Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Marc Takamori:

Thank you for comments dated October 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Thank you for the opportunity to review and comment on this project. We have no comments to make at this time.*

Response 1: We note that the County of Maui Department of Transportation does not have any comments to make at this time.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC’s website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

10238-04

Letter to Mr. Marc Takamori

Dear Mr. Hirokawa and Mr. Matsukawa:

**SUBJECT: COMMENTS ON THE DRAFT ENVIRONMENTAL
IMPACT STATEMENT (EIS) FOR THE PROPOSED EAST
MAUI WATER LEASE FOR THE NAHIKU, KEANAE,
HONOMANU AND HUELO LICENSE AREAS, MAUI,
HAWAII; TMKS: (2) 1-2-004:005, 007; (2) 1-1-002:002,
(2) 1-1-001:044, 050, (2) 2-9-014:001, 005, 011, 012, 017
(EAC 2019/0010)**

The Department of Planning (Department) is in receipt of the above-referenced document for the proposed East Maui Water Lease (Project). The Department has the following comments for preparation of the Final EIS:

1. We are supportive of a long-term water lease. The County only pays six cents per 1,000 gallons of water from the East Maui Irrigation Company. This is very inexpensive, and we understand its importance to our residents and farmers. We also understand that an investor, whether it be Mahi Pono or a local farmer, is better supported by financial institutions if water is guaranteed over a longer term period.
2. We note that the proposal is consistent with County long-range plans, such as the Maui Island Plan and our community plans, which include policies and actions to support agriculture, sustainable local food source,

conservation, open space and business. In addition, they call for the protection of the environment, near shore waters and water source/aquifers.

3. We note that Alexander and Baldwin is the owner of the East Maui Irrigation Company (EMI) and, as per orders of the Board of Land and Natural Resources (BLNR) in April and June of 2016, Alexander and Baldwin is the applicant for the subject water lease. Because the water lease from the BLNR grants the lessee the “right, privilege, and authority to enter and go upon” the License Areas, which in this case is State-owned land, the Department questions whether the lessee should also be the applicant for the EIS and if the Office of Environmental Quality Control has commented on who should serve as applicant.
4. We realize that farm efforts require an investment of time, and that this is one of the reasons why the proposed water lease is for a period of 30 years. Because one of the landowners, Mahi Pono, owns large acreages proposed for farming, and their operations timeline included in the Draft EIS indicates that they should show crop growth and sales within approximately 12 years, the Department would support a shorter lease period of 15 or 20 years. Thirty years is a long time and agricultural, economic, climatic, corporate, social or other significant and relevant changes could occur within that time period. For example, the economy could take a downturn, or the lessee could go out of business. Per the Draft EIS, the water lease must accommodate a reservation in favor of the Department of Hawaiian Home Lands, which could have plans in the next few years that require more water. Because there are many scenarios of what could happen in the next 30 years, a somewhat shorter time period would allow activities associated with all water diversions to be monitored.
5. One of the impacts that the proposal may have on the environment is that it could potentially affect flora and fauna in areas dominated with native species. The Department supports the proposed mitigation of ensuring that when maintenance is conducted in the area, a qualified biological monitor is onsite to ensure no listed or candidate species are impacted and that when equipment, vehicles and construction material is brought from outside of the area, they should be washed and inspected.

Mr. Ian Hirokawa and Mr. Earl Matsukawa, AICP

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Michelle McLean:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *We are supportive of a long-term water lease. The County only pays six cents per 1,000 gallons of water from the East Maui Irrigation Company. This is very inexpensive, and we understand its importance to our residents and farmers. We also understand that an investor, whether it be Mahi Pono or a local farmer, is better supported by financial institutions if water is guaranteed over a longer term period.*

