matsukawa and Mr Hirokawa,

Please accept my comments on the subject of DEIS for East Maui Stream Leases

I care very deeply about this proposed lease of public water because I have been a RESIDENT OF HUELO (Door of Faith Church Rd) since 1992. I know care very deeply about this proposed lease of public water because I have been a RESIDENT OF HUELO since 1992. Some of my neighbors have lived here far longer than I have, and I have heard MANY comments going something like this: 'This used to be all *green ... but since the streams have been diverted ... no more ...*'

By what rights, do you GIVE AWAY ANY of our public resources, with no respect for local residents or their needs, and with seemingly no regard for those who love the natural beauty of such streams? Who can we trust to take care of our natural (public) resources if not our own government? This is capitalism with no controls - all for short term 'profit' and the government seems to be buying into it. Where are MY personal rights when it comes to use of public resources?

The assumptions made in the current DEIS are distinctly flawed - eg it is assumed that any evaluation of impacts of long term leases should be based

upon the 100 years plus of diverted depleted stream conditions, rather than on pre-diversion conditions, or even current conditions of relatively modest 20 - 25 MGD diversion levels.

Another assumption that REALLY stuck in my craw was that only Central Maui has the substantial potential to grow useful food crops for Maui's future. By assuming this, you are assuming that all future agribusiness will be a continuation of large tracts of monoculture - a model which the rest of America is coming to realize just doesn't work for the health of the soil and the well being of surrounding residents! What I found particularly worrisome was this FICTION: "East Maui has only 44 acres potential for Kalo cultivation and 35 acres suitable for truck farming." FACT: local residents of East Maui are mostly all on 2 acre ag parcels and ALL OF US have to file an AG FARM PLAN with the State. I'm pretty sure that I have more than 18 or 19 neighbors who produce food!!! THIS STATEMENT IS DANGEROUSLY MISLEADING AND HAS ABSOLUTELY NO BASIS IN FACT!!!

If you are seriously going to consider ANY lease of our resources, then may I request that you impose conditions which involve the well being of our soil resources. We've all seen where the chemical heavy monoculture ag got us. Dusty, depleted soil. (Yet I was fascinated to read a news article about Maui Pono growing potatoes the other day - on soil that has been 'fallow' for 3 or 4 years, so was then considered 'safe' for food crops. No testing results, of course, were quoted in support this claim).

Maui is experiencing its hottest, driest summer on record. I am on a surface well. It has dried up. No rain is in sight. My neighbors are in a similar state. This well has been reliable since the 1970's. This is the first time EVER it has dried. Yet, you want to give away our water resources???? I say: please don't!

Mahalo

Sharyn Stone

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Stone:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *'This used to be all green ... but since the streams have been diverted ... no more ...'*

By what rights, do you GIVE AWAY ANY of our public resources, with no respect for local residents or their needs, and with seemingly no regard for those who love the natural beauty of such streams? Who can we trust to take care of our natural (public) resources if not our own government? This is capitalism with no controls - all for short term 'profit' and the government seems to be buying into it. Where are MY personal rights when it comes to use of public resources?

Response 1: We acknowledge your comments. Please note that pursuant to HRS § 171-58 the State of Hawai‘i has the authority to issue a Water Lease up to 65 years. Regarding your comment about the Public Trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B’s 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the

BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

Comment 2: *The assumptions made in the current DEIS are distinctly flawed - eg it is assumed that any evaluation of impacts of long term leases should be based upon the 100 years plus of diverted depleted stream conditions, rather than on pre-diversion conditions, or even current conditions of relatively modest 20 - 25 MGD diversion levels.*

Response 2: Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat

in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

However, we respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the "No Action" alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *Another assumption that REALLY stuck in my craw was that only Central Maui has the substantial potential to grow useful food crops for Maui's future. By assuming this, you are assuming that all future agribusiness will be a continuation of large tracts of monoculture - a model which the rest of America is coming to realize just doesn't work for the health of the soil and the well being of surrounding residents!*

Response 3: Please note that nowhere is it stated that Central Maui is the 'only' region that has the substantial potential to grow food crops. Rather as summarized in Section 4.7.4 of the Draft EIS and Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts):

Central Maui has some of the best agricultural conditions in the State for farming, including a large area in a compact configuration, high-quality soils, high solar radiation, a location near markets and shipping terminals, and potentially ample water at low delivery costs (assuming a new Water Lease with a reasonable use fee), and for lessees rents that will be comparatively low.

The basis for this finding is given in Subsection 5 of Appendix I of the Draft EIS, along with Figures 4 to 12 in Appendix I of the Draft EIS.

Moreover, as discussed in Section 5 of Appendix I and Section 4.7.4 of the Draft EIS, the overwhelming majority of the Central Maui agricultural fields (approximately 80%) are rated by the UH Land Study Bureau (LSB) as having the highest Overall Productivity Rating of "A" (on a scale of "A" to "E" with "E" being the lowest soil rating), and a little over 11% has a "B" rating. In other words, about 27,567 acres (90.9%) are high-quality lands rated A or B. The Agricultural Lands of Importance to the State of Hawai'i (ALISH) Classification System, developed and compiled in 1977 by the State Department of Agriculture with assistance from the U.S. Department of Agriculture - Natural Resources Conservation Service (NRCS), and the College of Tropical Agriculture, University of Hawai'i. Approximately 25,669 acres of the Central Maui agricultural fields are classified under the ALISH system as "Prime", which means "agricultural land which is land that is best suited for the production of crops because of its ability to sustain high yields with relatively little input and with the least damage to the environment." Also, as discussed in Section 5.1.4 of the EIS and Section 5 of Appendix I, approximately 22,000 of the 30,000 acres of agricultural fields in Central Maui are designated as Important Agricultural Lands (IAL). Under Article XI, Section 3, of the Constitution of Hawai'i, the State is required to conserve and protect agricultural lands, promote diversified agriculture, increase agricultural self-sufficiency and assure the availability of agriculturally suitable lands. HRS Chapter, 205, § 205-41 through § 205-52, provides for the designation of IAL. As stated in HRS Chapter 205: "*The objective for the identification of important agricultural lands is to identify and plan for the maintenance of a strategic agricultural land resource base that can support a diversity of agricultural activities and opportunities that expand agricultural income and job opportunities and increase agricultural self-sufficiency for current and future generations.*" IAL designation facilitates the long-term dedication of lands for future agricultural use so long as there is a sufficient supply of water to allow for profitable farming.

However, the EIS and the associated technical studies do not claim that only Central Maui has the substantial potential to grow useful food crops for Maui's future. As discussed in Section 2.1 of the Draft EIS, the scope of this EIS is to assess the Proposed Action which is, "...to enable the Board of Land and Natural Resources (BLNR)-awarded lessee the right, privilege and authority

to enter and go upon State-owned lands for the purposes of developing, diverting, transporting and using government-owned waters. The requested Water Lease would allow the use of government-owned waters from the License Area (approximately 33,000 acres which includes lands within Nāhiku, Ke‘anae, Honomanū, and Huelo) through the East Maui Irrigation Company, LLC (EMI) Aqueduct System. Use of that surface water would allow the continued provision of water to enable approximately 30,000 acres of farmland in Central Maui to remain in agriculture.” Hence, the EIS assesses the action of obtaining a Water Lease and diverting water from East Maui. With regards to agriculture, under the Proposed Action, a major portion of the diverted water from East Maui would be used to irrigate the agricultural fields in Central Maui to continue to transition to diversified agriculture.

Comment 4: *What I found particularly worrisome was this FICTION: "East Maui has only 44 acres potential for Kalo cultivation and 35 acres suitable for truck farming." FACT: local residents of East Maui are mostly all on 2 acre ag parcels and ALL OF US have to file an AG FARM PLAN with the State. I'm pretty sure that I have more than 18 or 19 neighbors who produce food!!! THIS STATEMENT IS DANGEROUSLY MISLEADING AND HAS ABSOLUTELY NO BASIS IN FACT!!!*

Response 4: We respectfully disagree with your comment. Specifically, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM

D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Comment 5: *If you are seriously going to consider ANY lease of our resources, then may I request that you impose conditions which involve the well being of our soil resources. We've all seen where the chemical heavy monoculture ag got us. Dusty, depleted soil. (Yet I was fascinated to read a news article about Maui Pono growing potatoes the other day - on soil that has been 'fallow' for 3 or 4 years, so was then considered 'safe' for food crops. No testing results, of course, were quoted in support this claim).*

Response 5: We acknowledge your comments. Please note that the terms and conditions are at the discretion of the BLNR. In response to your comments about soil resources, please note that the Mahi Pono farm team follows Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion. Once crops are planted (particularly the permanent orchard crops), ground disturbance will be a limited, resulting in a further reduction of dust and erosion. In addition, lease terms will require farm tenants to follow BMPs.

Regarding your comment about food safety, O'ahu farmers have demonstrated that food crops can be grown safely and successfully on former sugarcane lands. Regarding the potatoes grown in Central Maui, Maui News reported that they were tested by a third-party laboratory (Environmental Micro Analysis Inc.) for 400 chemicals, and that the potatoes were found to be free of pesticide residuals and safe for eating (2-8-2020). These results were reviewed by the Maui District Health Officer who confirmed that none of the hundreds of chemicals tested for were detected.

Comment 6: *Maui is experiencing its hottest, driest summer on record. I am on a surface well. It has dried up. No rain is in sight. My neighbors are in a similar state. This well has been reliable since the 1970's. This is the first time EVER it has dried. Yet, you want to give away our water resources???? I say: please don't!*

Response 6: We acknowledge your comments. However, you do not offer any specificity to where your well is located, therefore, we cannot offer you any specific comments. However, please note that Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License

Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts. As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area. These impacts are related to stream habitat, as there will be a reduction from natural flow conditions which can be mitigated by adjustments in diversions to minimize entrainment; terrestrial flora and fauna resources, as well as historic and archeological resources, from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; cultural resources and practices which can be mitigated by a myriad of recommendations proposed by Cultural Surveys Hawai'i; and socio-economic characteristics which can be mitigated by further public outreach and consultation.

Moreover, climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct

10238-04
Letter to Ms. Sharyn Stone
Page 9 of 9
September 3, 2021

System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown on the pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Re: Proposed Lease for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas; Draft Environmental Impact Statement (DEIS)

November 6, 2019

Dear Mr. Matsukawa:

I am submitting comments to you as an individual regarding the draft environmental impact statement referenced above. My primary concern relates to the alternative related to a change in ownership. Per the DEIS:

Page iv "Alternatives Considered":

"Alternatives considered but dismissed included certain water source alternatives, including use of groundwater and use of reclaimed water, as well as additional water storage. A change of ownership of the EMI Aqueduct System was similarly considered but dismissed from further study."

Page 3-4, Section 3.1.2 Aqueduct Ownership:

"During public scoping for the DEIS in 2016 and 2017, it was suggested that the EMI Aqueduct System should be brought under new ownership, without the further involvement of A&B and EMI, and potentially under public ownership. Ownership of the EMI Aqueduct System changed in January 2019 to include Mahi Pono, which intends to pursue diversified agriculture in Central Maui. Consideration of another change in ownership is too speculative at this point to warrant analysis. A change in the ownership of the EMI Aqueduct System will not enhance environmental quality or avoid, reduce, or minimize all or even some adverse environmental effects, costs, or risks of the Proposed Action. ...Furthermore, the EMI Aqueduct System is not for sale, and forced acquisition of the system is projected to be prohibitively expensive, resulting in substantial costs to the public. For these reasons, this alternative is viewed as a highly speculative and unreasonable alternative, and one that would not meet the objectives of the Proposed Action. Therefore, it was dismissed from further review."

On July 19, 2019, the Maui County Board of Water Supply formed a Temporary Investigative Group (TIG) to explore options for ensuring public access to water, including the feasibility of purchasing and maintaining the EMI Water Delivery System. The TIG's Report was made public on October 16, 2019 and can be accessed at the links below. It has not yet been deliberated on by the Board of Water Supply.

<https://www.mauicounty.gov/DocumentCenter/View/119847/2019-10-17-TIG-Report>
<https://www.mauicounty.gov/DocumentCenter/View/119848/2019-10-17-TIG-Report-Appendices>

I am also attaching a PDF of the narrative report with this email.

The 283-Page TIG Report and the significant interest shown by members of the Maui County Council in it demonstrates that a change in the ownership of the EMI Aqueduct System as an alternative is not speculative.

The report further demonstrates that public ownership will enhance environmental quality and will avoid, reduce, and minimize the majority of the adverse environmental effects, costs, or risks of the Proposed Action, as addressed in the following chapters:

- **STRATEGIES FOR CREATING AND CONSERVING FRESH WATER CAPACITY**
- **NATIVE HAWAIIAN LAND & WATER RIGHTS**
- **CONSIDERATIONS RE: PURCHASING & MAINTAINING EMI SYSTEM**

The report also addresses an imminent domain acquisition, which will **not** be prohibitively expensive, and will in fact likely provide revenues for addressing the environmental and cultural issues described in the chapters outlined above. Information regarding purchase price, revenues, and expenses can be found in the following chapters:

- **CALCULATIONS FOR INITIAL PURCHASE PRICE, ESTIMATED EXPENSES, AND POTENTIAL REVENUES FOR A PUBLIC TRUST WATER SYSTEM**
- **COUNTY BIDDING ON A LONG-TERM LEASE**
- **EXAMPLE GOVERNANCE STRUCTURES**

Given that the DEIS devotes less than half a page to the ownership change alternative, while a volunteer community board produced an 85-page document with 198 pages in supporting appendices regarding the feasibility of purchasing the aqueduct for public ownership, **the draft EIS clearly has not adequately addressed this alternative, and at the very least needs to address the issues raised in the Temporary Investigative Report: *Feasibility of Purchasing and Maintaining the EMI Water Delivery System.***

Specific issues to address include, but are not limited to the initial purchase price and cost to restore the EMI Ditch System described on page 70 and 71 of the TIG report:

Initial Purchase Price	Amount	Notes
Includes 15,000 acres of land parcels and ditches utilized for the EMI system.	\$5,442,333.48 (possibly less any depreciation since 12/17/18 purchase due to neglect.)	Based on MP purchase price for full system, (only half has been paid.)
Estimated costs to restore the EMI ditch system and to correct deferred maintenance.	\$12 million over two years.	Based on 6% of Replacement Asset Value (RAV) of \$200 million, which is the modern system replacement cost cited in the EMI Draft EIS
Total Purchase Price plus substantial improvements:	\$17.4 million	Improvements from the beginning

Bond Payments:

If the EMI System is acquired by the County or State, properly structured bond financing could be utilized for acquisition and restoration of the system. Borrowing \$17.4 million at 3.75% over thirty years would require debt service payments totaling \$966,985 annually.

Value of Purchasing System Prior to Mahi Pono Obtaining a Long-Term Lease:

If Mahi Pono is able to obtain a 30-year lease, the company will likely try to argue that the EMI aqueduct system has a higher value with a long-term lease than its purchase price of \$5.4 million. There are clear indications from the December 17, 2018 purchase agreement with Alexander & Baldwin that a core component of Mahi Pono’s investment strategy is the monetization of public trust water resources as evidenced by A&B’s obligation to rebate Mahi Pono \$62 million of the purchase price if Mahi Pono does not obtain a water lease allocation of at least 30 mgd. (See sales agreement)

Another issue raised in the TIG report is the value of the water requested in the lease application. The figures shown on page 72 of the TIG report need to be addressed:

According to the Draft EIS, Page 2-18:

The Mahi Pono farm plan assumes the following: The total surface water available for use after system losses is estimated to be approximately 65.88 mgd.

Based on maximum delivery of water and current agricultural and domestic water rates charged to Maui County farmers and residents, the highest potential annual agricultural revenue that can be derived from the 65.88 mgd is:

Convert 65.88 mgd to kgal (1,000 gallons)	Convert to kgal per year (365 days)	If water were delivered at current agricultural rates (\$1.10 per 1,000 gallons)
65,880 kgal	24,046,200 kgal per year	\$26,450,820

And finally, the EIS needs to address the issues raised under “Recommendations and Conclusion” on Page 81:

Based on all the information available to the TIG at this time, the Temporary Investigative Group is convinced that in order to protect the public’s health, safety, and well-being in the short- and long-terms, actions need to be taken immediately to utilize legal and financial vehicles to secure the public’s control of the EMI Water Delivery System.

A. County Application for a Long-Term Lease:

Maui County should immediately apply for a long-term (Water Lease) for the Nāhiku, Ke’anae, Honomanū, and Huelo License Areas, situated at TMK Nos. (2) 1-2- 004:005, 007 (por.), 1-1-002:002, 1-1-001:044, 1-1-001:050, 2-9-014:001, 005, 011, 012, 017 in the Makawao and Hana Districts, on the island of Maui.

The above action would be valuable on its own, in terms of supporting the next step, as well as working in tandem with “Recommended Near-Term Actions” below.

B. Re-negotiate Current Contracts with EMI/Mahi Pono

Maui County should immediately re-negotiate a new contract with EMI/Mahi Pono that does not require that EMI/Mahi Pono obtain a Revocable Permit or Lease in order for the Kamole Treatment Plant to access Wailoa Ditch waters. This lease could also include requirements that address the various issues raised in this document from repair and maintenance of the system to native Hawaiian stream rights to investment in watershed protection and addressing liability issues.

By applying for a long-term lease, the County would be better positioned to re-negotiate the contract with EMI/Mahi Pono. Excluding corporation counsel personnel costs, this option would be relatively straightforward and would not be cost prohibitive. (See current Lease Appendix 13.)

However, this option would require enforcement on the part of the County, which would only be realistic if the County were willing to fully utilize its powers and responsibilities to protect the public interest. Furthermore, long-term solutions are needed to ensure the well-being of Maui residents.

4. Recommended Near-Term Actions:

As outlined under "Governance Structures" and described in more detail previously, because the financial incentive structure of a private equity-controlled water delivery system is misaligned with the long-term public interest, it would be imprudent to assume that the "Primary" and "Other Considerations" described above [on Page 80] will be addressed by Mahi Pono.

Therefore, the TIG recommends that the County of Maui exercise its powers of eminent domain as soon as possible to begin the process of supporting acquisition of the system.

Furthermore, if the County of Maui is interested in facilitating community control of the EMI Aqueduct system and meeting the multiple needs of stakeholders, acquiring the system at a price close to the \$5.4 million paid by Mahi Pono in December 2018 is essential. As noted previously, if Mahi Pono obtains a 30-year water lease, the private equity fund will likely argue that the EMI aqueduct system has a value higher than the original purchase price. (Mahi Pono's sales agreement with A&B states that the water lease is worth a minimum of \$62 million.) Acquiring the system in the near term will thus increase the chances of minimizing long-term debt.

Thank you for your attention to this matter. I look forward to seeing the issues raised in the Board of Water Supply's Temporary Investigative Group Report integrated into the final Environmental Impact Statement.

Sincerely,

Shay Chan Hodges

ALL DOCUMENTS ARE INCLUDED AS A REFERENCE FOR WHAT HAS BEEN SAID ABOUT THE SYSTEM, MAUI RESIDENTS' NEEDS, AND THE LEGAL ENVIRONMENT. INCLUSION IN THIS REPORT DOES NOT IMPLY THAT THE TEMPORARY INVESTIGATIVE GROUP HAS IN ANY WAY CONFIRMED THE VERACITY OF ANY DOCUMENTS OR CLAIMS.

WE HAVE MADE EVERY ATTEMPT TO INCLUDE INTERNET LINKS TO THE ORIGINAL DOCUMENTS AND/OR ATTACHMENTS AS APPENDICES, AND TO MAKE THE SOURCES OF TEXTS CLEAR. WE HOPE THAT THE READER WILL USE THIS DOCUMENT AS A STARTING POINT FOR FURTHER RESEARCH.

PLEASE ALSO NOTE THAT SOME GRAMMATICAL ERRORS, MISSPELLINGS, AND INCONSISTENCY IN SPELLINGS OF HAWAIIAN PLACE NAMES ARE PART OF THE ORIGINAL DOCUMENTS, AND THEREFORE HAVE NOT BEEN CORRECTED.

I. TIG Investigation Background:

Stated Purpose of the Investigation:

Explore the Feasibility of Purchasing and Maintaining the EMI Water Delivery System and Examine Other Alternatives for Ensuring That The People of Maui County Have Authority Over the Delivery of Water, Which is A Public Trust

Attempts to Access Information on Behalf of the Public:

Over the last several months the Maui County Board of Water Supply (BWS) has had several discussions regarding the role of Mahi Pono in the community. In a letter approved unanimously by the Board on September 19, 2019 to be sent to Mahi Pono Operations Manager Grant Nakama, contingent upon approval by Mayor Michael Victorino, the BWS stated the following:

...the [Maui County] Board [of Water Supply] has been extending invitations for Mahi Pono, LLC to attend one of our board meetings since March. We are very eager to have a continued dialog between the Board and Mahi Pono as we continually get testimony submissions and questions from the Maui community on water and land use subjects that are beyond our purview. A dialog between the Board and Mahi Pono can help mitigate any falsely placed frustrations throughout the community that are generated from the perceived lack of transparency from the Board when we don't have the answers to provide them.

As a Board that is dedicated to addressing matters related to safeguarding Maui residents' access to water, we are very interested in developing a clear vision of the island's total water resources and current and future demand. To that end, the Board has recently reached out to all private water purveyors and extended invitations to meetings. These invitations have been extended in order to gain an inclusive picture of the island water resources and delivery options as well as to see if there are untapped opportunities for County and private water purveyors to support one another.

Based on statements made in your July 1 letter and discussions during recent meetings, the Board would still welcome your attendance at our next meeting. If that cannot be arranged, we would like to extend some follow-up questions regarding Mahi Pono's current and future plans as they relate to water use. Having some answers to these questions that we pose here will help us to communicate with the wider Maui community that has been addressing the Board. For example: In your July 1 letter, you state: **"We have always been committed to supplying the County of Maui – and by**

extension, the Upcountry Maui community – with water from the EMI system. Having said that, our ability to supply water is 100% dependent on our right to legally access and deliver water.” You further state, “That said, if a [Revocable Permit] is successfully obtained – whether by A&B, EMI or by Mahi Pono – then the County will continue to receive water for the Upcountry Maui community.” We appreciate the clarity of this statement but the follow up to this is what will happen if Mahi Pono does not obtain a Revocable Permit to divert water?

“We would greatly appreciate any clarity that Mahi Pono can provide on this list of questions that has been generated by or presented to the Board:

- **If Mahi Pono does not obtain a Revocable Permit, will Mahi Pono be able to still commit to working with the County of Maui to ensure affordable access to water for upcountry Maui residents?**
- **Since the water that flows from the Wailoa Ditch to the Kamole Treatment Plant is maintained by Mahi Pono and EMI, would the lack of a Revocable Permit cease that ditch maintenance and flow?**
- Is Mahi Pono interested in exploring an agreement to provide water that is harvested from its own lands to the County’s Kamole Water Treatment plant?
- Is Mahi Pono willing to consider shared management of the Wailoa Ditch and other ditch systems? The current condition of the ditch system and the cost of maintenance/repairs that are needed would help clarify the monetary constraints of providing water to the Kamole Water Treatment plant, and
- If the water leases are obtained by EMI, what portion would go to Mahi Pono lands and what portion would go to remaining A&B lands, many of which are entitled for development? Are there other agreements besides the original sales agreement between Mahi Pono and A&B?”

(Bold added for emphasis, July 1, 2019 Grant Nakama letter and BWS draft letter attached, Appendices 1 and 2)

As noted in the letter, the Board of Water Supply has been reaching out to Mahi Pono since March, 2019. The only communication received from Mahi Pono was the letter referred to above from Mr. Nakama to Director Jeff Pearson, which Mr. Pearson has stated was intended to be shared with the BWS.

As a result of growing concerns about communication and transparency, a Temporary Investigative Group (TIG) to explore options for ensuring access to water was approved on July 18, 2019, including the following TIG members:

- Board Member Norman Franco
- Board Chair Shay Chan Hodges
- Board Member Toni Eaton
- Board Member Joseph Aquino

Norman Franco was approved to be Chair of the TIG, Shay Chan Hodges was approved to be Vice Chair.

On July 23, 2019, Joseph Aquino resigned from the TIG due to work responsibilities.

Scope of investigation:

As approved on July 18, 2019, during its investigation, the temporary investigative group (TIG) may:

- a. Conduct interviews and discussions with County of Maui personnel related to the delivery of water to Upcountry and Central Maui.
- b. Conduct interviews and discussions with State of Hawaii personnel related to the delivery of water to Upcountry and Central Maui.
- c. Conduct interviews and discussions with anyone whom the TIG determines has the knowledge, expertise and experience necessary to assist TIG members in increasing their understanding of the scope, operations and maintenance of the EMI Water Delivery System as well as the costs related to the purchase or condemnation of the EMI water delivery system and the cost of its maintenance, including, if necessary, the purchase or condemnation of relevant Mahi Pono lands.
- d. Conduct interviews and discussions with anyone whom the TIG determines has the knowledge, expertise and experience necessary to assist TIG members in increasing their understanding of potential financial mechanisms and organizational structures necessary for the acquisition and governance of the EMI Water Delivery System, in order to promote system sustainability, ensure fiscal integrity, maximize the public welfare and maintain the public trust.
- e. Consult with representatives and stakeholders with diverse expertise relating to the TIG investigation.
- f. Review documents, contracts, studies and other written information relevant to the investigation.

Urgency of Investigation:

Mahi Pono's Intentions per the Draft EIS

On September 23, 2019, the East Maui Irrigation System (EMI) and Alexander & Baldwin (A&B) Draft Environmental Impact Statement (DEIS) for the *Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas*¹, situated at TMK Nos. (2) 1-2- 004:005, 007 (por.), 1-1-002:002, 1-1-001:044, 1-1-001:050, 2-9-014:001, 005, 011, 012, 017 in the *Makawao and Hana Districts, on the island of Maui* was posted by the Hawaii Department of Health Office of Environmental Quality Control (OEQC) in its bulletin and on its website.

The 2,700 page Draft Environmental Impact Statement provides some information regarding Mahi Pono's costs and plans, and is available online (see footnote). It is referenced throughout this report as "DEIS" with accompanying page numbers.

This document answers some of the questions posed by the Board. For example:

"Without the Water Lease, even if EMI could find it economically feasible to continue maintaining the EMI Aqueduct System to divert non-governmental water for diversified agriculture in Central Maui, **there may not be enough water to allocate much or any to the MDWS.** This lack of water would exacerbate the effects of drought when other surface water sources are unreliable for the KAP and the Nāhiku, this could eliminate their primary source of water. **Insufficient water delivered to the County through the EMI Aqueduct System could have significant effects on health and safety of those who currently rely on that water delivery.**"

(Bold added for emphasis, DEIS, *Page xiii, Relationship Between Local Short-term Uses of Humanity's Environment and the Maintenance and Enhancement of Long-Term Productivity*)

"The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore **if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate.** Under the Reduced Water Volume alternative, depending on the amount of water authorized under the Water Lease, the MDWS may receive no water from the Wailoa Ditch or some amount up to 7.1 mgd². **The greater the reduction in the amount authorized under the Water Lease, proportionally less water will be available to the MDWS.**"

(Bold added for emphasis, DEIS, *Page 3-5, 3.2 Alternative Analysis 3.2.1 Reduced Water Volume Alternative*)

¹ http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2019-09-23-MA-DEIS-East-Maui-Water-Lease.pdf

² "mgd" = million gallons per day

The following table from the Draft EIS, Page 1945, T-1, shows how Mahi Pono intends to allocate water from the EMI Aqueduct under various scenarios, including “no lease,” along with other water sources.

Table 1. Water Supply, Allocation, and Costs

Item	Multiplier or Source	Baselines			Alternative Future Water Leases		Units
		Typical Sugar	Recent Sugar	Post Sugar	Limited to D&O	No Lease	
1.a. SURFACE AND BRACKISH WATER SUPPLY							
Surface water from the EMI System							
East of Honopou Stream							
State lands	70%	n.e.	n.e.	n.e.	61.57	-	mgd
Private lands	30%	n.e.	n.e.	n.e.	26.39	26.39	mgd
Total, east of Honopou Stream		n.e.	n.e.	23.99	87.95	26.39	mgd
Honopou Stream to Maliko Gulch, private lands	D&O & A&A	n.e.	n.e.	4.37	4.37	4.37	mgd
Total surface water supply	A&B or D&O	156.54	113.71	28.36	92.32	30.76	mgd
Brackish groundwater	A&B, D&O, or PEP	42.50	69.90	-	21.31	7.69	mgd
Total water supply		199.04	183.61	28.36	113.63	38.44	mgd
Reduction in supply of surface water							
From typical sugar flow of 156.69 mgd		-	42.83	n.e.	64.22	125.79	mgd
From recent sugar flow of 113.71 mgd			-	n.e.	21.39	82.96	mgd
1.b. WATER ALLOCATION							
MDWS, surface water from EMI	D&O	3.23	7.10	2.86	7.10	-	mgd
Ag and related uses							
Sugarcane	D&O	143.19	132.45				mgd
Pineapple	HC&S	0.25					mgd
HC&S, industrial activities	D&O	7.98	6.25	1.00			mgd
Diversified Ag	A&B or Total less losses			4.00	82.34	29.72	mgd
Maintenance of reservoirs for fire protection	D&O			n.e.			mgd
Other	D&O		0.41				mgd
System losses (excludes water for pineapple)	22.7% losses or D&O	44.39	41.67	n.e.	24.18	8.73	mgd
Total Ag uses	Supply less MDWS	195.81	180.78	n.e.	106.53	38.44	mgd
System losses, Ag use and system losses		22.7%	23.05%	n.e.	22.7%	22.7%	
Ag Uses, after system losses (excluding pineapple)							
Irrigation Use	Residual	143.19	132.45	n.e.	82.34	29.72	mgd
Non-irrigation Use	Above	7.98	6.66	n.e.	-	-	mgd
Total Ag uses, after system losses		151.17	139.11	n.e.	82.34	29.72	mgd
Split							
Irrigation use		94.72%	95.21%	n.e.	100.0%	100.0%	
Non-irrigation use		5.28%	4.79%	n.e.	0.0%	0.0%	
Irrigation use, after system losses							
Surface water	Residual	112.07	81.24	n.e.	65.88	23.77	mgd
Brackish groundwater	Groundwater – % loss x % irrigation use	31.12	51.21	n.e.	16.47	5.94	mgd
Total Ag use (excluding pineapple)	from above	143.19	132.45	4.00	82.34	29.72	mgd
Split							
Surface water		78.3%	61.3%	n.e.	80.0%	80.0%	
Brackish groundwater		21.7%	38.7%	n.e.	20.0%	20.0%	
Adjustment			(4.27)				mgd
Total water use		199.04	183.61	n.e.	113.63	38.44	mgd
1.c. WATER DELIVERY COSTS							
Surface water from EMI	MHI	3.5	3.9	16.2	6.8	12.9	¢/1,000 gal
Brackish groundwater	A&B/EMI	n.e.	52.0	52.0	52.0	52.0	¢/1,000 gal

The DEIS describes the ownership relationship of EMI, Mahi Pono, and A&B in this way:

“the EMI Aqueduct System is owned and operated by the EMI. EMI was previously a wholly owned subsidiary of A&B. In February, 2019, MP EMI, LLC, became a co-owner of EMI. In addition to becoming the co-owner of the EMI Aqueduct System, as noted above, Mahi Pono acquired former sugarcane and watershed lands, including the Central Maui agricultural fields, from A&B in December 2018. Agricultural operations are centralized under Mahi Pono, LLC.” (DEIS, Page 1-2, *The EMI Aqueduct System*.)

BWS TIG Obligations to the Public

The Board of Water Supply approved convening a “Temporary Investigative Group” to examine Alternatives for Ensuring That The People of Maui County Have Authority Over the Delivery of Water, Which is A Public Trust” in July, 2019.

According to the Draft Environmental Impact Statement that was completed as a necessary step in Mahi Pono’s application for a 30-year lease:

***“if no Water Lease is issued, it is assumed that the delivery of water to the [Maui Department of Water Supply] would terminate,” and given that -- as stated in the DEIS -- “insufficient water delivered to the County through the EMI Aqueduct System could have significant effects on health and safety of those who currently rely on that water delivery.*”**

On October 11, 2019, contrary to recommendations by its staff, the Board of Land and Natural Resources unanimously approved a one-year permit allowing Alexander & Baldwin to continue to divert water from East Maui streams on state lands in 2020 – an increased draw by 10 million gallons per day. Of the 45 mgd³ approved, 5 mgd would supply state projects and the County Department of Water Supply⁴.

Because Mahi Pono has not committed to working with the County of Maui to ensure affordable access to water for Upcountry Maui residents if a revocable permit or lease is not approved and given that the public trust continues to be tethered to legal decisions made regarding EMI, A&B, and Mahi Pono, TIG members believe that it is a public health imperative for the County Council and Mayor to explore all facets for self-determination with regard to access to water as soon as possible.

³ mgd” = million gallons per day

⁴ Maui News, State board OKs more water for Mahi Pono, October 12, 2019, <https://www.mauinews.com/news/local-news/2019/10/state-board-oks-more-water-for-mahi-pono/>

II. How the EMI System Impacts East Maui & Upcountry Maui:

Description of the EMI System Per the Draft Environmental Impact Statement:

The EMI Aqueduct System was constructed in phases, beginning in the 1870s and extending to its completion, as it currently stands, in 1923. It consists of approximately 388 separate intakes, 24 miles of ditches, and 50 miles of tunnels, as well as numerous small dams, intakes, pipes, 13 inverted siphons and flumes. **The EMI Aqueduct System collects surface stream water from approximately 50,000 acres of land (Collection Area), of which approximately 33,000 acres are owned by the State of Hawaii (which includes lands within Nāhiku, Keʻanae, Honomanū and Huelo) (License Area)⁵, and the remaining approximately 17,000 acres which are privately owned by EMI and Mahi Pono.⁶**

The EMI Aqueduct system starts at Makapipi Stream, in the Nahiku portion of the License Area, with the Koolau Ditch. The Koolau Ditch traverses westward across the Keʻanae License Area and into the Honomanū License Area where it crosses paths with the Spreckles Ditch. This is where streams had multiple diversions at different levels to supply water to the EMI Aqueduct System. Separating higher elevation ditches allows them to maintain the very slight slope necessary to convey flows by gravity over long distances to irrigate higher elevation fields. This avoids the cost of energy required to pump water up from ditches delivering water at lower elevations. As the system continues westward, the Koolau Ditch transitions at the boundary between the Honomanū and Huelo portions of the License Area to the Wailoa Ditch. Makai of the Koolau/Wailoa Ditch, are the Manuel Luis and the Center Ditch. At Waikamoi Stream, the New Hamakua Ditch begins, running parallel to the Wailoa Ditch, but at a lower elevation.⁷

The Spreckles Ditch terminates its mauka segment at Waikamoi Stream, and begins its makai segment at Kaʻaiea Stream, until it converges with the Lowrie Ditch at Niliʻilihae Stream. Makai of Lowrie Ditch is the Haiku Ditch. At Honopou Stream, the water collected within the License Area by the EMI Aqueduct System exits the License Area. Crossing this western boundary of the License Area in descending elevation are the Wailoa Ditch, the New Ditch, the Lowrie Ditch, and the Haiku Ditch. West of Honopou Stream, the EMI Aqueduct System traverses land that was largely owned by A&B and is now largely owned by Mahi Pono. Additional flows from streams located on this land are diverted by the EMI Aqueduct System until it crosses Maliko Gulch beyond which there are no stream diversions. Crossing Maliko Gulch in descending elevation are the Wailoa Ditch, Kauhikoa Ditch, Lowrie Ditch, and the Haiku Ditch.⁸

⁵ DEIS, Page 1-2

⁶ DEIS, Page 2-4

⁷ DEIS, Page 2-4

⁸ DEIS, Page 2-4

Current Diversion by the EMI Delivery System As Stated in the Draft EIS:

Currently, the EMI Aqueduct System is only diverting approximately 20 mgd⁹. As a result, very little surface stream water is currently being diverted relative to what would be allowed should the Water Lease be awarded per the Proposed Action. However, the amount of water that may be diverted should the Water Lease be issued is substantially less than the amount that was diverted during normal sugar production. For example, in 2006 it is estimated that the EMI Aqueduct System delivered approximately 156.69 mgd at Maliko Gulch, whereas under the CWRM¹⁰ D&O¹¹, it is estimated that the delivery at Maliko Gulch will be approximately 92.32 mgd (Akinaka, 2019).¹²

Examples of Community Concerns as Relayed at Focus Group Per DEIS:

Excerpts from the DEIS, 4.7.2 Social Characteristics (Page 4-135):

A focus group with residents and farmers from Huelo and Ha`ikū was convened on November 15, 2018 at Hale Akua in Huelo. Most of these participants live in the Huelo watershed area and many live and farm in areas adjacent to streams that are subject to the CWRM's and D&O.

Also, participants said that EMI personnel do not notify residents in the area when the gates open to allow downstream flow. The sudden onrush of stream water has endangered several people who happened to be in/near the stream at that time.

It was noted that, with the closing of the sugar plantation, the low level of maintenance has deteriorated even further given the reduction of EMI staffing to, reportedly, about eight people.

A second major concern with this group is fairness in how they, as a community, have been treated in two ways. First, they reported of the 25 streams in the petition before the CWRM, only three streams in the Huelo watershed were considered kalo streams and designated for full flow. While they agreed with such designation in other watersheds, they felt more streams in their area should have been considered.

Another fairness related concern raised by the group is that residents and farmers in Huelo and streams. Except for those whose properties have deeds allowing stream water access via pipes, most cannot access stream water. They cannot use the water for agriculture or domestic uses. Participants noted that they are off the electricity grid, and they are very interested in using stream flow for hydroelectricity. It was reported that there have been drought times in which residents had to truck in water even though they live next to streams. It was also said that those who were fortunate to have wells on their property share their water with neighbors during these times.

⁹ mgd" = million gallons per day

¹⁰ CWRM=Hawaii State Commission on Water Resource Management

¹¹ D&O=Decision and Order

¹² DEIS, Page 2-8

An issue often raised in the November 2018 focus group sessions was the reportedly poor condition of the EMI Aqueduct System. Interviewees also discussed this topic from the perspective of reducing water losses. They said that the reduction of water losses would reduce the amount of water required for agricultural operations.

These interviewees wanted to know how Mahi Pono will ensure that continued use of the EMI Aqueduct System will be monitored and operated for efficient use of water, which is valued as a public trust, an integral environmental resource, and essential for healthy ecosystems.

Interviewees pointed out that, even though the CWRM D&O restored several streams in East Maui, the social and cultural effects of historical and significant stream diversions have yet to be rectified. This belief was reiterated several times in the November 2018 focus groups and expressed by those interviewed.

While there has been interaction between Mahi Pono and East Maui residents, there still needs to be acknowledgement of past wrongs and a “path to healing” that will allow residents and the new landowner to have a constructive relationship.

Those interviewed understood that Mahi Pono is not responsible for whatever occurred during A&B’s tenure. Mahi Pono inherited a legacy that developed for over one hundred years. Nevertheless, to move forward as an integral part of the Maui community, Mahi Pono needs to “make pono” with East Maui so that everyone can move forward. One person said, “There needs to be apology, repentance and reparation.”

Description of EMI System Per Dept of Water Supply Draft Water Use & Development Plan for Ko`olau and Central Sectors:

Excerpted from the Maui Island Water Use And Development Plan Draft, Part III Regional Plans, Ko`olau Aquifer Sector Area (ASEA)¹³:

Transport of Stream Water from East Maui

The EMI collects surface water from the [Ko`olau] sector and delivers it to Hawaiian Commercial & Sugar’s (HC&S) Central Maui cane fields. Some of the water is also used to generate electrical power. **A relatively small amount of water is used for residential and agricultural use by the DWS for its Upcountry Maui Water Systems, which include the Upper Kula and Lower Kula Water Systems.** The EMI ditch system, which began construction in 1876, is the nation’s largest privately built and operated water system; it consists of approximately seventy-five (75) miles of ditches, tunnels, siphons, flumes, and reservoirs. The Ko`olau Department of Agriculture’s AWUDP (2004) listed the average delivery at 165 mgd with a delivery capacity of 435 mgd¹⁴.

¹³ <https://waterresources.mauicounty.gov/DocumentCenter/View/223/Draft-Plan-Section-III-Chapter-17-PDF?bidId=>

¹⁴ Ko`olau WUDP, Page 22

Wailoa Ditch	195 mgd
New Hamakua Ditch	100 mgd
Lowrie Ditch	70 mgd
Ha`ikū Ditch	70 mgd
Total Capacity	435 mgd

In drought conditions, both the Lower and Upper Kula systems require supplemental surface water from Kamole Weir and groundwater pumped up to 4,000 feet. Under current agreement with EMI, MDWS receives 12 mgd from the Wailoa Ditch with an option for an additional 4 mgd. During periods of low flow, MDWS will receive a minimum allotment of 8.2 mgd with HC&S also receiving 8.2 mgd, or prorated shares if less water is available. Proposed amended IIFS could restrict Wailoa ditch off stream uses so that less than 7 mgd is available a few days a year. When more than 7 mgd is available under non-drought conditions, the proposed restored amount would come from EMI’s share of the 16.4 mgd. The 2017 Proposal and the current allocation between MDWS and EMI would allow sufficient ditch use for MDWS to meet current demand on the Upcountry system. Under normal flow, exceeding 16 mgd at Wailoa Ditch, and under an allocation of up to 12 mgd for MDWS, projected future demand of 16.4 mgd could also be met. Treatment of more than 6 mgd at the Kamole Weir will require expansion of the water treatment facility and storage construction. Future demand on the Upcountry system as a whole is addressed in the Central aquifer sector report.¹⁵

Water Use Maui Department of Water Supply Upcountry System

MDWS relies on three surface water sources, one of which is delivered by EMI through the Wailoa Ditch, and the other two through two MDWS higher elevation aqueducts maintained by EMI that transport water to Olinda and Kula, under a contractual agreement originated under the 1973 East Maui Water Agreement and subsequent agreements. MDWS and EMI diverts water from Ko`olau ASEA, conveyed to treatment plant facilities located in Ko’olau ASEA (Piiholo Water Treatment Facility) and the Central ASEA (Olinda and Kamole Weir Water Treatment Facilities)¹⁶.

Water Treatment Facility	Elevation	Conveyance System	Production Capacity	Average Production
Olinda	4,200 feet	Upper Kula Flume	2.0 mgd	1.6 mgd
Piiholo	2,900 feet	Lower Kula Flume	5.0 mgd	2.5 mgd
Kamole-Weir	1,120 feet	Wailoa Ditch	6.0 mgd	3.6 mgd

¹⁵ Ko`olau WUDP, Page 123

¹⁶ Ko`olau WUDP, Page 119

Excerpted from Department of Water Supply Fiscal Year 2018 Annual Report:¹⁷

- **Piiholo Water Treatment Plant:** Water produced during FY18: 1,197,415,000 gallons.
- Daily average: **3.28 MGD**
- **Kamole Water Treatment Plant:** Water produced during FY18: 449,530,000 gallons. Daily average: **1.50 MGD**
- **Olinda Water Treatment Plant:** Water produced during FY18: 484,370,000 gallons. Daily average: **1.33 million gallons per day (MGD).**

Excerpted from the Maui Island Water Use And Development Plan Draft, Part III Regional Plans, Central Aquifer Sector Area (ASEA):¹⁸

The Olinda facility diverts water at the upper Waikamoi Flume from the Waikamoi, Puohokamoa, and Haipuena Streams. Water is stored in two 15 million gallon reservoirs and one 100-million gallon reservoir. The Piiholo facility diverts water from the Waikamoi, Puohokamoa, Haipuena Streams and Honomanu streams into a 50-million gallon reservoir. The Kamole-Weir facility relies on EMI diversions from eastern most Makapipi stream to the western most Honopou stream.

The Upcountry system spans Ko`olau and Central aquifer sectors, ...and serves about 35,200 people. MDWS also serves non potable water to 31 farm lots at the Kula Agricultural Park (KAP). Current water use at the KAP is about 0.4 mgd. About 80 – 90 percent of the delivered water comes from surface water sources and the remaining portion from basal aquifer wells. Haiku Well and Kaupakalua Well are located in the Ko`olau ASEA, Hamakuapoko Well 1 & 2 and Po`okela Well are located in the Central ASEA. The combined surface and groundwater source production capacity is 17.9 mgd, 13 mgd from surface water and 4.9 mgd from groundwater. Accounting for system and operational limitations, and use restrictions from Hamakuapoko wells, the reliable capacity is 9.1 mgd. Current water use averages 7.9 mgd within a range of 6 – 10 mgd.

The DOH¹⁹ divides the MDWS Upcountry System into three separate systems: Upper Kula; Lower Kula and the Makawao systems, although all three are interconnected.

MDWS Makawao/Upcountry Water System (PWS 213)

The MDWS Makawao/Upcountry System, also referred to as Makawao District by the DOH, generally serves the area extending from Ha`iku, Makawao, and Pukalani to Hali`imaile/Pa`ia. The system has 6,680 meters and serves about 28,702 people. The sources of water are primarily from surface water imported from East Maui (80%) and well water (20%) from the Haiku and Makawao aquifers. Surface water from the Wailoa Ditch, generated in the Ko`olau ASEA, is

¹⁷ <https://www.mauicounty.gov/DocumentCenter/View/115629/DWS-FY18-Annual-Report>

¹⁸ <https://waterresources.mauicounty.gov/DocumentCenter/View/221/Draft-Plan-Section-III-Chapter-15-PDF?bidId=>, Page 45, 46

¹⁹ DOH=Department of Health

treated at the Kamole Water Treatment Facility (WTF). The facility uses micro-filtration technology and is the largest surface water treatment facility on Maui. It has four booster pumps to move water up to the 2,800 foot elevation, where it can be pumped to the highest service areas at 4,500 feet. Historically, the Kamole WTF is the primary source of water for nearly all of Upcountry during times of drought. There is no raw water storage at the WTF.

MDWS Lower Kula/Upcountry Water System [PWS 247]

The MDWS Lower Kula/Upcountry System, also referred to as Lower Kula District by the DOH, generally serves the area extending from Kula Kai to Omaopio to mid and lower Kimo Drive areas. The system has 1,064 meters and serves about 3,192 people. The sources of water are primarily from surface water imported from East Maui treated at the Piʻiholo WTF. The facility uses direct filtration technology. Granular activated carbon and air stripping treatments were added in 2015 to reduce disinfection-byproducts in the water supply. The system can be supplemented with groundwater from Makawao aquifer.

MDWS Upper Kula/Upcountry Water System [PWS 215]

The MDWS Upper Kula/Upcountry System, also referred to as Upper Kula District by the DOH, generally serves the area extending from Upper Kula to Kula Highlands to Kama`ole to Upper Olinda-Piʻiholo to Kula Glen to Ulupalakua-Kanaio. The system has 2,346 meters and serves about 7,038 people. The source of water is primarily from surface water from Waikamoi treated at the Olinda WTF. The facility uses micro-filtration technology. Disinfection is provided by anhydrous ammonia, blended with chlorine to form chloramines. Water is stored in 30 MG²⁰ Waikamoi Reservoirs and the 100 MG Kahakapao Reservoirs.

Future Water Use MDWS Upcountry System

Based on growth rates and the socio-economic forecast referenced in the Maui Island Plan, the population Upcountry is projected to grow by about 8,424 to a total of about 43,675 people by 2030. Projected water demand for the base, low and high growth scenarios are shown below.

Water losses due to leaks, seepage, evaporation and other inefficiencies in the treatment, conveyance, distribution and storage of water range widely depending on storage and source transmission system age, length, type and many other factors. To account for water losses and determine source needs for Upcountry, water produced, rather than water billed is used as basis to determine source needs. For the Upcountry system, water losses average 20%.²¹

²⁰ MG=million gallons

Production	7.61	8.53	9.20	7.80

Table 16-56 Projected Consumption and Production MDWS Upcountry District System, Base, High and Low Scenarios (mgd) *Excludes Kula Ag Park

Upcountry Meter List²²

In 1993, the MDWS determined that the existing Upcountry water system was found to have insufficient water supply developed for fire protection, domestic and irrigation purposes to add new or additional water services without detriment to those already served.

MDWS created a list of Upcountry properties, by date of application, who requested new and additional water service. In 2002, an administrative rule "Water Meter Issuance Rule for the Upcountry Water System", Title 16, Chapter 106 was created. The rule outlined the procedure for processing applications for water service. New applicants were continually added to the list until provisions were codified in 2013 so that no new applications were accepted after the 2013 provisions became effective. A 2015 ordinance provided certain fire protection exemptions. Still, about half of meter offers are declined presumably due to the expense of required system improvements. The Priority List is estimated to represent an additional 3.7 – 7.3 mgd demand on the Upcountry system as a whole. There are about 1,800 requests for 4,300 meters (excluding those that did not accept a reservation offered, accepted a reservation, or where a meter was installed) for 1,900 dwelling units and a nominal number of commercial units. About two-thirds of the remaining requests are located outside designated growth areas. There remains uncertainty over the number and timing of new meters as well as occupancy.

Sources for requests in Haiku are primarily served by basal wells with sufficient backup capacity to reliably add new services. Sources for requests on the Lower and Upper Kula subsystems are East Maui streams in the Waikamoi area that are subject to Instream Flow Standards and vulnerable to drought. Groundwater from Po`okela Well in Makawao aquifer can supplement the Lower and Upper Kula subsystems. There remains uncertainty over the number and timing of new meters as well as occupancy.

Providing reliable capacity to satisfy the Priority List could be accomplished in alternative ways:

1. Develop basal wells to provide reliable capacity and assume significantly higher cost of service due to energy required to pump up to 4,000 foot elevation
2. Separate the Priority List by service area and source, so that subsystems with adequate and reliable capacity are prioritized over subsystems reliant on surface water.
3. Public-private partnerships to develop source and infrastructure that benefit end users of the same subsystem.

²² Central WUPD, Page 106-107

III. Strategies for Creating and Conserving Fresh Water Capacity

Hawaii Fresh Water Blueprint for Action:

Excerpted from website:²³

Hawai'i has been blessed with consistent rainfall, advantageous geology, and high-quality drinking water stores for centuries. **Recent findings, however, have raised concern about long-term fresh water security for our Islands. University of Hawai'i and other scientists have documented troubling trends including reduced rainfall, higher evaporation rates, and declining stream flows in recent decades.** These findings, coupled with the demand of an ever-increasing population, suggest that Hawai'i is entering an era of fresh water uncertainty.

The Hawai'i Fresh Water Initiative (Initiative) was launched in 2013 to bring multiple, diverse parties together to develop a forward-thinking and consensus-based strategy to increase water security for the Hawaiian Islands. Organized by the independent, nonprofit Hawai'i Community Foundation (HCF), the Initiative relied on a blue ribbon advisory panel of individuals (Hawai'i Fresh Water Council or Council) with deep knowledge of water and a collaborative spirit to articulate a vision for a more secure and sustainable water future based on shared values, and shared sacrifice. This Blueprint is the result of their work, and provides Hawai'i policy and decision-makers with a set of solutions that have broad, multi-sector support in the fresh water community that should be adopted over the next three years to put Hawai'i on a path toward water security. The Blueprint also builds on the good work, findings, and recommendations over the years by preceding stewards of Hawai'i's most important resource.

Goal: The Fresh Water Council distilled nearly two years of research and analysis into a single goal: creating 100 million gallons per day (mgd) in additional reliable fresh water capacity for island by 2030.

To achieve the ambitious goal of 100 mgd in additional fresh water capacity, the group outlined three aggressive water strategy areas and individual targets that the public and private sectors must work together to achieve by 2030:

1. **Conservation:** Improve the efficiency of our population's total daily fresh groundwater water use rate by 8% from the current 330 gallons per day/person to 305 gallons per day/person. By 2030, this goal will provide 40 mgd in increased water availability.
2. **Recharge:** Increase Hawai'i's ability to capture rainwater in key aquifer areas by improving storm water capture and nearly doubling the size of our actively protected watershed areas. By 2030, this goal will provide 30 mgd in increased water availability.

²³ https://www.hawaiicommunityfoundation.org/file/cat/Fresh_Water_Blueprint_FINAL_062215_small.pdf, Page 3

3. **Reuse:** More than double the amount of wastewater currently being reused in the Islands to 50 mgd. By 2030, this goal will provide an additional 30 mgd in increased water availability.

Initiative Principles²⁴

***Water is a complex issue that demands a comprehensive set of solutions.**

*Solutions will come from many different sectors, and a good solution in one geographic area may not be appropriate for another area.

***Solutions should focus on financial sustainability and cost effectiveness.**

***Better information and access to accurate data facilitates good decision-making.**

***Entering an era of climate unpredictability argues for more aggressive gathering and monitoring of water data than currently occurs.**

*"Applied" and/or "targeted" education efforts are more effective than general outreach and awareness campaigns.

***Water is as important to our economy and culture as it is to our ecology.**

***The current price of water in Hawai'i does not reflect its "true cost."**

***Any successful supply solution must provide for Hawai'i's broad spectrum of water uses.**

*Hawai'i is better-positioned than many other geopolitical bodies to meaningfully address long-term fresh water sustainability.

***Native Hawaiian cultural traditions place a high value on water and can provide guidance on how best to steward water.**

*Public Trust doctrine and our state water code provide an adaptable framework.

***There is an urgency to the fresh water supply issue that is not widely evident to the public.**

***Costs to address fresh water supply will rise with each year of delay.**

***The nexus between water and energy is clear and compelling.**

Adapting To Climate Change, State of Hawaii, Office of Planning:

Hawaii's Climate Change Adaptation Policy²⁵

[Act 234, Session Laws of Hawaii 2007](#), established the state's policy framework and requirements to address Hawaii's GHG emissions. In Act 234, the legislature recognized the following: "... climate change poses a serious threat to the economic well-being, public health, natural resources, and the environment of Hawaii. **The potential adverse effects of global warming include a rise in sea levels resulting in** the displacement of businesses and residences and **the inundation of Hawaii's freshwater aquifers**, damage to marine ecosystems."

²⁴ Fresh Water Blueprint, Page 13

²⁵ <https://planning.hawaii.gov/czm/initiatives/adapting-to-climate-change-2/>

Water Use Development Plan Strategies for Addressing Impacts of the Climate Crisis:

Excerpted from the Central ASEA Draft Water Use and Development Plan²⁶:

Issue and Background: Data and research suggest that Hawai'i should be prepared for a future with a warmer climate, diminishing rainfall, declining stream base flows, decreasing groundwater recharge and storage, and increased coastal groundwater salinity, among other impacts associated with drought. Reliance on surface water will become more uncertain in a future of longer droughts and varying rainfall. No streamflow projections are available for the coming century but projections include a decline in base flow and low flows, with stream flows becoming more variable and unstable (flashy), especially in wet years. Groundwater recharge decreases in drought but local impact from climate change has not been projected to date.

The Central ASEA is especially vulnerable due to water resources used:

- Upcountry region and agriculture dependent on surface water as primary resource.
- Irrigation and other non-potable wells in Paia and Kamaole aquifer coastal areas are subject to sea-level rise

In consistency with the *Climate Change Adaptation Priority Guidelines*, water purveyors should increase resilience and reduce vulnerability to risks related to climate change. Chapter 12 Island Wide Strategies in this plan include the following strategies that can mitigate impacts from climate change:

1. Continue Maui County financial support for watershed management partnerships' fencing and weed eradication efforts (Chapter 12.3, Strategy#1). The Central ASEA is heavily dependent on forested watersheds in the Wailuku and Ko'olau hydrologic units to provide fresh water supplies.
2. Demand side conservation measures, such as water conserving design and landscaping in new development, incentives for efficient irrigation systems, landscape ordinance and promoting xeriscaping in dry areas will increase tolerance for prolonged droughts. (Chapter 12.3 Strategies # 13, 14, 15, 17)
3. Promote alternative resource incentives, such as greywater systems and rainwater catchment to supplement conventional resources. Incentives for green infrastructure and use of alternative water sources are needed to ensure such upfront investments in new development. (Chapter 12.3 Strategies# 20 and 21)
4. Diversify supply for agricultural use to increase reliability. Under extended droughts and low stream flows, diversified agriculture on HC&S lands will compete with priority public trust uses for surface water. Planned extension of R-2 recycled water from the Kahului WWTF to HC&S fields can supplement groundwater from the Central aquifer sector. (Chapter 12.3 Strategy #51).

²⁶ Central WUDP, Page 124

5. Expand requirements for new development to connect to recycled water infrastructure, promote closer collaboration between MDWS and MDEM to utilize Drinking Water State Revolving Funds to maximize recycled water use. (Chapter 12.3 Strategies # 61 and 62)
6. Explore and promote opportunities for large volume stormwater runoff for agricultural irrigation. (Chapter 12.3 Strategy # 66)

Excerpted from the Ko`olau ASEA Draft Water Use and Development Plan:

The concerns regarding climate change in the Ko`olau aquifer are more general. References include:

- Improving the understanding of the concepts of "precautionary planning" to reduce and adapt to the effects of drought and climate change upon water resource availability and quality is important. ²⁷
- Understanding potential impact of climate change adds to uncertainty in long-term groundwater availability. The primary responsibility to determine potential impacts on water resource availability lies with the State CWRM who in turn relies on studies and predictions by the scientific community and other agencies. Water purveyors need guidance how to mitigate and adjust to potential changes in groundwater availability. ²⁸
- Strategy #3: Support collaborative hydrogeological studies to inform impact from climate change and future well development on groundwater health for Haiku and Honopou aquifers. ²⁹

Upcountry Conservation:

The Upcountry region has experienced voluntary and mandatory conservation measures for decades, primarily in dry season when the MDWS Upcountry System reservoir levels are low. Reliance on surface water and constraints in developing additional groundwater causes the system to be vulnerable to droughts.

Demand Side Conservation Measures

Demand side conservation strategies recommended in Section 12.2 that would target outdoor uses of potable water include comprehensive water conservation ordinance to include xeriscaping regulations, landscaping and water efficient irrigation system incentives. In evaluating cost-effectiveness, MDWS compared the costs to develop and deliver new sources of water to meet future demand with the savings attributed to conservation.

²⁷ Ko`olau WUDP, Page 4

²⁸ Ko`olau WUDP, Page 104

²⁹ Ko`olau WUDP, Page 105

A preliminary analysis of the proposed conservation measure portfolio outlined in Section 12.2 shows that doubling current investments (MDWS annual FY14 – FY17 conservation budget, excluding leak detection is \$170,000) would result in net capital and operational savings. The potential for a net savings is expected for both the MDWS Central System and the Upcountry System due to the need for new source development.

Recommended demand side conservation measures at all levels and type of use for public water systems are outlined in table 13-1 (strategies # 10 – 25). There is an opportunity to design and implement conservation measures in new housing development throughout planned growth areas. The recommended conservation Strategies #17, 22 and 25 outlined in Table 13-1 are implemented in the design and build phase and are especially appropriate in planned growth areas:

- Revise county code to require high efficiency fixtures in all new construction. Develop a comprehensive water conservation ordinance to include xeriscaping regulations.
- Revise County Code: Water conserving design and landscaping in new development (xeriscaping targets dry areas).
- Revise County Code and/or incentivize water- efficient building design that integrates alternative sources (grey water, catchment).

Supply Side Conservation Measures

The sustainable and efficient use of water resources, as well as the capacity and integrity of water systems, can be improved by accounting for water as it moves through the system and taking actions to ensure that water loss is prevented and reduced to the extent feasible.

A water audit provides a data driven analysis of water flowing through a water system from source to customer point-of-service and is the critical first step in determining water supply efficiency and responsible actions to manage and reduce water loss consistent with available source, operational and financial resources. Public water systems serving a population of 1,000 or more and those within water management areas regardless of population served are required to submit annual water audits beginning July 1, 2020. Except for the MDWS systems, there are no large public water systems in the aquifer sector subject to the requirement. The fiscal year 2017 audit for the Upcountry system revealed that apparent water losses are often due to data gaps between the amount of water withdrawn at the source, treated, stored and billed. The results will guide MDWS data collection, maintenance and repair programs.

Input from the WUDP public process and issues identified in the community plans relate to water shortages and conservation³⁰:

³⁰ Central WUDP, Page 102

- Reliance on surface water Upcountry makes the system vulnerable to drought conditions
- Voluntary and mandatory water use restrictions imposed on residential and agricultural users during droughts often negatively impact the productivity of farmers
- Promote conservation of potable water through use of treated wastewater effluent for irrigation.
- Reuse treated effluent from the County’s wastewater treatment system for irrigation and other suitable purposes in a manner that is environmentally sound.
- Provide incentives for water and energy conservation practices.
- Promote energy conservation and renewable energy.
- Incorporate drought-tolerant plant species and xeriscaping in future landscape planting.

Qualitative criteria to evaluate and measure resource strategies against this planning objective include:

- Per capita water use decreased
- Potable and irrigation systems water loss decreased
- Community water education increased
- Incentives for water conservation increased
- Renewable energy use increased

Other Ways of Increasing Availability of Potable and Non-Potable Water:

Reservoirs:	
<p><u>Central WUDP, Page 123:</u> In summary, reservoir and treatment plant expansion would have multiple benefits:</p> <ol style="list-style-type: none"> 1. Improve reliable capacity 2. Economical water supply that minimizes expensive groundwater pumping costs 3. Defer source development in Haiku aquifer in light of uncertainties related to the East Maui Consent Decree 4. Recharge regional groundwater in wet season when maximizing use of stormflow from rainfall <p>If financing can be secured, raw water storage construction presents an economic strategy compared to basal well development. If a string of basal wells and extensive transmission would be added to the MDWS Upcountry System during the same time frame as a reservoir, the economic benefit would be significantly diminished. Both resource strategies have long implementation time frames and can be adjusted over time. Should development of basal source in the Makawao aquifer produce adequate yield and quality, additional wells in Haiku aquifer OR expanded surface</p>	<p><u>Central WUDP, Page 124: Strategy #8:</u> Pursue hydrologic studies needed to explore the Haiku aquifer and an updated ditch flow analysis to optimize raw water storage and treatment plant capacity at Kamole Weir in order to expedite the most feasible new source. Raw water storage and Kamole Water Treatment Facility expansion are contingent on a long term agreement with A&B Properties allocating adequate surface water for the MDWS Upcountry System. Lead agency is MDWS.</p> <p>This strategy supports multiple planning objectives, including to seek expanded municipal withdrawal from the lowest cost source to serve the Upcountry region and to increase water storage capacity with a reserve for drought periods.</p> <p><u>Central WUDP, Page 104, Water Loss Mitigation:</u> Explore funding and conduct a cost benefit analysis of improvements to the EMI non potable conveyance system to mitigate losses and preserve existing reservoirs at risk of decommissioning. County of Maui and A&B Properties/EMI Company in partnership would</p>

<p>water storage and treatment will meet projected demand. Uncertainties in future stream flow must be weighed against increased reliability and cost of basal well development. Maximizing affordable surface water use in wet season must be weighed against “over building” expensive wells and infrastructure that is not used to capacity.</p> <p>On Oahu, the BWS also operates brackish and recycled water nonpotable water systems for irrigation and industrial use in ‘Ewa, Mākaha, and Hālawā Airport. The BWS owns and maintains five dams or open reservoirs. Four reservoirs in Nu‘uanu are now used solely for flood control, and the fifth, Mauna ‘Olu reservoir, stores nonpotable water used for irrigation. The four Nu‘uanu reservoirs may be used for stormwater capture, infiltration, or hydropower in the future.³¹</p>	<p>lead initiatives. Priority components and associated costs TBD.</p> <p><u>Page 3-4, DEIS:</u> EMI Aqueduct System has eight reservoirs, mostly along the lower ditch systems, and the Central Maui field irrigation system has 48 major reservoirs The combined storage capacity of these existing reservoirs is approximately 1,344 mg (Akinaka, 2019). Most of these reservoirs, however, have not been used since the closure of sugar in 2016 and others have not been used because they do not meet dam safety requirements. As a result, many will require extensive upgrades to put them back into service. These upgrades could cost between \$50 – 100 million (Akinaka, 2019). Obtaining permits to upgrade and repair these reservoirs will also be challenging due to current dam safety requirements. Assuming that the existing reservoirs can be restored to their full capacity of 1,344 mg, and the amount of flow available for irrigation under the Proposed Action is approximately 92.32 mgd, then the existing reservoirs could provide about 16 days of storage</p>
<p>Recycled Water:</p>	
<p>The State of Hawai‘i defines R-1 water as the highest-quality recycled water; it has undergone filtration and disinfection to make it safe for use on lawns, golf courses, parks, and other areas used by people. R-2 recycled water can only be used under restricted circumstances where human contact is minimized.</p>	<p><u>Central WUDP, Page 57:</u> Wastewater generated within the Central ASEA is treated at the Kahului Wastewater Reclamation Facility (WWRF), east of Kahului Harbor, and the Kihei WWRF.</p>
<p>Rainwater Catchment:</p>	
<p><u>Ko‘olau WUDP, Page 73:</u> Rainwater catchment is the collection of rainwater from a roof or other surface before it reaches the ground.</p> <p>Rainwater catchment systems are not regulated by the Department of Health, making estimates of their use difficult. No inventory of installed catchment systems throughout the island is available.</p> <p><u>Central WUDP, Page 129:</u> Rain barrel incentive programs are included in recommended demand side conservation strategies and the MDWS conservation program.</p> <p>Catchment systems for agricultural uses have historically played an important role Upcountry. Support for increased adaptation to natural ambient rainfall and climate adapted crops is consistent with the objective to</p>	<p><u>Ko‘olau WUDP, East Maui, Page 28:</u> On average, USGS data indicates rainfall ranges from 101-454 inches per year, making the Ko‘olau ASEA Maui Island’s rainiest ASEAs and one of the wettest places in Hawai‘i. The heaviest rainfall is in the Ke‘anae ASYA, where it rains as much as 454 inches per year. The cooler, dryer upper elevations may have as little as 101 inches of rain per year. Rainwater catchment is not as reliable a conventional water resource because it is extremely sensitive to the climate; however, rainwater catchment is a viable option in this region.</p> <p><u>Central WUPD, Upcountry and Central, Page 56:</u> Rainfall averages 15 inches along the southern coastline on Haleakala, and it increases to 70 inches as one moves eastward and into higher elevations. Rainfall catchment systems occur in the eastern part of the hydrologic unit,</p>

<p>use appropriate water quality for appropriate uses.</p>	<p>from Makawao and Olinda and also scattered throughout Kula. There is no official inventory of catchment systems but it is an important supplemental resource for non-potable purposes. Catchments systems using potable treatment technologies have been installed Upcountry due to water meter limitations imposed by the Upcountry Meter Priority List.</p>
<p>Stormwater Reuse:</p>	
<p>The Fresh Water Council believes that a critical element of protecting long-term water security in the Hawaiian Islands is to aggressively increase our ability to capture rainfall and surface storm water. Our underground fresh water supply can be restored with: 1) reduced pumping from the aquifers; 2) increased rainfall; and/or, 3) increased effective recharge.³²</p> <p><u>Central WUPD, Page 129:</u> Stormwater capture and use can provide multiple mitigating effects on climate change, including off-setting potable supply for irrigation needs; recharging low level and more brackish portions of the region’s aquifers; and mitigating sediment runoff reaching the nearshore marine environment and reefs.</p> <p><u>Central WUDP, Page 58:</u> Capture and reuse of stormwater runoff is an under-utilized water resource that provides an opportunity to reduce reliance on groundwater and surface water for landscape irrigation, especially when incorporated into the design of development projects in order to minimize infrastructure costs.</p>	<p>There is no reported stormwater reuse within the Ko’olau ASEA, although a limited number of development projects may have stormwater controls incorporated into project design to reduce runoff and its effects.</p> <p>Stormwater reuse at the parcel scale may also provide an opportunity to offset landscape and other irrigation demand of projects or households.</p> <p><u>Central WUPD, Page 58:</u> There is no reported stormwater reuse in the Central ASEA, although some development projects may have stormwater controls incorporated into project design to reduce runoff and its effects. The <i>Hawai’i Stormwater Reclamation Appraisal Report, 2005, and Study Element 3: An Appraisal of Stormwater Reclamation and Reuse Opportunities in Hawai’i</i>, September 2008, screened and identified four projects on Maui within the final ranking, which might provide opportunities to augment agricultural irrigation water that is diverted currently from Maui streams, in addition to providing other benefits.</p>
<p>Desalinization:</p>	
<p>Desalination of ocean or brackish water was studied as an option in the 2013 MDWS study, Maui Island Water Source Development Options for the Central MDWS system, but an assessment has not been conducted for the Ko’olau ASEA, and there are presently no desalination projects within. There are no desalination projects in the Central ASEA.</p>	<p>One major cost to operate a desalination plant is the high energy demand of the process, and the disposal of the brine liquid byproduct creates logistical and environmental challenges that also increase cost. As desalination technology advances and energy costs decrease, brackish and ocean water desalination should continue to be evaluated for their potential as effective future water supply alternatives.</p>

³² Fresh Water Council, Page 13

Excerpted from the Maui Island Water Use and Development Plan Draft, Part III Regional Plans, Ko`olau Aquifer Sector Area (ASEA)³³:

Conventional water sources include groundwater (wells and tunnels) and surface water (stream diversions). Region specific planning objectives related to ground and surface water use and development identified and confirmed in the WUDP update public process include:

- Improving the understanding of the concepts of "precautionary planning" to reduce and adapt to the effects of drought and climate change upon water resource availability and quality
- Adapting future populations to local water resource conditions, integrating conservation and the use of alternative resources
- Water needs of DHHL in the Ko`olau should be considered in general and in accordance with the 2017 State Water Projects Plan

Planning objectives related to groundwater and surface water source use and development identified to apply island wide include:

- Manage water equitably
- Provide for Department of Hawaiian Homelands needs
- Provide for agricultural needs
- Protect cultural resources
- Provide adequate volume of water supply
- Maximize reliability of water service
- Minimize cost of water supply
- Increase water storage capacity with a reserve for drought periods.
- Ensure that adequate water capacity is available for domestic needs of the region.
- Ensure that the development of new water sources does not adversely affect in-stream flows.
- Improve the existing potable water distribution system and develop new potable water sources prior to further expansion of the State Urban District boundary or major subdivision of land in the State Agricultural or Rural Districts.
- Ensure adequate supply of groundwater to residents of the region before water is transported to other regions of the island.

³³ Ko`olau WUPD, Page 103

East Maui Watershed Management:

Excerpted Ko`olau Draft Water Use and Development Plan³⁴:

East Maui watersheds are predominately vegetated by native Hawaiian rainforest. The plants there evolved over millions of years into the most efficient water collection system for our island's geography. It works in layers – tall 'ōhi'a and koa trees provide a canopy for shorter trees, while shrubs and ferns fill in underneath, and a thick layer of mosses and leaf litter complete the floor. These layers act like a giant sponge, slowing down heavy raindrops and soaking up water for slow release into underground aquifers. Even during droughts, our watersheds can produce water, pulling water out of the clouds by collecting fog drip. This uniquely evolved, specialized forest is the key to Maui's healthy water supply harbor endemic and rare native plant and bird species. The main threats to the native forest and ecosystems are habitat loss and alterations due to feral ungulates (pigs, deer, goats) and invasive plants. These are detrimental both to biodiversity and water supply.

Active management to ensure protection and preservation of these important watershed lands occur on federal, state and community levels.

Excerpted from the Central Draft Water Use and Development Plan³⁵:

Issue and Background: Most land within this hydrologic unit are water resource "import" areas, rather than "export" areas in the sense that population and agricultural operations rely on water resources from adjacent watersheds. Watershed management in both types of watersheds are important. The Department of Land and Natural Resources has identified "Priority Watershed Areas" which are areas of highest rainfall and resupply, based on climatic conditions that provide high recharge and fog capture. Currently protective measures are focused in these priority areas above the 3,000 foot elevation with direct benefit to makai lands and the nearshore environment. The East Maui Watershed Partnership (EMWP) manages most of the forested upper critical watersheds of Ko`olau aquifer sector. Ongoing efforts include ungulate control through fence construction, retrofitting and regular trap checks weed management, monitoring, and human activities management through outreach and education. On the dry side of Haleakala, the Leeward Haleakala Watershed Restoration Partnership (LHWRP) works towards restoring the disturbed landscape where once dryland forests captured rain and fog that recharged the freshwater supply. The Maui Invasive Species Committee (MISC) targets pest animals and plant species to prevent their influx and establishment in the mauka critical watersheds. Their efforts occur throughout the Central ASEA in rural and agricultural regions as needed.

³⁴ Ko`olau WUDP, Page 99

³⁵ Central, WUDP, Page 100, 101

The Makawao-Pukalani-Kula Community Plan states as objectives:

- ***Recognize the importance of the forested watershed areas and that their health and well-being are vital to all the residents of the Upcountry area.***
 - ***Explore a comprehensive reforestation program to increase and catch more rainwater for the Upcountry area.***
-

The objectives support the ongoing efforts by EMWP, LHWRP and MISC. State and county agencies as well as private purveyors can provide financial support and participation in watershed protection partnerships and reforestation programs. Strategies for watershed management in Ko`olau is addressed in the Ko`olau ASEA Report, Chapter 16.8.1. Management efforts on leeward Haleakala is addressed in the Kahikinui ASEA Report, Chapter 18.8.1

Maui Forest Protection and Cost Savings:

Recent studies underway are showing that investment in the restoration and maintenance of the East Maui watershed will provide financial benefits far greater than the costs being expended. The benefits will come in the form of increase water supply, more dependable water supply, and perhaps even fewer costs in the maintenance of the ditch system itself.

For example: Researchers from the University of Hawaii Economic Research Organization (UHERO) and Water Resources Center partnered with the Nature Conservancy of Hawaii to evaluate how native forest conservation contributes to local water supplies in a water stressed area in East Maui. They found that by preventing the degradation of native forest, conservation efforts could save the local water utility up to 137.6 million dollars over 100 years depending on a range of assumptions. This finding demonstrates that it makes practical sense for water utilities to join collective action efforts to finance watershed conservation, which in turn provides a suite of benefits in addition to water.³⁶

The Department of Water Supply Division of Water Resources and Planning provided \$20,000 to help fund the study through a grant to the Nature Conservancy. The UHERO study limited data to watershed conversion from one native species (ohia) to one invasive species (strawberry guava). DWS is funding a USGS study that addresses complex relationship between hydrologic impact from actual watershed protection/restoration of specific native species and habitats on Maui. This completion date of the study is not yet determined.

³⁶ <https://uhero.hawaii.edu/news/view/356>

Excerpts from a paper titled “Contributions of native forest protection to local water supplies in E. Maui Study”³⁷:

While the direct and indirect benefits of forest conservation efforts are multiple and diverse, we focus on quantifying one key hydrologic service (groundwater recharge) and associated benefit (present value benefit¹ to the water utility), as an important step towards understanding the synergies between land and water management.

We focus on groundwater recharge benefits, as groundwater is an important source of drinking water and was identified by the Maui County Department of Water Supply (DWS) as clearly linked to future costs of meeting water consumption needs into the future. We worked with DWS to estimate future water consumption needs and to calculate the projected benefits (expressed in present value terms) of protecting groundwater recharge via watershed conservation. We also collaborated with the land manager, The Nature Conservancy, to assess management costs of protection.

2.5. Costs of watershed management

In order to compare the benefits of forest conservation in terms of groundwater recharge and cost savings to the water utility to the costs of maintaining native forest through watershed protection and management, we also estimated the management costs covered by the land manager. Watershed management efforts in Waikamoi began over three decades ago. Historical expenditures over the period 1995–2012 were aggregated from The Nature Conservancy's Long-Range Management Plans ([The Nature Conservancy of Hawai'i, 1993](#), [The Nature Conservancy of Hawai'i, 1999](#), [The Nature Conservancy of Hawai'i, 2006](#), [The Nature Conservancy of Hawai'i, 2011](#)). Costs were attributed to ungulate control, invasive plant control, invertebrate and small mammal control, monitoring, rare species protection and research, public outreach programs, personnel, equipment, and facilities. Expenditures on fence construction for the exclusion of ungulates were estimated based on the total length of regularly inspected fence line in Waikamoi (30.6 km) and unit costs of \$124,275/km and \$246,064/km for pig and deer fences respectively. Recent expenditures (2013–2017) were obtained through discussions with TNC Maui staff. Future annual watershed protection costs for the period 2018–2117 were projected based on average historical maintenance costs, i.e. not including costs associated with initial fence construction and major ungulate removal drives.

³⁷ <https://www.sciencedirect.com/science/article/pii/S0048969719327937>

3.2. Monetary benefits of avoided loss of groundwater recharge/reduced water costs

Present value benefits for the benchmark scenario (assuming a 10% spread rate, 3% discount rate and 2035 shortfall year) totaled \$37.2 million. Reducing the non-native forest spread rate from 10% to 5%, while keeping the discount rate and shortfall assumption unchanged, substantially reduced benefits to \$11.1 million. However, benefits appear fairly robust to changes in the shortfall year for both counterfactual scenarios. Varying the date of initial supplementation of existing groundwater sources to 2030 and 2040 resulted in benefits of \$38.5 million and \$35.7 million respectively for the 10% spread rate scenario and \$11.3 million and \$10.9 million for the 5% spread rate scenario. Benefit estimates were much more sensitive to the discount rate. Assuming a 10% spread rate, decreasing the discount rate to 1% increased benefits to \$137.6 million, while increasing the discount rate to 5% reduced benefits to \$11.3 million. In the 5% spread case, reducing the discount rate raised benefits to \$52.1 million, while increasing the discount rate lowered benefits to \$2.7 million.

Nexus Between EMI Delivery System & East Maui Watershed:

A detailed environmental and cost analysis of Watershed Management and Restoration building on the Water Use and Development Plan and UHERO study above is needed.	Watershed Restoration has proven water production results. In order to ensure optimum water value realization based on research and data, public and private entities must be required to make the necessary investments.
The Hawaii Fresh Water Initiative calls for investment in watershed protection statewide as a crucial step for water security. Consistent, reliable public funding is the most difficult and important part of watershed protection and storm water capture. ³⁸	One recent University of Hawai'i Economic Research Organization (UHERO) study estimated that <u>investing \$43.2 million</u> in watershed restoration work in the Ko'olau mountains could result in over <u>\$900 million in actual realized water value</u> for O'ahu. ³⁹
Current commitments to management and restoration by Maui County represent 1/3 of total investment. Fiscal Year 2020: \$900,000	Watershed Partnership Annual Investment in East Maui Watershed Restoration. Fiscal Year 2020: \$1,781,000
There appear to be no specific commitments to Management and Restoration of the East Maui Watershed by Mahi Pono/EMI in the Draft EIS. <u>Page 2-2, DEIS</u> : Under the Proposed Action, it is anticipated that EMI and/or Mahi Pono will continue to pursue watershed management activities."	HRS § 171-58(e) requires that any new lease of water rights "shall contain a covenant that requires the lessee and the department of land and natural resources to jointly develop and implement a watershed management plan. The board shall not approve any new lease of water rights without the foregoing covenant or a watershed management plan."
Commitments to providing water for taro farming are crucial to the care of the watershed.	... Native Hawaiians divided the land into <i>ahupua'a</i> — subdivisions running from the ocean to the mountains, roughly defined by their watersheds. Fresh water flowed through complex ditch systems called <i>'auwai</i> , often toward taro <i>lo'i</i> , where it supported the cultivation of hundreds of variety of taro—a dietary mainstay for the population. Intact native forests in the <i>wao akua</i> , along with diversion systems of <i>'auwai</i> and <i>lo'i</i> in the lowland areas slowed down water down and increased aquifer recharge in each watershed. ⁴⁰
Various computer climate models predict divergent precipitation futures for Hawai'i, although there seems to be common agreement that our rainfall future will be increasingly extreme and inconsistent. There is also high variation throughout the islands in terms of each watershed's ability to catch and hold water. In sum, the question is not whether Hawai'i will have water in the future, but rather will Hawai'i continue to have an affordable, predictable supply in the places we need at the times that we need for a growing population?" ⁴¹	<ul style="list-style-type: none"> • Rainfall in Hawai'i decreased by 18% over a 30 year period in Hawai'i from 1978 to 2007. • Annual "tradewind days" have declined 28% from 291 days in 1973 to 210 days in 2009, resulting in less rain and recharge of aquifers. • Hawai'i has been feeling the impact of prolonged drought. In the summer of 2013, 75% of Hawai'i's land area was "Abnormally Dry." • Groundwater provides 99% of the state's domestic water use and in several key areas groundwater levels have been dropping. • Increased temperatures associated with global warming mean increased evaporation for surface water and soil moisture. • Certain invasive plant and tree species have higher evapotranspiration rates than native species in Hawai'i. Hawai'i forests are increasingly encroached on by invasives.⁴²

⁴¹ Fresh Water Blueprint, Page 5

⁴² Fresh Water Blueprint, Page 5

Stream Restoration:

A separate but related issue for watershed management and repair and maintenance of the EMI Water Delivery System is restoration of the streams, due in part to changes in stream diversions.

In 2020, the State Department of Agriculture is providing \$4.5 million to support local agriculture. This is currently a one-time allocation, which will support the plans, design and construction to rebuild auwai in Ke'anae-Wailuanui and similar rural water infrastructure projects. This allocation is considered to be a fraction of what is truly needed to support taro farmers, and is limited somewhat because funds can only be used on public lands (county or state) and expenses for each project are high due to accessibility and dangerous conditions. The goal is to maintain and hopefully increase funding in the future. Further, it indirectly helps the watershed by supporting lo'i (see above).

Environmental and Social Impacts of Agriculture:

Per the November 2018 Impact investing in the global food and agricultural investment space, Investing profitably whilst fostering a sustainable and thriving agriculture⁴³:

It is now acknowledged that agriculture is a strong contributor to climate change, with a sector contribution of 19-29% of total global greenhouse gas emissions. According to the Food and Agriculture Organization (FAO), Agriculture, forestry and other land uses (AFLOU) have emitted a total of 10.6 gigatonnes of CO2 equivalent in 2010. The main direct sources of GHG emissions in agriculture are not only carbon dioxide (CO2), but also nitrous oxide (N2O), mostly through the application of fertilizers, and methane (CH4), essentially from livestock and rice cultivation. Deforestation and land degradation have also reduced the sector's capacity to absorb or sequester carbon dioxide from the atmosphere.

Moreover, as has been stated in the report on "Strategies for mitigating climate change in agriculture" by California Environmental Associates and Climate focus, April 2014, while governments, bilateral development agencies, and multilateral financial institutions are dedicating significant resources to increasing agricultural yields globally, less emphasis has been placed on making agriculture environmentally sustainable. Croplands and pasturelands already cover nearly 40 percent of the earth's land area, and agriculture consumes 70 percent of freshwater used by humans.

⁴³ <https://www.valoral.com/wp-content/uploads/Valoral-Advisors-Impact-Investing-November-2018.pdf>

Agriculture is also the world's largest driver of species loss and habitat conversion and is a major contributor to toxic and nutrient pollution, soil degradation, and invasive species introductions. These pressures on our resources will only continue to grow as global population and income levels rise. It is important that the agriculture sector transforms itself and implements sustainable agricultural practices that allow it to become more caring of nature and of the environment that surrounds us.

At the same time, climate change is already affecting the agriculture sector in a multitude of ways, which can vary from region to region. For example, we have started to observe rising temperatures, loss of biodiversity, increased prevalence of extreme weather events such as floods, cyclones and hurricanes and increased unpredictability of weather patterns.

...All these changes have deep consequences in the agriculture sector, and can be translated into harmed crops and reduced yields, reduced feed supply and carrying capacity of pastures and increases in animals' vulnerability to disease, which reduces fertility and milk and meat production, reduced fish stocks due to warmer water temperatures and reduced capacity of forests to provide crucial goods and services.

According to its DEIS, Mahi Pono intends to use 65.88 mgd of water from the EMI aqueduct for agriculture, and while the EIS acknowledges the negative impacts of agriculture on the climate crisis, there are no specific estimates of how Mahi Pono's farm activities will impact climate, only the statement that ranching activities will be "negligible." The following section is excerpted from the Draft EIS⁴⁴:

The Proposed Action will allow for the continued conveyance of water through the EMI Aqueduct System to allow for the transition of the agricultural fields in Central Maui to a diversified agricultural operation. Various studies indicate that agricultural activities can be a source of GHGs that aggravate climate disruption. Agriculture creates both direct and indirect emissions. Direct emissions come from fertilized soils and livestock manure. While indirect emissions come from runoff and leaching of fertilizers, emissions from land-use changes, use of fossil fuels for mechanization, transport and agro-chemical and fertilizer productions. Various management practices in the agricultural land can lead to production and emission of GHGs, which range from fertilizer application to methods of irrigation, tillage and cattle and feedlots.

However, the agricultural sector has large potential to mitigate climate change. According to the Intergovernmental Panel on Climate Change (IPCC) (2013), mitigation is an intervention to reduce the emissions sources or enhance the GHG sinks. GHG emissions through energy conservation, lower levels of carbon-based inputs, lower use of synthetic fertilizer and other features that minimize GHG emissions and sequester carbon in the soil.

⁴⁴ DEIS, P. 4-74 and 4-75

As Mahi Pono's farm plan becomes operational, GHG emissions from internal combustion engines in farming equipment, and transportation related to crop production and workers will increase over the current fallow conditions. When fully operational, the amount of GHG emissions compared to former sugarcane operations does not suggest that one would be significantly greater than the other. There will be seasonal differences in emissions with a sugar monocrop generating more emissions during seasonal harvests while diversified agriculture would likely be distributed due to differences in crop cycles. Sugar also involved burning but such emissions were not from fossil fuels. Sugar also involved transporting products overseas for processing and distribution while diversified agriculture could reduce the amount of food crops imported from overseas as it increases the amount of local food production.