Response 1: We acknowledge that the County of Maui Department of Planning is supportive of the long-term water lease. Please note that as discussed in 4.7.3 of the Draft EIS, under the Proposed Action (where the maximum amount of water is limited by the CWRM D&O and therefore below historical averages), the rate MDWS currently pays to EMI (\$0.06 per kgal) will increase because EMI’s per unit operating cost will increase as a result of fixed costs being spread out over a lower volume of water diverted and possible higher lease payments to the State compared to historic payments. While it is anticipated that the delivery costs to the County of Maui will increase, the exact amount of the increase cannot be known until the Water Lease is finalized. However, the estimate analyzed in the Draft EIS assumed a year 2030 water service

fee rate of \$0.08 per kgal. This figure was calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, the MDWS would pay an estimated \$214,600 per year to EMI. However, please note that this discussion in Section 4.7.3 of the Final EIS has been updated to take into account the latest equivalent per unit cost under the latest revocable permit as shown on pages 4-277 and 4-283.

With regards to your comment that water is very inexpensive and is important to Maui residents and farmers, the EIS recognizes that the Water Lease has the potential to affect many potable water users, as discussed in Appendix H and Appendix I of the EIS which are reflected in Chapter 3 and Chapter 4 of the EIS. Under the Proposed Action, potable water users would not experience any significant impacts. However, under the No Action alternative, or the Reduced Water Volume alternative, MDWS potable water users may experience significant increases in water costs or some users may even be left without a reliable source of potable water.

Comment 2: *We note that the proposal is consistent with County long-range plans, such as the Maui Island Plan and our community plans, which include policies and actions to support agriculture, sustainable local food source, conservation, open space and business. In addition, they call for the protection of the environment, near shore waters and water source/aquifers.*

Response 2: We acknowledge that the County of Maui Department of Planning notes that the Proposed Action is consistent with County long-range plans and community plans, which include policies and actions to support agriculture, sustainable local food source, conservation, open space and business as discussed throughout Chapter 5 of the EIS.

You comment, "...they call for the protection of the environment, near shore waters and water source/aquifers" is unclear. However, please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of Final EIS.

Comment 3: *We note that Alexander and Baldwin is the owner of the East Maui Irrigation Company (EMI) and, as per orders of the Board of Land and Natural Resources (BLNR) in April and June of 2016, Alexander and Baldwin is the applicant for the subject water lease. Because*

the water lease from the BLNR grants the lessee the "right, privilege, and authority to enter and go upon" the License Areas, which in this case is State-owned land, the Department questions whether the lessee should also be the applicant for the EIS and if the Office of Environmental Quality Control has commented on who should serve as applicant.

Response 3: As noted in Comment #3 above and as discussed in Section 1.4 of the Draft EIS, in 2016 the BLNR ordered A&B to prepare an EIS for the proposed Water Lease. However, please note that the State Office of Environmental Quality Control has not commented on who should serve as applicant to this EIS process.

Comment 4: *We realize that farm efforts require an investment of time, and that this is one of the reasons why the proposed water lease is for a period of 30 years. Because one of the landowners, Mahi Pono, owns large acreages proposed for farming, and their operations timeline included in the Draft EIS indicates that they should show crop growth and sales within approximately 12 years, the Department would support a shorter lease period of 15 or 20 years. Thirty years is a long time and agricultural, economic, climatic, corporate, social or other significant and relevant changes could occur within that time period. For example, the economy could take a downturn, or the lessee could go out of business.*

Response 4: We acknowledge that the County of Maui Department of Planning supports a shorter lease period of 15 or 20 years. Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Comment 5: *Per the Draft EIS, the water lease must accommodate a reservation in favor of the Department of Hawaiian Home Lands, which could have plans in the next few years that require more water. Because there are many scenarios of what could happen in the next 30 years, a somewhat shorter time period would allow activities associated with all water diversions to be monitored.*

Response 5: Regarding your comment about a reservation in favor of the Department of Hawaiian Home Lands, specific information regarding the DHHL future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related

to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019 as shown on pages 2-4 to 2-7. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM. Consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture.

With regards to shorter lease durations, please see Response #4 above.

Comment 6: *One of the impacts that the proposal may have on the environment is that it could potentially affect flora and fauna in areas dominated with native species. The Department supports the proposed mitigation of ensuring that when maintenance is conducted in the area, a qualified biological monitor is onsite to ensure no listed or candidate species are impacted and that when equipment, vehicles and construction material