Mahi Pono's farm plan proposes livestock operations on the agricultural fields in Central Maui. The livestock sector requires a significant amount of natural resources and has a role in GHG emissions, especially methane and nitrous oxide. Methane, mainly produced by enteric fermentation and manure storage, is a gas which has an effect on global warming 28 times higher than carbon dioxide. Nitrous oxide, arising from manure storage and the use of organic/inorganic fertilizers, is a molecule with a global warming potential 265 times higher than carbon dioxide (IPCC, 2013). However, in comparison to other livestock operations on the island, such as Ulupalakua Ranch, which operates on approximately 18,000 acres, Mahi Pono's livestock operation will be negligible. Additionally, Mahi Pono's farm plan also includes a utility scale solar farm to supply power to the public power grid, and will also use power from two existing hydro- electric facilities to provide power to pumps and wells, and other infrastructure.

However, the exact nature of how the climate will change and impacts from any changes is unknown. As research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

General Resource Management:

Planning objectives related to resource management identified in the WUDP update public process include: ⁴⁵

- Watershed protection and its prioritization, including invasive alien plant control, ungulate control, and reforestation via watershed partnership programs
- Maintaining access to lands for gathering, hunting and other native Hawaiian traditional and customary practices
- Improving the understanding of the concepts of "precautionary planning" to reduce and adapt to the effects of drought and climate change upon water resource availability and quality

⁴⁵ Ko'olau WUDP, Page 99

- Consultation and coordination with Native Hawaiian community/moku and local experts on resource management and invasive species removal

The Hāna Community Plan reflects regional issues expressed at the community WUDP meetings. Policies related to water resource management include:

- Protect, preserve and increase natural marine, coastal and inland resources, encouraging comprehensive resource management programs
- Ensure that groundwater and surface water resources are preserved and maintained at capacities and levels to meet the current and future domestic, agricultural, commercial, ecological and traditional cultural demands
- Recognize residents' traditional uses of the region's natural resources which balance environmental protection and self-sufficiency
- Discourage water or land development and activities which degrade the region's existing surface and groundwater quality
- Encourage resource management programs that maintain and re-establish indigenous and endemic flora and fauna
- Protect, restore and preserve native aquatic habitats and resources within and along streams
- Ensure that the development of new water sources does not adversely affect in-stream flows
- Increase water storage capacity with a reserve for drought periods.
- Improve the existing potable water distribution system and develop new potable water sources prior to further expansion of the State Urban District boundary or major subdivision of land in the State Agricultural or Rural Districts.
- Ensure adequate supply of groundwater to residents of the region before water is transported to other regions of the island.

Key issues for the Ko`olau region were identified in public meetings held in Hāna over 2016. Community concerns overlap with those of the Hāna aquifer sector and relate to watershed management and participation by the local community; maintenance of traditional resource management using the ahupua`a system and ensuring that traditional and customary practices are safe guarded. Community members state that younger generations are returning to Ko`olau and Hāna to establish taro lo`i. Other key issues for the region focus on providing affordable water for future needs, providing for taro lo`i and other public trust uses during droughts, and managing resources in a sustainable way.

Due to resource interdependencies, East Maui (Hāna and Ko`olau ASEAs) community concerns are also related to the primary concerns of Makawao-Pukalani-Kula residents, which center on the limited development of water resources and a distribution system to meet the needs of the region. The proper allocation of water resources is considered essential to, in order of priority:

- (1) preserve agriculture as the region's principal economic activity, promote diversified agricultural activities, and effectively encourage the development of Department of Hawaiian Home Lands (DHHL) parcels; and
- (2) However, water use in the Upcountry region is recognized as having impacts on the streams of East Maui and the agricultural activities of the central valley.

A comprehensive water management strategy must be developed to strike a balance between the various interests and accommodate environmental, agricultural and on Upcountry and East Maui water issues as they relate to each other and the Central Maui ASEA.⁴⁶

⁴⁶ Ko'olau WUDP, Page 98

IV. Native Hawaiian Land & Water Rights

Hawaiian Homes Commission Act, 1921:

(**Bold added for emphasis**):

[§101. Purpose.] *[Text of section subject to consent of Congress.]*

(a) The Congress of the United States and the State of Hawaii declare that the policy of this Act is to enable native Hawaiians to return to their lands in order to fully support self-sufficiency for native Hawaiians and the self-determination of native Hawaiians in the administration of this Act, and the preservation of the values, traditions, and culture of native Hawaiians.

b) The principal purposes of this Act include but are not limited to:

- 1) Establishing a permanent land base for the benefit and use of native Hawaiians, upon which they may live, farm, ranch, and otherwise engage in commercial or industrial or any other activities as authorized in this Act;
- 2) Placing native Hawaiians on the lands set aside under this Act in a prompt and efficient manner and assuring long-term tenancy to beneficiaries of this Act and their successors;
- 3) Preventing alienation of the fee title to the lands set aside under this Act so that these lands will always be held in trust for continued use by native Hawaiians in perpetuity;
- 4) Providing adequate amounts of water and supporting infrastructure, so that homestead lands will always be usable and accessible; and**
- 5) Providing financial support and technical assistance to native Hawaiian beneficiaries of this Act so that by pursuing strategies to enhance economic self-sufficiency and promote community-based development, the traditions, culture and quality of life of native Hawaiians shall be forever self-sustaining.

c) In recognition of the solemn trust created by this Act, and the historical government to government relationship between the United States and Kingdom of Hawaii, the United States and the State of Hawaii hereby acknowledge the trust established under this Act and affirm their fiduciary duty to faithfully administer the provisions of this Act on behalf of the native Hawaiian beneficiaries of the Act.

d) Nothing in this Act shall be construed to:

- 1) Affect the rights of the descendants of the indigenous citizens of the Kingdom of Hawaii to seek redress of any wrongful activities associated with the overthrow of the Kingdom of Hawaii; or

- 2) Alter the obligations of the United States and the State of Hawaii to carry out their public trust responsibilities under section 5 of the Admission Act to native Hawaiians and other descendants of the indigenous citizens of the Kingdom of Hawaii. [L 1990, c 349, §1]

§220. Development projects; appropriations by legislature; bonds issued by legislature; mandatory reservation of water.

- a) Subject to subsection (d), the department is authorized directly to undertake and carry on general water and other development projects in respect to Hawaiian home lands and to undertake other activities having to do with the economic and social welfare of the homesteaders, including the authority to derive revenue from the sale, to others than homesteaders, of water and other products of such projects or activities, or from the enjoyment thereof by others than homesteaders, where such sale of products or enjoyment of projects or activities by others does not interfere with the proper performance of the duties of the department; provided that roads through or over Hawaiian home lands, other than federal-aid highways and roads, shall be maintained by the county in which the particular road or roads to be maintained are located.
- b) The legislature is authorized to appropriate out of the treasury of the State such sums as it deems necessary to augment the funds of the department and to provide the department with funds sufficient to execute and carry on such projects and activities. The legislature is further authorized to issue bonds to the extent required to yield the amount of any sums so appropriated for the payment of which, if issued for revenue-producing improvements, the department shall provide, as set forth in section 213.
- c) To enable the construction of irrigation projects which will service Hawaiian home lands, either exclusively or in conjunction with other lands served by such projects, the department is authorized, with the approval of the governor, and subject to subsection (d), to:
 - 1) Grant to the board of land and natural resources, or to any other agency of the government of the State or the United States undertaking the construction and operation of such irrigation projects, licenses for rights-of-way for pipelines, tunnels, ditches, flumes, and other water conveying facilities, reservoirs, and other storage facilities, and for the development and use of water appurtenant to Hawaiian home lands;
 - 2) Exchange available lands for public lands, as provided in section 204 of this Act, for sites for reservoirs and subsurface water development wells and shafts;
 - 3) Request any such irrigation agency to organize irrigation projects for Hawaiian home lands and to transfer irrigation facilities constructed by the department to any such irrigation agency;
 - 4) Agree to pay the tolls and assessments made against community pastures for irrigation water supplied to such pastures; and

- 5) Agree to pay the costs of construction of projects constructed for Hawaiian home lands at the request of the department, in the event the assessments paid by the homesteaders upon lands are not sufficient to pay such costs;

provided that licenses for rights-of-way for the purposes and in the manner specified in this section may be granted for a term of years longer than is required for amortization of the costs of the project or projects requiring use of such rights-of-way only if authority for such longer grant is approved by an act of the legislature of the State. Such payments shall be made from, and be a charge against the Hawaiian home operating fund.

- d) For projects pursuant to this section, sufficient water shall be reserved for current and foreseeable domestic, stock water, aquaculture, and irrigation activities on tracts leased to native Hawaiians pursuant to section 207(a). [Am Jul. 10, 1937, c 482, 50 Stat 507; Nov. 26, 1941, c 544, §6, 55 Stat 786; Jun. 14, 1948, c 464, §7, 62 Stat 393; Aug. 1, 1956, c855, §1, 70 Stat 915; am L 1963, c 207, §§2, 5(a); am L 1986, c249, §4; am L 1991, c 325, §2]

Law Journals and Reviews

Native Hawaiian Homestead Water Reservation Rights: Providing Good Living Conditions for Native Hawaiian Homesteaders.25 UH L. Rev. 85.

Case Notes

Pursuant to article XI, §§1 and 7 of the Hawaii constitution, subsection (d) of this Act, and §174C-101(a), a reservation of water constitutes a public trust purpose.103 H. 401, 83 P.3d 664.

Where commission on water resource management failed to render the requisite findings of fact and conclusions of law with respect to whether applicant had satisfied its burden as mandated by the state water code, it violated its public trust duty to protect the department of Hawaiian home lands' reservation rights under the Hawaiian Homes Commission Act, the state water code, the state constitution, and the public trust doctrine in balancing the various competing interests in the state water resources trust.103 H. 401, 83 P.3d 664.

Where commission on water resource management refused to permit cross examination of water use applicant's oceanography expert regarding the limu population along the shoreline, in effect precluding the commission from effectively balancing the applicant's proposed private commercial use of water against an enumerated public trust purpose, the commission failed adequately to discharge its public trust duty to protect native Hawaiians' traditional and customary gathering rights, as guaranteed by this section, article XII, §7 of the Hawaii constitution, and §174C-101.103 H. 401, 83 P.3d 664.

§221. Water.

(a) When used in this section:

- 1) The term "water license" means any license issued by the board of land and natural resources granting to any person the right to the use of government-owned water; and
- 2) The term "surplus water" means so much of any government-owned water covered by a water license or so much of any privately owned water as is in excess of the quantity required for the use of the licensee or owner, respectively.

b. All water licenses issued after the passage of this Act shall be deemed subject to the condition, whether or not stipulated in the license, that the licensee shall, upon the demand of the department, grant to it the right to use, free of all charge, any water which the department deems necessary adequately to supply the livestock, aquaculture operations, agriculture operations, or domestic needs of individuals upon any tract.

- c) In order adequately to supply livestock, the aquaculture operations, the agriculture operations, or the domestic needs of individuals upon any tract, the department is authorized (1) to use, free of all charge, government-owned water not covered by any water license or covered by a water license issued after the passage of this Act or covered by a water license issued previous to the passage of this Act but containing a reservation of such water for the benefit of the public, and (2) to contract with any person for the right to use or to acquire, under eminent domain proceedings similar, as near as may be, to the proceedings provided in respect to land by sections 101-10 to 101-34, Hawaii Revised Statutes, the right to use any privately owned surplus water or any government-owned surplus water covered by a water license issued previous to the passage of this Act, but not containing a reservation of such water for the benefit of the public. Any such requirement shall be held to be for a public use and purpose. The department may institute the eminent domain proceedings in its own name.
- d) The department is authorized, for the additional purpose of adequately irrigating any tract, to use, free of all charge, government-owned surplus water tributary to the Waimea river upon the island of Kauai, not covered by a water license or covered by a water license issued after July 9, 1921. Any water license issued after that date and covering any such government-owned water shall be deemed subject to the condition, whether or not stipulated therein, that the licensee shall, upon the demand of the department, grant to it the right to use, free of all charge, any of the surplus water tributary to the Waimea river upon the island of Kauai, which is covered by the license and which the department deems necessary for the additional purpose of adequately irrigating any tract.

Any funds which may be appropriated by Congress as a grant- in-aid for the construction of an irrigation and water utilization system on the island of Molokai designed to serve Hawaiian home lands, and which are not required to be reimbursed to the federal government, shall be deemed to be payment in advance by the department and lessees of the department of charges to be made to them for the construction of such system and shall be credited against such charges when made.

4. **All rights conferred on the department by this section to use, contract for, or acquire the use of water shall be deemed to include the right to use, contract for, or acquire the use of any ditch or pipeline constructed for the distribution and control of such water and necessary to such use by the department.**
5. Water systems in the exclusive control of the department shall remain under its exclusive control; provided that the department may negotiate an agreement to provide for the maintenance of the water system and the billing and collection of user fees. If any provision or the application of that provision is inconsistent with provisions contained in this section, this section shall control.

Water systems include all real and personal property together with all improvements to such systems acquired or constructed by the department for the distribution and control of water for domestic or agricultural use. [Am Aug. 1, 1956, c 855, §§2, 3, 70 Stat 915; am L 1963, c 207, §§2, 5(b); am Const Con 1978 and election Nov. 7, 1978; am L 1981, c 90, §10; am L1984, c 36, §1; am L 1990, c 24, §1]

Cross References

Board of land and natural resources empowered to prepare irrigation plans, see §§174-5, 174-6.

Law Journals and Reviews

Native Hawaiian Homestead Water Reservation Rights: Providing Good Living Conditions for Native Hawaiian Homesteaders 25 UHL. Rev. 85.

Case Notes

Although the Hawaii administrative rules denominate aquifer- specific reservations of water to the department of Hawaiian home lands, such a limitation for purposes of water resource management does not divest the department of its right to protect its reservation interests from interfering water uses in adjacent aquifers. 103 H. 401, 83 P.3d 664.

Insofar as the commission on water resource management, as the agency authorized to administer the state water code, determines the contents of the Hawaii water plan, which includes the designation of hydrologic units and sustainable yields, and the commission's "interpretation of its own rules is entitled to deference unless it is plainly erroneous or inconsistent with the underlying legislative purpose", it is within the commission's authority to limit reservations of water to specific aquifers. 103 H. 401, 83 P.3d 664.

Where commission on water resource management failed to render the requisite findings of fact and conclusions of law with respect to whether applicant had satisfied its burden as mandated by the state water code, it violated its public trust duty to protect the department of Hawaiian home lands' reservation rights under the Hawaiian Homes Commission Act, the state water code, the state constitution, and the public trust doctrine in balancing the various competing interests in the state water resources trust. 103 H. 401, 83 P.3d 664.

Where commission on water resource management's findings supporting its conclusion that the proposed use of water would not interfere with department of Hawaiian home lands' reservation rights under this section failed to address whether the proposed user had adduced sufficient evidence with respect to the impact of the proposed use on the department's reservation in the adjacent aquifer system, commission erred in concluding that proposed user had met its burden under §174C-49 to obtain a water use permit. 103 H. 401, 83 P.3d 664.

Excerpt from the Ko`olau Water Use and Development Plan, DHHL Maui Island Plan:

The Hawaiian Homes Commission adopted its Maui Island Plan as the overarching planning document in 2004. The Department of Hawaiian Homelands (DHHL) East Maui planning region encompasses three tracts totaling 985 acres: Ke`anae, Wākiu, and Wailua. All three tracts are within the Hāna Community Plan designated Area. However, only Ke`anae (150.6 acres) and Wailua tracts are within the Ko`alau ASEA, covering 242 acres the State Land Use Commission has mostly zoned Agriculture, with a very small percentage zoned Conservation. The County zoning and Community Plan designations for the lands is Agricultural. For the Ke`anae tract, Two acres of community use is proposed on the makai property, and 32 three- acre agricultural lots are proposed on 57 acres of the mauka property. The chosen DHHL project for the Wailua tract proposes 28 acres of subsistence agricultural use, 52 acres of General Agricultural use and 10 acres of Conservation.⁴⁷

Excerpt from the Central Water Use and Development Plan DHHL Water Resources:

Due to the extensive Department of Hawaiian Homelands (DHHL) land holdings and their plans to further develop the area for Native Hawaiian habitation and farming activities; adequate water supply is becoming increasingly important for Native Hawaiians to resettle and facilitate their cultural practices in the area. DHHL lands are occupied by Native Hawaiians who are assumed to live the full-range of traditional Native Hawaiian cultural practices based on their ability to implement the knowledge of their heritage. Upcountry Maui (Kēōkea/Waiohuli, Ulupalakua, Kualapa) has over 6,000 acres of DHHL lands.

The Makawao-Pukalani-Kula Community Plan section, "Identification of Major Problems and Opportunities of the Region Problems," cites "limited development of water resources and distribution system to meet the needs of the region as a primary concern," and notes that "The proper allocation of water resources is considered essential to encourage the development of Department of Hawaiian Home Lands (DHHL) parcel."⁴⁸

Kēōkea/Waiohuli – Priority Tract

According to the DHHL Maui Island Plan, with adequate water and funding, this area has the potential to be the largest homestead region on Maui. Over 6,000 acres of DHHL land are

⁴⁷ Ko`olau WUDP, P. 43

⁴⁸ Central WUDP, Page 30

located below Kula Highway on the slopes of Haleakala. A 70-unit farm lot subdivision at Keōkea was planned prior to the *Maui Island Plan*. A second phase of 343 residential lots can be implemented using allocations from the existing water system if planned in the mid-section of the tract between existing residential lots and the Keōkea farm lots. An additional 768 residential lots are proposed for future residential homesteads at Waiohuli pursuant to the development of an on-site production well.

Kualapa

Located along Kula Highway south of Ulupalakua near Kanaio, this tract does not have immediate development potential due to infrastructure constraints. The water system is old and undersized and is not able to accommodate any further growth; and extensive off-site improvements would be needed to support residential development.

Kula Residence Lots

The Kula Residence Lots subdivision is located in the northern portion of the Keōkea-Waiohuli homestead area (yellow on the accompanying map). The subdivision will include a total of 420 lots developed to Rural Residential half-acre standards.

Future DHHL Development

DHHL has long range conceptual plans for about 1,100 more residential lots in the area below the latest developments. The future subdivisions are envisioned to include community facilities, a school site, parks, archaeological preserves, and open space. These future plans are dependent on the development of water, wastewater, road improvements, and funding. The timeframe for these developments is beyond 2020.

Excerpts from Draft EIS Relating to DHHL Lands:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for K kea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its K kea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.⁴⁹

⁴⁹ DEIS, Page 2-4

Failure of the State to Fulfill Fiduciary Responsibility:

Whether the State of Hawaii is meeting its fiduciary responsibility to Native Hawaiians regarding their claim to revenue sharing as granted by the State Constitution needs to be resolved.

In *Nelson v. the Hawaiian Homes Commission*, six individual plaintiffs filed a first amended complaint alleging that the State Defendants and DHHL had violated Article XII, Section 1 of the Hawai'i State Constitution. That constitutional provision states the following:

The legislature shall make sufficient sums available for the following purposes: (1) development of home, agriculture, farm and ranch lots; (2) home, agriculture, aquaculture, farm and ranch loans; (3) rehabilitation projects to include, but not limited to, educational, economic, political, social and cultural processes by which the general welfare and conditions of native Hawaiians are thereby improved; (4) the administration and operating budget of the department of Hawaiian home lands; in furtherance of (1), (2), (3) and (4) herein, by appropriating the same in the manner provided by law.

Plaintiffs alleged that the State had failed to make sufficient sums available to DHHL for the four purposes enumerated above. In Count 2, the Plaintiffs alleged that DHHL breached its trust duties to its beneficiaries by failing to request sufficient sums from the State. The progress of this case and the appeals provides insight into the dissatisfaction of beneficiaries with regard to revenue sharing.

Case is attached as Appendix 11.

*Excerpts from: Wai o ke Ola He Wahi Mo'olelo no Maui Hikina, A Collection of Native Traditions and Historical Accounts of the Lands of Hāmākua Poko, Hāmākua Loa and Ko'olau, Maui Hikina (East Maui), Island of Maui, Kumu Pono Associates*⁵⁰

At the request of Garret Hew, Manager of East Maui Irrigation Company, Ltd. (EMI), Kumu Pono Associates conducted a two phased study of cultural historical resources in the lands of Hāmākua Poko, Hāmākua Loa, and Ko'olau, in the region of Maui Hikina (East Maui), Island of Maui (an area that includes some 73 individual ahupua'a or native land divisions). The study included— conducting detailed research of historical records in public and private collections (Volume I); and conducting oral history interviews with individuals known to be familiar with the cultural and natural landscape, and history of land use in the Maui Hikina study area (Volume II). This study was conducted in conjunction with the Water License Application of the East Maui Irrigation Company, Ltd., to the Board of Land and Natural Resources of the State of Hawai'i.⁵¹

Page 444-445 (Appendix 8)

In 1928, J.H. Foss (Chief Engineer, East Maui Irrigation Company), submitted a paper to the Public Lands Commission as a part of the appraisal process associated with General Lease No.'s 1134 (Honomanu), 974 (Hamakua), and 276 B (Spreckels). In the paper, Foss provided readers with a historical summary of the history of the East Maui Ditch System and Water Licenses:

A brief history of Government Water Licenses on East Maui will give a background for the details to be considered in these three appraisements. There are in all five such licenses, two in addition to the above three. All of them are now somewhat interwoven due to the fact that the transportation of water from each is handled by one and the same general ditch system; accordingly, the two additional ones...are Keanae, No. 1706; and Nahiku, No. 520 B...

...Honomanu License, No. 1134, is a new license which replaced the original lease on Honomanu lands. At the expiration of said lease all improvements thereon, and in connection therewith, reverted to the Government. The present Honomanu License also provides that improvements thereon and in connection therewith revert to the Government...

The present ownership of the ditches transporting water from the Honomanu and Spreckles Hamakua Licenses is somewhat involved. The original ditches on the Honomanu lease are the Spreckels and M. Louis, which are to a great extent still in use. They reverted to the Government at the expiration of the Honomanu lease in 1908. The Koolau Ditch which also crosses the Honomanu License, but which was built under the Keanae License in 1903 1904, reverted to the Government at the expiration of that license in 1925. Thus all the aqueducts in the land of Honomanu are now, and have been for several years, the property of the Government.

⁵⁰ <http://www.ulukau.org/elib/collect/maly6/index/assoc/D0.dir/book.pdf>

⁵¹ Wai o ke Ola He Wahi Mo'olelo no Maui Hikina, Page 3

The Spreckels, Center, Lowrie and New and Old Haiku Ditches are still the property of East Maui Irrigation Co^[19]. Those portions of those ditches located on Government land may automatically become the property of the Government at the expiration of the Spreckels License in 1938, although the Spreckels License does not provide for reversion of improvements.

Those portions of the new and old Hamakua Ditch, located upon Government land, reverted to the Government with the expiration of the Hamakua (1916) and Keanae (1925) Licenses respectively; and accordingly have been the property of the Government for some time. The Wailoa Ditch, which is located on the Spreckels Hamakua License, is still the property of East Maui Irrigation Co., but those parts which are on Government land will revert to the Government at the expiration of the Spreckels Hamakua License in 1938...

Page 448-449 (Appendix 9)

September 7, 1876

C.T. Gulick, Interior Department;

to Messrs. Castle and Cooke, Agents Haiku Sugar Co. : .

..I am directed by His Excellency the Minister of the Interior to say in reply to your Application of the privileges, that the Government will grant to the Haiku Sugar Co., Alexander and Baldwin, James M. Alexander, The Grove Ranch Plantation and Thomas Hobron, and their respective and several successors heirs and assigns the license to take water from the streams named in the application and to carry the same over all Govt. lands intervening between the said Streams and the remotest of the lands to which it is now desired to carry said water for the period of twenty (20) years from date of acceptance at the rate of One Hundred Dollars (\$100.) pr Annum, upon condition:

1st: That a sufficient ditch, canal or other waterway shall at once be commenced and finished in a reasonable time.

2nd: That this grant shall in no way interfere with the rights of tenants upon said Government streams or lands.

3rd: Nor shall it in any way affect the right of the Government to grant to any person or persons the right to take water (not to interfere with the water herein granted) from the same or other streams to be carried over the same land or lands for any purpose whatsoever, and if need be through the ditch or canal to be constructed by these grantees, provided however that during the said twenty years the supply of water, a right to take which is herein granted, shall not be diminished by act of the Government.

4th: That at any time during the said period the government may purchase the said ditch canal or other water way, * (* upon payment of the actual cost thereof only) and in case of said

purchase will continue to furnish water to these grantees and their respective and several successors, heirs and assigns at a just and reasonable rate not to exceed that paid by other parties taking water from such ditch or waterway.

Page 486-489 (Attached Appendix 10)

[Extension of Lease from the 30th of Sept. 1893, to the 30th of Sept. 1916]

August 10, 1893 J.A. King, Minister of the Interior; to Haiku Sugar Company and Paia Plantation Company]

An Indenture made this 10th day of August, A.D. 1893, by and between His Excellency, James A. King, Minister of the Interior of the Hawaiian Islands, acting with the advice and consent of the Executive Council of the Provisional Government of said Islands, of the first part, and The Haiku Sugar Company and the Paia Plantation Company, Corporations established and existing under and by virtue of the laws of the said Islands, of the second part;

Whereas said parties of the second part hold a certain grant of the right to take water for purposes of irrigation from certain streams on the Island of Maui, and the right of way across certain Government Lands for a ditch to convey such water, which said grant is contained in an Indenture made by and between W.L. Moehonua, Minister of the Interior, acting with the consent of the King in Cabinet Council, of the first part, and the Haiku Sugar Company, James M. Alexander, Alexander and Baldwin and T.H. Hobron, of the second part, dated Sept. 30th, 1876, of record in the Hawaiian Registry of Deeds in Lib. 49, Fols. 167 172, which said grant is for the term of twenty years;

And Whereas said Indenture was, on the 7th day of Oct. 1878, modified by agreement of the parties, of record in said Registry in Lib. 57, Fols. 343 345, the parties of the second part, then associated under the name of the Hamakua Ditch Company, on consideration of the waiver by the party of the first part of the right reserved to purchase said ditch and appurtenances, agreeing to pay the sum of Five hundred Dollars (\$500.00) per annum rental;

And Whereas the Paia Plantation Co. has acquired all of the rights of said James M. Alexander, Alexander and Baldwin, and T.H. Hobron in said Indenture;

And Whereas said indenture contains a covenant for renewal for a further term of twenty years, provided the rights therein granted should be granted to any person or corporation...

Honolulu, July 25, 1898. Senator Hocking; to J. F. Brown Esq., Agent of Public Lands:

...Mr. H. P. Baldwin, Mr. W. F. Pogue and myself have entered into a preliminary agreement to erect a sugar mill at Nahiku, Island of Maui, for the purpose of manufacturing sugar from cane grown and furnished by parties who have taken up government lands at Nahiku, Island of Maui, and also to pipe and ditch water along the heads of said lands, providing we can acquire the right from the Government to do so.

Therefore providing the Company be incorporated under the law of Hawaii, will you grant it a license to use the water on said lands for the above named purpose, providing it be used for the benefit of all parties owning land in said tract, and depriving no person of their rights to water, we would necessarily like the privilege for a long term of years if you should decide to grant this license will you please state the terms... [HSA, F.O. & Ex, Public Lands Commission – 1898]

August 2, 1898 Land License No. 520 B Public Lands Commission;

The water from this tract shall be used for the general benefit of the owners and occupiers of lands within the Nahiku tract of Public Lands Map No. 20, for irrigation and domestic purposes, and for cane fluming and general Mill and Plantation purposes, and no person or persons shall be deprived of the use of any water to which they would have been entitled in the absence of this License.

...The right as regards the use of the land to be occupied under this license, is limited to such operations as are required for ditching, building dams, flumes and for the utilization and conveyance of water, no rights of taking timber except for construction of such dams, flumes and c, and no rights of using the said tract for other purposes being granted.

At the expiration of the term of this license all flumes, pipes and improvements for conducting said water shall remain upon said land and shall revert to the Government.

Per the Office of Hawaiian Affairs, Kipuka database, of the 30,000 acres of land on the Tax Map Key numbers listed in the Draft EIS, 18,000 are crown lands.⁵²

<u>TMK</u>	<u>Acres</u>
2/1-2-004-005	1576.07
2/1-1-004-007	3821
2/1-1-002-002	13007.1
2/1-1-001-044	3371.97
2/1-1-001-005	2121.85
<u>2/2-9-014-001, 005, 011, 012, 017</u>	<u>6630.84</u>
Total acres	30,528.83

⁵² <http://kipukadatabase.com>

TMK: 2/1-1-002-002

- 35,740 acres owned by the State DLNR-DOFAW considered Ko`olau Forest Reserve
- 13,518 acres of Crown Land

1895 Land Use: Kalo laukea Description⁵³:

These three lands adjoin each other and extend along the coast from Makoloaka point where Wailua joins the government land of Waiohue on the east, to a ravine called Napuumahoenui at the extreme westerly end of Honomanu, a distance of about 6 1/2 miles. These tracts are mostly mountain and wood land, and full of deep and precipitous gulches. At Keanae there is quite a stretch of low table land where considerable taro is cultivated and where the most of the natives reside. Has a very good landing. In the Wailua valley all of the lower portion is rice land, about 75 acres. On these lands there is at all times a great abundance of water. The land of Honomanu is valuable for its water, from which a large section of the Hawaiian Commercial and Sugar Co.'s land is supplied. Wailua contains about 3000 acres, Keanae 11,148 and Honomanu 3260.

- Land Patent Grant 10879 from the Territory of Hawaii to Amalia K. Bodnar 7.75 acres dated 9/4/40.
- Royal Patent Grant #3223 awarded to Kaakuamoku and Kailiau for 120 acres in 1879, Book 15

TMK: 2/1-1-001-044 Honomanu

- 4270 acres of Crown Land
- Same description as above
- 1895 Land use: Valuable Water Rights

V. Considerations RE: Purchasing & Maintaining EMI System

The Maui County Board of Water Supply Temporary Investigative Group has conducted interviews and discussions with various individuals in the community with knowledge, expertise and experience who have increased TIG members’ understanding of the scope, operations and maintenance of the EMI Water Delivery System as well as the costs related to the purchase or condemnation of the EMI water delivery system and the cost of its maintenance, and the purchase or condemnation of relevant Mahi Pono lands.

The BWS TIG has also reviewed various documents related to the above.

General Considerations:

In response to community research, the BWS TIG learned that there are many members of the community who have been considering the option of purchasing the East Maui water delivery system and/or watersheds and had already begun their own analyses prior to the establishment of the TIG.

For example the East Maui H2O Roundtable discussed the following:

<p>East Maui H2O Roundtable, convened by Sustainable Living Institute of Maui, June 2018, Break-out group on Financing strategies for East Maui Watershed and Water systems.</p>	<p>Participants: <i>ALLISON COHEN (Nature Conservancy)</i> <i>GLADYS BAISA (DWS DIRECTOR at the time)</i> <i>CARL FREEDMAN (economic analyst on water and energy policy)</i> <i>DAVID FISHER (Economist and business advisor)</i> <i>CAROL REIMAN- A&B Public relations head</i> <i>WARREN WATANABE- Maui farm bureau</i> <i>LUCIENNE DE NAIE - Sierra Club Maui/ east Maui resident</i> <i>HUGH STARR- ag property specialist/ water researcher</i></p>
<p>Price tag depends on needed systems improvements and community priorities. Costs associated with watershed and ditch system (not County water treatment systems) include:</p> <ul style="list-style-type: none"> • <i>ditch system upkeep and maintenance</i> • <i>watershed management and restoration activities</i> • <i>monitoring gear / programs</i> • <i>alternative water sources</i> • <i>needed studies and plans</i> • <i>system modifications/ expansions</i> • <i>OHA/DHHL share</i> 	
<p>Funding Sources:</p> <ul style="list-style-type: none"> • System users • Private sector funding • International & local bonds • Social impact investors interested in : <ul style="list-style-type: none"> • sustainability • education • carbon offset • adopt a tree programs 	<ul style="list-style-type: none"> • NGO investors (charitable foundations) • Corporate sponsors • County • Federal appropriations (climate impact mitigation funds?) - USFWS/ USDA/ EPA- GRANTS • USGS programs and projects • State - Legislature plus CWRM/ OHA/DHHL

Determine **pricing structure** for portion of funding coming from potential water system users:

- DWS: potable system & ag parks
- A&B or successor- farming leases /hydropower
- taro farmers/ kuleana farmers
- Hui partition holders in Huelo
- Maui Gold pineapple
- Ranches
- Recreational users PUC would need to regulate the prices set & PUC bases decision on cost, not “value”

SIDEBAR: AG WATER RATES

- Charging 3 cents per 1000 gal , 100 mgd would cost \$1 million
- Upcountry farmers currently pay \$1.10/ 1000 gal at the County Ag park
- State irrigation district (Hawaii Island) charges 20 cents/ 1000 gal.

Condemnation Requirements (Per Maui County Corp Counsel):

In an August 2, 2017 transmittal from then-Corporation Counsel Pat Wong to then-Council Member Elle Cochran, advice is provided on the process for initiating condemnation proceedings by the County of Maui. Mr. Wong cites the following sections of the Hawaii Revised Statutes (HRS):

§46-1.5 (6) Each county shall have the power to exercise the power of condemnation by eminent domain when it is in the public interest to do so;

§46-61 Eminent domain; purposes for taking property. Each county shall have the following specific powers: To take private property for the purpose of establishing, laying out, extending and widening streets, avenues, boulevards, alleys, and other public highways and roads; for pumping stations, waterworks, reservoirs, wells, jails, police and fire stations, city halls, office and other public buildings, cemeteries, parks, playgrounds and public squares, public off-street parking facilities and accommodations, land from which to obtain earth, gravel, stones, and other material for the construction of roads and other public works and for rights-of-way for drains, sewers, pipe lines, aqueducts, and other conduits for distributing water to the public; for flood control; for reclamation of swamp lands; and other public uses within the purview of section 101-2 and also to take such excess over that needed for such public use or public improvement in cases where small remnants would otherwise be left or where other justifiable cause necessitates the taking to protect and preserve the contemplated improvement or public policy demands, the taking in connection with the improvement, and to sell or lease the excess property with such restrictions as may be dictated by considerations of public policy in order to protect and preserve the improvement; provided that when the excess property is disposed of by any county it shall be first offered to the abutting owners for a reasonable length of time and at a reasonable price and if such owners fail to take the same then it may be sold at public auction.

§46-62 Eminent domain; proceedings according to chapter 101. The proceedings to be taken on behalf of the county for the condemnation of property as provided in section 46-61, shall be taken and had in accordance with chapter 101, as the same may be applicable.

§101-13 Exercise of power by county. Whenever any county deems it advisable or necessary to exercise the right of eminent domain in the furtherance of any governmental power, the proceedings may be instituted as provided in section 101-14 after the governing authority (county council, or other governing board in the case of an independent board having control of its own funds) of the county has authorized such suit by resolution duly passed, or adopted and approved, as the case may be. The resolution, in the case of the city and county of Honolulu or an independent board thereof, shall, after its introduction, be published in a daily newspaper with the ayes and noes, once (Sundays and legal holidays excepted) at least three days before final action upon it, and in the case of any other county or an independent board thereof, be published in a newspaper with the ayes and noes, at least one day (Sundays and legal holidays excepted), before final action upon it.

§101-14 Plaintiff. The attorney general of the State may, at the request of the head of any department of the State, or as otherwise provided by law, institute proceedings for the condemnation of property as provided for in this part. Any county may institute proceedings in the name and on behalf of the county for the condemnation of property within the county for any of the purposes provided in this part which are within the powers granted to the county.

Section 4-2(7) of the Revised Charter of the County of Maui (1983) states: "Resolutions authorizing in eminent domain shall be adopted as provided by law."

Maui County Code Section 3.44.O15(E) states: "The council may authorize proceedings in eminent domain by resolution. Any proceedings so authorized are subject to the requirements of chapter 101, Hawaii Revised Statutes."

The remainder of HRS chapter 101 sets forth the process for completing condemnation proceedings.. In summary, after the Council passes a resolution, the County is required to file a complaint in Circuit Court and provide notice of the action to all owners of the property. The County will be required to compensate the property owners for the property taken, and if the parties cannot agree on compensation, the Court will hold a trial on the issue.

Prior to drafting the resolution, the County should obtain a title report for the property, as well as an appraisal of the property's value. The appraised value of the property should be included in the County's budget. The resolution itself should authorize the Department of Corporation Counsel to initiate condemnation proceedings, specifically describe the property, state the public purpose proposed for the property, and authorize Corporation Counsel to deposit money equivalent to the estimated value of the property to obtain immediate possession, if applicable. It is also advisable for the Council work closely with the County department that will be responsible for oversight of the property throughout the condemnation proceedings.

In your request, you discuss the possibility of condemnation of the structures but not the land within the proposed property. Owning the structures without owning the land would limit the County's control of the land to effectuate the purpose of the condemnation.

Please see Appendix 5 for a copy of the transmittal.

In an email request from Board of Water Supply Chair and TIG Vice Chair Shay Chan Hodges, Corporation Counsel Caleb Rowe, stated the following:

"In general, when a condemnation occurs, the governmental body undertaking the condemnation must pay "fair market value" of the property taken. The Hawaii Supreme Court in its decision in Honolulu v. Collins (attached) specifically states that the value of use of water derived from the land shall be considered in a determination of fair market value ("this land has a special value as water producing land. The owners, therefore, are entitled to compensation according to its value as such.")

The calculation of damages would be a little weird for this one since the system is technically on state land and the rights to the water are entirely speculative (dependent on the RP from BLNR). Still, some consideration of the value of water would likely be deemed appropriate in a determination of fair market value."

See Appendix 6 for a copy of Honolulu vs. Collins.

Fair Market value of the EMI System:

Market Value in 2018	Based on one-year old purchase price
1. Price paid by Mahi Pono:	\$5,442,333.48 per the purchase and sales agreement with Mahi Pono. Only 50% paid to date. ⁵⁴
2. Assuming that Mahi Pono did its due diligence and assuming that A&B did not sell the EMI System to Mahi Pono for a concessionary price at less than fair market value contrary to the interests of its shareholders, \$5.4 million was a fair price for the system last year. Has the value increased or decreased since the time of purchase?	Due to the reduction in agriculture, there has been reduced use of the aqueduct system over the last three years, and thus a reduction in EMI staff (as confirmed by Kamole Treatment Plant staff). It is likely that changes in delivery system use combined with less maintenance of ditches and the watershed would have a negative impact on the overall condition of the system.
Increased Value if EMI/Mahi Pono Receives 30-Yr Lease	A&B/Mahi Pono Purchase and Sale Agreement
1. The sale by A&B of its property and EMI interest to Mahi Pono required that A&B shareholders be informed of material details of the transaction through the filing of SEC Form 8-K. A&B's 8-K filing prescribes a minimum value of \$62 million of Mahi Pono obtaining state water leases with sufficient water to fully implement its plan through a requirement that Mahi Pono be rebated this amount to reflect the diminished value of the property purchased from A&B if the water leases with sufficient allocation are not granted. As false and misleading statements made in SEC filings are prohibited by law, it is reasonable to assume that the information provided in A&B's 8-K regarding Mahi Pono's acquisition is accurate	Seller will make a one-time rebate to Buyer of \$31,000,000 of the Purchase Price if at any time prior to the earlier of (i) the date State Leases are obtained as provided in Section 2.7(d) below or (ii) eight (8) years after the Closing Date: (x) EMI or Seller is legally prohibited from delivering the Minimum Water Amount (defined below) to Buyer, and (y) the amount of water that EMI is then not legally prohibited from delivering to Buyer is less than Buyer's actual surface water need at that time, as determined by Buyer in its sole discretion, exercised in good faith, to meet the irrigation requirement of its then existing crops or crops planned for the upcoming 24 months in the area served by East

⁵⁴ A&B/Mahi Pono, Purchase and Sales Agreement and Escrow Instructions, Page 4, <https://www.sec.gov/Archives/edgar/data/1545654/000119312518354682/d664171dex101.htm>

and based on proper due diligence.	Maui surface water (a " <u>Productivity Loss Event</u> ." On the date one year after the initial Productivity Loss Event described in subsection (a) (the " <u>Initial Productivity Loss Event</u> "), Seller will rebate to Buyer an additional \$31,000,000 of the Purchase Price for a total reduction in the Purchase Price of \$62,000,000, unless by that date the Initial Productivity Loss Event is cured. ⁵⁵
------------------------------------	--

Legal Ownership of the EMI System:

As noted under "Ownership Considerations" on Page 32, per the contractual agreements between EMI and the Hawaiian government, the East Maui Irrigation System should have reverted back to the Hawaiian government. **A thorough legal analysis of the current ownership needs to take place immediately.**

Assessed Value of the EMI System Relative to Repairs Needed:

Per the Central WUPD: Public concerns were voiced over the EMI system falling into disrepair, inefficiencies due to unlined storage reservoirs and system losses. In the East Maui Streams Contested Case, system losses were assessed to about 22 percent. As sugarcane cultivation is transitioned to other uses, EMI continues to maintain the system and keeping the main ditches functional even with reduced volume flow. CWRM in its June 2018 decision encourages HC&S to seek to make its storage and delivery of water to its fields more efficient to increase the productive yield of the irrigation water from East Maui.⁵⁶

On December 20, 2016, the Department of Water Supply commented on the early consultation for the preparation of the EIS for the proposed 30-year lease. Some comments included:

The costs of the EMI System management, capital improvement, system operation and maintenance are important in assessing the future viability of the system and should be disclosed by the applicant. Relevant information include[s]:

The current and projected costs of the EMI system management, capital improvements, system operation and maintenance.

Although the DEIS, Page 548, refers to some repair and maintenance, there does not appear to be any explicit plans or expenditures cited in the EIS:

⁵⁵ <https://www.sec.gov/Archives/edgar/data/1545654/000119312518354682/d664171dex101.htm>, Page 6

⁵⁶ Central WUPD, Page 104

Implementation of the CWRM D&O may require modification or complete removal of specific diversion in the EMI Aqueduct System. Mason Architects prepared a Historic Structure Assessment report for the subject Water Lease. It was determined that the EMI Aqueduct System is eligible to be placed on the NRHP. Historically significant structures to be modified or removed will be documented photographically and with location sketch plans conforming to the Historic American Engineering Survey (HAER) standards. Any future developments will need to be in conformance with the goals, policies, and objectives of the State of Hawai'i CZMP⁵⁷.

Assessing the current condition of the EMI System and the costs of appropriate repairs:	How would a fair appraisal be conducted?
<p>1. Comprehensive information from EMI/Mahi Pono about the condition of the delivery system would be extremely useful to the community, not just for the purposes of determining market value, but for assessing overall impacts on the ecosystem, health, safety, and traditional and customary practices.</p> <p>The BWS TIG requested a copy of a safety analysis conducted by Oceanit from EMI that might have provided valuable information about the state of the system, as well as recommended improvements. EMI/A&B declined to provide a copy of the report.</p> <p>BWS TIG requested a tour; which has not been scheduled by EMI yet.</p>	<p>Based on the draft EIS, it is unclear what the current condition of the EMI system is. One statement indicates that there WILL be maintenance but does not clarify what the current maintenance is.</p> <p><u>Page 3-15, Draft EIS:</u> "ongoing maintenance and operation of the EMI Aqueduct System is expected to take place under all alternatives, to the extent operations and maintenance of the system is financially feasible."</p>
<p>2. Appraisal Process</p> <p>Scope of Work includes details of the property to be evaluated, reason for appraisal, who is ordering, who will receive report and how it will be used. Appraiser then identifies parcels, makes physical inspection, takes measurements, pictures and creates field notes. The appraiser then makes adjustment calculations to compare subject property to similar size, zoned, special features (in the case of vacant land - it is important to note the useable land area, the utilities available on the property, road access) Appraiser identifies any and all improvements on the parcels.</p>	<p>In the case of condemnation for purposes of obtaining a water storage and distribution system for the public trust, the appraiser will need to have an MAI designation (a professional certification) in order to be able to appear in court.</p> <p>Only a handful of appraisers in Hawaii are MAIs. Hiring the appraiser with court experience would probably cost from \$25,000 to \$50,000.</p>
<p>3. From US Department of the Interior, Fish and Wildlife Service.</p> <p>Dan Pohlhemus of USFWS attended June 2018 East Maui H2O Roundtable offered the following observations on the E. Maui ditch system from recent experiences he has had doing stream surveys:</p>	<p>Dan Pohlhemus: "At the present time, there is also no water being diverted from any stream east of the Koolau Gap by the Koolau Ditch, because in that sector at least as far west as Wailuanui Stream it is stagnant or dry. EMI and Mahi Pono are only diverting what they currently need to serve Maui County, fire control, and a few limited ag customers, which all amounts to less than 30 mgd. This is easily supplied by diversions on the Wailoa Ditch</p>

⁵⁷ CZMP=Coastal Zone Management Plan

<p>" ... due to lack of maintenance, the various ditch systems other than the Wailoa Ditch (which has the highest elevation alignment and is thus of greatest use to Maui County Water) are gradually falling apart, with numerous treefalls and land slips beginning to obstruct them, and their headgate machinery rusting and deteriorating.</p> <p>"As far as I can see, neither the Lowry Ditch nor the New Hamakua Ditch are currently functional, and with each passing day it will take progressively more work and money to bring them back into service.</p>	<p>from Puouhokamoa westward, a fair number of which are still active to some degree. But there seems to be no master plan here, just EMI taking the limited amount of water they still need from whatever are the easiest diversions to maintain. Everything else will go back to the forest, as has already happened to many diversions and access roads associated with the Waiahole Ditch on Oahu. Essentially, the system is downsizing itself, although that is not all bad."</p>
<p>4. Community Members provided feedback about the condition of the EMI Delivery System and the impacts on safety at focus groups convened for the Draft EIS.</p> <p><u>Page 4-121, DEIS:</u> Mr. Hau states that the EMI Aqueduct System requires mapping that shows the 388 intakes, ditches, dams, pipes, and flumes. Each diversion should be located and identified accurately with GPS coordinates. Elevations should also be recorded. The amount of water moving through the system should be measured at specific locations within the EMI Aqueduct System as well.</p>	<p><u>Page 4-135, DEIS:</u> As landowners and farmers downstream of the EMI Aqueduct System, two major concerns emerged among participants. First, many reported that the EMI Aqueduct System is not maintained in a manner that was safe for people in the area and located downstream. Focus group participants said that portions of the ditch area are so overgrown with vegetation that people visiting the area are injured if they stumble upon or fall into ditches and flumes that are not readily visible. Two bridges on State land often flood in this wet season, and people cannot drive to their residences until the water level subsides. It was felt that the bridges are unsafe because of a lack of maintenance.</p> <p>Also, people who visit popular areas in the vicinity of the State Forest Reserve, such as Twin Falls (which is partially within License Area; the upper falls are within the License Area but, the area that is frequently visited is outside the License Area), and area trails, noted that these areas are subject to overgrown landscaping and flash flood conditions. Participants noted that neither EMI nor the State has participated in maintenance of the EMI Aqueduct System and trails in this area, even though this area attracts residents and visitors alike.</p>
<p>5. Examples of repairs and modifications:</p>	<p>Replace old diversion apparatus with modern diversion devices (solar powered, plus batteries) that allow established minimum flows to pass through, mauka to makai, and divert only excess water, and which allow migrating aquatic animals, plants can pass under device unimpeded both up and downstream.</p> <p>Install 24" pipes as used in mainland fracking water transport, laying the pipe in existing ditches, tunnels, flumes. This will reduce leakage to a minimum and save many mgd.; and prevent contamination of one stream with snails and other biota unique to each stream,</p>
<p>6. A formula for estimating initial repair costs is utilizing 3% of Replacement Asset Value (RAV) per year, over two years, which would total of \$12 million.</p>	<p><u>Page 802, DEIS:</u> "The development and improvement of the EMI Aqueduct System over time has cost nearly \$5,000,000, compared to its modern assessment of nearly \$200,000,000 to create a comparable system."</p>

Operating Costs and Management Considerations:

In the Draft EIS, EMI provides specific current and anticipated operations costs. If a public entity purchases the EMI Water Delivery System, these figures would represent the cost of operating the system with current EMI staff in place, which would be the most efficient plan at least in the short-term. Given that the EMI system is a relatively small operation with regard to personnel, taking over management and administration of the system would be relatively straightforward.

Breakdown of Operations Per EMI/A&B:	Page 2-1, 4-150, Draft EIS: \$2.5 M Annually
In the DEIS, EMI provided total operational costs for Mahi Pono, which are quoted here. Specific operational costs are also listed, though not enough information is available to confirm how final calculations were reached.	Page 2-1, DEIS: Total costs for labor, fringe benefits, materials, professional services, taxes, maintenance, anticipated rental payments to the State for the Water Lease, and other expenses are projected to be approximately \$2.5 million per year (Munekiyo, 2019).
1. Personnel	EMI is expected to employ a staff of 17 people with a payroll of \$0.8 million. Total direct and indirect jobs is 24, with an associated payroll of \$1.1 million .
2. Operations	EMI's operating cost (including personnel above) under the Proposed Action would be \$0.068 per kgal, for a total of \$2.2 million. (Table 4. EMI Water System Economic and Fiscal Impacts, DEIS Page 18)
3. Taxes	GET revenue would be estimated at \$37,000 while payroll tax would be \$45,400 per year
4. Payments to DHHL and OHA	\$169,300 would be disbursed to OHA and \$254,000 would be set aside for the DHHL
5. State Leases	Based on appraisal

Opportunities for Direct Cost Savings Through Improved Maintenance:

Engineering study of the EMI system that assesses the cost-benefit of mitigating 20% losses is needed.	What are the funding options available for environmental assessments?
1. Given the amount of water that is lost through leakages on a regular basis, what would the savings be of proper repair and maintenance to the owner of the system, and would that savings offset any of the R&M costs?	Ko'olau WUDP, Page 121: "...water losses due to leaks, seepage, evaporation and other inefficiencies in the treatment, conveyance, distribution and storage of water range widely depending on storage and source transmission system age, length, type and many other factors...To account for water losses and determine source needs for Upcountry, water produced, rather than water billed is used as basis to determine source needs. For the Upcountry system, water losses average 20%. "
2. What would the estimated increased availability of water to Upcountry residents be as a result of proper repair and maintenance?	
3. What would the impact be on overall East Maui stream restoration if less water needed to be diverted to supply Upcountry Maui?	

Liabilities:

Prior to the current sale of the EMI system to Mahi Pono, EMI has been operating under a “status quo” mentality with various grandfather clauses in effect. There are numerous liabilities and additional legal obligations that any new owner will need to address such as issues related to abutting landowners:

- Trespass and safety issues related thereto;
- Risks of extra water flow in storms; and
- Trees falling and other natural and man-made dangers encroaching on abutting land.

The DEIS does not contemplate a risk management plan that will be necessary to address these liabilities that Mahi Pono will be assuming when it takes full ownership of EMI and when the various grandfather clause exemptions currently enjoyed by EMI are no longer in effect.

Opportunities for Indirect Cost Savings through Mitigating Health and Safety Risks:

Health and Safety Considerations and Concerns, including Climate Crisis Impacts	In addition to direct costs, the County should look at other considerations that affect the well-being of Maui residents.
1. What are the safety concerns that would affect the community at large if the system is not properly maintained, regardless of ownership?	Page 3-14, DEIS: Impact to historic properties. Components of the aqueduct system that deteriorate and begin to fail, such as broken ditch walls or collapsed tunnels, have the potential to alter natural drainage patterns and increase erosion in downstream areas that are outside of established stream channels. These areas have the potential to contain surface and subsurface historic properties that could be affected by flooding and erosion. (Mason Architects, 2019).
2. What are the health and social effects on East Maui residents, including community benefits for intergenerational farmers returning to the valleys that have been without water for over a hundred years, if EMI Delivery system is not maintained optimally?	This would require a thorough study of the impacts of access to water on farmers and communities from a socio-economic perspective, looking at potential impacts of returns to East Maui.
3. How does maintenance of the EMI Delivery System impact Climate Crisis safety concerns with regard to flooding? (Steps to be taken regarding climate crisis mitigation over the next thirty years were not found in the DEIS although climate change is mentioned as a factor.)	Page 4-72, DEIS: Climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. With several streams being within East Maui, greater, episodic rainfall could increase stream flows and possible exceed the capacity of the EMI Aqueduct System as discussed in Section 4.3.1. The Modified Lease Area alternative could present risks to public safety if unfettered public access within the License Area meant more people could be put at risk due to stream flooding.

Opportunities to Support Culturally and Community-Based Economic Development As Defined by the Community:

The EMI Delivery System and Economic Development	The County should look at how public ownership would further support value-aligned economic options as defined by East Maui residents.
1. An analysis of the economic and social value of a well-maintained aqueduct system that supports local farming beyond state laws governing stream flow standards would allow the public to support multiple stakeholder needs from a variety of perspectives.	<u>Summary, Page 58, DEIS:</u> At full development, East Maui farms would produce about 1.0 million pounds per year of taro and about 400,000 pounds per year of other crops, resulting in \$2.9 million in direct and indirect sales per year. Farms would support a total of 21 direct and indirect jobs. (Munekiyo, 2019).
2. The impact of eliminating water loss on streams and waterfalls could be looked at from the perspective of impacts on the visitor industry.	What would loss of waterfalls impact be on tourism dollars? How would a managed tourism plan that acknowledges the contributions of and impacts on residents and the natural environment look?

Economic and Other Benefits of Accountability Regarding Streams Flows:

Although legal decisions have supported the return of water to streams, there is a lack of funding for monitoring and enforcement	Public ownership of the water delivery system would provide transparency, accountability, and multiple remedy options to the public if laws are not followed.
1. As noted previously, maintaining water in the streams has an impact on the watershed. There are also local and global environmental, community, tourism, energy, food security, and cultural imperatives for being able to ensure that streams are being restored as mandated by law.	The Code (HRS § 171C-3) defines “instream use” as: beneficial uses of stream water for significant purposes which are located in the stream and which are achieved by leaving the water in the stream. Instream uses include, but are not limited to: <ol style="list-style-type: none"> 1. Maintenance of fish and wildlife habitats; 2. Outdoor recreational activities; 3. Maintenance of ecosystems such as estuaries, wetlands, and stream vegetation; 4. Aesthetic values such as waterfalls and scenic waterways; 5. Navigation; 6. Instream hydropower generation; 7. Maintenance of water quality; 8. The conveyance of irrigation and domestic water supplies to downstream points of diversion; and, 9. The protection of traditional and customary Hawaiian rights.
2. If the water delivery system were publicly owned and/or controlled, there could be more opportunities and motivation for pursuing robust and authentic engagement with East Maui families regarding care of watershed and ahupua’a, including a community-based system of repair and maintenance (kuleana) to support ongoing communication and relationship building, as well as potential sources of funding for community	<u>Ko’olau WUDP, Page 15:</u> There are 36 streams in the Koolau ASEA, that are classified as perennial. Of these streams, 31 are considered continuous and 5 are considered intermittent. The CWRM database indicates that there are 323 declared stream diversions in the Ko’olau ASEA and 11 gauges, of which, only three are “active.” Most of these diversions belong to the East Maui Irrigation Company (EMI). Developing an East Maui community-based/owned system of

appropriate technology, including installing monitoring devices that can withstand heavy storm floods with wireless data broadcast that accurately measure stream flow and diversion amounts.	watershed stewardship could be an economic and educational driver from Keanae to Kaupo, based on generations of knowledge combined with environmental and climate change educational opportunities.
3. If EMI/Mahi Pono is granted a 30-year lease, there will be very limited opportunities for the community to demand accountability until 2050, long after intense effects of climate change have impacted Maui.	Page 4-121, DEIS: Mr. Hau relayed via email that he recommends a five-year lease with constant updates due to the fact that the project description lacks information on the amount of water flowing through the EMI Aqueduct System and the actual amount of water collected at each diversion and/or ditch without the factor of climate change accounted for.

Safeguarding Public Health & Community Security:

In addition to weighing the cost/benefits of owning/controlling the EMI Aqueduct System in the context of providing domestic water to Maui residents, the County needs to consider the long-term benefits of having control over its water supply over the next 30 years.	How does control of the delivery system combined with the fact that water is a public trust support proactive access to water and system improvements?
If the County of Maui owns the EMI Delivery system, given that Act 126 specifically allows for the continued diversion of water to serve Upcountry Maui domestic needs, the County would be in a strong position to receive a long-term lease from DLNR. Having its own long-term lease would release the County from dependence on a private company, thereby ensuring that the County can safeguard the public health of Upcountry and East Maui residents.	Issuance of a long-term lease of State land from the Board of Land and Natural Resources pursuant to Hawai'i Revised Statutes (HRS) Section 171-58(c) would provide the "right, privilege, and authority to enter and go upon" state-owned license areas "for the purpose of developing, diverting, transporting, and using government-owned waters" including the right to go upon those State lands to maintain and repair existing access roads and trails used in connection with the privately owned water aqueduct system.
According to DWS Director Jeff Pearson at the September 19, 2019 Meeting of the Board of Water Supply, the County of Maui would not be able to apply for a revocable permit or lease unless it owned the "diversion." If he is correct in his assertion, ownership of the EMI delivery system would allow the County or another public entity such as a Public Trust Water System to be able to apply for a lease.	Director Pearson made this statement in response to a recommendation by Hawaii State Senator Kai Kahele that Maui County apply for a Revocable Permit and lease immediately. Per Senator Kahele, the county is a domestic water provider, its rights are constitutionally protected. If they have an RP or a long-term lease, no matter who runs the transmission system, they can always get water for Kamole. See attached Appendix #3
Having ownership of the system and its own lease, the County of Maui or "Public Trust Water System" would be able to protect the public interest and support public access to the area as needed. Beyond access to domestic water, there are also health and safety issues related to Climate Change for Upcountry Maui. As noted by the State of Hawaii, Office of Planning, "the potential adverse effects of global warming include a rise in sea levels resulting in ... the inundation of	Page 473, DEIS: Changes in precipitation may affect Upcountry Maui's ecosystems and communities include flooding, erosion, drought, and fire. In addition, the ability to support smaller, local farmers and increased food security would be enhanced. Page iii, DEIS: The Water Lease will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow continued operation of the EMI Aqueduct System.

Hawaii's freshwater aquifers."	
Any publicly-owned entity that entity owned and/or controlled the system would have access to public funding for maintenance of the system and restoration of wetlands that a private owner can't access.	A current example of this kind of benefit for public entities is the \$4.5 million currently allocated by the Dept of Agriculture to help restore stream access in East Maui. The DoA cannot use the funds on private lands, such as EMI/Mahi Pono property. Similarly, USDA and other funding that could be used to repair the EMI delivery system could only be accessed if the system were owned by a public entity.
Public ownership of the delivery system – particularly if combined with lands owned by the County of Maui – would allow for more comprehensive systems-oriented solutions to water needs by combining renewable energy, farming plans that are tailored to community needs, and efficient water systems.	Water and farming plans that integrate analysis of use of curtailed wind energy for water pumping in agriculture and municipal systems can reduce agricultural water needs, lower energy costs for pumping water upcountry, and potentially increase stream flows. (Examples: A Systems Approach for Investigating Water, Energy, and Food Scenarios in East-Central Maui ⁵⁸)
Public ownership would also allow for mechanisms that require a Water Management Plan, building on the Water Use and Development Plan, but with enforcement mechanisms and funding allocations.	<u>Page 4-145, DEIS</u> : Interviewees stressed that Mahi Pono should implement a Water Management Plan. The Plan should outline improvements to the EMI Aqueduct System, including brush fire prevention and relate water needs to specific crops.
Public control over water delivery systems and watershed areas would support proactive and integrated efforts to ensure an affordable and predictable supply of water.	Board of Water Supply, City and County of Honolulu, 2016 Master Plan, 6.2 Sustain ⁵⁹ The BWS manages thousands of acres of watershed area on O'ahu to protect and preserve 212 separate potable water sources, the combination of 194 individual groundwater wells, 13 active potable water tunnels, and 5 shafts. The BWS's proactive efforts to manage and protect the watersheds include limiting access and development, combatting invasive animals and plants, promoting healthy forests, and encouraging customer water conservation to reduce the amount of water withdrawn from the environment. These BWS efforts are discussed in more detail in Section 4, Water Supply Sustainability.
Public or quasi-public ownership of the water delivery system would enable the public to ensure that workers are paid a living wage.	Jobs resulting from the use of a public trust resource such as water should pay enough for Maui residents to support their families.
As noted at the beginning of this document, the impetus for forming the Temporary Investigative Group grew out of the fact that Mahi Pono has been minimally responsive to community concerns and has been unresponsive to requests by the Board of Water Supply for engagement. Water Department Director Jeff Pearson has stated that his continued attempts to encourage Mahi Pono representatives to respond to the Water Board have	<u>Page 4-141 of the DEIS</u> : It is recommended that interest groups, or stakeholder groups, are clearly defined so that there is recognition of who will be affected by the proposed Water Lease. Groups should include geographic communities, environmental, agriculture and business interests, and public agencies. Each group would be encouraged to reach consensus on their own needs, concerns, opportunities and possible solutions. It is recommended that interest groups are equitably

⁵⁸<http://ulupono.com/media/W1siZiIsIjIwMTQvMTEvMTgvMjNfMjhfNDJfOTQxX0FfU3IzdGVtc19BcHByb2FjaF9mb3JfSW52ZXN0aWdh dGluZ19XYXRlci5wZGYiXV0/A%20Systems%20Approach%20for%20Investigating%20Water.pdf?sha=eea0a5f3>

⁵⁹ <https://boardofwatersupply.com/bws/media/files/water-master-plan-final-2016-10.pdf>

<p>been unsuccessful.</p> <p>Even though Director Pearson and the Maui County Administration have lobbied the State Legislature and will be lobbying the Department of Land and Natural Resources to support EMI/Mahi Pono application for a long-term lease, Mahi Pono has not been compelled to meet with the only volunteer board that advises the Mayor and County Council on matters related to water.</p> <p>Given that Mahi Pono is funded through PSP (Public Sector Pension), which “capture[s] value by integrating environmental, social and governance (ESG) factors throughout the investment process and across all asset classes,” it is surprising that community engagement, which is a key ESG value, has not been a priority for Mahi Pono.</p> <p>According to PSP’s Responsible Investment Report: “Through engagement, one can assess a community’s perceptions of the acceptability of a company’s project or local operations. In this context, community can be broadly defined to include stakeholders and interested parties well outside the immediate areas of operations, or any group or individual that can affect or is affected by the achievement of a company’s project. In other words, companies cannot operate sustainably without community support.”⁶⁰</p>	<p>represented in a “Core Working Group” that would serve as a forum for exchanging ideas and collaborative efforts, as well as provide feedback and suggestions to Mahi Pono. Each member of the Core Working Group would be expected to reach out to their own networks to extend the discussion beyond the Core Working Group. While there would likely be strong differences in perspectives and opinions, the Core Working Group would need to find ways to establish core principles, common ground and manageable solutions.</p> <p>The fundamental value that will help bring people to the same table is trust. The Proposed Action has elicited skepticism and distrust over many decades, and these feelings prevent willingness for participating in mediation and collaboration. While developing trust among the various groups will be challenging, the first step is transparency. Being open about intent, plans, and activities can begin to establish credibility and open the door to dialogue.</p>
<p>Public ownership of the EMI water delivery system would provide an opportunity to move towards reparations for the Native Hawaiian families who have not had access to their streams for over 100 years. Unlike local government, which exists to meet the needs of its citizens, a private entity – particularly one that is funded by an institutional investor with obligations to pension fund beneficiaries -- would need to develop a business plan that both maximizes revenues, while addressing environmental and cultural considerations. While this is possible, the DEIS does not describe such a plan.</p>	<p><u>Ko’olau WUDP</u>: Historically, great efforts were made to allocate water for all needs on Maui. Today, native Hawaiians are challenged with the negative consequences of resource “ownership,” with “owners” sometimes lacking sensitivity or requirements to share with others. Perhaps past strategies of sharing distribution and timing of water flows can be adopted in order for all water users to be supplied with this important resource. Consortiums of water partners have been discussed as options to ownership and management of the East Maui Irrigation water system.⁶¹</p>

Potential Sources of Public and Environmental and Infrastructural investment funds:

As noted in the table, any publicly-owned water delivery entity, whether the County or a “Public Trust Water System” would have access to public funding for maintenance of the system and restoration of wetlands that a private owner can’t access.

⁶⁰ https://www.investpsp.com/media/filer_public/documents/PSP-2018-responsible-investment-report-en.pdf

⁶¹ Ko’olau WUDP, Page 39

For example, grants and loans are available through the US Department of Agriculture, Rural Development agency for water and environmental programs. These grants are focused on populations of 10,000 or less so they could possibly apply to East Maui.⁶² The USDA’s Rural Utilities Service (RUS) provides much-needed infrastructure or infrastructure improvements to rural communities. These include water and waste treatment, electric power and telecommunications services. The US Bureau of Reclamation also provides funding for large scale water management, efficiency, and development.⁶³ There are other federal revolving loan funds with favorable terms that are designed to finance these types of water projects. And as noted in the table above, the State of Hawaii can be a source of funding, as it was in the \$11.2 million CIP Waikamoi flume replacement project. There are also a number of charitable foundations that have an interest in funding feasibility studies for municipal bond financing of environmentally beneficial projects.

Risks of Leaving Access to the Public Trust in Private Hands:

<p>The County also needs to consider the risks of an outside private equity firm with a “2 and 20” compensation structure and whose institutional funding source is seeking a net annualized return in excess of 10% controlling a significant amount of Maui water supply for 30 years.</p>	<p>Unless the existing owners make legally binding commitments, the community is at risk.</p>
<p>The DEIS is very clear that if EMI does not receive a 30-year long-term lease, EMI/Mahi Pono will not guarantee water for Upcountry Maui even though EMI/Mahi Pono has other sources of water that can be accessed for Upcountry (up to 30 mgd based on their reporting).</p>	<p>Page xiii, DEIS: Without the Water Lease, even if EMI could find it economically feasible to continue maintaining the EMI Aqueduct System to divert non-governmental water for diversified agriculture in Central Maui, there may not be enough water to allocate much or any to the MDWS. This lack of water would exacerbate the effects of drought when other surface water sources are unreliable for the KAP and the Nahiku, this could eliminate their primary source of water. Insufficient water delivered to the County through the EMI Aqueduct System could have significant effects on health and safety of those who currently rely on that water delivery.</p>
<p>As climate change creates more uncertainty and extreme impacts on residents, based on statements made in the DEIS and the record of Mahi Pono’s parent company Trinitas in California during the California drought in 2015⁶⁴, it is imprudent to assume that Mahi Pono will be a responsible community citizen, if extreme weather reduces water availability and/or if community groups request more investment in sustainable farming and/or water conservation practices.</p>	<p>Page 3-11, DEIS: Climate change may cause a decline in rainfall in Upcountry Maui. Any alternative that may result in less water being delivered through the EMI Aqueduct System to the MDWS for use in the Upcountry Maui Water System could increase periods of intense water shortages in Upcountry Maui.</p>
<p>As the climate crisis creates more uncertainty and extreme</p>	<p>A current and very dramatic example of a corporate</p>

⁶² <https://www.rd.usda.gov/about-rd/agencies/rural-utilities-service>

⁶³ <https://www.usbr.gov>

⁶⁴ <https://www.businessinsider.com/the-65-billion-almond-crop-is-driving-the-sharp-debate-about-california-water-use-2015-4>

<p>impacts on residents, it would be imprudent to assume that a private equity firm such as Mahi Pono with a financial incentive structure which is not aligned with the long-term public interest will take responsibility for addressing potential infrastructure damage and resource losses which will have significant impact on Maui. The DEIS makes it clear that if Mahi Pono does not receive all the public resources to which it believes that it is entitled, it may cut some or all of its water allocation to upcountry residents "which could pose long-term risks to health" (DEIS 7-5) as well as abandon agricultural fields (DEIS 6-4) and the EMI Aqueduct System. "Under such a scenario, the aqueduct system's historic resources may be found at risk for neglect from reduced or lack of maintenance, and/or possible demolition."</p>	<p>entity not taking responsibility for the potential long-term public impact of neglecting prudent infrastructure and resource management is Pacific Gas & Electric which earlier this month was forced to cut power to 800,000 households causing well over a billion dollars in economic losses in a matter of days.</p> <p>In the case of PG&E, regulatory bodies such as the California Public Utilities Commission have broad authority to implement and enforce corrective action. If Mahi Pono is granted a 30-year water lease under the proposed action, it is unclear what, if any, resourced mechanisms for accountability would be available to ensure that the public interest continued to be served for full term of the lease.</p>
<p>As noted above, PSP is likely seeking an annualized return in excess of 10% on its investment in Mahi Pono. A common approach to increasing return among private equity firms is to leverage an acquisition with a high amount of debt. As highly leveraged deals can rapidly lead to a crisis when financial projections are not met, it is important for stakeholders to have adequate knowledge of the debt structure. The DEIS does not provide this.</p>	<p><u>Page 3-6, DEIS:</u> "[A] lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in <u>establishing</u> successful diversified agricultural operations and crops that may take years to reach economic viability."</p>
<p>Perpetuation of a narrative that supports water scarcity, where one has to choose between returning water to the streams and Upcountry domestic water use and/or water in the streams versus agriculture, as opposed to one that promotes collective pro-active measures to support increasing recharge, conservation, and collaborative sharing of water resources has the potential to divide a community that currently is supportive of diverse interests and needs.</p>	<p><u>Page 4-137, DEIS:</u> "Balance" was a frequent theme among interviewees. They acknowledged that various groups need water originating from East Maui State watershed lands and felt that users should have access to water they truly need. Of note is that, regardless of one's own interest in the Water Lease, no one wanted water withheld from other groups.</p> <p><u>Page 4-140, DEIS:</u> A common theme with the Upcountry Maui residents was the continuation of reliable water service to Upcountry Maui residents, businesses and farmers. There was general appreciation for water provided by the EMI Aqueduct System. It is noted that these Upcountry Maui residents felt that East Maui agricultural and cultural practitioners should also have the water they need for their activities. They understood the need for flowing cold water in kalo cultivation.</p>
<p><u>March 2019 WUDP Draft, Water Resource Management, Strategies And Recommendations, Page 231-234:</u> #29 Research, support and use of less water consumptive crops and climate adapted crops" #30 Improve irrigation management and efficiency #32 Augment agricultural water supplies with alternative resources, #47 Diversify supply for agricultural use to increase reliability #50 "Balance existing diversions with alternative sources for agriculture to mitigate low-flow stream conditions #51 Maximize efficiencies in surface water transmission, distribution and storage</p>	<p>In terms of supporting agriculture, it is important to differentiate between export and crops for local consumption; how specific agricultural practices impact the climate crisis; whether the specific economic activity results in good jobs for Maui residents; and or whether it will exacerbate the housing crisis by importing workers.</p> <p>While Mahi Pono is technically governed by pension fund PSP's ESG (Environmental, Social, Good Governance) principles, there has been no explanation of how those principles impact decision making, nor has the company been transparent (Good Governance is the "G" in ESG).</p>

In Summary: Determining Costs and Benefits of Purchasing EMI System

- 1) Determination of legal ownership of all aspects of the EMI Water Delivery System is necessary, regardless of what the County/public decides to do.
- 2) A thorough engineering and cost analysis of the current EMI Delivery system is needed to determine the EMI System's true value as a stand-alone or partial system (and the various permutations thereof), in conjunction with improvements. This analysis needs to provide reliable information about:
 - What parts of the system are usable and what is the cost and value of repair, particularly in light of the "natural downsizing" currently taking place as a result of neglect;
 - Based on the domestic water use needs in Upcountry Maui and the condition of various aspects of the EMI system, what would be the most cost-effective strategy for partial purchase and use of the EMI system if there is one?
 - What are the options for condemning parts of the system and/or small tracts of land?
 - What are the benefits, if any, of purchasing specific ditch systems, such as only the Wailoa Ditch System?
- 3) Annual costs of maintaining the EMI System; including an assessment of liability issues;
- 4) Potential revenues based on domestic water and agricultural water sales;
- 5) Potential positive impacts of control of the revenue stream of Wailoa Ditch and/or the entire EMI system, such as:
 - Estimates of socio-economic benefits of increased farming in East Maui based on stakeholder control of instream flows;
 - Estimates of potential cost savings from improved health, safety, and other socio-economic indicators for East Maui residents who rely on the streams for farming and other cultural and recreational practices;
 - Estimates of the value of improved environmental stewardship based on modifications to the appurtenances and increased stream flow;
 - Estimates of potential increased water production from substantial watershed investments, combined with analysis of socio-economic benefits to East Maui of such an investment (with ancillary cost savings to other county departments as a result thereof);
 - Estimates of economic development and support of farming based on decreasing water rates for local farmers and reducing infrastructure costs for local residents with regard to water meters and subdivision outlays.
- 6) Risk of allowing a private equity firm and foreign pension fund to control a significant amount of Maui's water, which is a Public Trust, and to have outsized influence over Maui's water, agricultural industry and food security for 30 years.

VI. Alternative Water Sources

In addition to considering the viability and costs of purchasing parts or all of the EMI Aqueduct System, the TIG was tasked with assessing alternatives to ownership of the system that might also provide water security for Maui residents.

Pi`iholo and Olinda Water Treatment Facilities:

It is important to remember that with regard to Upcountry Maui, the Maui Department of Water Supply relies on three surface water sources:

- Wailoa Ditch, which is on state lands, and for which the current 30-year land lease is being sought by EMI/Mahi Pono, and
- Two MDWS higher elevation aqueducts that transport water to Olinda and Kula, owned by the County but maintained by EMI, under a contractual agreement originated under the 1973 East Maui Water Agreement and subsequent agreements.

MDWS and EMI diverts water from Ko`olau ASEA, conveyed to treatment plant facilities located in Ko`olau ASEA (Pi`iholo Water Treatment Facility) and the Central ASEA (Olinda and Kamole Weir Water Treatment Facilities). (See page 15 of this report)

The two upper aqueducts are owned by the County and provide the majority of the water to Upcountry Maui. In 2018, they provided a total of 4.61mgd, compared to 1.5mgd at Wailoa.

Per the DEIS, the other two surface water sources are not supplied by the EMI Aqueduct System, but are fed by streams located on lands previously owned by A&B and now owned by Mahi Pono. Under a contractual agreement with EMI, these waters are diverted and transported by two MDWS high-elevation aqueducts (Upper and Lower Waikamoi Flumes) that are also situated on land that was previously owned by A&B and now owned by Mahi Pono, located above the License Area (Ha`iku Uka Watershed). These aqueduct systems deliver water to the MDWS' Olinda and Pi`iholo Water Treatment Plants (See Figure 2- 4). These two high elevation aqueducts are maintained by EMI. However, these sources are not part of the proposed Water Lease being addressed by this DEIS as they are outside the License Area. The water received at the higher elevation is preferred by the MDWS because it can be delivered to users at higher elevations without the cost of pumping from a lower elevation source like the Wailoa Ditch.⁶⁵

⁶⁵DEIS, Page 2-10

Potable Groundwater Development:

From Ko`olau WUDP:

The amount of groundwater that can be developed is limited by the amount of natural recharge and aquifer outflow that contribute to streamflow and to prevent seawater intrusion, established as sustainable yield. Because delineation of aquifer sectors and systems in some cases are based on limited hydrologic information, areas for potential groundwater development must be assessed on its own merits to determine any additional needs for hydrologic studies and interaction with surface water and other sources.

Understanding potential impact of climate change adds to uncertainty in long-term groundwater availability. The primary responsibility to determine potential impacts on water resource availability lies with the State CWRM who in turn relies on studies and predictions by the scientific community and other agencies. Water purveyors need guidance how to mitigate and adjust to potential changes in groundwater availability.

Other constraints on groundwater availability include access and cost. Conveyance from high yield aquifers in remotely located watersheds to growth areas can be difficult and expensive due to topography and distance. Basal well development at high elevations, such as Makawao aquifer above 1200 feet would result in high pumping costs, just in terms of pumping water from the water table to ground elevation.

Potential effects of groundwater development on streamflow and on the quality of water pumped from existing wells in a region can be evaluated by robust hydrologic studies and models. Joint funding and collaboration between the municipal and private purveyors, CWRM and the U.S. Geological Survey would focus studies to maximize benefits and prevent conflicts in water development and designation. Aquifer systems in Ko`olau are not extensively studied, as indicated by CWRM's confidence rating in establishing sustainable yield. Haiku aquifer has sufficient yield to serve regional demand and support development of planned growth areas outside Ko`olau. It is recommended that CWRM prioritize hydrological studies and groundwater modeling in Haiku and Honopou regions to guide private and public well development and ensure potential impacts on surface water is addressed first.⁶⁶

Additional points from Central WUDP:

Other constraints on groundwater availability include access and cost. Conveyance from high yield aquifers in remotely located watersheds to growth areas can be difficult and expensive due to topography and distance. The Central ASEA consists of the driest regions on Maui, with annual rainfall generally less than 50 inches. Population centers and growth rely on groundwater imports from the Wailuku ASEA and the Ko`olau ASEA where rainfall and groundwater recharge are substantially higher.⁶⁷

⁶⁶ Ko`olau WUDP, Page 104

⁶⁷ Central WUDP, Page 105

<p>In order to determine whether development of wells in East Maui should be considered as an alternative to surface water, yield, aquifer capacity, and energy cost need to be studied.</p>	
<p><u>Ko`olau WUPD, Page 46:</u> The Ko`olau ASEA includes 149 wells, of which 131 are considered "production" wells, the remainder (18) are classified as "unused" (9), observation (2), and seven classified as "other" that do not produce water. The 131 production wells include County municipal (4), private public municipal (3), domestic (59), agricultural (crop use [39]), agricultural (1), agricultural (aquatic plants & animals use [1]), one agricultural (livestock and pasture use), three agricultural (ornamental & nursery plants use), 15 irrigation, and seven irrigation (landscape/water features use).</p> <p>CWRM pumpage reports for 2014 show that pumpage for the Ko`olau ASEA was approximately 0.92 MGD with County Municipal wells accounting for 0.878 MDG (95.81 percent of total sector pumpage), Municipal Private Public wells accounting for 0.015 MDG (1.63 percent of total sector pumpage), Agriculture wells accounting for 0.014 MGD (1.53 percent of total sector pumpage), Domestic wells accounting for 0.008 MGD (0.86 percent of total sector pumpage), and irrigation wells accounting for 0.0017 MGD (0.19 percent of total sector pumpage). However, it is likely that domestic use is underreported.</p>	<p>Page 4-59, DEIS: While no groundwater is transferred from the Ko`olau Aquifer Sector, surface water is conveyed from the sector to the Central Aquifer Sector via the EMI Aqueduct System. Since surface and groundwater interchange depends on the underlying geology, the increase in surface flow since the cessation of sugar cultivation in 2016 also contributes to an increase in groundwater in East Maui.</p> <p><u>Central WUDP, Page 112:</u> Strategy #4 Explore East Maui well development in combination with Makawao aquifer basal groundwater to meet projected demand on the MDWS Upcountry System. Initiate a hydrologic study to determine any negative impact on existing ground and surface water sources, stream flow and influences from dikes. Potential yield is more than the needed 6.3 mgd (potentially in addition to development for the MDWS Central System). Lead agencies would be CWRM and MDWS and hydrologic study to be completed by USGS.</p> <p><u>Page 3-9, DEIS:</u> There may be a connection between decreased stream diversions and increased groundwater. However, the current pumpage of wells in the four aquifers in East Maui (Ha`iku, Honopou, Waikamoi, and Ke`anae of the Ko`olau Aquifer Sector) is well below the SY (Sustainable Yield.)</p>
<p>Wells are more expensive than surface water due to energy costs for development and pumping, but costs can be mitigated with solar, wind, hydro-pumped storage, particularly if the Department has access to land.</p> <p>In order to comprehensively compare costs, all factors described previously in this report related to repair and maintenance of the EMI Aqueduct System, combined with the environmental, safety and cultural benefits of EMI ownership would need to be compared to well development costs.</p> <p>Any well development plan should include scenarios that utilize renewable energy, the costs of the development of which would also need to be calculated. However, agreements with MECO and the benefits of bringing the State to its goal of 100% renewable energy by 2045 would also need to be factored in.</p> <p><u>Per DWS comments on early consultation for EIS on 12/16/16:</u> Although the non-consumptive use of water</p>	<p><u>Page 3-2 to 3-3, DEIS:</u> "a single well is normally allowed to pump about 1 mgd within its area"</p> <p>Given current figures regarding Kamole Treatment Plant needs, 3 to 7 wells would need to be developed. Each well site would have an estimated development cost of \$6 million. (Akinaka, 2019).</p> <p>The cost of planning, obtaining permits for, and constructing 7 wells would be approximately \$13 million. Added to this cost would be transmission pipes, additional pumping and related energy consumption to reach higher elevations, and reservoirs.</p> <p><u>Central WUDP, Page 110:</u> The 2013 MDWS study estimated well development at 2,050 foot elevation and related booster pump and transmission line to about \$8.4M and a 20-year cost of \$2.90 per 1,000 gallons for development of 1.2 mgd pump capacity, normally run at 0.8 mgd source capacity. The study only evaluated a scenario with one well in Makawao aquifer and in</p>

<p>involved in hydroelectric uses is likely difficult to appraise, the EIS should describe the extent to which hydroelectricity is generated, including the associated costs and revenues.</p>	<p>combination with well development outside Makawao aquifer.</p> <p><u>Central WUDP, Page 110:</u> Explore new basal well development in the Makawao aquifer to accommodate growth Upcountry and add reliable new source. Potential yield is up to 3 mgd. Lead agency is MDWS, DLNR and/or public/private partnerships.</p>
<p><u>Central WUDP, Page 109:</u> Adding 20% to projected 2035 demand of 8.53 mgd for Upcountry is 10.23 mgd. With the addition of the Priority List demand of 7.3 mgd, total demand is 17.54 mgd. Available source capacity is 11.2 mgd, which would require the balance 6.34 mgd to be developed. (includes 7.0 Surface Water)</p>	<p><u>Page 3-17: DEIS:</u> If the MDWS has to replace the 7.1 mgd supplied by the EMI Aqueduct System, and in addition develop to the 7.95 mgd projected to be needed to meet future water demands, the MDWS would need to develop 15.05 mgd of new water source. It is estimated that the life- cycle unit cost to develop those necessary wells and reservoirs for Upcountry Maui is \$38 per kgal. This would translate to \$2.6 billion, compared to \$1.2 billion under the Proposed Action.</p>

VII. Alternatives to Purchasing the EMI System

<p>While community ownership of parts or the full EMI Delivery System, as well as ownership of key land parcels are straightforward avenues for ensuring that the Maui community benefits from and controls Maui water as a public trust, other remedies should also be explored.</p>	<p>What are the legal actions that can be taken besides condemnation? Are there other vehicles for accomplishing community goals?</p>
<p>Negotiate new Domestic water use Agreements with EMI/Mahi Pono:</p> <p>As noted in the DEIS, “EMI agreements with the MDWS provide that water supplied to the MDWS is contingent upon the Water Lease being issued...Currently the MDWS is being charged 6¢ per 1,000 gallons to receive East Maui surface water for the KAP and other Upcountry Maui farm areas.”</p> <p>In the past, EMI was required to maintain the roads and trails, maintain the delivery system, and leave enough water in streams for downstream domestic water users and Kuleana users, and they were required to post a \$100,000 performance bond.⁶⁸</p>	<p>One key way to safeguard the public is to negotiate new agreements with EMI/Mahi Pono that:</p> <ol style="list-style-type: none"> 1. Remove contingency of access to the public trust on a private company receiving permits/leases from BLNR. 2. Require a minimum level of repair and maintenance of the Ditch System by EMI/Mahi Pono to ensure the health and safety of the community. 3. Require that EMI/Mahi Pono reduce leakages in the delivery system to optimize water availability, thereby increasing amount of water going to the Kamole Treatment Plant, and decrease the amount of water diverted from streams, and increase amount of water for agriculture. 4. Require a minimum investment in the care of the watershed and other environmental responsibilities, that includes partnerships with stakeholders. 5. Require EMI/Mahi Pono to address liabilities.
<p>State Irrigation System</p> <p>The Agricultural Resource Management Division manages state irrigation systems at Hoolehua, Kahuku, Waimanalo, Waimea and Honokaa-Paauilo, two on Oahu, two on the island of Hawaii, and one on Molokai. The ARMD also manages Honokaia, Paauilo, Puu Pulehu, Waimea, Waimanalo, and Kualapuu Reservoirs. Arguments in favor of a state irrigation system include the fact that much of the system is on state land, and the state has the bonding to fund big capital improvements.</p>	<p>Concerns re: limited funding of Dept. of Agriculture and the requirement of requesting funding from the state legislature every year, particularly since Molokai Rep Lynn DeCoite is the only farmer in the legislature.</p> <p>However, due to the diversity of stakeholders and the potential revenue sources, the state would be managing a different kind of economic water system.</p> <p>To adequately study this model, legislators, stakeholders, and the Department of Agriculture would need to research this option in the context of the various issues raised in the report.</p>

⁶⁸ Land Lease Bearing, General Lease #3578, 1959, Pages 3,4, 15,16, Contracts under Native Hawaiian Land and Water Rights

VIII. Calculations for Initial Purchase Price, Estimated Expenses, and Potential Revenues for a Public Trust Water System

There are numerous variables to consider with regard to acquisition costs, maintenance, and potential revenues. These calculations are presented to provide a framework for beginning the process of determining a financial structure that would feasibly allow a Public Trust Water System to provide the best service to Maui residents in the short- and long-term based on the various considerations already presented in this report. While the purchase price of \$5.4 million is very clear, an appraisal could affect the condemnation price and would provide a better estimate of short-term improvements.

Initially, the TIG was interested in considering the cost of acquiring just the Wailoa Ditch System, which feeds into the Kamole Treatment Plant. However, given the number of variables in determining the percentage of the system represented by Wailoa, which could be as high as 70%, this analysis is focusing on the entire system, where numbers are more readily available, specifically the total purchase price and the expected water used by Mahi Pono.

Initial Purchase Price and Cost to Restore EMI Ditch System:

Initial Purchase Price	Amount	Notes
Includes 15,000 acres ⁶⁹ of land parcels and ditches utilized for the EMI system.	\$5,442,333.48 (possibly less any depreciation since 12/17/18 purchase due to neglect.)	Based on MP purchase price for full system, (only half has been paid.) ⁷⁰
Estimated costs to restore the EMI ditch system and to correct deferred maintenance.	\$12 million over two years.	Based on 6% of Replacement Asset Value (RAV) of \$200 million, which is the modern system replacement cost cited in the EMI Draft EIS
Total Purchase Price plus substantial improvements:	\$17.4 million	Improvements from the beginning

Bond Payments:

If the EMI System is acquired by the County or State, properly structured bond financing could be utilized for acquisition and restoration of the system. Borrowing \$17.4 million at 3.75% over thirty years would require debt service payments totaling \$966,985 annually.

Value of Purchasing System Prior to Mahi Pono Obtaining a Long-Term Lease:

If Mahi Pono is able to obtain a 30-year lease, the company will likely try to argue that the EMI aqueduct system has a higher value with a long-term lease than its purchase price of \$5.4 million. There are clear indications from the December 17, 2018 purchase agreement with

⁶⁹ <https://mauitime.com/news/business/mahi-pono-purchase-agreement-lots-of-legalese-with-a-few-tasty-nuggets/>

⁷⁰ <https://www.sec.gov/Archives/edgar/data/1545654/000119312518354682/d664171dex101.htm>

Alexander & Baldwin that a core component of Mahi Pono's investment strategy is the monetization of public trust water resources as evidenced by A&B's obligation to rebate Mahi Pono \$62 million of the purchase price if Mahi Pono does not obtain a water lease allocation of at least 30 mgd. (See sales agreement)

Value of the System Based on Water Delivery Rights:

Maui County Department of Water Supply potable water rates for agricultural users: **\$1.10 per 1,000 gallons for use over 15,000 gallons per month.**

Maui agricultural users who use less than 15,000 per month pay residential rates (\$2.05 to \$3.90 per 1,000 gallons.)

Agricultural Use rates per 1,000 gallons on the Big Island are assessed as follows:

In addition to standby, power cost, and energy CIP charges, a consumption charge will be applied to all agricultural use customers as follows:

Up to 5,000 gallons, .93 cents

5,001-15,000 gallons: \$2.01

Over 15,000 gallons: \$1.27

State Agricultural Rates range from .20 to .50 cents per 1,000 gallons with an additional acreage assessment fee from .36 cents to \$9.37 cents per acre per month.

Per the Organisation for Economic Co-operation and Development report on Water Pricing in the United States⁷¹:

In summary, irrigation costs and prices are rising in most regions of the United States, due to a combination of increasing scarcity, changes in public preferences regarding water allocation among competing uses, increasing budget scrutiny in the national and state legislatures, rising energy prices, and increasing awareness of climate change and the potential implications for rainfall and the availability of surface water resources. These issues likely will continue encouraging public officials to utilize water pricing and other market-based incentives to motivate further improvements in water use efficiency in agriculture and other sectors.

Some of the public investments in irrigation in the United States and other countries have involved large expenditures that governments have not fully recovered from project beneficiaries over time. The subsidies implicit in the lack of cost recovery have gained the attention of citizens and legislators concerned with public budgets, resource allocation, and the off-farm impacts of irrigation and drainage in some areas.

⁷¹ <https://www.oecd.org/unitedstates/45016437.pdf>

Many observers agree that irrigation will play a major role in providing sufficient food for the world's increasing population, but many also wish to see the full costs of irrigation reflected in farm-level irrigation water prices (Merrett, 2002). Accurate prices can promote irrigation efficiency within agriculture and increase the likelihood of achieving economic efficiency across the sectors that compete for limited water resources.

...Looking forward, farmers in the United States and elsewhere must adjust to rising energy costs and increasing water scarcity. While the outlook for agricultural prices is uncertain, recent increases in food prices suggest that crop prices might be notably higher in some years. Higher crop prices will contribute to higher land prices, just as subsidies for irrigation water have done historically. From a water management perspective, higher land prices are helpful in promoting farm-level crop and technology decisions that generate higher values per unit of irrigation water. Thus the impacts of irrigation subsidies that once encouraged farmers to plant low-valued crops and to minimize water management efforts, likely will be negated in future by rising land prices and increasing water scarcity.

According to the Draft EIS, Page 2-8:

With the issuance of the Water Lease under the Proposed Action, the EMI Aqueduct System would divert only the maximum allowable amount under the CWRM D&O from streams within the License Area, which is estimated to be approximately 87.95 mgd. The EMI Aqueduct System is estimated to divert an additional 4.37 mgd from the point that it leaves the License Area at Honopou Stream and collects water from streams on privately owned land to its last diversion at Maliko Gulch. Thus, an estimated total of approximately 92.32 mgd would be conveyed to supply the MDWS for users in Upcountry Maui, Nahiku, and the agricultural fields in Central Maui.

According to the Draft EIS, Page 2-18:

The Mahi Pono farm plan assumes the following: **The total surface water available for use after system losses is estimated to be approximately 65.88 mgd.**

Based on maximum delivery of water and current agricultural and domestic water rates charged to Maui County farmers and residents, the highest potential annual agricultural revenue that can be derived from the 65.88 mgd is:

Convert 65.88 mgd to kgal (1,000 gallons)	Convert to kgal per year (365 days)	If water were delivered at current agricultural rates (\$1.10 per 1,000 gallons)
65,880 kgal	24,046,200 kgal per year	\$26,450,820

Water System Operations Costs:

There will be variances in operational costs depending on whether the water delivery system is managed by a private, public, non profit, or quasi-public entity.

Or estimates below for maintenance and total expenses are calculated at \$10 million higher than Mahi Pono’s expenses, based on how they are described in the EMI DEIS.

Per the DEIS, Mahi Pono’s \$2.5 million in operations costs includes maintenance as well as water leases, but does not appear to include annual monitoring and restoration of the watershed. We calculate an additional \$3 million per year for maintenance and \$6 million for the watershed.

Estimated Annual Expenses	Amount	Notes
Annual Operating Costs	\$2.5 million	Per the Draft EIS, \$2.5M includes labor, fringe benefits, materials, professional services, taxes, maintenance, anticipated rental payments to the State for the Water Lease, and other expenses
Annual Improvements, maintenance, and system risk management	\$3 million	1.5% of Replacement Asset Value (RAV) of \$200 million (EMI DEIS estimate of full system replacement cost)
Annual Watershed Monitoring, Maintenance, and Restoration	\$6 million	In 2020, DWS and nonprofits allocated a total of \$2.69 million to East Maui watersheds. We recommend adding \$6 million to bring total watershed expenditures to \$8.69 million annually.
Debt Service on \$17.4 million 30-year municipal bond (3.75% interest)	\$1 million	Annual \$966,985 payment
Total Estimated Annual Expenses	\$12.5 million	

Annual operations cost, including yearly improvements, maintenance and risk management along with watershed monitoring and restoration, plus annual debt service results in an estimated \$12.5 million in total annual expenses.

As noted above, watershed monitoring is not accounted for by EMI/Mahi Pono and annual improvements are minimal (included in \$2.5 million in operations) so totals for both expense categories could be reduced somewhat if needed.

Potential Revenue Streams:

In terms of estimating revenues, factors such as stream restoration, seasonal water flow variations, the actual payments to the state for four leases, plus additional needs by Upcountry residents, the Kula Ag Park and the new Kula Ag Park, and the water meter list would impact how much of the maximum \$26 million in water value could and should be recouped.

Additionally, grants and other support that a public or quasi-public entity could access from public and private sources could impact expenses. Furthermore, a pro-active entity could seek out additional private investment or municipal investment in renewable energy systems to address electricity costs associated with Upcountry pumping and domestic water treatment, thereby impacting expenses.

The table below therefore only provides an example of how revenues could be collected to pay for the \$12.5 million in annual expenses, which includes the 30-year municipal bond debt service payment. As noted above, there are many variables, including water rates and stakeholder interests that would affect how the revenue streams should be structured in order to be of the highest benefit to the community in the short- and long-term.

Thus, the example below is NOT a recommendation on how revenues should be collected, but instead one example of how the purchase and operation costs could be recouped.

Notes on Assumptions:

Light Grey Column:

- For this scenario, it is assumed that the Public Trust Water System would continue to contract with the Maui County Department of Water Supply to deliver water from the Kamole Treatment plant/Wailoa Ditch at the same rates estimated by EMI in the DEIS. Thus, "2030 water service fee rate is estimated to be \$0.10, which has been calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, EMI would receive an estimated \$268,000 in 2030 from the MDWS."
- The total number of gallons per day currently being contracted by MDWS from EMI is already excluded from the 65.88 that Mahi Pono stated that it needs in the DEIS.
- Thus, neither the revenues nor the water use are included in the total calculations.

Dark Grey Column

- The 5.5 mgd shown for new Upcountry water meter users is the average of the additional 3.7 – 7.3 mgd estimated demand on the Upcountry system as a whole if the full water meter list were fulfilled, per the Central Water Use and Development Plan. However, since significant amounts of Upcountry water come from the higher elevation aqueducts that transport water to Olinda and Kula, 5.5 mgd is a high estimate.

- Upcountry agricultural users are often impacted by drought restrictions. An additional 2 mgd allocated to them is added to this table in consideration of the need for dependable water availability. This is a somewhat arbitrary number as studies would need to be conducted to determine how best to support these farmers.
- Since the delivery of the additional Upcountry Water would be added to the current delivery by MDWS, revenues from both of these columns would be absorbed by MDWS, from which appropriate operational, pumpage, and water treatment expenses would be allocated.
- Therefore, although 7.5 mgd of the water volume is subtracted from the 65.88 mgd available water supply, the revenues would be the same rate that EMI/Mahi Pono will be charging for the current water delivery to upcountry users, and thus would only add \$273,750 to the Public Trust Water System revenue stream.

Upcountry Users, including domestic, agriculture, and Ag Parks, based on MP estimate for 2030 (.10 per Kgal ⁷² per DEIS)	Additional water delivery to Upcountry Ag users, based on MP estimate for 2030 (.10 per Kgal per DEIS)	Priority List water meter users, based on MP estimate for 2030 (.10 per Kgal per DEIS)	Central Maui Ag Users – Recommended reduced rate of \$.95 per kgal (DWS charges \$1.10 per kgal presently) MGD is low end for large ag user	Total Water Delivery Revenues (Excludes \$268K Upcountry Ag and domestic use already allocated to WDS). MGD total includes added upcountry water delivery	Increased Stream Flow (In addition to current CWRM D&O)	Net Annual Income (Subtract \$12.5 Million Annual Expenses)
7.3465 mgd	2 mdg	5.5 mgd	40 mgd	47.5 mgd	(18.38)	
\$268,000	\$73,000	\$200,750	\$13,870,000	\$14,143,370	\$0	\$1,643,750

As stated in the Draft Water Use and Development Plan and the Draft EIS, if repair and maintenance are conducted at proper levels, available water could increase by at least 20% or 13.18 mgd. This additional water could be returned to the stream or added to the water supply for farmers, increasing revenues.

Purchase of the whole EMI Delivery System and Mahi Pono land:

Access to Mahi Pono land in addition to the EMI Water System would allow the Maui community to implement a comprehensive Water Management Plan that includes care of the watersheds, comprehensive support for East Maui cultural practices, renewable energy options, supporting proactive and integrated efforts to ensure an affordable and predictable supply of water combined with flexibility with regard to revenue generation that is not dependent on water consumers. Various regulations relating to renewable energy production, as well as issues such as affordable housing, and how best to ensure that agricultural practices do not negatively impact climate, while also providing food security, provide justifications for purchasing substantial land parcels in addition to the EMI Water Delivery System.

⁷² kgal=1,000 gallons

IX. County Bidding on a Long-Term Lease

On May 2, 2019, Hawaii State Senator Kaiali'i Kahele wrote to Maui County Mayor Michael P. Victorino, and stated the following:

In light of these developments, I would highly recommend that the County of Maui and DWS immediately submit a water lease application to the DLNR. A copy of the Request for State Lands Application Form is attached for your convenience. Doing so now will provide the Board of Land and Natural Resources ample time to review and issue a revocable permit to the County of Maui and DWS by the end of this year so that Maui County secures its own, independent authority to continue to provide its residents with access to diverted surface water imported from state lands in East Maui via the EMI aqueduct system. Domestic water use is a protected "public trust purpose" and I am confident that as the necessary application requirements are satisfied, the County of Maui and DWS will secure a long-term water lease from the State of Hawai'i.⁷³

HRS 171-58 c describes the bidding (Auction) process, which includes an Environmental Impact Statement and the joint creation of a watershed management plan. A state lease is subject to Chapter 343 (requiring EIS) and HRS 171-58 describes the jointly created (Lessee/Lessor) watershed management plan prescribed by the BLNR.

Excerpts below (full section attached as Appendix 12)

§171-58 Minerals and water rights. (a) Except as provided in this section the right to any mineral or surface or ground water shall not be included in any lease, agreement, or sale, this right being reserved to the State; provided that the board may make provisions in the lease, agreement, or sale, for the payment of just compensation to the surface owner for improvements taken as a condition precedent to the exercise by the State of any reserved rights to enter, sever, and remove minerals or to capture, divert, or impound water.

...(c) [Repeal and reenactment on June 30, 2019. L 2016, c 126, §4(1).] Disposition of water rights may be made by lease at public auction as provided in this chapter or by permit for temporary use on a month-to-month basis under those conditions which will best serve the interests of the State and subject to a maximum term of one year and other restrictions under the law; provided that:

⁷³ Appendix 3

...(2) Any disposition by lease shall be subject to disapproval by the legislature by two-thirds vote of either the senate or the house of representatives or by majority vote of both in any regular or special session next following the date of disposition; and

(3) After a certain land or water use has been authorized by the board subsequent to public hearings and conservation district use application and environmental impact statement approvals, water used in nonpolluting ways, for nonconsumptive purposes because it is returned to the same stream or other body of water from which it was drawn, and essentially not affecting the volume and quality of water or biota in the stream or other body of water, may also be leased by the board with the prior approval of the governor and the prior authorization of the legislature by concurrent resolution.

... (e) Any new lease of water rights shall contain a covenant that requires the lessee and the department of land and natural resources to jointly develop and implement a watershed management plan. The board shall not approve any new lease of water rights without the foregoing covenant or a watershed management plan. The board shall prescribe the minimum content of a watershed management plan; provided that the watershed management plan shall require the prevention of the degradation of surface water and ground water quality to the extent that degradation can be avoided using reasonable management practices.

(f) Upon renewal, any lease of water rights shall contain a covenant that requires the lessee and the department of land and natural resources to jointly develop and implement a watershed management plan. The board shall not renew any lease of water rights without the foregoing covenant or a watershed management plan. The board shall prescribe the minimum content of a watershed management plan; provided that the watershed management plan shall require the prevention of the degradation of surface water and ground water quality to the extent that degradation can be avoided using reasonable management practices.

X. Example Governance Structures

Page 4-140, DEIS: Another theme, expressed primarily in the Kula / Pukalani focus group, was that water is a public trust, and should not be controlled by a single private corporation. They suggested a restructuring of public utilities to include a water utility that would be administered similar to the current electricity in the public utility structure. Further, profit made from use of this public trust should be invested in public need.

In addition to the various considerations described in the last 70-plus pages, consideration of the pros and cons of the various governance structures is recommended.

For example:

Governance structure	Pros	Cons
Shareholder owned (Example, A&B)	<ul style="list-style-type: none"> • Significant access to capital and human resources 	<ul style="list-style-type: none"> • Objectives of shareholders are often not aligned with the public interest
Private Equity controlled (Example, Mahi Pono)	<ul style="list-style-type: none"> • Potential to facilitate growth and innovation • Access to various sources of capital 	<ul style="list-style-type: none"> • Relatively high cost of capital • Financial incentive structure which is misaligned with the long-term public interest • Potential financial distress with broad impact if acquisition is heavily leveraged. • Absentee ownership and foreign governance
Co-op	<ul style="list-style-type: none"> • May have access to Rural Development funding • Align stakeholder interests 	<ul style="list-style-type: none"> • Strength of leadership may vary based on outcome of board elections. • Local population might be unengaged or uninterested in water co-op management
Municipal Water Authority	<ul style="list-style-type: none"> • Low cost of capital • May benefit from access to tax exempt debt financing • Public accountability • Could lower rate water rates for local farmers and fund watershed restoration and management 	<ul style="list-style-type: none"> • Potential difficulties in recruiting employees with adequate technical skills needed to run water authority • May be subject to political interference.
Hybrid (private sustainable business corporation with majority government ownership)	<ul style="list-style-type: none"> • Public / private ownership could provide "best of both worlds." • Government ownership can present "halo" effect for raising capital • Potential for both equity and debt • Exempt from civil service restrictions 	<ul style="list-style-type: none"> • Potential political interference. • Possible conflicting incentives between entities on the board. <p>Uncommon ownership structure may result in greater legal complexity and stakeholder confusion</p>

Independent Public Water Authority	<ul style="list-style-type: none"> • With well designed and implemented governance structure, would allow for optimized delivery and system reliability, coordinated planning in sync with public interest. 	<ul style="list-style-type: none"> • Requires establishment of independent entity. • Possible need for charter amendment • Potential challenges in raising capital
---	--	---

Given the amount of information needed to serve the public purpose, and the importance of coordinating various public entities (Department of Water Supply, Wastewater, Environmental Management, and Energy Commissioner) with the activities of private purveyors, Department of Hawaiian Homelands (DHHL) and Office of Hawaiian Affairs (OHA), as well as diverse stakeholders, from native Hawaiian taro farmers to Upcountry domestic and agricultural water users, this Temporary Investigative Group recommends that Maui County thoroughly research how best to create a public governance model with bonding authority, hereinafter referred to as the “Public Trust Water System (PTWS).”

The TIG has researched some of the steps necessary for creating a Public Trust Water System. These steps include, but are not be limited to:

- 1) Outlining the legal requirements for creating the PTWS with bond authority and determining whether it would be regulated by the Public Utilities Commission (PUC);
- 2) Determining whether a charter change would be necessary and how such a change fits into the overall timeline of purchasing EMI and obtaining bidding rights;
- 3) Identifying potential private and public partners, if appropriate, including investors, public funders, and foundations;
- 4) Developing a design for the governance infrastructure that embeds transparency, accountability, and commitment to environmental, cultural, and community values, with a focus on decision-making taking place in the affected communities.

The County will need access to:

- ✓ Legal expertise about how to create new water utility with bonding authority,
- ✓ Financial and real estate expertise to evaluate feasibility and to estimate a fair cost of acquisition,

In order to ensure maximum accountability, the Public Trust Water System would need to include very strong mechanisms for ensuring oversight by diverse stakeholders, with priority given to DHHL, kuleana water rights, riparian rights, and traditional and customary native Hawaiian access rights. Furthermore, hearings and other engagement processes need to take place in the affected communities.

XI. Recommendations and Conclusion:

At the conclusion of its investigation, the Temporary Investigative Group shall:

- a. Present recommendations to the Board of Water Supply regarding the feasibility of the purchasing or condemnation of the EMI Water Delivery System and, if necessary, the purchase or condemnation of relevant Mahi Pono lands, including the structure of the governing entity that would have authority over the system, and/or
- b. Other strategies for ensuring that the people of Maui County have authority over the delivery of water, which is a public trust.

1. Primary Considerations with Regard to the Public Trust:

As noted in the Scope of the Temporary Investigating Group, the primary objective of this body was to determine how best to ensure that the people of Maui have authority over the delivery of water, which is a public trust.

In making this determination, TIG members examined:

- **Needs of East Maui residents and taro farmers and**
- **Needs of upcountry domestic and agricultural water users.**

The TIG also considered short-term needs as well as long-term impacts of climate change, including ensuring maximum availability of water within the context of the realities of climate crisis impacts in the next 5, 10, 15, 20 years and longer; and how those impacts would affect water supply and the safety of residents, thereby affecting **the public's access to water in the future, specifically:**

- 1) Watershed Protection;
- 2) General storage, wastewater, and other conservation options;
- 3) Renewable Energy and battery storage, including solar, wind, and hydro (including wastewater use);
- 4) Improved maintenance of water systems to reduce and eliminate water loss;
- 5) Integration of the above with agricultural recommendations that support food security and soil regeneration (with labor and affordable housing considerations).

2. Other Considerations Re: Serving the People of Maui:

- **Environmental Considerations Not Directly Related to Water Security;**
- **Native Hawaiian Land and Water Rights;**
- **Support of Beneficial Agriculture;**
- **Community Control of Where the Water Goes;**

- **Maintaining a Reasonable Cost of Delivered Water;**
- **Support of Economic Development for Residents.**

Hawaiian land and water rights also included examining:

- 1) Complying with DHHL requirements, including intent as well as the letter of the law;
- 2) Supporting Native Hawaiian customary practices for social justice and environmental reasons in addition to DHHL requirements.

It was determined that in order to ensure that all of these considerations are taken into account and integrated into a comprehensive, binding, and well-funded water plan that balances source development, surface water use, support of Hawaiian communities, and long-term maintenance of the aquifer, the following principles need to be followed:

- **Communication among and within government entities;**
- **Utilization of existing research and data, as well as funding of additional up to date research;**
- **Transparency by all government and private entities involved in water production and delivery;**
- **Accountability of all government and private entities involved in water production and delivery;**
- **Mechanisms that ensure accountability to ALL stakeholders, including decision-making in and by affected communities.**

3. Recommended Immediate Actions:

Based on all the information available to the TIG at this time, the Temporary Investigative Group is convinced that in order to protect the public’s health, safety, and well-being in the short- and long-terms, actions need to be taken immediately to utilize legal and financial vehicles to secure the public’s control of the EMI Water Delivery System.

A. County Application for a Long-Term Lease:

Maui County should immediately apply for a long-term (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas, situated at TMK Nos. (2) 1-2- 004:005, 007 (por.), 1-1-002:002, 1-1-001:044, 1-1-001:050, 2-9-014:001, 005, 011, 012, 017 in the Makawao and Hana Districts, on the island of Maui.

The above action would be valuable on its own, in terms of supporting the next step, as well as working in tandem with “Recommended Near-Term Actions” below.

B. Re-negotiate Current Contracts with EMI/Mahi Pono

Maui County should immediately re-negotiate a new contract with EMI/Mahi Pono that does not require that EMI/Mahi Pono obtain a Revocable Permit or Lease in order for the Kamole Treatment Plant to access Wailoa Ditch waters. This lease could also include requirements that address the various issues raised in this document from repair and maintenance of the system to native Hawaiian stream rights to investment in watershed protection and addressing liability issues.

By applying for a long-term lease, the County would be better positioned to re-negotiate the contract with EMI/Mahi Pono. Excluding corporation counsel personnel costs, this option would be relatively straightforward and would not be cost prohibitive. (See current Lease Appendix 13.)

However, this option would require enforcement on the part of the County, which would only be realistic if the County were willing to fully utilize its powers and responsibilities to protect the public interest. Furthermore, long-term solutions are needed to ensure the well-being of Maui residents.

4. Recommended Near-Term Actions:

As outlined under “Governance Structures” and described in more detail previously, because the financial incentive structure of a private equity-controlled water delivery system is misaligned with the long-term public interest, it would be imprudent to assume that the “Primary” and “Other Considerations” described above will be addressed by Mahi Pono.

Therefore, the TIG recommends that the County of Maui exercise its powers of eminent domain as soon as possible to begin the process of supporting acquisition of the system.

Furthermore, if the County of Maui is interested in facilitating community control of the EMI Aqueduct system and meeting the multiple needs of stakeholders, acquiring the system at a price close to the \$5.4 million paid by Mahi Pono in December 2018 is essential. As noted previously, if Mahi Pono obtains a 30-year water lease, the private equity fund will likely argue that the EMI aqueduct system has a value higher than the original purchase price. (Mahi Pono’s sales agreement with A&B states that the water lease is worth a minimum of \$62 million.) Acquiring the system in the near term will thus increase the chances of minimizing long-term debt.

5. Additional Recommendations for Long-Term Stewardship of the Public Trust:

In order to evaluate the most cost-effective and comprehensive solutions that address the urgent issues described in this report and to facilitate purchasing the EMI Aqueduct by a Public Trust Water System, the Temporary Investigative Group recommends that the Maui County Council and Mayor plan on taking the following steps:

Evaluate Capital Expenses Of Acquisition And Modernization

- ✓ Contract engineering studies of the current condition of the EMI Delivery System;
- ✓ Obtain reliable data regarding elevations and the amounts of water moving through the 388 intakes, ditches, dams, pipes, and flumes;
- ✓ Obtain cost estimates for repair and maintenance as well as alternate modifications, such as installing pipes in open ditches and flumes and modern diversions that support connectivity for streamlife;
- ✓ Determine the amount of the EMI Aqueduct and possibly other water systems that are connected to the Kamole Weir, as well as watershed lands that would be optimal for the most efficient short- and long-term delivery of water to the public, with maximum sustainability of the aquifer;
- ✓ Draft a plan for the County to acquire existing land, easements, and infrastructure by eminent domain, using bond financing.

Research Forward-Thinking Revenue and Expense Models

- ✓ Contract additional studies that build on current research regarding the measurable impact of watershed restoration on increased availability of water;
- ✓ Develop models and estimates regarding potential costs of installation of renewable energy systems to support treatment facilities, uphill transmission, and/or well pumping, along with energy savings;
- ✓ Develop models and estimates of hydro-pumped energy creation and storage utilizing water and wastewater;
- ✓ Determine the water rate fee structure that allows a reasonable rate of return to the investors, estimates of fees collected from the Department of Water Supply, Mahi Pono, A&B, residents, farms, and other commercial users. (If the structure created is regulated by the Public Utility Commission (PUC), the PUC will approve a fee structure that allows a reasonable rate of return to the investors to recover the capital expenses of acquisition and modernization, plus operating costs, and watershed restoration.)
- ✓ Develop a risk management plan that addresses liabilities that a new owner will assume when the various grandfather clause exemptions currently enjoyed by EMI are no longer in effect.
- ✓ Work with the East Maui community to create models for community stewardship and educational programs that operate the EMI system in the long-term.

Philanthropic support is available for the funding of some of these studies and models.

6. In Conclusion:

Determining the most efficient and effective way to ensure that the public water trust is managed and controlled by stakeholders is of the utmost urgency, given the current stressors on the water systems that serve Maui residents, residents' diverse needs, and the impending realities of the climate crisis.

Furthermore, because of the risks that will be borne by Maui residents and the County of Maui if a private entity controls the EMI Aqueduct for thirty years (which is the current stated goal of Mahi Pono/EMI), combined with the benefits of purchasing the system before any private owner has obtained a long-term water lease, the benefit of purchasing the EMI water delivery system in the near-term is much higher than it would be further in the future.

It is therefore incumbent on those who represent the interests of Maui residents to determine the most cost-effective way to achieve true control of access to water by the public as soon as possible.

This TIG believes that ownership of the EMI Water Delivery system by the people of Maui – in the form that is most cost-effective, accountable, environmentally responsible, transparent, and meets the needs of the island's diverse stakeholders, in particular native Hawaiians – will ultimately be the only way to guarantee that the public trust is maintained and remains safely in community hands.

The TIG therefore recommends that the County of Maui take immediate steps to secure community ownership and control of the EMI water delivery system.

XII. Final Statements

This report has been approved by all three members of the Temporary Investigative Group (TIG).

The TIG members would like to mahalo the many community members, experts in their fields, and government employees who provided valuable information for this report, including those who worked on the studies and reports referenced herein.

In all, TIG members volunteered approximately 30 hours in meetings as a group, more than 25 additional hours each on research, and 50-70 hours in report preparation.

The TIG was not provided with a budget to complete this work. As a result, all research was based on existing documentation, interviews, and a tour of the Kamole Weir.

Please note that TIG members are volunteers whose professional knowledge is not in the environmental or engineering spheres. Feel free to contact us through the Department of Water Supply to relay any corrections to data or information, or to submit questions.

The members learned a great deal, enjoyed their time learning from experts, and appreciate the time that they spent working together.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Shay Chan Hodges:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am submitting comments to you as an individual regarding the draft environmental impact statement referenced above. My primary concern relates to the alternative related to a change in ownership. Per the DEIS:*

Page iv “Alternatives Considered”:

“Alternatives considered but dismissed included certain water source alternatives, including use of groundwater and use of reclaimed water, as well as additional water storage. A change of ownership of the EMI Aqueduct System was similarly considered but dismissed from further study.”

Page 3-4, Section 3.1.2 Aqueduct Ownership:

“During public scoping for the DEIS in 2016 and 2017, it was suggested that the EMI Aqueduct System should be brought under new ownership, without the further involvement of A&B and EMI, and potentially under public ownership. Ownership of the EMI Aqueduct System changed in January 2019 to include Mahi Pono, which intends to pursue diversified agriculture in Central Maui. Consideration of another change in

ownership is too speculative at this point to warrant analysis. A change in the ownership of the EMI Aqueduct System will not enhance environmental quality or avoid, reduce, or minimize all or even some adverse environmental effects, costs, or risks of the Proposed Action. ...Furthermore, the EMI Aqueduct System is not for sale, and forced acquisition of the system is projected to be prohibitively expensive, resulting in substantial costs to the public. For these reasons, this alternative is viewed as a highly speculative and unreasonable alternative, and one that would not meet the objectives of the Proposed Action. Therefore, it was dismissed from further review.”

On July 19, 2019, the Maui County Board of Water Supply formed a Temporary Investigative Group (TIG) to explore options for ensuring public access to water, including the feasibility of purchasing and maintaining the EMI Water Delivery System. The TIG’s Report was made public on October 16, 2019 and can be accessed at the links below. It has not yet been deliberated on by the Board of Water Supply.

<https://www.mauicounty.gov/DocumentCenter/View/119847/2019-10-17-TIG-Report>

<https://www.mauicounty.gov/DocumentCenter/View/119848/2019-10-17-TIG-Report-Appendices>

I am also attaching a PDF of the narrative report with this email.

Response 1: We acknowledge that you are submitting comments to the subject Draft EIS in your individual capacity, and that your primary concern regarding the subject Draft EIS is the change in ownership alternative, discussed in Section 3.1.2. and also briefly summarized in the Draft EIS Executive Summary.

We are aware of the County Board of Water Supply (BWS) Temporary Investigative Group (TIG) Report, which was published after the Draft EIS, on the potential acquisition of the EMI Aqueduct System by the County, speaks directly to the “ownership change” alternative referenced in your comment. To provide further context, on July 19, 2019, the Maui County BWS formed the TIG to explore options for ensuring public access to water, including the feasibility of purchasing and maintaining the EMI Aqueduct System.

Our understanding is such action by the County of Maui is subject to conjecture and is largely speculative. Such a course of action would not meet the Applicant’s objectives and goals outlined for the Proposed Action within this EIS, and is a course of action that the applicant could not even unilaterally pursue making it irrelevant to the scope of assessment within this EIS process. Even were this EIS able to entertain the evaluation of that action, it would be incredibly difficult to demonstrate that it could materially avoid, reduce, and or minimize the adverse environmental effects, costs or risks associated to a degree of marked improvement of the Proposed Action. Please note that HAR §11-200-17(f) requires an analysis of alternatives to the proposed action "*which could attain the objectives of the action.*" The objectives of the Water

Lease (i.e., the Proposed Action), as stated in Section 1.2 of Draft EIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku.

As of the postmarked date of your comment letter (November 6, 2019) BWS had not yet deliberated on the findings of the TIG Report, or issued any such guidance in response to its findings. However, our understanding is that on December 19, 2010, the BWS approved the TIG Report. However, based upon the information obtained to date, the County's acquisition of the EMI Aqueduct System still remains speculative. The BWS has not yet deliberated on the findings of the TIG Report, nor issued any guidance in response to its finding.

We acknowledge the receipt of the TIG Report attached to your comment letter. The existence of the TIG report and its findings have been included in Section 3.1.2 of the Final EIS as shown on pages 3-19 to 3-20.

Comment 2: *The 283-Page TIG Report and the significant interest shown by members of the Maui County Council in it demonstrates that a change in the ownership of the EMI Aqueduct System as an alternative is not speculative.*

Response 2: Please note that by definition, “speculative” is an adjective that is used to describe:

The state of, “engaged in, expressing, or based on conjecture rather than knowledge” or, “(of an investment) involving a high risk of loss.”

Pursuant to the findings of the TIG report, there is marked level of risk associated with any plan to acquire the subject EMI Aqueduct System. Although consideration has been given to such an acquisition, to the knowledge of the applicant, no formal offer or negotiated proposal has been made. Furthermore, BWS has not yet deliberated on the findings of the TIG Report, nor issued any guidance in response to its finding. Consequently, for the purposes of the EIS, the potential change in ownership of the EMI Aqueduct System is very much speculative in nature.

Based upon information available in relation to findings and conclusions of the TIG report, it is our assessment that the County's potential acquisition of the EMI Aqueduct System remains speculative. Furthermore, much of the institutional knowledge needed to properly operate the EMI Aqueduct System would be lost under any change in ownership scenario. This could reduce the efficacy of the system, the new owner may not have the expertise needed to properly maintain it, and possibly lead to additional and unforeseen environmental impacts. Moreover, as

discussed in Response #1 above, a change in ownership would presumably directly contradict the objectives of the Proposed Action as outlined within the EIS. It is noted that the TIG report's proposal for water rates for the Central Maui agricultural fields is nearly ten times that of what is being charged to the Agricultural Park and Upcountry agricultural users, thus rendering the economic viability of agriculture on the Central Maui fields unfeasible.

Comment 3: *The report further demonstrates that public ownership will enhance environmental quality and will avoid, reduce, and minimize the majority of the adverse environmental effects, costs, or risks of the Proposed Action, as addressed in the following chapters:*

- ***STRATEGIES FOR CREATING AND CONSERVING FRESH WATER CAPACITY***
- ***NATIVE HAWAIIAN LAND AND RIGHTS***
- ***CONSIDERATION RE: PURCHASING & MAINTAINING EMI SYSTEM***

Response 3: A change in ownership will not enhance the environmental quality as stated in Section 3.1.2. of the Draft EIS:

A change in the ownership of the EMI Aqueduct System will not enhance environmental quality or avoid, reduce, or minimize all or even some adverse environmental effects, costs, or risks of the Proposed Action.

This statement derives from several of the technical studies conducted for the subject EIS. Specifically, this alternative was discussed in Appendix C, E, and F. Hence, the statement “a change in ownership will not enhance environmental quality” is based on assessments by experts in their respective fields for the subject EIS. We acknowledge that the TIG Report investigates the potential ramifications of purchasing and maintaining the EMI Aqueduct System. However, we believe the statement, “*public ownership will enhance environmental quality and will avoid, reduce, and minimize the majority of the adverse environmental effects, costs, or risks of the Proposed Action*” to be unsubstantiated. The subject TIG report does not make clear reference or justification for how any potential change in ownership of the EMI Aqueduct System would materially avoid, reduce, and or minimize the adverse environmental effects, costs or risks associated with the Proposed Action. Moreover, throughout the TIG Report, there are numerous statements indicating that costs associated with the EMI Aqueduct System are not known. Thus, we do not believe that “*public ownership will enhance environmental quality and will avoid, reduce, and minimize the majority of the adverse environmental effects, costs, or risks of the Proposed Action*” is an adequate statement to make at this time. Virtually all the same issues raised in the EIS would still remain and apply under Public Ownership. Thus, we still believe that the following statement is adequate:

A change in the ownership of the EMI Aqueduct System will not enhance environmental quality or avoid, reduce, or minimize all or even some adverse environmental effects, costs, or risks of the Proposed Action.

Comment 4: *The report also addresses an imminent domain acquisition, which will not be prohibitively expensive, and will in fact likely provide revenues for addressing the environmental and cultural issues described in the chapters outlined above. Information regarding purchase price, revenues, and expenses can be found in the following chapters:*

- ***CALCULATIONS FOR INITIAL PURCHASE PRICE, ESTIMATED EXPENSES, AND POTENTIAL REVENUES FOR A PUBLIC TRUST WATER SYSTEM***
- ***COUNTY BIDDING ON A LONG-TERM LEASE***
- ***EXAMPLE GOVERNANCE STRUCTURES***

Response 4: It is acknowledged that the subject TIG report provides calculations and some level of quantitative justification for the estimation of the value of the EMI Aqueduct System – the costing exercise discussed within does not reflect an appropriate, comprehensive appraisal of the actual or fair market value of the asset in question. It is not the intent of the Proposed Action to appraise the value of the EMI Aqueduct System. While the pros and cons of condemnation of the EMI Aqueduct System are beyond the scope of this Environmental Impact Statement, we have the following response to some of the issues raised by a possible condemnation.

- **Valuation.** As correctly noted by Deputy Corporation Counsel Caleb Rowe in a response to the BWS TIG, an appraisal would need to be done for the EMI Aqueduct System before condemnation could be filed. The TIG Report makes the assumption that just compensation for the EMI Aqueduct System would be the price stated in the purchase and sale agreement between Alexander & Baldwin and Mahi Pono, that is, approximately \$5.4 million. Under Hawai'i law, however, the price to be paid for the EMI Aqueduct System would be the market value of the EMI Aqueduct System as of the date that the condemnation action is filed and legal summons is issued. (See Hawai'i Revised Statutes § 101-24 (property assessed as of the date of summons).) The condemnee would not be bound by the price that might have been stated in the purchase and sale agreement, but would be entitled to the full fair market value of the EMI Aqueduct System as of the date of the summons.

The market value of property for condemnation purposes is generally arrived at through an appraisal by a qualified appraiser. Under generally-accepted appraisal methodology, there are three accepted approaches to determining value.

- The first is the Sales Comparison Approach, which is probably the approach most familiar to laymen. There, the appraiser looks for other properties which are

comparable to the subject property. These values of these comparable properties are then adjusted up and down based on factors by which the subject property is deemed to be superior or inferior to the comparable property. Going through this process results in the appraiser being able to give an opinion of value for the subject property based on the comparables.

- The second is the Income Approach. Here, the appraiser looks at the income generated by the subject property, and by capitalizing the income stream is able to arrive at a market value for the property.
- The third is the Cost Approach. Here, the appraiser researches what it would take to essentially re-create or re-build the subject property.

The appraiser typically will attempt to derive a value under each of the three approaches, and then will use their expert judgment to derive a final value taking each of the three approaches into account.

In this instance, it may be difficult to arrive at the market value of the EMI Aqueduct System for condemnation purposes, and that value may be far different than set forth in the TIG Report. First, the Income Approach would not be applicable in this instance, because the EMI Aqueduct System is not an income-producing property.

Second, the Sales Comparison Approach may not be especially helpful, because water systems are not typically bought and sold in Hawai'i although there have been transactions in the past. For example, the much smaller Waiahole Ditch System on the Island of Oahu was acquired on a voluntary basis by the State of Hawai'i in 1998 for a price of \$8.5 million, plus funds for repair in the amount of \$1.2 million (See 1998 Session Laws, Act 111, Part IV). Given the fact that the EMI Aqueduct System is much larger than the Waiahole Ditch and the fact that substantial time has elapsed since that transaction, it can be anticipated that there would be substantial upward adjustment for passage of time and for size of the EMI Aqueduct System.

Finally, the Cost Approach may yield a much higher number in this instance. The price of being able to reproduce or reconstruct the System given today's costs and constraints could be much higher than it may have cost originally to construct the EMI Aqueduct System.

Further, to the extent that the County of Maui is seeking to take private lands that are being used to provide water to the EMI Aqueduct System, the owner is entitled to be paid compensation based on the special value of the land as water-producing. State v. Collins, 42 Haw. 199 (1957).

Additionally, to the extent that the County of Maui is attempting to acquire the EMI Aqueduct System as an operating concern, it will likely also have to acquire the various vehicles,

machinery, equipment and other personal property being used to operate the EMI Aqueduct System. (See Hawai'i Revised Statutes §101-71, governing the condemnation of personal property used in connection with real property being taken.)

- Identification of Property to be Condemned and Parties to Be Named In the Condemnation. As also correctly indicated by Deputy Corporation Counsel Rowe, prior to filing a condemnation complaint the County of Maui will need to obtain a title report which would describe the property being taken and provide a legal metes-and-bounds description of that property (which would require a survey), as well as identifying any persons who have or could potentially claim an interest in that property or whose legal rights could be affected by the condemnation. All such persons would then need to be named in the condemnation complaint in addition to EMI. This could for example include easement holders and others who may have use or other rights in the EMI Aqueduct System.

Preparation of such a title report for the EMI Aqueduct System could prove to be a daunting task. As indicated in the TIG Report, the System was constructed in phases beginning in the 1870s and extending until 1923. It presently consists of approximately 388 separate intakes, 24 miles of ditches, and 50 miles of tunnels, as well as numerous small dams, intakes, pipes, 13 inverted siphons and flumes. It collects surface stream water from approximately 50,000 acres of land, of which approximately 33,000 acres are owned by the State, and the remaining approximately 17,000 acres are owned by EMI and Mahi Pono. Even if the State lands are omitted from the condemnation (which they would have to be, since the counties cannot condemn State land since it is a superior governmental entity), a search and metes-and-bounds property description of all the area being condemned would need to be done for the remaining lands. The surveying expense for doing this alone would likely be substantial.

- Public Use Concerns. Hawai'i Revised Statutes §46-61 provides that counties have the power to take private property, among other things, “for pumping stations, waterworks, [and] reservoirs, . . . and for rights-of-way for . . . pipe lines, aqueducts, and other conduits for distributing water to the public” Although the power to take property for public use has generally been construed broadly by the courts, there are some unique issues present with regard to the EMI Aqueduct System. First, there may be a question regarding whether the condemnation power only extends to taking property for construction of new public water improvements, rather than authorizing a taking of an already constructed system.

Beyond that, however, a substantial amount of the water transported through the EMI Aqueduct System is being used for private use, not public use. For example, the Draft EIS estimates that delivery of water at Maliko Gulch will be approximately 92.32 million gallons per day (mgd) if the State Water Lease allows up to the amount that can be diverted while still complying with the

CWRM IIFS Decision and Order. As noted in the TIG Report, however, “[a] relatively small amount of water is used for residential and agricultural use by the MDWS for its Upcountry Maui Water Systems, which include the Upper Kula and Lower Kula Water Systems.” At present, the County of Maui Department of Water Supply on average producing 1.6 mgd at Olinda, 2.5 mgd at Piihola, and 3.6 mgd at Kamole-Weir. It seems that there could be a question whether “public use” would cover condemning a water delivery system where only a relatively small percentage of the water transported by the system would actually be used for public use.

Hawai‘i law is unclear whether the government can take property where public use is arguably only a small portion of the taking. Hawai‘i statutes indicate there could be issues with that type of taking. For example, Hawai‘i Revised Statutes §101-2, which governs governmental takings generally, states that:

Private property may be taken for public use. Private property may also be taken by the State of any county in excess of that needed for such public use in cases where small remnants would otherwise be left or where justifiable cause necessitates such taken to protect and preserve the improvement

In this case the question would be whether there is justifiable cause to take the entire EMI Aqueduct System when only a small portion of its use is needed by the County.

- Additional Costs to be Considered in Condemnation. In undertaking condemnation, the County of Maui needs to understand that once it acquires the EMI Aqueduct System, its obligations are just beginning. As legal owner of the EMI Aqueduct System, the County of Maui will become responsible for the costs of operating, repairing and maintaining the entire EMI Aqueduct System. As indicated in the TIG Report, those costs could be substantial. It is possible they could be covered in water rates charged to users, or may otherwise be paid for out of the tax revenues received by the County of Maui, but the ultimate legal responsibility for covering such costs is the County’s. The amount of such costs, and a plan for how those costs are going to be covered in future years, should be developed by the County of Maui prior to undertaking any condemnation.

Comment 5: *Given that the DEIS devotes less than half a page to the ownership change alternative, while a volunteer community board produced an 85-page document with 198 pages in supporting appendices regarding the feasibility of purchasing the aqueduct for public ownership, the draft EIS clearly has not adequately addressed this alternative, and at the very least needs to address the issues raised in the Temporary Investigative Report: Feasibility of Purchasing and Maintaining the EMI Water Delivery System.*

Response 5: We acknowledge that a volunteer community board produced an 85-page document with respect to the feasibility of purchasing the EMI Aqueduct System for public ownership. However, to fully assess this alternative, a fair market value and appraisal would need to be conducted for the EMI Aqueduct System which is beyond the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS. Moreover, as noted in Response #1 above, pursuant to Section 11-200-17(f), HAR, a Draft EIS must include a section discussing alternatives which could attain the objectives of the action regardless of cost, in sufficient detail to explain why they were rejected. In each case, the analysis of the alternatives must be sufficiently detailed to allow the comparative evaluation of the environmental benefits, costs, and risks of the Proposed Action and each **reasonable alternative**. Particular attention should be given to alternatives that might enhance the environmental quality or avoid, reduce, or minimize some or all of the adverse environmental effects, costs, and risks.

The objectives of the Proposed action are:

- Preserve and maintain the EMI Aqueduct System, including its access roads
- Continue to meet domestic and agricultural water demands in Upcountry Maui
- Continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses)
- Continue to serve community water demands in Nāhiku

Specifically, Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were well-discussed, but ultimately not assessed to the same degree as (a) through (d). Moreover, based on comments received on the Draft EIS, the alternatives analysis in Chapter 3 has been further expanded within the spectrum of alternatives presented in the Draft EIS. See pages 3-2 to 3-19 of the Final EIS.

Other alternatives were also considered and discussed, including the alternative ownership of the EMI Aqueduct System (Section 3.1.2 of the EIS). However, a preliminary analysis determined that this alternative option is not considered viable for various reasons including the expected intensification of environmental effects and lack of feasibility. Therefore, the alternative ownership of the EMI Aqueduct System option was considered but dismissed from further study.

As previously mentioned above, and in Section 3.1.2:

A change in the ownership of the EMI Aqueduct System will not enhance environmental quality or avoid, reduce, or minimize all or even some adverse environmental effects, costs, or risks of the Proposed Action.

Comment 6: *Specific issues to address include, but are not limited to the initial purchase price and cost to restore the EMI Ditch System described on page 70 and 71 of the TIG report:*

<i>Initial Purchase Price</i>	<i>Amount</i>	<i>Notes</i>
<i>Includes 15,000 acres of land parcels and ditches utilized for the EMI System</i>	<i>\$5,442,333.48 (possibly less any depreciation since 12/17/18 purchase due to neglect.)</i>	<i>Based on MP purchase price for full system, (only half has been paid.)</i>
<i>Estimated costs to restore the EMI ditch system and to correct deferred maintenance.</i>	<i>\$12 million over two years.</i>	<i>Based on 6% of Replacement Asset Value (RAV) of \$200 million, which is the modern system replacement cost cited in the EMI Draft EIS</i>
<i>Total Purchase Price plus substantial improvements:</i>	<i>\$17.4 million</i>	<i>Improvements from the beginning</i>

Response 6: As mentioned and described above, under the context of the Proposed Action evaluated within the subject EIS, the change in ownership alternative clearly fails to achieve the objectives and goals outlined. The speculative acquisition of the EMI aqueduct system is acknowledged as a potential option, but is not carried forward for detailed analysis within the EIS for reasons mentioned in the responses above. However, we agree that the public acquisition of the subject EMI Aqueduct System would warrant further evaluation, and should be subject to its own, independent HRS 343 EIS process.

Comment 7: *Bond Payments:*

If the EMI System is acquired by the County or State, properly structured bond financing could be utilized for acquisition and restoration of the system. Borrowing \$17.4 million at 3.75% over thirty years would require debt service payments totaling \$966,985 annually.

Response 7: We agree that the calculations of debt service payments contained within the TIG report are mathematically accurate, but largely irrelevant under the scope of assessment of the Proposed Action within the subject EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 8: *Value of Purchasing System Prior to Mahi Pono Obtaining a Long-Term Lease: If Mahi Pono is able to obtain a 30-year lease, the company will likely try to argue that the EMI aqueduct system has a higher value with a long-term lease than its purchase price of \$5.4 million. There are clear indications from the December 17, 2018 purchase agreement with Alexander & Baldwin that a core component of Mahi Pono’s investment strategy is the monetization of public trust water resources as evidenced by A&B’s obligation to rebate Mahi Pono \$62 million of the purchase price if Mahi Pono does not obtain a water lease allocation of at least 30 mgd. (See sales agreement)*

Response 8: As described above, following conventional appraisal methodology, the \$62 million dollar rebate obligation serves as more of a tangible estimation of the value of the system on the cost basis / comparison approach. Theoretically, the potentially valuation of the system could be exponentially higher if appraisal follows the income approach. Clearly, the true value of the productivity of the Central Maui Agricultural fields critically relies on the conveyance of water by the subject EMI Aqueduct System – consequently, it is fairly clear that any realistic valuation of the system would far exceed the value cited in the subject TIG report.

Comment 9: *Another issue raised in the TIG report is the value of the water requested in the lease application. The figures shown on page 72 of the TIG report need to be addressed: According to the Draft EIS, Page 2-18:*

The Mahi Pono farm plan assumes the following: The total surface water available for use after system losses is estimated to be approximately 65.88 mgd.

Response 9: An appraisal to determine the fair market value of the Water Lease will be conducted prior to issuance of the Water Lease. Our expectation is that the DLNR, on behalf of the BLNR, will commission, or approve the commissioning of, the appraisal. The cost of water to the County of Maui also depends on the operational costs of running the EMI Aqueduct

System, including all costs of complying with applicable regulations and laws. However, as discussed in 4.7.3 of the Draft EIS, under the Proposed Action (where the maximum amount of water is limited by the CWRM D&O and therefore below historical averages), the rate MDWS currently pays to EMI (\$0.06 per kgal) will increase because EMI’s per unit operating cost will increase as a result of fixed costs being spread out over a lower volume of water diverted and possible higher lease payments to the State compared to historic payments. While it is anticipated that the delivery costs to the County of Maui will increase, the exact amount of the increase cannot be known until the Water Lease is finalized. However, the estimate analyzed in the Draft EIS assumed a year 2030 water service fee rate of \$0.08 per kgal. This figure was calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, the MDWS would pay an estimated \$214,600 per year to EMI. However, please note that this discussion in Section 4.7.3 of the Final EIS has been updated to take into account the latest equivalent per unit cost under the latest revocable permit as shown on pages 4-277 and 4-283.

Comment 10: *Based on maximum delivery of water and current agricultural and domestic water rates charged to Maui County farmers and residents, the highest potential annual agricultural revenue that can be derived from the 65.88 mgd is:*

<i>Convert 65.88 mgd to kgal (1,000 gallons)</i>	<i>Convert to kgal per year (365 days)</i>	<i>If water were delivered at current agricultural rates (\$1.10 per 1,000 gallons)</i>
<i>65,880 kgal</i>	<i>24,046,200 kgal per year</i>	<i>\$26,450,820</i>

Response 10: The calculations cited in the TIG report under reference by your comment are mathematically accurate.

Comment 11: **And finally, the EIS needs to address the issues raised under “Recommendations and Conclusion” on Page 81:**

Based on all the information available to the TIG at this time, the Temporary Investigative Group is convinced that in order to protect the public’s health, safety, and well-being in the short- and long-terms, actions need to be taken immediately to utilize legal and financial vehicles to secure the public’s control of the EMI Water Delivery System.

Response 11: Our understanding is that the purpose of the TIG and TIG Report is to inform the County as a fact-finding, context building exercise. The acquisition of the subject EMI Aqueduct System is tangential and largely irrelevant under the context of the Proposed Action (issuance of a lease to A&B/Mahi Pono). Moreover, to our current understanding, the County has yet to deliberate on the TIG Report.

Comment 12: *A. County Application for a Long-Term Lease:*

Maui County should immediately apply for a long-term (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas, situated at TMK Nos. (2) 1-2- 004:005, 007 (por.), 1-1-002:002, 1-1-001:044, 1-1-001:050, 2-9-014:001, 005, 011, 012, 017 in the Makawao and Hana Districts, on the island of Maui.

The above action would be valuable on its own, in terms of supporting the next step, as well as working in tandem with “Recommended Near-Term Actions” below.

Response 12: As noted previously, we agree that the application for a competing, long-term lease by the County of Maui could occur. However, the evaluation of that act would be subject to its own HRS, 343 process governed by a completely different set of objectives and goals, which is outside the scope of this EIS process. Our understanding is that course of action is largely speculative, and would not meet the objectives and goals outlined by the Proposed Action within this EIS. Moreover, such an alternative would not materially avoid, reduce, and or minimize the adverse environmental effects, costs or risks associated with the Proposed Action.

Comment 13: *B. Re-negotiate Current Contracts with EMI/Mahi Pono*

Maui County should immediately re-negotiate a new contract with EMI/Mahi Pono that does not require that EMI/Mahi Pono obtain a Revocable Permit or Lease in order for the Kamole Treatment Plant to access Wailoa Ditch waters. This lease could also include requirements that address the various issues raised in this document from repair and maintenance of the system to native Hawaiian stream rights to investment in watershed protection and addressing liability issues.

By applying for a long-term lease, the County would be better positioned to re-negotiate the contract with EMI/Mahi Pono. Excluding corporation counsel personnel costs, this option would be relatively straightforward and would not be cost prohibitive. (See current Lease Appendix 13.)

However, this option would require enforcement on the part of the County, which would only be realistic if the County were willing to fully utilize its powers and responsibilities to protect the public interest. Furthermore, long-term solutions are needed to ensure the well-being of Maui residents.

Response 13: It is our understanding that current contractual agreements in place between the MDWS and EMI will be re-negotiated should a new Water Lease is issued. The MDWS has been able to receive its surface waters from all three Upcountry Maui water sources through a series of agreements with EMI. Because the EMI agreements with the MDWS provide that water supplied to the MDWS is contingent upon the Water Lease being issued, for purposes of this EIS, no water is presumed to be provided to the MDWS if the Water Lease is not issued.

Moreover, the Water Lease and lessee will be subject to HRS § 171-58 as discussed in Section 2.1 of the EIS:

The amount of water awarded by the Water Lease is subject to all applicable requirements under HRS § 171-58. HRS § 171-58(c), (d), and (e) articulate terms for the disposition of the Water Lease. HRS § 171-58(e) requires that any new lease of water rights "shall contain a covenant that requires the lessee and the department of land and natural resources to jointly develop and implement a watershed management plan. The board shall not approve any new lease of water rights without the foregoing covenant or a watershed management plan."

At the March 22, 2019 meeting of the BLNR, the DLNR staff proposed a watershed management cost share formula and contribution for leases of water rights pursuant to HRS § 171-58(e). The BLNR deferred decision-making on the staff's proposal, the consensus was that compliance with the watershed management provision of HRS § 171-58(e) should be determined on a case-by-case basis for each individual water lease.

Furthermore, we agree that the County of Maui should explore all its options related to the TIG Report should the outlined actions specified within the report are likely to be acted upon in some fashion. As previously noted, this action would be subject to its own HRS 343 process.

Comment 14: *Recommended Near-Term Actions:*

As outlined under "Governance Structures" and described in more detail previously, because the financial incentive structure of a private equity-controlled water delivery system is misaligned with the long-term public interest, it would be imprudent to assume that the "Primary" and "Other Considerations" described above [on Page 80] will be addressed by Mahi Pono.

Response 14: It is acknowledged that the TIG Report recommends that the County of Maui exercise its powers of eminent domain to acquire the EMI Aqueduct System. However, please note that in undertaking condemnation, the County of Maui needs to understand that once it acquires the EMI Aqueduct System, its obligations are just beginning. As legal owner of the EMI Aqueduct System, the County of Maui will become responsible for the costs of operating, repairing and maintaining the entire EMI Aqueduct System. As indicated in the TIG Report, those costs could be substantial. It is possible they could be covered in water rates charged to users, or may otherwise be paid for out of the tax revenues received by the County of Maui, but the ultimate legal responsibility for covering such costs is the County's. The amount of such costs, and a plan for how those costs are going to be covered in future years, should be developed by the County of Maui prior to undertaking any condemnation.

Comment 15: *Furthermore, if the County of Maui is interested in facilitating community control of the EMI Aqueduct system and meeting the multiple needs of stakeholders, acquiring the system at a price close to the \$5.4 million paid by Mahi Pono in December 2018 is essential. As noted previously, if Mahi Pono obtains a 30-year water lease, the private equity fund will likely argue that the EMI aqueduct system has a value higher than the original purchase price. (Mahi Pono's sales agreement with A&B states that the water lease is worth a minimum of \$62 million.) Acquiring the system in the near term will thus increase the chances of minimizing long-term debt.*

Response 15: As previously noted, the TIG Report makes the assumption that just compensation for the EMI Aqueduct System would be the price stated in the purchase and sale agreement between Alexander & Baldwin and Mahi Pono, that is, approximately \$5.4 million. Under Hawai'i law, however, the price to be paid for the EMI Aqueduct System would be the market value of the EMI Aqueduct System as of the date that the condemnation action is filed and legal summons is issued. (See Hawai'i Revised Statutes § 101-24 (property assessed as of the date of summons).) The condemnee would not be bound by the price that might have been stated in the purchase and sale agreement, but would be entitled to the full fair market value of the EMI Aqueduct System as of the date of the summons. How fair market value is derived is described in more detail above.

Comment 16: *Thank you for your attention to this matter. I look forward to seeing the issues raised in the Board of Water Supply's Temporary Investigative Group Report integrated into the final Environmental Impact Statement.*

Response 16: We acknowledge your comments and provided you with detailed responses to each of your comments above. Please note that we are aware of the County BWS TIG Report, which was published after the Draft EIS, on the potential acquisition of the EMI Aqueduct System by the County, speaks directly to the "ownership change" alternative referenced in your comment. To provide further context, on July 19, 2019, the Maui County BWS formed the TIG to explore options for ensuring public access to water, including the feasibility of purchasing and maintaining the EMI Aqueduct System.

Based upon information available in relation to findings and conclusions of the TIG report, it is our assessment that the County's potential acquisition of the EMI Aqueduct System remains speculative. Furthermore, much of the institutional knowledge needed to properly operate the EMI Aqueduct System would be lost under any change in ownership scenario. This could reduce the efficacy of the system, the new owner may not have the expertise needed to properly maintain it, and possibly lead to additional and unforeseen environmental impacts. Moreover, a change in ownership would presumably directly contradict the objectives of the Proposed Action as outlined within the EIS. It is noted that the TIG report's proposal for water rates for the Central Maui agricultural fields is nearly ten times that of what is being charged to the

Agricultural Park and Upcountry agricultural users, thus rendering the economic viability of agriculture on the Central Maui fields unfeasible.

For purposes of assessment in this EIS, it is assumed that an alternative owner of the EMI Aqueduct System would be required to meet goals of the Proposed Action as described in this EIS, including meeting the Proposed Action's stated objective to support an economically feasible, sustainable diversified agricultural operation across the Central Maui agricultural fields.

For the reasons discussed above, the County's acquisition of the EMI Aqueduct System, and the County's pursuit of a water lease from the BLNR are viewed as speculative and an unreasonable alternatives. However, the existence and findings of the TIG Report has been acknowledged in Section 3.1.2 of the Final EIS, as shown on pages 3-19 to 3-20. A copy of the TIG Report has been included in the Final EIS as Appendix P.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments RE: DEIS for Proposed East Maui Water Lease

Aloha Mr. Hirokawa and Mr. Matsukawa,

My name is Spencer Hyde, I am 26 years old, and I am writing because I care a lot about my home and the news that A&B and Mahi Pono may take control of our water resources by diverting East Maui streams for another thirty years deeply concerns me.

I understand that Mahi Pono wants to ensure access to all of the water that they need for the foreseeable future in order to invest in their business. Growing food locally is important.

But we would be foolish to believe that growing food is Mahi Pono's main interest. Water is an increasingly valuable resource, one in which investors around the world have described as "the new oil," or "the new gold." Just Google either of those two statements and you will find a plethora of articles about it.

In 30 years it will be 2050. At the rate in which civilization continues to emit CO2 into the atmosphere, we cannot be certain that Maui's ecosystem will still be functioning like it is today. Just Google "climate change 2050."

A&B and Mahi Pono's lease on East Maui water should be limited and conditional. I hope you consider shorter term lease options, because we just don't know what the state of the planet will be in 2050.

Thanks for the opportunity to comment,
Spencer

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Spencer Hyde:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *My name is Spencer Hyde, I am 26 years old, and I am writing because I care a lot about my home and the news that A&B and Mahi Pono may take control of our water resources by diverting East Maui streams for another thirty years deeply concerns me.*

Response 1: We acknowledge your comments and understand that you are a Maui resident. Please note that we provide detailed responses to your comments below.

Comment 2: *I understand that Mahi Pono wants to ensure access to all of the water that they need for the foreseeable future in order to invest in their business. Growing food locally is important.*

But we would be foolish to believe that growing food is Mahi Pono's main interest. Water is an increasingly valuable resource, one in which investors around the world have described as "the new oil," or "the new gold." Just Google either of those two statements and you will find a plethora of articles about it.

In 30 years it will be 2050. At the rate in which civilization continues to emit CO2 into the atmosphere, we cannot be certain that Maui's ecosystem will still be functioning like it is today. Just Google "climate change 2050."

Response 2: Please note that Under the Proposed Action, the proposed Water Lease requests to divert the maximum amount of water from the License Area after compliance with the CWRM D&O for uses described in the EIS.

We respectfully disagree with your comment that it is foolish to believe that agriculture is Mahi Pono's main interest. Under the Proposed Action, Mahi Pono will introduce new agricultural activity to the State of Hawai'i, which will benefit the State by increasing food production, employment, payroll, profits for farm tenants and companies supplying goods and services, and tax revenues to the State and County of Maui as described in Sections 4.7.3 and 4.7.4 of the Draft EIS as well as Appendix H (Economic and Fiscal Impact Study) and Appendix I (Agricultural and Related Economic Impacts). While profits from Mahi Pono's farming activities, when they exist, will be distributed to its investors, including but not limited to PSP, a Canadian pension fund, most of the economic benefits will remain in Hawai'i. Please note that farming activity typically requires significant upfront investment, with much later returns. The capital for that investment is provided by Mahi Pono's investors.

Please note that as discussed in Section 2.1.2 of the Draft EIS, under the Proposed Action, at full buildout of the Mahi Pono farm plan, it is estimated that approximately 87.95 mgd will be diverted from the License Area and an additional 4.37 mgd in between Honopou Stream and Māliko Gulch to support uses described in the EIS. However, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

The only development within Central Maui contemplated in connection with the proposed Water Lease is the continued re-development and re-establishment of agriculture on approximately 30,000 acres of agricultural fields that used to be in sugarcane and are now planned and being used for diversified agriculture. It is expected that the Water Lease will authorize specific character of use for the leased water and any use that is outside of that authorization would not be permitted.

With regards to climate change, please note that the EIS includes the most recent information regarding climate change within its analysis. As discussed in Section 4.3.1 of the Draft EIS:

Regular trade winds are key in driving the Hawai'i's hydrological cycle, generating rainfall which helps maintain Maui's water supply. However, a recent

study showed that Hawai‘i’s trade winds have decreased in frequency by approximately 30% over the past 37 years, from 291 days per year in 1973, to 210 days per year in 2009 (Garza et. al, 2012). The decrease in the trade winds could have serious implications for the Hawaiian Islands, including adversely impacting local agriculture, native ecosystems and endangered species, and the State’s limited freshwater supply.

Overall, the State of Hawai‘i is experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014)...

Climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. Such rainfall patterns increase the amount of stormwater runoff flowing through the region, including through the streams within the License Area that reach the shoreline. The expected climatic changes in precipitation patterns and streamflow will influence the quantities and concentration of stormwater runoff entering the nearshore environments and coastal waters, resulting in increased sedimentation, impacting coral reefs. However, because of the continuous wave energy in shore areas in East Maui, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species. (SE & MRC, 2019).

Hence, the EIS recognizes that the State of Hawai‘i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall. Moreover, Section 4.3.1 of the Final EIS has been expanded to include information from the archeological literature review and field inspection

(LRFI) report (Appendix E), the Cultural Impact Assessment (CIA) report (Appendix F), and the Terrestrial Flora and Fauna Technical Report (Appendix C) prepared for this EIS as shown on pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Comment 3: *A&B and Mahi Pono's lease on East Maui water should be limited and conditional. I hope you consider shorter term lease options, because we just don't know what the state of the planet will be in 2050.*

Response 3: We acknowledge your comments. Please note that the terms and conditions are at the discretion of the BLNR. With regards to your comment about a shorter lease duration, Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for

10238-04
Letter to Spencer Hyde
Page 5 of 5
September 3, 2021

various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement

Dear Mr. Matsukawa,

Climate change

It would be highly irresponsible to assume that any EIS no matter how thorough could be any indication of near future impacts due to extreme climate change. A 30 year lease would be a stab in the back of the security of future Maui generations. As the stress factors on marine and stream ecosystems, increase with climate change, we need a government agency that can adjust the needs of water distribution. Only short term, renewable leases should even be considered. Knowledge in the field of Biology is exploding. In well under 30 years, we will probably realize how dependent our island ecosystems are on our native microbial biome. This is not the Mid-West, nor the Central Valley of California.

Public confidence in Government

Hundreds of years of foreign then corporate privilege, have stunted the sophistication of the public as far as standing up for their rights. Personally, I have witnessed shady 'public' hearings regarding East Maui water for over 35 years. Maui's residents are used to being 98% in favor of fair distribution of water and environmental rights, only to be ignored or voted down, virtually every time. We now have two generations of disgruntled citizens, who believe less in Democratic values on Maui, then on being victims of a Corporate/foreign dictatorship.

#Glyphosate in drinking water

Having been on Sierra Club hikes, I have had a chance to see first hand, the ridiculous amount of herbicide spraying along both sides of even the upper forest ditch system. Closer to home the dead vegetation attests to a management of what for many is 'public' drinking water, that boarderlines criminally liable actions. Considering the shameful amount of leaks in the system, this poisoning of those of us who have had ditch water as our 'County' water, shows a lack of responsible management. We cannot trust another Corporation, especially one that as a special relationship to A&B, to be in charge of such a critical public health resource.

Our rights to Waipio stream

I purchased my 3.8 acres in Huelo 19 years ago, the deed specifies that I have the water right to a 1 inch pipe to Waipio Stream, which was not listed during previous water diversion documents. I have brought this up at several public hearings, and never got any response. After 19 years of catchment only for two houses and almost 4 acres, it is time to respect my rights. Waipio stream has been so heavily tapped that taking my small share of the water would be damaging to the already heavily compromised ecosystems of both the damaged stream and the diminished biodiversity of Waipio Bay, not to mention the poor quality of the trickling brook that once carved a beautiful bay.

Excessive size of EIS

After so many years of undemocratic corporate control of both the water and the access to Maui's most pristine land, the EIS should have been done by DLNR, not a private for profit agency, who's goal was to get the lease not do a fair assessment.

Sincerely,

Steven Slater

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Slater:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Climate change*

It would be highly irresponsible to assume that any EIS no matter how thorough could be any indication of near future impacts due to extreme climate change. A 30 year lease would be a stab in the back of the security of future Maui generations. As the stress factors on marine and stream ecosystems, increase with climate change, we need a government agency that can adjust the needs of water distribution. Only short term, renewable leases should even be considered. Knowledge in the field of Biology is exploding. In well under 30 years, we will probably realize how dependent our island ecosystems are on our native microbial biome. This is not the Mid-West, nor the Central Valley of California.

Response 1: We acknowledge your comments. Climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai‘i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and

coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown on pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

With regards to the lease duration, please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to

reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

With regards to your comment about marine ecosystems, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment

problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSheP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83.

Comment 2: *Public confidence in Government*

Hundreds of years of foreign then corporate privilege, have stunted the sophistication of the public as far as standing up for their rights. Personally, I have witnessed shady 'public' hearings regarding East Maui water for over 35 years. Maui's residents are used to being 98% in favor of fair distribution of water and environmental rights, only to be ignored or voted down, virtually every time. We now have two generations of disgruntled citizens, who believe less in Democratic values on Maui, then on being victims of a Corporate/foreign dictatorship.

Response 2: We acknowledge your comments. However, please note it is not within scope to assess government meetings and public hearings as the EIS is not a document that authorizes or mandates any actions. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS. However, please note that over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M). The Applicant made every reasonable effort to convey information through the Draft EIS in a manner that is accurate, thorough, and appropriately concise in order to provide the public with an opportunity to fairly analyze the potential impacts of the Proposed Action.

Comment 3: *#Glyphosate in drinking water*

Having been on Sierra Club hikes, I have had a chance to see first hand, the ridiculous amount of herbicide spraying along both sides of even the upper forest ditch system. Closer to home the dead vegetation attests to a management of what for many is 'public' drinking water, that boarderlines criminally liable actions. Considering the shameful amount of leaks in the system, this poisoning of those of us who have had ditch water as our 'County' water, shows a lack of responsible management. We cannot trust another Corporation, especially one that as a special relationship to A&B, to be in charge of such a critical public health resource.

Response 3: Regarding your comment about pesticide use, as discussed in Section 4.12 pesticide use is regulated by both State and Federal law. The use of these chemicals is compliant with all laws regulating pesticide use, and certified commercial applicators are utilized as required. Act 45 which was passed by the 2018 Hawai'i Legislature and effective on January 1, 2019 required that all Certified Applicators of Restricted Use Pesticides (RUP) submit a report of the RUP that were applied each year. This report as well as any other report required by law is publicly available from the respective government entity. The State of Hawai'i DOA's Pesticide Branch also provides regulatory oversight over EMI's pesticide use. In accordance with this oversight, records of pesticide use must be kept and made available to the Pesticide Branch upon request at any time. It is also noted that since January 2020 EMI committed to discontinuing use of Round-Up. This information has been included in the Final EIS as shown on pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations.

Comment 4: *Our rights to Waipio stream*

I purchased my 3.8 acres in Huelo 19 years ago, the deed specifies that I have the water right to a 1 inch pipe to Waipio Stream, which was not listed during previous water diversion documents. I have brought this up at several public hearings, and never got any response. After 19 years of catchment only for two houses and almost 4 acres, it is time to respect my rights. Waipio stream has been so heavily tapped that taking my small share of the water would be damaging to the already heavily compromised ecosystems of both the damaged stream and the diminished biodiversity of Waipio Bay, not to mention the poor quality of the trickling brook that once carved a beautiful bay.

Response 4: We acknowledge your comments. However, please note that your comment regarding your water rights to a 1-inch pipe is not within the scope of the document. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including

A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS. However, we do note that Waipi'o stream was one of the streams not subject to the CWRM D&O as discussed in Section 1.3.4 of the Draft EIS. Please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown on pages 4-61 to 4-62 of the Final EIS. The above excerpt and the updated text on pages 4-61 to 4-62 of the Final EIS present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area, which includes an assessment of the non-petitioned streams. The Final EIS has included this clarifying statement in Section 4.2.1.

Comment 5: *Excessive size of EIS*

After so many years of undemocratic corporate control of both the water and the access to Maui's most pristine land, the EIS should have been done by DLNR, not a private for profit agency, who's goal was to get the lease not do a fair assessment.

Response 5: BLNR determined that A&B was to prepare the EIS for the proposed Water Lease. As explained in Section 1.4 of the Draft EIS, in connection with A&B's May 2001 submittal to the BLNR requesting that the BLNR offer a long-term (30 year) water lease at public auction, A&B offered to perform the associated HRS, Chapter 343 environmental review. As part of the contested case hearing on the proposed Water Lease, NHLC, on behalf of Nā Moku, objected to A&B undertaking the environmental review process, and asserted that the BLNR was required to prepare conduct the environmental review. NHLC later orally withdrew its objection during oral arguments before the BLNR in May 2015. BLNR issued an order on April 14, 2016, directing A&B to scope the EIS, including the identification of the portions of the EIS that could proceed prior to the CWRM issuing a final IIFS decision, and those portions which could not. That scope was filed with the BLNR in June 2016. On July 8, 2016, the BLNR approved the scope and instructed that “A&B and EMI should proceed with the preparation of an environmental impact statement (EIS) in as expeditious manner as possible.” The EIS recites this history in Section 1.3.3 of the Draft EIS and recognizes that the Water Lease will be awarded by public auction. The Draft EIS fully complied with all relevant requirements, including the content requirements set forth in §11-200-16 and 11-200-17, and the Draft EIS even includes a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement. The Draft EIS meets the necessary content requirements and for that reason we disagree with your comment that the Draft EIS does not disclose sufficient information about the anticipated impacts of the Proposed Action, alternatives to the Proposed Action, and feasible measures that might be taken to mitigate potential impacts, sufficient to allow informed decision making.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Please extend the comment period due to the lengthy nature of the document and the importance of this issue to the community. TO ACHIEVE THIS, A&B SHOULD WITHDRAW ITS DEIS AND RESUBMIT IT FOR PUBLICATION IN THE ENVIRONMENTAL NOTICE WITHOUT ALTERATIONS. This short delay is minor in comparison to the 30-year lease that is sought, and will ensure community members who have direct knowledge of the potential impacts of the proposed lease have an opportunity to offer their comments and strengthen the process.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Van Paepegham:

Thank you for comments dated November 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please extend comment period due to the lengthy nature of the document and the importance of this issue to the community. TO ACHIEVE THIS, A&B SHOULD WITHDRAW ITS DEIS AND RESUBMIT IT FOR PUBLICATION IN THE ENVIRONMENTAL NOTICE WITHOUT ALTERATIONS. This short delay is minor in comparison to the 30-year lease that is being sought, and will ensure community members who have direct knowledge of the potential impacts of the proposed lease have an opportunity to offer their comments and strengthen the process.*

TIMES TWO SO YOU GET IT?

Response 1: We acknowledge your comments noting for a time extension to allow for additional public comment. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai'i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement

Dear Mr. Matsukawa,

Aloha my name is Stevensdrake Kaikeola Hookano my Ohana resides in Ko'olau since time immemorial I am a kalo farmer that continues to farm and was affected in the contested case hearing, I am submitting my testimony on behalf of my Hookano Ohana who reside in Wailuanui Ko'olau Maui As a direct descendent and native tenant, I am concerned about the negative impact on the dewatering of areas within our Moku of Ko'olau which have been in a state of improper management practices for decades Please take it to consideration that native tenet rights will be affected under HRS Article 12 section 7 my Ohana's rights to gather in streams for cultural sustenance will be in jeopardy as my Ohana have direct ties to areas being diverted and we continue to practice in Ko'olau right now all water is reaching the ocean and thru the years have seen the streams repair itself the fish has returned in abundance and life in the streams are returning please address my concerns and my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui so our community can have a healthy flow of water Mauka to Makai. I believe that there is much more that can be done to address this issue and find solutions to fix the issue and should be talked about more on this issue so all parties can come up with positive solutions that will not put Maui's most precious resource in jeopardy for future generations with deep sadness on this issue Mahalo.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Stevensdrake Hookano

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Hookano:

Thank you for comments dated October 9, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Aloha my name is Stevensdrake Kaikeola Hookano my Ohana resides in Ko‘olau since time immemorial I am a kalo farmer that continues to farm and was affected in the contested case hearing ,I am submitting my testimony on behalf of my Hookano Ohana who reside in Wailuanui Ko‘olau Maui*

Response 1: We acknowledge your comments and understand that you are a kalo farmer that resides in East Maui within Wailuānui.

With regards to kalo farming and Wailuānui Stream, please note that this is one of the streams identified by the CWRM D&O for full restoration. The CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on pages 1-19 to 1-23 of the Final EIS. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration statuts); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is

assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 2: *As a direct descendent and native tenant, I am concerned about the negative impact on the dewatering of areas within our Moku of Ko’olau which have bin in a state of improper management practices for decades Please take it to consideration that native tenet rights will be affected under HRS Article 12 section 7 my Ohana’s rights to gather in streams for cultural sustenance will be in jeopardy as my Ohana have direct ties to areas being diverted and we continue to practice in Ko’olau*

Response 2: Your comment about improper management practices is unclear. However, please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed

management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

With regards to your comment about native tenant rights, as discussed in the *Ka Pa`akai* decision, we acknowledge that BLNR will be required to “to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible.” *Ka Pa`akai* at, 94 Hawai`i at 35, 7 P. 3d at 1072. BLNR has confirmed that in its Findings of Fact, Conclusions of Law, and Decision and Order filed on March 23, 2007 in the contested case proceeding that is still pending regarding issuance of the proposed Water Lease (the 2007 D&O) as follows:

Public trust principles require that adequate provision be made for the protection of traditional and customary Hawaiian rights, the protection and procreation of fish and wildlife, the maintenance of proper ecological balance and scenic beauty, and the preservation and enhancement of waters of the State for municipal uses, public recreation, public water supply, agriculture and navigation.

2007 D&O COL No. 6 at page 41 (*citing In Re Water Use Permit Applications*, 94 Hawai`i 97, 9 P. 3d 409 (2000)). CWRM, in its June 20, 2018 D&O, also recited the State’s constitutional obligation to consider the impacts of stream diversions in East Maui on traditional and customary practices of Native Hawaiians at pages 242 through 245, including the Supreme Court of Hawai`i’s more recent holding on this subject in *State v. Pratt*, 127 Hawai`i 206, 277 P. 3d 300 (2012).

In order to facilitate BLNR’s compliance with this obligation, the EIS discussed cultural resources and practices, and the impacts to cultural resources and practices, in section 3.4.10 and in 4.6. The EIS also includes a comprehensive CIA prepared by CSH. Note that the CIA now includes information from a second round of consultation, which was done in response to comments submitted on the Draft EIS. We believe that the EIS (including Appendix F) together with the CWRM D&O, provide ample information for the BLNR to consider regarding potential impacts to traditional and customary practices, and that information will enable BLNR, at the point in the future that it is deliberating on the Water Lease, to fulfill its constitutional obligation “to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible.” *Ka Pa`akai* at, 94 Hawai`i at 35, 7 P. 3d at 1072.

Comment 3: *right now all water is reaching the ocean and thru the years have seen the streams repair itself the fish has returned in abundance and life in the streams are returning*

Response 3: We acknowledge your comments. Please note that many people at the EISPN public scoping meetings on February 22nd and 23rd, 2017 testified noting positive impacts seen from increased stream flow resulting from the cessation of sugar operations, please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See page 4-168 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted. This is expected as it was discussed in Section 4.2.1 of the Draft EIS that the Proposed Action would increase the number of HU as compared to sugarcane operations. Please note that that as of October 2020, an average of 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System. Hence it can be assumed that current water diversion rates from the License Area are comparable to the amount that would be diverted under the No Action alternative, which is estimated to be approximately 26.39 mgd. The HSHEP model estimated that approximately 79.8% of total habitat units (HU) would be available under the No Action alternative. However, please note that under the Proposed Action, the total HU would be less than projected under the No Action alternative.

Comment 4: *please address my concerns and my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui so our community can have a healthy flow of water Mauka to Makai. I believe that there is much more that can be done to address this issue and find solutions to fix the issue and should be talked about more on this issue so all parties can come up with positive solutions that will not put Maui's most precious resource in jeopardy for future generations with deep sadness on this issue Mahalo.*

Response 4: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

10238-04
Letter to Mr. Stevensdrake Hookano
Page 7 of 7
September 3, 2021

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Resending: Comment: Oppose 30 year water lease to A&B

Resending this comment, was an error in address in prior email

I write to comment on the EIS submitted in conjunction with the A&B application for a 30 year water lease for island of Maui.

I found the projections of the amount of water needed for agricultural use unreasonably high and unsubstantiated by the applicant A&B or its successor Mahi Pono.

I think 30 years is an unreasonably long period to assign such a large amount of public water to a private owner especially with no established track record in this state and allegations of speculation, profiteering and conflict of interest lurking in the wings.

The massive EIS does not adequately address the question of the **public interest in this situation** and instead floods the decision making body with a massive amount of irrelevant and slanted information.

I urge you to deny this application and reject the assertions of A&B and Mahi Pono and reopen the bidding to other qualified applicants.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Halas:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I write to comment on the EIS submitted in conjunction with the A&B application for a 30 year water lease for island of Maui.*

I found the projections of the amount of water needed for agricultural use unreasonably high and unsubstantiated by the applicant A&B or its successor Mahi Pono.

Response 1: We acknowledge your comments. With regards to your comment about the projections of the amount of water needed for the Mahi Pono farm plan, note that presently, Mahi Pono is unable to irrigate the majority of the agricultural fields in Central Maui to provide groundcover due to the water limitations under the terms of its current water revocable permits. Moreover, it will not be able to do so in the future without the proposed Water Lease. This will render lands uncultivated or unused, due to lack of water. As a result, the land in Central Maui will revert to its natural arid condition which is susceptible to wind-blown erosion. The Draft EIS provided a table projecting the Mahi Pono water use for full development of the farm plan. To better explain how much water is available now and expected for the near term for

agricultural groundcover, Section 2.1.4 of the Final EIS has been updated with more current water projections as shown on pages 2-30 and 2-32.

However, in order to implement Mahi Pono's full build-out farm plan, approximately 82.33 mgd is needed to irrigate the majority of the approximate 30,000 acres in Central Maui.

Comment 2: *I think 30 years is an unreasonably long period to assign such a large amount of public water to a private owner especially with no established track record in this state and allegations of speculation, profiteering and conflict of interest lurking in the wings.*

Response 2: With regards to your comment about the length of the lease, Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live

technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

With regards to your comment about Mahi Pono not having a track record, please note that Mahi Pono has been farming the Central Maui agricultural fields since they were sold A&B's former sugarcane land in December 2018 and has been expanding their agricultural operations since then. It is acknowledged that Mahi Pono is new entity that has just been recently formed with the goal of operating a large diversified agriculture farm in Hawai'i. However, in its first 18 months of existence, Mahi Pono has hired over 200 workers from Maui, most of whom have farm experience on the island. In addition, Mahi Pono's management has significant experience cultivating diverse crops on more than 100,000 acres on the continental U.S. Also, the company has established market channels, and substantial financial resources. The Mahi Pono farm plan is discussed not only in the Executive Summary, but in detail in Section 2.1.4. and Section 4.7.4, as well as Appendix I. Water requirements for 2030 are discussed in Subsection 9.a of Appendix I, with details provided in Table 3, Section 3.a of Appendix I. This table includes average daily per-acre water requirements by crop. Production figures are discussed in Subsection 10.a, with details provided in Table 4, Section 4.a of Appendix I.

The Mahi Pono farm plan will evolve over time based on a number of factors, including the available supply of surface water, experience which will be gained on crops that grow well in Central Maui, crops that are profitable, the size of the market for profitable crops, etc.

Comment 3: *The massive EIS does not adequately address the question of the **public interest in this situation** and instead floods the decision making body with a massive amount of irrelevant and slanted information.*

I urge you to deny this application and reject the assertions of A&B and Mahi Pono and reopen the bidding to other qualified applicants.

Response 3: We acknowledge your comments. However, your comment about public interest is unclear. Note that over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M). Moreover, over 400 comments were received in response to the Draft EIS. The Social Impact Assessment and the Cultural Impact Assessment also conducted community outreach in conjunction with this EIS process to analyze social and cultural impacts of the Proposed Action. Hence, we believe that the public interest is adequately captured in the EIS.

We respectfully disagree with your comment that the EIS ‘floods the decision making body with a massive amount of irrelevant and slanted information.’ The Proposed Action implicates complex substantive issues with long histories. The EMI Aqueduct System has been diverting East Maui stream water for over a century as discussed in Section 1.3.2 of the Draft EIS. A&B's request that the Board of Land and Natural Resources (BLNR) offer a long-term (30-year) water lease at public auction was made on May 14, 2001 and has yet to be acted upon due to a series of regulatory and legal challenges. The proceedings before the Commission on Water Resource Management (CWRM) started in 2001 and only concluded in June 2018. In May 2001, Native Hawaiian Legal Corporation (NHLC) filed 27 petitions to amend the interim instream flow standards (IIFS) for numerous streams within the License Area on behalf of Nā Moku ‘Aupuni ‘O Ko‘olau Hui (Nā Moku), Beatrice Kepani Kekahuna, Marjorie Wallett, and Elizabeth Lehua Lapenia (IIFS petitions). The IIFS proceedings concluded 17 years later, in June 2018, with CWRM's issuance of its Findings of Fact, Conclusion of Law and Decision and Order in CCH-MA13-01 (CWRM D&O). The Draft EIS addresses this historical perspective, as required under HAR § 11-200-17.

We also note that the actual text of the Draft EIS is approximately 560 pages, which includes numerous graphics, and there are a total of thirteen appendices, nine of which were completed by technical consultants.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease)

From: Susanna Pol
To: Ian Hirokawa, Earl Matsukawa
Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Keanae, Honomanū, and Huelo License Areas

Please accept my comments on the subject DEIS.

I care very deeply about this proposed lease of public water because I'm a concerned upcountry Maui resident and hiker who uses the East Maui watershed lands.

The EIS needs to discuss the option of not diverting any streams, and discuss how that would benefit East Maui ecosystems and East Maui communities.

- The EIS should include discussion of a plan and funding to manage the invasive species in the license area. These invasive plants and animals are hurting the health and the function of the watershed lands.
- The EIS should give an in-depth review of and discuss the benefits of shorter term lease options of less than 30 years, due to uncertainties of future rainfall and future water supplies.
- The EIS should discuss the benefits of creating more options for more public hiking access to public lands in the proposed lease area without every hiker needing to get permission from EMI.
- In the past, stagnant pools along diverted streams have been breeding grounds for mosquitos that carried Dengue fever virus to East Maui residents. The EIS needs to discuss the role that diverted streams have on mosquito populations in East Maui, and the impact that resuming diversions will have on people living and/or visiting the area.
- The EIS needs to discuss methods of restoring the 13 streams in the Honopou to Kailua area, where lots of people live and farm and gather. All that is said is that it's estimated that all of the water will be diverted from the streams 60% of the time. The EIS needs to discuss the impacts of continuing those diversions, which will decimate 85% of native stream habitat and impact thousands of local residents.

I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.

Aloha,
Susanna Pol

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Pol:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments on the subject DEIS.*

I care very deeply about this proposed lease of public water because I'm a concerned upcountry Maui resident and hiker who uses the East Maui watershed lands.

Response 1: We acknowledge your comments and understand that you are an Upcountry Maui resident.

Comment 2: *The EIS needs to discuss the option of not diverting any streams, and discuss how that would benefit East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to

enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the "No Action" alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The EIS should include discussion of a plan and funding to manage the invasive species in the license area. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 3: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Comment 4: *The EIS should give an in-depth review of and discuss the benefits of shorter term lease options of less than 30 years, due to uncertainties of future rainfall and future water supplies.*

Response 4: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the

lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80 of the Final EIS, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 5: *The EIS should discuss the benefits of creating more options for more public hiking access to public lands in the proposed lease area without every hiker needing to get permission from EMI.*

Response 5: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could

conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 6: *In the past, stagnant pools along diverted streams have been breeding grounds for mosquitos that carried Dengue fever virus to East Maui residents. The EIS needs to discuss the role that diverted streams have on mosquito populations in East Maui, and the impact that resuming diversions will have on people living and/or visiting the area.*

Response 6: With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-61.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Mauistreams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Comment 7: *The EIS needs to discuss methods of restoring the 13 streams in the Honopou to Kailua area, where lots of people live and farm and gather. All that is said is that it's estimated that all of the water will be diverted from the streams 60% of the time. The EIS needs to discuss the impacts of continuing those diversions, which will decimate 85% of native stream habitat and impact thousands of local residents.*

Response 7: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-61 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at

10238-04
Letter to Ms. Susanna Pol
Page 8 of 8
September 3, 2021

impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 8: *I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.*

Response 8: We acknowledge your comments and offer you detailed responses to each of your comments above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: EIS for the diversion of East Maui streams

Dear Mr. Matsukawa,

Diversion of East Maui streams is not the right direction to go in for Maui's environment. What is needed is to stop the diversions and restore these important ecosystems.

Restricting use of public lands is also the wrong direction - hiking access for the public should be increased.

These are but two of the many land management issues at stake. The mismanagement of public lands and water on Maui should not continue as it has in the past. This is the wrong direction to go in! Grabbing land and water from the public for private profit needs to stop.

Thank you for hearing our comments.

Sincerely,
Sylvia Litchfield

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Litchfield:

Thank you for comments dated October 12, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Diversion of East Maui streams is not the right direction to go in for Maui's environment. What is needed is to stop the diversions and restore these important ecosystems.*

Response 1: We acknowledge your comments. It is generally known that water can aid in the regeneration of an ecosystem. Please note that the HSHEP model was used to quantify the impacts of flow restoration on native stream animal habitat to determine an appropriate balance between instream and offstream water uses. Impacts to stream habitats and native amphidromous stream species, are analyzed in Section 4.2.1 and Appendix A of the EIS. Impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B of the EIS. Impacts to terrestrial flora and fauna, including threatened and endangered species, are analyzed in Section 4.4 and Appendix C of the EIS.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed

management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Comment 2: *Restricting use of public lands is also the wrong direction - hiking access for the public should be increased.*

Response 2: Please note that the Proposed Action does not restrict public access to the License Area. In any event, public access within portions of the License Area has been provided, as discussed in Section 4.8 of the Draft EIS, and it is expected either that public access will continue if the scope of the License Area remains the same, or, if the License Area is reduced, that public access within the former License Area lands will be dictated by a State agency. However, please note that Section 4.8 of the Final EIS, has been revised as shown on pages 4-305 to 4-309 to include more recreational facilities and an accurate discussion regarding access into the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the "Modified Lease Area" alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access

into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access to areas that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding impacts to the areas that would allow for more public access. Moreover, impacts of the Modified Lease Area alternative are discussed in Section 3.4 of the EIS (Comparative Evaluation of Reasonable Alternatives) against different environmental resource categories

Comment 3: *These are but two of the many land management issues at stake. The mismanagement of public lands and water on Maui should not continue as it has in the past. This is the wrong direction to go in! Grabbing land and water from the public for private profit needs to stop.*

Thank you for hearing our comments.

Response 3: We acknowledge your comments. Please note that we provided you detailed responses to each of your comments above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Aloha,
please acknowledge receipt of this email.

Firstly, I need more time to read this 2700 + page document. The time allotted our community is unrealistic for those I spoke with. Full time busy schedules, family & home, leaves very little time within a tight 45 day window to address a topic as important as a 30 year lease of our water system of east Maui.

I request an extension. I know many folks who wanted to write a testimony.

Secondly: I understand the East Maui Watershed Partnership has a study related to land way above the 1,000 ft elevation. Where is the study reflecting the data for all streams at that elevation to the dea?? Seems there should be a full body of research, as the major concern is of the east Maui streams. This needs to be included for a comprehensive report.

Thirdly, I do not agree that only the central valley has substantial potential to grow usefl food crops.
Can this be proven?

I have little time , I'm so tired tonight. I want to write at least 10 pages of my testimony.
This must be extended. A&B did not give enough time for our community to express ourselves.

mahalo
Tara Grace

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Grace:

Thank you for comments dated November 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Firstly, I need more time to read this 2700 + page document. The time allotted our community is unrealistic for those I spoke with. Full time busy schedules, family & home, leaves very little time within a tight 45 day window to address a topic as important as a 30 year lease of our water system of east Maui.*

I request an extension. I know many folks who wanted to write a testimony.

Response 1: We acknowledge your comments noting for a time extension to allow for additional public comment. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai‘i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 2: *Secondly: I understand the East Maui Watershed Partnership has a study related to land way above the 1,000 ft elevation. Where is the study reflecting the data for all streams at*

that elevation to the sea?? Seems there should be a full body of research, as the major concern is of the east Maui streams. This needs to be included for a comprehensive report.

Response 2: Please note that we are not aware of this study that you are referring to as it relates to the East Maui Watershed Partnership. As discussed in Section 2.1 of the Draft EIS, A&B was a founding member of the East Maui Watershed Partnership (EMWP), which was the first watershed partnership in the State of Hawai'i and which served as a model for other watershed partnerships throughout the State. The lands under the jurisdiction of the East Maui Watershed Partnership span over 100,000 acres which includes the entire License Area. The License Area is actively managed by the multiple agencies and organizations, including EMWP, Maui Invasive Species Committee (MISC), DLNR, etc., in partnership with EMI. EMI continues to work with MISC by reporting sighting of invasive weeds and coordinating access in these areas, which are well below the 3,000' level. EMI personnel also monitor the License Area for signs of feral ungulates.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Comment 3: *Thirdly, I do not agree that only the central valley has substantial potential to grow useful food crops.*

Can this be proven?

Response 3: Please note that nowhere in the Draft EIS is it stated that Central Maui has the only substantial potential to grow useful food crops. The Central Maui agricultural fields at issue in this

EIS consist of approximately 30,000 acres of cultivatable land as discussed in Chapter 4 of the Draft EIS. Specifically, Chapter 4 of the Draft EIS states:

For the purposes of this DEIS, Central Maui is comprised of the approximately 30,000 acres of agricultural land that had been cultivated with sugarcane for over a century utilizing water from the EMI Aqueduct System. Geographically, what is referred to as Central Maui encompasses approximately 36,000 acres, but approximately 6,000 acres is comprised of uncultivated areas, including roads, gulches, and patches of uncultivated land as shown in Figure 4-1.

Please note that the above has also been added to the Executive Summary as shown on pages iii to iv.

As summarized in Section 4.7.4 of the Draft EIS and Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts):

Central Maui has some of the best agricultural conditions in the State for farming, including a large area in a compact configuration, high-quality soils, high solar radiation, a location near markets and shipping terminals, and potentially ample water at low delivery costs (assuming a new Water Lease with a reasonable use fee), and for lessees rents that will be comparatively low.

The basis for this finding is given in Subsection 5 of Appendix I of the Draft EIS, along with Figures 4 to 12 in Appendix I of the Draft EIS.

Moreover, as discussed in Section 5 of Appendix I and Section 4.7.4 of the Draft EIS, the overwhelming majority of the Central Maui agricultural fields (approximately 80%) are rated by the UH Land Study Bureau (LSB) as having the highest Overall Productivity Rating of "A" (on a scale of "A" to "E" with "E" being the lowest soil rating), and a little over 11% has a "B" rating. In other words, about 27,567 acres (90.9%) are high-quality lands rated A or B. The Agricultural Lands of Importance to the State of Hawai'i (ALISH) Classification System, developed and compiled in 1977 by the State Department of Agriculture with assistance from the U.S. Department of Agriculture - Natural Resources Conservation Service (NRCS), and the College of Tropical Agriculture, University of Hawai'i. Approximately 25,669 acres of the Central Maui agricultural fields are classified under the ALISH system as "Prime", which means "agricultural land which is land that is best suited for the production of crops because of its ability to sustain high yields with relatively little input and with the least damage to the environment." Also, as discussed in Section 5.1.4 of the EIS and Section 5 of Appendix I, approximately 22,000 of the 30,000 acres of agricultural fields in Central Maui are designated as Important Agricultural Lands (IAL). Under

Article XI, Section 3, of the Constitution of Hawai‘i, the State is required to conserve and protect agricultural lands, promote diversified agriculture, increase agricultural self-sufficiency and assure the availability of agriculturally suitable lands. HRS Chapter, 205, § 205-41 through § 205-52, provides for the designation of IAL. As stated in HRS Chapter 205: “*The objective for the identification of important agricultural lands is to identify and plan for the maintenance of a strategic agricultural land resource base that can support a diversity of agricultural activities and opportunities that expand agricultural income and job opportunities and increase agricultural self-sufficiency for current and future generations.*” IAL designation facilitates the long-term dedication of lands for future agricultural use so long as there is a sufficient supply of water to allow for profitable farming.

However, the EIS and the associated technical studies do not claim that only Central Maui has the substantial potential to grow useful food crops for Maui’s future. As discussed in Section 2.1 of the Draft EIS, the scope of this EIS is to assess the Proposed Action which is, “*...to enable the Board of Land and Natural Resources (BLNR)-awarded lessee the right, privilege and authority to enter and go upon State-owned lands for the purposes of developing, diverting, transporting and using government-owned waters. The requested Water Lease would allow the use of government-owned waters from the License Area (approximately 33,000 acres which includes lands within Nāhiku, Ke‘anae, Honomanū, and Huelo) through the East Maui Irrigation Company, LLC (EMI) Aqueduct System. Use of that surface water would allow the continued provision of water to enable approximately 30,000 acres of farmland in Central Maui to remain in agriculture.*” Hence, the EIS assesses the action of obtaining a Water Lease and diverting water from East Maui. With regards to agriculture, under the Proposed Action, a major portion of the diverted water from East Maui would be used to irrigate the agricultural fields in Central Maui to continue to transition to diversified agriculture.

Comment 4: *I have little time , I'm so tired tonight. I want to write at least 10 pages of my testimony.*

This must be extended. A&B did not give enough time for our community to express ourselves.

Response 4: As noted in Response #1 above, the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai‘i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –

Subject: Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanū, and Huelo License Areas Aloha,

Aloha,

The Draft EIS does not mandate standards for monitoring and streamflow compliance. A correctly done EIS should include an evaluation and examination of the possible impacts of this 30-year lease on our fisheries and nearshore gathering areas.

30 years is far too long. I object to this use of natural resources. It is not in the public interest.

You have a constitutional requirement of upholding the public trust. This DEIS and proposed arrangement will not.

I look forward to the opportunity to provide further comments on the Final EIS.

Aloha,

Terez Amato Maui resident

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Terez Amato:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The Draft EIS does not mandate standards for monitoring and streamflow compliance. A correctly done EIS should include an evaluation and examination of the possible impacts of this 30-year lease on our fisheries and nearshore gathering areas.*

Response 1: You are correct. An EIS does not mandate or authorize any decision. An EIS is an environmental disclosure document and in this case the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

With regards to the 2018 CWRM D&O, On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their

flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

With regards to nearshore fisheries, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on the pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui

stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have esturine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on the pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on the pages 4-78 to 4-83 of the Final EIS.

Comment 2: *30 years is far too long. I object to this use of natural resources. It is not in the public interest.*

Response 2: We acknowledge your comments. With regards to a shorter lease duration, Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations*

and crops that may take years to reach economic viability." The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Comment 3: *You have a constitutional requirement of upholding the public trust. This DEIS and proposed arrangement will not.*

Response 3: Regarding your comment about the mandated protection of the Public Trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has

10238-04
Letter to Terez Amato
Page 6 of 6
September 3, 2021

already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

Comment 4: *I look forward to the opportunity to provide further comments on the Final EIS.*

Response 4: We acknowledge your comments. Please note that we have provided you with detailed responses to your comments above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: COMMENTS on DEIS A&B Water Lease

ian.c.hirokawa@hawaii.gov
waterleaseeis@wilsonokamoto.com

Aloha kahou,

Below are my comments for related to the Draft Environmental Impact Statement (DEIS), September 2019, for the Proposed Water Lease for the Nāhiku, Ki;anae, Honomanū and Huelo License Areas.

Mahalo,

Thomas Bacon, PO Box 1032, Hana, HI, 96713 tom@rainbowridgewest.com

- Please extend the comment period due to the lengthy nature of the document and the importance of this issue to the community. TO ACHIEVE THIS, A&B SHOULD WITHDRAW ITS DEIS AND RESUBMIT IT FOR PUBLICATION IN THE ENVIRONMENTAL NOTICE WITHOUT ALTERATIONS. This short delay is minor in comparison to the 30-year lease that is sought, and will ensure community members who have direct knowledge of the potential impacts of the proposed lease have an opportunity to offer their comments and strengthen the process.
- The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species, and does not address the impact of stream restoration on recently restored streams and muliwai. Cultural practitioners and aquatic experts need to address changes in 'o'opu, hīhīwai and 'ōpae populations they have seen where flows have been restored recently, and this should be part of the environmental impact analysis.
- The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands and require a management plan and funding. How is it possible to analyze the environmental impact of a plan that doesn't exist? Where in the DEIS does it address the impact of potentially not managing the invasive species?
- The DEIS does not include analysis of an alternative to split the system into service area units. For example, Nahiku has a dedicated pipe from its source to the County Water system, using the ditch and tunnels only to support the pipe. A separate utility could possibly take over this portion of the lease area. The DEIS omits details which are needed to make these alternative analyses.
- The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for over 100 years as the "baseline condition". It does not address the impacts of operation and maintenance of the system which alter the natural baseline condition. The DEIS needs to focus on an option of no diverted streams and how that would benefit the East Maui ecosystems and communities.
- The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of demand, future rainfall and future water supplies. How do the uncertainties of the Mahi Pono agricultural needs, the same uncertainties they describe in their vague agricultural plans, support the concept of a 30 year commitment?
- The DEIS needs to include a Watershed Management Plan. The methods of managing the watershed for the next 30 years, including access management, have a huge impact on the environment and should be addressed before the DEIS is reviewed. Limiting access needs to be addressed.

- In the Cultural Impact Analysis, Section 7.6 Impacts and Recommendations, the DEIS recommends professional analysis by cultural, ethnobotanical, scientific and/or biological experts as the way to address impact questions of various alternatives. This analysis should be completed in the DEIS, rather than leaving than deferring these elements which have environmental impacts.
- The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.
- The DEIS needs to address the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Bacon:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please extend the comment period due to the lengthy nature of the document and the importance of this issue to the community. TO ACHIEVE THIS, A&B SHOULD WITHDRAW ITS DEIS AND RESUBMIT IT FOR PUBLICATION IN THE ENVIRONMENTAL NOTICE WITHOUT ALTERATIONS. This short delay is minor in comparison to the 30-year lease that is sought, and will ensure community members who have direct knowledge of the potential impacts of the proposed lease have an opportunity to offer their comments and strengthen the process.*

Response 1: We acknowledge your comments noting for a time extension to allow for additional public comment. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai‘i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 2: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species, and does not address the impact of stream restoration on recently restored streams and muliwai. Cultural practitioners and aquatic experts need to address changes in 'o'opu, hīhīwai and 'ōpae populations they have seen where flows have been restored recently, and this should be part of the environmental impact analysis.*

Response 2: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSheP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30%

Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Please note that the HSHEP model includes 'o'opu, hīhīwai and 'opae within its analysis, and overall their habitats are anticipated to improve under the Proposed Action. With regards to cultural practitioners, Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact

is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, see pages 4-158 to 4-159. The CIA, and Section 4.6 of the EIS on pages 4-239 to 4-252 of the Final EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Comment 3: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands and require a management plan and funding. How is it possible to analyze the environmental impact of a plan that doesn't exist? Where in the DEIS does it address the impact of potentially not managing the invasive species?*

Response 3: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including

calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

Please note that scope of the EIS is not to assess a watershed management plan, but rather assess the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Please note that Appendix C and Section 4.4 of the EIS discuss mitigation measures to minimize impacts to invasive species in the License Area which have been further expanded on based on comments received by the DLNR and the USFWS as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131.

Comment 4: *The DEIS does not include analysis of an alternative to split the system into service area units. For example, Nahiku has a dedicated pipe from its source to the County Water system, using the ditch and tunnels only to support the pipe. A separate utility could possibly take over this portion of the lease area. The DEIS omits details which are needed to make these alternative analyses.*

Response 4: HAR §11-200-17(f) requires an analysis of alternatives to the proposed action "*which could attain the objectives of the action.*" The objectives of the Water Lease (i.e., the Proposed Action), as stated in Section 1.2 of Draft EIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku. Hence, this alternative would not meet the objectives of the Proposed Action.

Specifically, Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the

Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were well-discussed, but ultimately not assessed to the same degree as (a) through (d). Additionally, Chapter 3 acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible for the reasons discussed in Chapter 3. Moreover, based on comments received on the Draft EIS, the alternatives analysis in Chapter 3 has been further expanded within the spectrum of alternatives presented in the Draft EIS. See pages 3-2 to 3-19 of the Final EIS.

Comment 5: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for over 100 years as the “baseline condition”. It does not address the impacts of operation and maintenance of the system which alter the natural baseline condition. The DEIS needs to focus on an option of no diverted streams and how that would benefit the East Maui ecosystems and communities.*

Response 5: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be

issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of demand, future rainfall and future water supplies. How do the uncertainties of the Mahi Pono agricultural needs, the same uncertainties they describe in their vague agricultural plans, support the concept of a 30 year commitment?*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters.

However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80 of the Final EIS, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS needs to include a Watershed Management Plan. The methods of managing the watershed for the next 30 years, including access management, have a huge impact on the environment and should be addressed before the DEIS is reviewed. Limiting access needs to be addressed.*

Response 7: Noted in Response #3 above, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Comment 8: *In the Cultural Impact Analysis, Section 7.6 Impacts and Recommendations, the DEIS recommends professional analysis by cultural, ethnobotanical, scientific and/or biological experts as the way to address impact questions of various alternatives. This analysis should be completed in the DEIS, rather than leaving than deferring these elements which have environmental impacts.*

Response 8: As noted in Response #2 above, the studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Comment 9: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 9: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided in pages 4-61 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 10: *The DEIS needs to address the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 10: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-61.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Mauistreams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for

RE: DEIS FOR PROPOSED LEASE (WATER LEASE) FOR NAHIKU, KE'ANAE, HONOMANU, AND HUELO LICENSE AREAS

Dear Mr. Glenn and Ms. Case,

A few thoughts. It might be useful for a Comparative Summary of various alternatives and their respective environmental impacts as outlined in Chapter 3 of the Draft EIS.

The publication of the DEIS is an important milestone, marking progress in the state water lease process, and providing a visible indicator of the desire—A&B/EMI's, Mahi Pono's and the State's—to get off of one-year permits and have a long-term lease offered at public auction. This is critical for Maui's agricultural future.

This long-term lease for East Maui waters is important for a future of sustainable and viable agriculture across the Central valley of Maui, and a reliable source of water for Upcountry Maui communities.

The document is well written and I recommend its approval.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Blackburn-Rodriguez:

Thank you for comments dated October 29, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *A few thoughts. It might be useful for a Comparative Summary of various alternatives and their respective environmental impacts as outlined in Chapter 3 of the Draft EIS.*

Response 1: We acknowledge your comments. Please note that a table of the comparative benefits and impacts has been added to Section 3.5 of the Final EIS summarize all the benefits and impacts from the Proposed Action and reasonable alternatives as shown on pages 3-49 to 3-80 of the Final EIS.

Comment 2: *The publication of the DEIS is an important milestone, marking progress in the state water lease process, and providing a visible indicator of the desire—A&B/EMI’s, Mahi Pono’s and the State’s—to get off of one-year permits and have a long-term lease offered at public auction. This is critical for Maui’s agricultural future.*

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Walsh:

Thank you for comments dated October 8, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Don't allow the continued diversion of wai from the east Maui watershed. 100 years is enough! Time to restore the natural stream flows.*

Response 1: We acknowledge your comments and understand that you are opposed to the Proposed Action. Please note that Section 3.3 of the Draft EIS discusses the No Action alternative whereby no Water Lease is issued. As discussed in Section 3.3 of the Draft EIS:

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. As a consequence, domestic and agricultural water needs in Upcountry Maui would need to be met by alternative water sources that would need to be developed by the MDWS. At this point in time, it is unknown whether sufficient groundwater resources exist in Upcountry Maui to meet these water demands. It is anticipated that the development of alternative water-source infrastructure would be prohibitively

10238-04
Letter to Mr. Tom Walsh
Page 2
September 3, 2021

expensive, and depending upon the specific sources, or combination of sources, could result in significant direct adverse impacts to the environment.

Hence, there would be adverse impacts to the Upcountry Maui Water System.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Dalton Beauprez

Subject: RE: Draft Environmental Impact Statement (DEIS) for the Proposed Lease...

07. Nowemapa. 2019

To: Ian Hirokawa, State of Hawai`i Board of Land & Natural Resources
Earl Matsukawa, Wilson Okamoto Corporation

Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanū, and Huelo License Areas

Aloha,

My name is Trinette Furtado and I was born and raised on this mokupuni o Maui. I grew up in Lahaina and now reside in Kula with my daughter, who was also born here and is being raised here because this is our papahānau. Mahalo for the opportunity to comment on the subject Draft EIS.

I care very deeply about this proposed lease of public water because I not only work for my community in County government, addressing issues that concern our `āina and governance, but also because I am raising a child here. I want my daughter and her contemporaries and the generations to come after them, to have a vital, thriving, healthy `āina that can continue to provide their bodily and spiritual sustenance. We are people of this land. I believe we need to make sure that requests such as these from our community and our resource should be properly and thoroughly vetted.

I would like to point out that not extending the 45-day period for public comment on a document that is 2,700 pages is preposterous, considering the request of our public trust resource that is being made. The applicant requests a permit guaranteeing water for 30 years at a time (environmentally) when we are working towards planning and implementing proper stewardship of our natural resources. For this very reason, this comment period should have been extended.

The Final EIS should contain information that can adequately address these questions and concerns:

1. Why weren't the alternatives (if the 30-year lease is denied) outlined in the Draft EIS evaluated more thoroughly? Why not evaluate possible benefits also, rather than focusing on possible negatives? A Water Lease with Different Terms could evaluate a Systematic Yearly Reduction to incentivize best water use practices. The Final EIS should include a more thorough examination and evaluation of alternative actions.
2. The Final EIS should include an analysis of the applicant's currently owned wells that could be used for their agricultural irrigation.
3. Variations in their crop types, the land being utilized and future water demands are uncertain.
 1. The Final EIS should address potential impacts on this lease if water needs increase/decrease or if the economic viability of the applicant cannot be sustainable by forecasted agricultural practices.
4. This subject Draft EIS contains no assurances that current streamflow standards will be monitored for compliance; Currently, 10 E. Maui streams have not been "restored".
 1. The Final EIS should contain information regarding these 10 streams and their impacts on/contributions to, the water delivery system.
5. Freshwater interface with the ocean at the muliwai is one of the most plentiful areas for fish and plantlife that comprise much of the food we include in our diets. For the health and productivity of our fisheries and

nearshore gathering areas, the Final EIS should include an evaluation and examination of the possible impacts of this 30-year lease on our fisheries and nearshore gathering areas.

6. Appendix D, Historical Structure Assessment of the subject Draft EIS is woefully inadequate, as it is stated that the report "is less an inventory, and more a reference/typology guide for irrigation systems and their components". This offers no real data concerning non-evaporative loss throughout the delivery system, to help calculate true use, loss and recharge.
 1. The Final EIS should include a proper structure assessment that involves evaluating the viability of these structures that will be part of the daily water delivery system. The report should not just be a reference/typology guide.

I am asking that the Final EIS include this important information.

I do have further concerns but with the short timeline given, cannot state them all. I look forward to the opportunity to provide further comments on the Final EIS and once again thank you for this opportunity to submit comments on this Draft EIS.

Aloha,
Trinette Furtado

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Furtado:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *My name is Trinette Furtado and I was born and raised on this mokupuni o Mauinuiakama. I grew up in Lahaina and now reside in Kula with my daughter, who was also born here and is being raised here because this is our papahānau.*

Mahalo for the opportunity to comment on the subject Draft EIS.

I care very deeply about this proposed lease of public water because I not only work for my community in County government, addressing issues that concern our `āina and governance, but also because I am raising a child here. I want my daughter and her contemporaries and the generations to come after them, to have a vital, thriving, healthy `āina that can continue to provide their bodily and spiritual sustenance. We are people of this land. I believe we need to make sure that requests such as these from our community and our resource should be properly and thoroughly vetted.

Response 1: We acknowledge your comments and understand that you are a Kula resident.

Comment 2: *I would like to point out that not extending the 45-day period for public comment on a document that is 2,700 pages is preposterous, considering the request of our public trust*

resource that is being made. The applicant requests a permit guaranteeing water for 30 years at a time (environmentally) when we are working towards planning and implementing proper stewardship of our natural resources. For this very reason, this comment period should have been extended.

Response 2: We acknowledge your comments noting for a time extension to allow for additional public comment. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai'i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 3: *The Final EIS should contain information that can adequately address these questions and concerns:*

Why weren't the alternatives (if the 30-year lease is denied) outlined in the Draft EIS evaluated more thoroughly? Why not evaluate possible benefits also, rather than focusing on possible negatives? A Water Lease with Different Terms could evaluate a Systematic Yearly Reduction to incentivize best water use practices. The Final EIS should include a more thorough examination and evaluation of alternative actions.

Response 3: HAR §11-200-17(f) requires an analysis of alternatives to the proposed action "*which could attain the objectives of the action.*" The objectives of the Water Lease (i.e., the Proposed Action), as stated in Section 1.2 of Draft EIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku.

Specifically, Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were well-discussed, but ultimately not

assessed to the same degree as (a) through (d). Additionally, Chapter 3 acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible for the reasons discussed in Chapter 3. Moreover, based on comments received on the Draft EIS, the alternatives analysis in Chapter 3 has been further expanded within the spectrum of alternatives presented in the Draft EIS. See pages 3-2 to 3-19 of the Final EIS.

Moreover, please note that Section 3.5 of the Final EIS includes a comparative table of the various alternatives and the associated impacts of each alternative as shown on pages 3-49 to 3-80.

Comment 4: *The Final EIS should include an analysis of the applicant's currently owned wells that could be used for their agricultural irrigation.*

Response 4: Regarding the use of well water, Draft EIS Section 2.1.4 (Central Maui Field System) explains:

In addition to the surface water imported from the EMI Aqueduct System to the Central Maui field irrigation system, the irrigation infrastructure includes fifteen brackish water wells that can supplement surface water to approximately 17,200 acres of the plantation at the lower elevations (CWRM D&O, FOF 738). These brackish wells extract groundwater from the subsurface aquifers lying beneath the agricultural lands, and which are cyclically dependent on recharge derived from the irrigation of the overlying lands by water from the EMI Aqueduct System. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water. Groundwater, however, can be delivered to 7,000 acres at higher elevations via a shared pipeline that served as a penstock line for a hydroelectric unit (CWRM D&O, FOF 739).

Draft EIS Figure 2-5 (Central Maui Infrastructure Map) identifies the wells in the Central Maui agricultural fields. However, please note that Section 2.1.4 has been revised in the Final EIS to more accurately describe the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono, and clarifies that only 10 of the 15 wells are on Mahi Pono lands and thus available for use by Mahi Pono, as shown on page 2-25 of the Final EIS.

The reference to 15 brackish wells was derived from the CWRM D&O, FOF 738, as that was the number of brackish wells that A&B utilized during its sugar cane operations. However, one of the 15 wells referred to, State Well No. 5128-002, does not serve the Central Maui agricultural fields and four of the other brackish wells are on lands that are not owned by Mahi Pono. As such, Mahi Pono has access to only 10 such wells. Draft EIS Figure 2-5 has been revised, as shown on page 2-24 of the Final EIS, to more accurately depict the water infrastructure within

the Central Maui agricultural fields that is available to Mahi Pono to support its farm plan for the Central Maui agricultural fields. Moreover, please see the table below, which has been added to Section 4.2.2 of the Final EIS as shown on page 4-75.

State Well No.	TMK Number	Installed Pump Capacity (MGD)	Typical Range of Chlorides (MG/L) from 2003 through 2014 ¹	CWRM Delineated Aquifer System
4825-001	(2) 3-8-004:001	20.448	225 to 350	Pā‘ia
5226-002	(2) 3-8-006:001	24.048	350 to 550	Kahului
5224-002	(2) 3-8-003:004	15.120	350 to 550	Pā‘ia
5323-001	(2) 3-8-001:006	20.016	No data	Pā‘ia
5424-001	(2) 3-8-001:007	5.760	400 to 700	Pā‘ia
5522-001	(2) 2-5-005:021	8.640	350 to 525	Pā‘ia
5422-001	(2) 2-5-005:054	10.080	350 to 525	Pā‘ia
5422-002	(2) 2-5-005:020	11.664	325 to 475	Pā‘ia
5321-001	(2) 2-5-005:019	30.240	400 to 1600	Pā‘ia
5520-001	(2) 2-7-004:032	10.080	900 to 1600	Ha‘ikū

Please note that the salinity levels fluctuate and therefore a range was provided.

Comment 5: *Variations in their crop types, the land being utilized and future water demands are uncertain.*

Response 5: In response to your comment that crop types under the Mahi Pono farm plan are uncertain, as noted in the Draft EIS the Mahi Pono farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e. orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community. Nevertheless, the currently proposed components of the Mahi Pono farm plan are provided in Table 2-1 (Mahi Pono Farm Plan) of the Draft EIS. . The calculations of future water requirements (year 2030) are presented in Table 3 of Appendix I, “East Maui Water Lease: Agricultural and Related Economic Impacts”. Plasch Econ Pacific LLC, June 2019 (PEP Report). The per-acre water requirements used in the calculations are based on published crop studies, farming experience with specific crops, and evapotranspiration rates for Central Maui.

¹ There is limited salinity data prior to 2003 and after December 2014, surface water for irrigation use rapidly declined as A&B ramped down operations prior to closing in 2016.

There is no significant uncertainty about the land to be used. Mahi Pono intends to farm approximately 30,000 acres of agricultural land in Central Maui (lands that were farmed by HC&S for generations). Figure 2-6 of the Draft EIS provides a graphic depiction of the Mahi Pono farm plan.

Comment 6: *The Final EIS should address potential impacts on this lease if water needs increase/decrease or if the economic viability of the applicant cannot be sustainable by forecasted agricultural practices.*

Response 6: In Section 3.2.1, the Reduced Water Volume Alternative is assessed. Specifically, Section 3.2.1 states:

The BLNR cannot authorize a lease that allows the use of more water than can be diverted under the CWRM D&O. However, the BLNR could elect to issue a water lease that authorizes the use of a lesser amount of water. Projections of the amount of government water available from the License Area at Honopou stream after taking into account the CWRM D&O, is approximately 87.95 mgd. This amount would be subject to further reduction in accordance with the DHHL reservation once called upon for use by the DHHL. The CWRM estimated that the amount of water potentially available after implementation of the CWRM D&O might be enough for about 90% of the irrigation needs for the approximately 23,000 IAL lands in Central Maui (although it is not clear if the CWRM D&O took into account the future DHHL reservation). However, there are approximately 30,000 agricultural acres in Central Maui (largely, but not exclusively, IAL lands), and Mahi Pono has expressed an intention to farm as much of that land as possible.

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. Under the Reduced Water Volume alternative, depending on the amount of water authorized under the Water Lease, the MDWS may receive no water from the Wailoa Ditch or some amount up to 7.1 mgd. The greater the reduction in the amount authorized under the Water Lease, proportionally less water will be available to the MDWS.

If more or less water were to be required than is planned, then the Mahi Pono farm plan would be adjusted so that the demand for water is limited to the available supply. In practice, this would mean a transfer of acreage between crop farming and unirrigated pasture. If this were to result in a 1% change in crop acreage, then most economic impacts would change by about 1%. This

occurs because crop farming dominates the economic impacts, far exceeding the impacts provided by cattle grazing.

As stated in Appendix I p. 34 of the PEP Report, the Mahi Pono farm plan

... will evolve over time based on a number of factors, including the available supply of surface water, experience which will be gained on crops that grow well in Central Maui, crops that are profitable, the size of the market for profitable crops, etc.

Another factor would be possible changes in per-acre water requirements.

Comment 7: *This subject Draft EIS contains no assurances that current streamflow standards will be monitored for compliance; Currently, 10 E. Maui streams have not been “restored”.*

Response 7: As noted in Section 2.1.4, 4.2.1, and 4.6 of the Final EIS as shown on pages 2-8, 4-62, 4-67, 4-242, 4-244, 4-247, and 4-251, the CWRM D&O requires EMI to report on changes in stream diversions and ditch settings as irrigation requirements increase. EMI also maintains a system of optical encoders with float tape and data loggers within the EMI Aqueduct System. The information obtained is reported to CWRM on a monthly basis.

Comment 8: *The Final EIS should contain information regarding these 10 streams and their impacts on/contributions to, the water delivery system.*

Response 8: Your comments are unclear. Please note that the fully restored streams will not be diverted by the EMI Aqueduct System at all. Hence, there will be no impacts. Upon making the voluntary commitment to permanently restore the stream flows in the “taro streams”, EMI returned approximately 90-95% of the natural flow of the streams—all that could be done by adjusting (opening or closing) the diversion gates. The final 5-10% to achieve complete restoration requires modifications to diversions, essentially construction projects, thus triggering various permitting processes that continue to be pursued.

Potential impacts from the abandonment of structures and equipment as it relates to native stream habitat was assessed and discussed in Appendix A, the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report.

The work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water

Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows.

The CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. CWRM ordered in relevant part (see CWRM D&O at p. 269):

- I. It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.*
- J. This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process*
- K. The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.*

CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

However, please note that generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best. The presence of cement or wood near or partially within the stream channel is not inherently bad for stream animals.

Conversely, meeting the instream flow standard at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the water flowing into the diversion and back to the stream from another location in the diversion ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

The two primary conditions where diversion structures could impact native stream species are structures where diversion and ditch water still comingle or structures that create a barrier to upstream migration. A diversion structure could also impact native stream animals as they move upstream if it creates an unnatural barrier. If no wetted pathway exists, upstream passage will be stopped.

Altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns.

In summary, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts.

Th above is discussed in more detail in Section 4.2.1 of the Final EIS as shown on pages 4-63 to 4-67.

Comment 9: *Freshwater interface with the ocean at the muliwai is one of the most plentiful areas for fish and plantlife that comprise much of the food we include in our diets. For the health and productivity of our fisheries and nearshore gathering areas, ther Final EIS should include an evaluation and examination of the possible impacts of this 30-year lease on our fisheries and nearshore gathering areas.*

Response 9: We acknowledge your comments. Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that

were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on the pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83 of the Final EIS.

Comment 10: *Appendix D, Historical Structure Assessment of the subject Draft EIS is woefully inadequate, as it is stated that the report “is less an inventory, and more a reference/typology guide for irrigation systems and their components”. This offers no real data concerning non- evaporative loss throughout the delivery system, to help calculate true use, loss and recharge.*

Response 10: Please note that was not within the scope of the report contained as Appendix D. The scope of Appendix D was to determine the historical significance of the EMI Aqueduct System. However, We assume that your comment relates to the physical condition of the EMI Aqueduct System. In this regard, the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System.

Comment 11: *The Final EIS should include a proper structure assessment that involves evaluating the viability of these structures that will be part of the daily water delivery system. The report should not just be a reference/typology guide.*

Response 11: As noted in Response #10 above, the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and

tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System.

Comment 12: *I am asking that the Final EIS include this important information.*

I do have further concerns but with the short timeline given, cannot state them all. I look forward to the opportunity to provide further comments on the Final EIS and once again thank you for this opportunity to submit comments on this Draft EIS.

Response 12: We acknowledge your comments and provided you with detailed responses to your comments above. However, please note that the Final EIS does not coincide with a public comment period as the Draft EIS does.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.² Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

² Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Free the wai

To whom it may concern,

I am strongly opposed to leasing water rights to A&B for 30 years, 20 years or even 1 year to a corporation who profits from the water while our ecosystems die out and our people have to rely on anything other than their own ahupua'a. Let us people of the community have the water to grow our own healthy food. Not only does the corporation profit, they also spray poison, which drifts in the air we breathe, runs off into the ocean we swim and fish in, and kills everything in its path. The poison they spray is known to cause cancer, allergies, auto-immune issues, infertility, eczema, and birth defects. Who, in their right mind, would give our precious natural resources away, in exchange for being poisoned? Privatization of water is not only wrong, it is unsafe for the community, the environment and all natural resources. The diversion of water takes away the natural flow of mauka to makai that kills and ruins our thriving ecosystems. We need the waters to reach the ocean in order for a healthy Earth.

We have come to a time in history that you must choose what side you are on. Please choose the right side so our children and generations to come have a chance. Stop putting profits over the people. Money runs out, aloha 'āina never does.

Mahalo for taking the time to read.

Sincerely, Wailani Stoner

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Wailani Stoner:

Thank you for comments dated October 25, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am strongly opposed to leasing water rights to A&B for 30 years, 20 years or even 1 year to a corporation who profits from the water while our ecosystems die out and our people have to rely on anything other than their own ahupua‘a. Let us people of the community have the water to grow our own healthy food.*

Response 1: We acknowledge your comments. Please note that with regards to growing healthy food, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Comment 2: *Not only does the corporation profit, they also spray poison, which drifts in the air we breathe, runs off into the ocean we swim and fish in, and kills everything in its path. The poison they spray is known to cause cancer, allergies, auto-immune issues, infertility, eczema, and birth defects. Who, in their right mind, would give our precious natural resources away, in exchange for being poisoned?*

Response 2: We acknowledge your comments. Mahi Pono has an inherent long-term interest in farming the Central Maui agricultural fields consistent with best practices that are most suitable for those lands. The Mahi Pono farm team, as well as its lessees, follow Best Management Practices (BMPs) approved by the Hawai‘i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in the use of chemicals, and controlling dust and erosion and runoff associated with their farming activities. As it relates to agricultural chemicals for diversified agriculture, usage would be in strict compliance with federal regulations and Mahi Pono will exercise due care to prevent the release of fuels, lubricants and other hazardous materials. Mahi Pono intends to use a limited amount of fertilizers and pesticides in accordance with all laws and regulations and only on an as-needed basis. In addition, as mentioned above, since January 2020, Mahi Pono has also committed to foregoing the use of Round-Up and other glyphosate-based products within the Central Maui agricultural fields and the EMI Aqueduct System.

Comment 3: *Privatization of water is not only wrong, it is unsafe for the community, the environment and all natural resources. The diversion of water takes away the natural flow of*

mauka to makai that kills and ruins our thriving ecosystems. We need the waters to reach the ocean in order for a healthy Earth.

Response 3: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity

flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 4: *We have come to a time in history that you must choose what side you are on. Please choose the right side so our children and generations to come have a chance. Stop putting profits over the people. Money runs out, aloha 'āina never does.*

Response 4: We acknowledge your comments. Thank you for your participation in this EIS process.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

Subject: Alexander and Baldwin's Draft EIS

Dear Mr. Matsukawa,

Aloha

Thank you for the opportunity to submit comments. I am in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. They have done enough damage!

There has not been enough analyzation of the effects of these diversions on the native ecosystems and stream habitats. In addition, how these diversions will impact the residents and local communities needs to be assessed. While they estimate the water will be diverted 60 percent of the time, nothing is mentioned about restoring the 13 streams in the Honopou to Kailua areas. Many people live and farm in these areas. We should be extremely concerned about them as well.

East Maui streams should not be diverted for agriculture in central Maui. We need to do better about holding these corporations accountable for the harm they've already caused to the East Maui Watershed. Long leases are not holding corporations accountable and they don't take into account future rainfall or water supply issues. We can do better!

Thank you for your time.

Sincerely,
Wendy Green

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Green:

Thank you for comments dated October 9, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Thank you for the opportunity to submit comments. I am in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. They have done enough damage!*

Response 1: We acknowledge your comments and understand that you are opposed to the Proposed Action.

Comment 2: *There has not been enough analyzation of the effects of these diversions on the native ecosystems and stream habitats. In addition, how these diversions will impact the residents and local communities needs to be assessed.*

Response 2: Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an

EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

Comment 3: *While they estimate the water will be diverted 60 percent of the time, nothing is mentioned about restoring the 13 streams in the Honopou to Kailua areas. Many people live and farm in these areas. We should be extremely concerned about them as well.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

To: ian.c.hirokawa@hawaii.gov; Public Comment
Subject: Comments of EIS

The 2700 page EIS is filled with FEAR MONGERING...below are some questions I have regarding chapter 3...I am a farmer and know much of what they way about agriculture is inaccurate

3.16 in the EIS discusses in the no water alternative that Mahi Pono estimates the cost of wells to supply Upcountry users of 7.95MGD at \$1.2B.

This is an example of the scare tactics that permeate this document. This is a completely false supposition. Currently the County system above 3000' would still function via the Wailoa Ditch with two lines reaching Upcountry...Upper line goes to Ulapalakua and Lower line goes to Hawaii Homelands.

What research provided the \$1.2B estimate for drilling wells?

In Appendix I Mahi Pono describes E Maui as having 35 acres of truck farms and 44 acres of potential Kalo production areas.

Hawaiian's have had over 100 years of depleted water resources which has impacted cultural agriculture practices. To publish these numbers as an implied potential reveals that this EIS is not intending to stand on facts, rather to act as a threat to the community.

I did not see anything in the EIS preventing Mahi Pono from providing water to Hotels and Shopping Centers by the Airport.

Section 3.4.11 In light of MP intention to pursue diversified ag would lead to improved stewardship of EMIOngoing maintenance and operation of EMI is expected to take place under all alternatives, **to the extent operations and maintenance of the system is financially feasible.**

Another veiled threat by Mahi Pono in this EIS. Maintenance of the WaterShed has been severely neglected under the management of A&B. This EIS needs to describe the resources MahiPono intends to utilize to clean up the overgrowth and invasives in the WaterShed area. No Roundup (which has been adjudicated as a cancer causing product should be used in the WaterShed

Mahi Pono has continually disced the field below Pukalani by the Kula Hiway. I can count over 2 dozen days when their tractors have been creating dust using cultivators. They do a lot of the work at night so the citizens don't see the dust they are creating. They claim they are getting rid of the remnants of the sugar cane plants. As a farmer, I can state with 100% certainty that they are not using good agriculture practices. Furthermore, the dust will lead to runoff during rainy season (now) and when no rain, the dust gets on the trades and blankets the Ma'alaea Reef.

3.7 Under the Proposed Action, there will be a beneficial impact on soils in Central Maui as they are improved through the removal of volunteer (i.e., rogue) sugarcane and weeds, and related soil preparations for diversified agriculture. These preparations include the application of effective micronutrients, plastic removal, pH adjustments, and the application of organic matter.

This statement in the EIS is false. If they are to do what they state, then at this point in time they do not need the amount of water they are requesting. They need to prove they will do what they say. There needs to be enforcement and oversight in the final decision.

3.15

This statement: Under all alternatives, crops will be grown, but the extent to which the crops will supply local vendors and restaurants, as desired by Central Maui residents, and increase food self-sufficiency will depend upon the amount of water that can be diverted from the License Area.

is false. As a local farmer, I know that sales to local restaurants and vendors is dependent on the cost of produce. Currently, most restaurants have their ingredients shipped to Maui at a price lower than what farmers can produce. Getting the water effects growing food, but not supplying vendors.

Maui has very low unemployment. Where will Mahi Pono get it's work force? This is a critical question relative to MahiPono fulfilling their promises.

Where will 700 wokers be housed? What happens to established farms when MahiPono hires away their skilled workers?

With the discussion on the County expanded Kula Ag Park, it only talks about phase 1 which is the purchase of the 262 acres. The EIS does not know about phase 2 which is to purchase 3 other lots around the initial lot purchase. In the end, the County is attempting to purchase around 870 acres and not just the 262. The largest lot that will be purchased will have the reservoir 40 on it. This reservoir will be the source for the expanded Kula Ag Park land and will still be used to provide water for the current KAP. There is no discussion on the water needs for this KAP expansion lots.

Dalton Beuprez

Sent: Monday, November 4, 2019 12:44 PM
To: ian.c.hirokawa@hawaii.gov; Public Comment
Subject: Draft EIS

Areas of concern not addressed in Draft EIS...

- The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.
- The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.
- The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.
- The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.
- The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.
- The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.
- The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.
- The fish that appear near the mouth of streams are important for feeding substance living practitioners. They have comeback when water flows and they are gone when water does not flow. That's called a direct relationship

Water is a public trust. The streams and the life in and near the streams that is dependent on the Mauka to Maka'i flow is protected in

the Hawaii State Constitution. That protection recognizes cultural practices and cultural practitioners rights to the life created in and around streams.

Mahi Pono has plenty of water and sharing is part of the culture. If they NEED more, they can ask.

First they should ask; What do the people need? From that question, discussions will have a heart. At this point in time, it's take, take and more take, just as it has been for over 100 years.

Mr. William Greenleaf
Bgreenleaf.maui@yahoo.com

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Greenleaf:

Thank you for comments dated November 3, 2019 and November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

11/3/2019

Comment 1: *The 2700 page EIS is filled with FEAR MONGERING...below are some questions I have regarding chapter 3...I am a farmer and know much of what they way about agriculture is inaccurate*

Response 1: We respectfully disagree with your comments that the EIS is ‘fear mongering’. Rather the EIS is an environmental disclosure document which assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 2: *3.16 in the EIS discusses in the no water alternative that Mahi Pono estimates the cost of wells to supply Upcountry users of 7.95MGD at \$1.2B.*

This is an example of the scare tactics that permeate this document. This is a completely false supposition. Currently the County system above 3000' would still function via the Wailoa Ditch with two lines reaching Upcountry... Upper line goes to Ulupalakua and Lower line goes to Hawaii Homelands.

Response 2: The County of Maui water service rates vary by class of users (i.e., residential, commercial, agricultural, etc.), but average approximately \$4 per kgal. Inasmuch as the same water rates are charged across the nine (9) water systems in the County of Maui, there are many factors that determine the water service rate. Due to the fact that water rates are not dependent on the service area a customer is located in, increases associated with increased water delivery costs from the EMI Aqueduct System and from new water source development for Upcountry Maui would affect MDWS ratepayers countywide, including the Upcountry farmers. Moreover, discussed in Section 4.7.3 of the Draft EIS an analysis conducted by Brown and Caldwell determined that the lifecycle cost of developing new water sources for Upcountry Maui customers would be \$34 per kgal, which far exceeds the current average water service rate of \$4 per kgal. Specifically, Section 4.7.3 of the Draft EIS, it is stated:

Under the Brown and Caldwell analysis, the life-cycle unit cost of developing and operating wells is \$34 per kgal. It is noted that the life-cycle unit cost to develop new water for Upcountry Maui customers is high. In comparison, a similar analysis conducted for the Central Maui Water System showed a unit cost of less than \$10 per kgal, or less than one third the cost of Upcountry Maui water development (Brown and Caldwell, 2014). The total life-cycle cost for 7.95 mgd of new wells is \$1.2 billion. The life-cycle cost is expressed as the net present value of all the costs incurred over 25 years, including capital, operating, and maintenance costs.

Please note that under the No Action alternative, all water agreements between EMI and the MDWS would terminate. Please note that the Wailoa Ditch is an extension of the EMI Aqueduct System which serves the MDWS directly through the Kamole-Weir Water Treatment Plant.

Comment 3: *What research provided the \$1.2B estimate for drilling wells?*

Response 3: Please note that this research is based on work conducted by Brown and Caldwell in 2014 in a letter titled, “*Petition to Amend Interim Instream Flow Standards for Waikamoi, Puohokamoa, Haipuaena, Punalau/Kolea, Honomanu, West Wailuaiki, East Wailuaiki, Kopiliula, Puakaa, Waiohue, Paakea, Kapaula & Hanawi Streams, Case No. CCH-MA13-01, Letter to Mr. Caleb P. Row, Deputy Corporation Counsel.*”

Comment 4: *In Appendix I Mahi Pono describes E Maui as having 35 acres of truck farms and 44 acres of potential Kalo production areas. Hawaiian’s have had over 100 years of depleted water resources which has impacted cultural agriculture practices. To publish these numbers as an implied potential reveals that this EIS is not intending to stand on facts, rather to act as a threat to the community.*

Response 4: Specifically, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Comment 5: *I did not see anything in the EIS preventing Mahi Pono from providing water to Hotels and Shopping Centers by the Airport.*

Response 5: Please note that the EIS is being prepared in support of a Water Lease application that would allow for water to be diverted from East Maui for uses described in the EIS, which includes only agricultural activities in Central Maui. If Mahi Pono wanted to develop other land uses, it is assumed that the Water Lease would terminate and need to be reapplied for.

Comment 6: *Section 3.4.11 In light of MP intention to pursue diversified ag would lead to improved stewardship of EMI Ongoing maintenance and operation of EMI is expected to take place under all alternatives, **to the extent operations and maintenance of the system is financially feasible.** Another veiled threat by Mahi Pono in this EIS. Maintenance of the WaterShed has been severely neglected under the management of A&B. This EIS needs to describe the resources MahiPono intends to utilize to clean up the overgrowth and invasives in the WaterShed area. No Roundup (which has been adjudicated as a cancer causing product should be used in the WaterShed*

Response 6: You appear to misunderstand the statement in Section 3.4.11 of the Draft EIS. Please note that maintenance and repair activities of the EMI Aqueduct System are anticipated to occur under the Proposed Action and all other alternatives. However, under the Reduced Water Volume alternative and the No Action alternative, it may be no longer financially feasible to operate and maintain the EMI Aqueduct System, therefore, maintenance and repair activities would cease.

With regards to watershed management, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Regarding your comment about pesticide use, as discussed in Section 4.12 pesticide use is regulated by both State and Federal law. The use of these chemicals is compliant with all laws regulating pesticide use, and certified commercial applicators are utilized as required. Act 45 which was passed by the 2018 Hawai'i Legislature and effective on January 1, 2019 required that all Certified Applicators of Restricted Use Pesticides (RUP) submit a report of the RUP that were applied each year. This report as well as any other report required by law is publicly available from the respective government entity. The State of Hawai'i DOA's Pesticide Branch

also provides regulatory oversight over EMI's pesticide use. In accordance with this oversight, records of pesticide use must be kept and made available to the Pesticide Branch upon request at any time. It is also noted that since January 2020 EMI committed to discontinuing use of Round-Up. This information has been included in the Final EIS as shown on pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations.

Comment 7: *Mahi Pono has continually disced the field below Pukalani by the Kula Hiway. I can count over 2 dozen days when their tractors have been creating dust using cultivators. They do a lot of the work at night so the citizens don't see the dust they are creating. They claim they are getting rid of the remnants of the sugar cane plants. As a farmer, I can state with 100% certainty that they are not using good agriculture practices. Furthermore, the dust will lead to runoff during rainy season (now) and when no rain, the dust gets on the trades and blankets the Ma'alaea Reef.*

Response 7: We are unclear to what you are specifically referring to however, the Mahi Pono farm team follows Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion and, thus, runoff associated with their current farming activities. As Mahi Pono incrementally increases the amount of farmed acreage over time and crops are planted (particularly the permanent orchard crops), ground disturbance will again be limited, as appropriate and consistent with farming BMPs. Moreover, it should be noted that Mahi Pono only prepares fields when they are ready to be cultivated.

Comment 8: *3.7 Under the Proposed Action, there will be a beneficial impact on soils in Central Maui as they are improved through the removal of volunteer (i.e., rogue) sugarcane and weeds, and related soil preparations for diversified agriculture. These preparations include the application of effective micronutrients, plastic removal, pH adjustments, and the application of organic matter.*

This statement in the EIS is false. If they are to do what they state, then at this point in time they do not need the amount of water they are requesting. They need to prove they will do what they say. There needs to be enforcement and oversight in the final decision.

Response 8: Your comments are unclear as it is generally known that soil preparation for diversified agriculture has beneficial impacts when compared to monocrop operations such as sugarcane or left unimproved. With regards to water demands, under the Proposed Action, as discussed in Response #111 above, there are approximately 9,100 acres planned to be unirrigated with the current Mahi Pono farm plan, even with the full allocation of the water. As discussed in Response #45 above, Mahi Pono intends to plant additional crops in areas that are currently

planned to be unirrigated pasture due to the lack of enough water to irrigate all 30,000 acres of land should water demands of the planned crops reduce.

Comment 9: *3.15 This statement: Under all alternatives, crops will be grown, but the extent to which the crops will supply local vendors and restaurants, as desired by Central Maui residents, and increase food self- sufficiency will depend upon the amount of water that can be diverted from the License Area.is false. As a local farmer, I know that sales to local restaurants and vendors is dependent on the cost of produce. Currently, most restaurants have their ingredients shipped to Maui at a price lower than what farmers can produce. Getting the water effects growing food, but not supplying vendors.*

Response 9: The Mahi Pono farm plan includes crops that are judged to be economically feasible to grow in Central Maui. To be successful, crops grown for the Hawai‘i market must be priced so that they are competitive with imports while allowing for profitable operations. The quantities produced will depend upon many factors, including how much water is available to irrigate crops.

Comment 10: *Maui has very low unemployment. Where will Mahi Pono get it’s work force? This is a critical question relative to MahiPono fulfilling their promises. Where will 700 wokers be housed? What happens to established farms when MahiPono hires away their skilled workers?*

Response 10: At full operations of the Mahi Pono farm plan, currently estimated to occur around 2030, an estimated 790 farming and crop-processing jobs will be provided in Central Maui (direct jobs) (about 160 more jobs than provided by HC&S sugar operations in 2006). As explained in Section 4.7.4:

The increase in employment would be gradual, with most jobs filled by former sugarcane workers, skilled workers from Maui and other islands, recent graduates of agricultural-schools and colleges, and unskilled workers who would receive on-the-job training.

Approximately an additional 227 indirect jobs on Maui will be generated by the purchase of goods and services, for a total exceeding 1,000 new jobs on Maui. Hiring workers will be spread out over a number of years as fields are planted, orchards mature, processing facilities are built, etc. Assuming 10 years to reach full operations, direct employment on Maui will increase by an average of about 80 jobs per year, while total direct and indirect jobs will increase by an average of about 100 jobs per year. The latter figure is less than 8% of the 1,270 annual job increase projected for the years 2020 to 2030 by the State for the County of Maui (DBEDT, “Population and Economic Projections for the State of Hawai‘i to 2045, June 2018).

In its first 18 months of existence Mahi Pono had hired over 200 workers, all of whom were living on Maui when hired. They were attracted by the type of work, wages and benefits.

Based on past hiring, nearly all future employees are expected to come from Maui. Also, at least in the near-term, attracting workers should be easier than in the recent past because of the long-term adverse economic effects of COVID-19 on tourism and Maui's economy. It may take years to rebuild the economy, and the Mahi Pono farm plan will contribute significantly to this rebuilding.

Since most, if not all, farm workers are expected to come from Maui, few homes will be required for workers new to the island. In any case, Mahi Pono will pay wages and provide benefits sufficient to attract and retain workers.

Comment 11: *With the discussion on the County expanded Kula Ag Park, it only talks about phase 1 which is the purchase of the 262 acres. The EIS does not know about phase 2 which is to purchase 3 other lots around the initial lot purchase. In the end, the County is attempting to purchase around 870 acres and not just the 262. The largest lot that will be purchased will have the reservoir 40 on it. This reservoir will be the source for the expanded Kula Ag Park land and will still be used to provide water for the current KAP. There is no discussion on the water needs for this KAP expansion lots.*

Response 11: The proposed Phase 2 of the Kula Agricultural Park expansion is addressed in Appendix I. Specifically, it states in Subsection 8.b: the PEP Report, Subsection 8.b, p. 37:

In addition, the County plans to expand Kula Ag Park by an additional 610 acres. However, it is assumed that this second expansion will not occur because of (1) insufficient water, and (2) better agronomic conditions in Central Maui, including cheaper rents and cheaper water.”

Your reference to 870 acres appears to be the total of the purchased 262 acres and the additional proposed 610 acres, rather than the amount of additional acreage propose to be purchased by the County.

11/4/2019

Comment 12: *Areas of concern not addressed in Draft EIS...*

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

Response 12: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI’s West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko‘olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 13: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 13: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section

4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 14: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 14: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream

habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are “flashy” where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that “government owned waters” from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 15: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 15: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content

requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Comment 16: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 16: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years

will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 17: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 17: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown in page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 18: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 18: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled "Modeling" of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-61.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders

and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Mauistreams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Comment 19: *The fish that appear near the mouth of streams are important for feeding substance living practitioners. They have comeback when water flows and they are gone when water does not flow. That's called a direct relationship*

Response 19: We acknowledge your comments. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

*Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; *Neritina graposa*), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulumui Tributaries), Honomanū, Nua'ailua, Pi'ina'au,*

Waiokamilo, Wailuānui (Waikani Waterfall), Kopili‘ula, Pa‘akea, Kapā‘ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua‘aka‘a Tributary, and Waia‘aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo‘i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe‘e, Puohokamoa, Ha‘ipua‘ena, Punala‘u (Kōlea and Ulunui Tributaries), Honomanū, Nua‘ailua, Pi‘ina‘au, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili‘ula, Pua‘aka‘a, Pa‘akea, Waia‘aka, Kapā‘ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, see pages 4-239 to 4-252 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared

for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Moreover, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have esturine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in shown on pages 4-78 to 4-83. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR

Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in shown on pages 4-78 to 4-83 of the Final EIS.

Comment 20: *Water is a public trust. The streams and the life in and near the streams that is dependent on the Mauka to Maka'i flow is protected in the Hawaii State Constitution. That protection recognizes cultural practices and cultural practitioners rights to the life created in and around streams. Mahi Pono has plenty of water and sharing is part of the culture. If they NEED more, they can ask.*

Response 20: Under the Public Trust Doctrine, BLNR will have to balance competing considerations before making a decision on the Water Lease. The balancing that BLNR is required to perform under the Public Trust Doctrine was described at length by the Hawai'i Supreme Court in *In Re Water Use Permit Applications*, 94 Hawai'i 97, 9 P. 3d 409 (2000) ("Waiahole I") and summarized in Section 1.5 of the Final EIS as shown on the included pages 1-25 to 1-27.

With regard to the potential effects of the Proposed Action on traditional and customary practices, as discussed in the *Ka Pa'akai* decision, we acknowledge that BLNR will be required to "to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible." *Ka Pa'akai*, 94 Hawai'i at 35, 7 P. 3d at 1072. BLNR has previously so stated in its Findings of Fact, Conclusions of Law, and Decision and Order filed on March 23, 2007 in the contested case proceeding that is still pending regarding the Proposed Action (the 2007 D&O) as follows:

Public trust principles require that adequate provision be made for the protection of *traditional and customary Hawaiian rights*, the protection and procreation of

fish and wildlife, the maintenance of proper ecological balance and scenic beauty, and the preservation and enhancement of waters of the State for municipal uses, public recreation, public water supply, agriculture and navigation.

2007 D&O COL No. 6 at page 41 (citing *Waiahole I*). CWRM, in its June 20, 2018 D&O, also recited the State's constitutional obligation to consider the impacts of stream diversions in East Maui on traditional and customary practices of Native Hawaiians at pages 242 through 245, including the Supreme Court of Hawaii's more recent holding on this subject in *State v. Pratt*, 127 Hawai'i 206, 277 P. 3d 300 (2012).

We believe that the Draft EIS (including Appendix F) together with the CWRM D&O, provide ample information for the BLNR to consider regarding potential impacts to traditional and customary practices, and that will enable BLNR, at the point that it is deliberating on the Water Lease, to fulfill its constitutional obligation "to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible." *Ka Pa'akai* at, 94 Hawai'i at 35, 7 P. 3d at 1072.

Comment 21: *First they should ask; What do the people need? From that question, discussions will have a heart. At this point in time, it's take, take and more take, just as it has been for over 100 years.*

Response 21: We acknowledge your comments. The socio-economic impacts of the Proposed Action are addressed at length in Section 4.7 of the Draft EIS, and in further detail in Appendices G through I (Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report). Draft EIS Section 4.7 has subsections addressing impacts to populations and impacts (Section 4.7.1), impacts to social characteristics (Section 4.7.2), impacts to the economy and other fiscal considerations (4.7.3), and impacts to the agricultural economy. (4.7.4). The potential socio-economic impacts of the alternatives to the Proposed Action considered by the Draft EIS are analyzed in Section 3.4.11 (Social Characteristics), 3.4.12 (Economic and Fiscal Resources), and 3.4.13 (Agricultural and Related Economic Resources). The Draft EIS thoroughly addressed cumulative socio-economic impacts in Section 4.17. That discussion has been further supplemented by updates in the Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report as shown on pages 4-331 to 4-336.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

Makawao **Hawaii November 7, 2019**

Thank you for allowing public comment on this Draft EIS. I am responding as a long-time Maui resident. I am very concerned about some aspects that have not been fully thought out in the EIS.

1. It does not appear that the DEIS has explained how they intend to manage the central valley and the impact of the dust on the reefs.
2. I found the DEIS inadequate in explaining how they intend to prevent a large rainfall from taking all of the bare ground into the ocean and destroying the reefs.
3. The DEIS has not explained how the public trust of water is being protected by giving a private company a lease for 30 years.
4. I am concerned the DEIS is not taking into consideration the right of the Hawaiian people to receive remuneration for the sale or lease of the water from state lands.
5. I found the treatment of the effect that this lease would have on Hawaiian cultural practices sorely lacking.

Mahalo,
Yarrow Walsh

Subject Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Yarrow Walsh:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Thank you for allowing public comment on this Draft EIS. I am responding as a long-time Maui resident. I am very concerned about some aspects that have not been fully thought out in the EIS.*

Response 1: We acknowledge your comments and understand that you are a Maui resident.

Comment 2: *It does not appear that the DEIS has explained how they intend to manage the central valley and the impact of the dust on the reefs.*

Response 2: Please note that the Mahi Pono farm team follows Best Management Practices (BMPs) approved by the Hawai‘i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion and, thus, runoff associated with their current farming activities. As Mahi Pono incrementally increases the amount of farmed acreage over time and crops are planted (particularly the permanent orchard crops), ground disturbance will again be limited, as appropriate and consistent with farming BMPs. Hence, coastal waters near the Central Maui agricultural fields will not be impacted for dust and runoff.

Comment 3: *I found the DEIS inadequate in explaining how they intend to prevent a large rainfall from taking all of the bare ground into the ocean and destroying the reefs.*

Response 3: As noted in Response #2 above, the Mahi Pono farm team follows BMPs approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion and, thus, runoff associated with their current farming activities. As Mahi Pono incrementally increases the amount of farmed acreage over time and crops are planted (particularly the permanent orchard crops), ground disturbance will again be limited, as appropriate and consistent with farming BMPs. Hence, coastal waters near the Central Maui agricultural fields will not be impacted for dust and runoff.

Moreover, Central Maui as noted in Section 4.3.1 of the Draft EIS:

Central Maui's climate is typical of Leeward coastal lowlands receiving little rainfall annually, and is relatively dry. The northeast areas receive more rain than the central and southern areas of Central Maui. The average annual rainfall ranges from less than 10 inches in the southern part of the isthmus to over 40 inches in the northeastern areas.

Hence, it is not very common for a large rain event that would move large amounts of earth into the ocean to occur within the Central Maui region.

Comment 4: *The DEIS has not explained how the public trust of water is being protected by giving a private company a lease for 30 years.*

Response 4: Regarding your comment about the mandated protection of the Public Trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

Comment 5: *I am concerned the DEIS is not taking into consideration the right of the Hawaiian people to receive remuneration for the sale or lease of the water from state lands.*

Response 5: Your comment about the right of the Hawaiian people to receive remuneration for sale or lease of water is unclear. However, the rental payments due under the Water Lease will be distributed into the State Special Land Development Fund (as is done for payments due on all the other leases and revocable permits in the State). The Office of Hawaiian Affairs (OHA) receives 20% of the revenue generated from each lease while the Department of Hawaiian Home Lands (DHHL) receives 30% of the revenue generated, as discussed in Section 4.7.3 of the EIS. However, please note that the State of Hawai‘i Department of Land and Natural Resources (DLNR) administers the Fund, i.e., decides how to use the revenue generated.

Comment 6: *I found the treatment of the effect that this lease would have on Hawaiian cultural practices sorely lacking.*

Response 6: We respectfully disagree with your comment. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to ‘ōpae, ‘o‘opu, pūpūlo‘i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe‘e, Puohokamoa, Ha‘ipua‘ena, Honopou (Puniawa Tributary), Punala‘u (Kōlea and Ulunui Tributaries), Honomanū, Nua‘ailua, Pi‘ina‘au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili‘ula, Pa‘akea, Kapā‘ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua‘aka‘a Tributary, and Waia‘aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo‘i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject

to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, see pages 4-239 to 4-252 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for

reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC’s website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on draft eis for east maui water

Aloha mai kākou. My name is Zack Williams and I live in the ahupua'a of Ko'olau in the valley of lower Nāhiku on an ancient 'āina named 'ihi'ihinui in the bay of Honolulu. Our 'āina is located between Makapipi stream and Hanawī streams and our lo'i kalo depends on surface and spring water from both kahawai to support our farming efforts. One major issue I had with the draft EIS, is it says there is no chance of biological or habitat restoration for Hanawī, Kapā'ula, Pa'akea and Waia'aka. These four streams hold more of our endemic resources such as hapa wai, hīhīwai, 'o'opu (numerous species that are endangered), moi, āholehole and akule that depend on that waters to breed and sustain their populations. The fact that the company doing the EIS says they surveyed 33000 acres of land in 4 days is just not possible. Ive lived in these valleys my entire life and still discover new kīpuka with flora and fauna found no where else in Hawai'i. Since the release of only some of the water to these streams in 2015 we have seen a major increase in fish populations between Nāhiku and Wailua Nui. The moi have been spawning more prolifically than any other point in my life. The same goes for the akule which have been living in the bay for almost the last two years now and have provided a major resource for substance gathering for our community in Nāhiku and Ko'olau. The hīhīwai are thriving in all the rivers i named plus in Waiohue, Kopili'ula and Wailua'iki. I don't agree with taking any more water from Pua'aka'a stream as well as that is one of the main tributaries to Kopili'ula. The fact you order one stream 94-100% restored for habitat restoration but then take 40% of the surface water from one of it's tributary streams is not only wrong, it is a question of legality. For the first time in over a century our watershed is being replenished by natural stream flow of surface waters. Let's not interrupt the progress we have made to sell off a public trust to the worst stewards in Hawai'i's history (EMI/Mahi Pono). If any more water is aloud to leave Ko'olau ahupua'a myself and all of my neighbors in Ko'olau with be adversely impacted economically, spiritually and culturally by taking away our inherent right to self sustain, gather, practice our culture and relegion. Mahalo nui loa for your time and please find it in your hearts to hear not only my voice, but the voice of the ancestors who cannot be hear physically to share their love, mana'o and 'ike for this 'āina.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Williams:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Aloha mai kākou. My name is Zack Williams and I live in the ahupua‘a of Ko‘olau in the valley of lower Nāhiku on an ancient ‘āina named ‘ihi‘ihinui in the bay of Honolulu. Our ‘āina is located between Makapipi stream and Hanawī streams and our lo‘i kalo depends on surface and spring water from both kahawai to support our farming efforts.*

Response 1: We acknowledge your comments and understand that you are a resident in Nāhiku in between Makapipi and Hanawī Streams. Please note that both of these streams were subject to the CWRM D&O and had flow restored. Specifically, Makapipi Stream was categorized as a taro stream and was fully restored while Hanawī Stream was categorized as a connectivity stream and had partial flow restoration. With regards to taro farming, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-

municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on pages 1-19 to 1-23. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration statuts); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or

nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 2: *One major issue I had with the draft EIS, is it says there is no chance of biological or habitat restoration for Hanawī, Kapā‘ula, Pa‘akea and Waia‘aka. These four streams hold more of our endemic resources such as hapa wai, hīhīwai, ‘o‘opu (numerous species that are endangered), moi, āholehole and akule that depend on that waters to breed and sustain their populations.*

Response 2: Please note that nowhere in the EIS is it stated that the above streams have no chance of habitat restoration. Rather it is stated in Section 1.3.4 of the EIS that, “*Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows... Streams that are set at connectivity flow are: Kapā‘ula, Pa‘akea, Pua‘aka‘a, Puohakamoa, Ha‘ipua‘ena, Nua‘ailua, Waia‘aka, and Hanawī.*” However, clarification has been added to this statement as shown on page 1-15 that these streams were restored flow to allow for some movement of biota, these streams should allow for a minimum connectivity flow across diversion structures to allow for passage of biota upstream. This is a positive for biological improvement. These spring-fed streams have had consistent baseflow downstream of the diversion as a result of the spring inputs. Hanawī Stream is noted for its large springs (Big Spring and Hanawī Spring) and Kapā‘ula Stream has Pali Spring adding consistent baseflow to the stream below the Koolau Ditch Diversions. As a result of the additional baseflow, the streams supported high numbers of native stream animals below the springs (DAR

2009) and had higher amounts of habitat units predicted from the HSHEP modeling for most native streams animals than most East Maui streams (Appendix 3 for HSHEP Report(Appendix A)). The connectivity flows are intended to consistently connect the lower spring-fed reaches with the upper reaches above the diversion.

Pa'akea is a small stream with a comparatively low amount of instream habitat for native stream species. Thus, additional flow restoration would have a small change on overall East Maui stream habitat. Waia'aka is classified as an intermittent stream and is unlikely to consistently contain habitat for the native amphidromous stream animals. Additional streamflow in this stream may not provide much benefit as it goes dry naturally.

Comment 3: *The fact that the company doing the EIS says they surveyed 33000 acres of land in 4 days is just not possible. Ive lived in these valleys my entire life and still discover new kīpuka with flora and fauna found no where else in Hawai'i.*

Response 3: Regarding your comment about the length of time to conduct physical surveys related to the flora and fauna resources, ground and aerial surveys were conducted in 2017 and 2018 by SWCA to field-verify vegetation types and species found during previous surveying and mapping efforts. It was determined that the HIGAP vegetation data layer produced by Gon et al. (2006) was highly representative of the vegetation found in the "Study Area." Please note that the SWCA report, provided as EIS Appendix C, defined the "Study Area" as the collective License Area and the 30,000 acres of agricultural land that it referred to as the "Service Area." The HIGAP mapping data was used to estimate species distributions and potential impacts for the entire 33,000-acre License Area. Threatened and endangered species were categorized by each species' potential to occur in each vegetation type based on habitat needs. Methods have been further clarified in Appendix C, as summarized in Section 4.4 of the Final EIS as shown on page 4-113.

Comment 4: *Since the release of only some of the water to these streams in 2015 we have seen a major increase in fish populations between Nāhiku and Wailua Nui. The moi have been spawning more prolifically than any other point in my life. The same goes for the akule which have been living in the bay for almost the last two years now and have provided a major resource for substance gathering for our community in Nāhiku and Ko'olau. The hīhīwai are thriving in all the rivers i named plus in Waiohue, Kopili'ula and Wailua'iki.*

Response 4: We acknowledge your comments. Please note that many people at the EISPN public scoping meetings on February 22nd and 23rd, 2017 testified noting positive impacts seen from increased stream flow resulting from the cessation of sugar operations, please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section

4.6 of the Final EIS. See page 4-168 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted. This is expected as it was discussed in Section 4.2.1 of the Draft EIS that the Proposed Action would increase the number of HU as compared to sugarcane operations. Please note that that as of October 2020, an average of 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System. Hence it can be assumed that current water diversion rates from the License Area are comparable to the amount that would be diverted under the No Action alternative, which is estimated to be approximately 26.39 mgd. The HSHEP model estimated that approximately 79.8% of total HU would be available under the No Action alternative. However, please note that under the Proposed Action, the total HU would be less than projected under the No Action alternative as noted above in Response #17.

Comment 5: *I don't agree with taking any more water from Pua'aka'a stream as well as that is one of the main tributaries to Kopili'ula. The fact you order one stream 94-100% restored for habitat restoration but then take 40% of the surface water from one of it's tributary streams is not only wrong, it is a question of legality.*

Response 5: We acknowledge your comments. However, please note that the CWRM was charged with setting the IIFS for the various streams and tributaries that were subject to it in the License Area as discussed in Section 1.3.4 of the Draft EIS.

Comment 6: *For the first time in over a century our watershed is being replenished by natural stream flow of surface waters. Let's not interrupt the progress we have made to sell off a public trust to the worst stewards in Hawai'i's history (EMI/Mahi Pono).*

Response 6: We acknowledge your comments. Regarding your comment about the Public Trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

Comment 7: *If any more water is aloud to leave Ko‘olau ahupua‘a myself and all of my neighbors in Ko‘olau with be adversely impacted economically, spiritually and culturally by taking away our inherent right to self sustain, gather, practice our culture and relegion.*

Response 7: Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to ‘ōpae, ‘o‘opu, pūpūlo‘i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe‘e, Puohokamoa, Ha‘ipua‘ena, Honopou (Puniawa Tributary), Punala‘u (Kōlea and Ulunui Tributaries), Honomanū, Nua‘ailua, Pi‘ina‘au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili‘ula, Pa‘akea, Kapā‘ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua‘aka‘a Tributary, and Waia‘aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo‘i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe‘e, Puohokamoa, Ha‘ipua‘ena, Punala‘u (Kōlea and Ulunui Tributaries), Honomanū, Nua‘ailua, Pi‘ina‘au, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili‘ula, Pua‘aka‘a, Pa‘akea, Waia‘aka, Kapā‘ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates

that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, on pages 4-239 to 4-252 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the

existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Comment 8: *Mahalo nui loa for your time and please find it in your hearts to hear not only my voice, but the voice of the ancestors who cannot be hear physically to share their love, mana ‘o and ‘ike for this ‘āina.*

Response 8: Thank you for participating in this EIS process.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC’s website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, November 2, 2019 11:55:30 AM

Dear Mr. Matsukawa,

Please accept my comments in full OPPOSITION to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams MUST NOT be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities. Additionally, the DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. Overall, the DEIS does NOT sufficiently analyze the threat and damage the diversions have caused to our communities, as well as native aquatic species.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
A.L. Steiner

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear A.L. Steiner:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI’s West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko‘olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume” alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft

EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that

could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to our communities, as well as native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different

10238-04
Letter to A.L. Steiner
Page 6 of 6
September 3, 2021

flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 19, 2019 9:31:46 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

I have personally seen the decline in the coral reefs around Kahekili!

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Alison Simmons

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Simmons:

Thank you for comments dated October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Chen:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Allison Alberts:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Gordon:

Thank you for comments dated November 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration,

potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas

Dear Ms. Niles:

Thank you for comments dated October 3, 2019 and November 4th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration,

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Smock:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 18, 2019 7:33:30 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. I am incredibly disappointed in the choices that were made here. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Amber H

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Amber H.:

Thank you for comments dated October 10, 2019 and October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct

System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. I am incredibly disappointed in the choices that were made here. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 2: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish

and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, October 2, 2019 6:38:18 PM

Dear Mr. Matsukawa,

DON'T LET BIG CORPORATE GREED FURTHER DESTROY THE ECOSYSTEM.

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.

The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Amy Harlib

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 10:22:29 PM

Dear Mr. Matsukawa,

SAVE MAUI'S STREAMS!

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

I totally agree with these statements for Sierra Club, Hawaii:

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.

The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Keʻanae, Honomanū and Huelo License Areas

Dear Ms. Harlib:

Thank you for comments dated October 2, 2019 and November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawaiʻi Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *DON'T LET BIG CORPORATE GREED FURTHER DESTROY THE ECOSYSTEM. Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct

System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via

EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nāhiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that it's estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on

the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the

Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the

continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Comment 9: *SAVE MAUI'S STREAMS! Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 9: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty

percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā‘ula, Pa‘akea, Pua‘aka‘a, Puohokamoa, Ha‘ipua‘ena, Nua‘ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 10: *I totally agree with these statements for Sierra Club, Hawaii: The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 10: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI

Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the "No Action" alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80, enclosed. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 11: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 11: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate

stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-61 to 4-67.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 12: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 12: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 13: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 13: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Comment 14: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 14: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and

Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 15: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 15: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the

License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 16: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 16: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled "Modeling" of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-61.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it

is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 2:46:59 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Amy Pick

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Amy Pick:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration,

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Walton:

Thank you for comments dated November 8, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200, Section 18. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

- 1. Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response: The objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nahiku. DEIS 1-1. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject

to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 23,000 acres of the applicable Central Maui fields.

The CWRM's D&O ordered significant return of flows to East Maui streams. CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law [COL] 138).

Some of the petitioned streams have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ₅₀), which generally represents the flow necessary to restore 90% of the habitat in a stream (H₉₀), based on the biological diversity and habitat that already exists. These streams were ordered to be restored to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian rights (CWRM D&O, COL 131). These streams are: Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopili'ula, and Waiohue. (CWRM D&O, COL 132)

CWRM also found that there were other petitioned streams for which restoration of flow would not result in significant biological or ecological gains and that the water may be better used for noninstream purposes. For these streams, a connectivity flow to allow for movement of instream biota would be sufficient (CWRM D&O, COL 129). This minimum connectivity flow was determined to be twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, Waia'aka, and Hanawī. (CWRM D&O, COL 146). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

CWRM acknowledged that in the context of a proceeding to set the IIFS, it does not have the authority to determine how much water may be used for noninstream use by any particular party. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, which lease would be subject to the IIFS set by CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream uses. (CWRM D&O, COL 150)

10238-04
Letter to Ms. Amy Walton
Page 3 of 3
September 3, 2021

CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. (CWRM D&O, COL 151). The CWRM recognized that the stream water that may be leased/licensed by the BLNR from the petitioned East Maui streams may not be sufficient to satisfy the full implementation of a diversified agricultural plan for Central Maui. However, CWRM expected that a sufficient amount of noninstream water would be available to provide the initial phase of allowing lands already designated as IAL under HRS Chapter 205 in Central Maui to be developed for diversified agriculture. (CWRM D&O, COL 152).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the DEIS and in Section 1.3.4 of the Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Andrew Isoda:

Thank you for comments dated November 1, 2019 and November 3rd, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Anna Friedman:

Thank you for comments dated November 2nd, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Comments for A&B DEIS
Date: Thursday, November 7, 2019 6:56:14 AM

Dear Mr. Matsukawa,

I adamantly oppose A&Bs proposal to further divert the streams of East Maui. Water belongs to the people, it should not be held by a private entity.

Here are some important points:

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.

The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease.

These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Anna Lieding

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Anna Lieding:

Thank you for comments dated November 7th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I adamantly oppose A&Bs proposal to further divert the streams of East Maui. Water belongs to the people, it should not be held by a private entity.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject

streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the "No Action" alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water*

will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not

scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant

requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes.

However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and

implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR. It is unlikely that the removal of the Hanawī NAR from the License Area will result in additional public access to the area, as the NAR rules

restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poeciliid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poeciliid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poeciliid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Tuesday, November 5, 2019 8:58:03 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease.

These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

Please consider what is pono for the people, land and water.

Thank you for this opportunity to submit comments on this Draft EIS.

Anne Allison Kihei resident

Sincerely,

Anne Allison

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Anne Allison:

Thank you for comments dated November 15th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 2: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Comment 3: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 3: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from

30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 4: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 4: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR. It is unlikely that the removal of the Hanawī NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 11, 2019 5:23:25 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Anuheha Dudoit
Kihei, HI 96753

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Anuheia Dudoit:

Thank you for comments dated October 11, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Beverly Shamblin:

Thank you for comments dated November 11th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, October 2, 2019 8:00:17 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Blake Wu

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Blake Wu:

Thank you for comments dated November 2nd, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, October 16, 2019 8:24:12 PM

Dear Mr. Matsukawa,

- The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.
- The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.
- The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.
- The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.
- The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.
- The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.
- The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Sincerely,
Bobbie Numata

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Bobbie Numata:

Thank you for comments dated October 17th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 1: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry

Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI’s West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko‘olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 2: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 2: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the

License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 3: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 3: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or

diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 4: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 4: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the FEIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Comment 5: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 5: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 6: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 6: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking

in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR. It is unlikely that the removal of the Hanawī NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 7: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 7: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poeciliid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poeciliid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poeciliid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 5:53:01 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
brett gobar

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Brett Gobar:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration,

potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Brian Gibbons:

Thank you for comments dated October 3rd, 2019 and November 2nd, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, November 7, 2019 7:50:20 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Bryan Stewart

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Bryan Stewart:

Thank you for comments dated November 7th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

September 3, 2021

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Sunday, October 6, 2019 12:00:30 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS is woefully inadequate. It does not address the harm that stream diversion has caused, how native streamlife habitat & species are being, and will be, adversely affected by present & future diversions. There is no plan or funding to address invasive plant and animal species in the leased lands, nor to address the effects on the mosquito populations of East Maui. As we have been experiencing drought conditions here I feel that lease terms should be less than 30 years...the climate is changing, and the water supply is not guaranteed. Finally, these are public lands, and the people of Maui should have access to them without having to jump through EMI's hoops.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Carla Hess

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Sunday, October 20, 2019 1:19:01 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Here are the main points:

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.

The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.

It sounds as though the BLNR simply rubber-stamped Alexander & Baldwin's/Maui Pono's request, without any consideration of the consequences to the people and environment of Maui. This is profoundly wrong. Additionally, there was absolutely no justification given for increasing the amount of water allowed by 10 million gallons per day.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Carla Hess

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Carla Hess:

Thank you for comments dated October 6th 2019 and October 20th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI’s West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko‘olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions

amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from

30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits

10238-04
Letter to Carla Hess
Page 9 of 9
September 3, 2021

of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 12, 2019 10:23:28 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Carli Gardner

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Carli Gardner:

Thank you for comments dated October 12, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Carlos Echevarria:

Thank you for comments dated October 2, 2019 and November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 3:49:26 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.

The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.

The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East maui residents over the years.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Carol Collins

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Carol Collins:

Thank you for comments dated October 3rd, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI’s West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko‘olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume” alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the

trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see on pages 3-49 to 3-80, noted in Response #2 above, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *The DEIS should discuss options for more public hiking access to public lands in the proposed lease area without every hiker needed to get permission from EMI. These are public lands that people should be allowed to reasonably access.*

Response 7: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the Final EIS to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on pages 1-2, and pages 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawā NAR from

the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 8: *The DEIS doesn't talk about the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 8: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poeciliid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poeciliid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poeciliid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Monday, November 4, 2019 5:21:45 PM

Dear Mr. Matsukawa,

Please accept my comments opposing Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui. The DEIS assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This is an incorrect assumption. The DEIS should consider how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. Instead they say that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. The DEIS does not sufficiently address the threat and damage the diversions have caused to native aquatic species. They have no plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands. The DEIS should look into and support shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies. Mosquito populations in East Maui threaten rare native species, as well as human populations. Stagnant pools along diverted streams have been breeding grounds.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Carol Joan Patterson

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Carol Joan Patterson:

Thank you for comments dated November 4th, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions

individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI’s West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko‘olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume” alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *The DEIS should consider how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. Instead they say that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native stream life habitat and impact thousands of local residents.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘ahea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *They have no plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 5: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The

requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 6: *The DEIS should look into and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm
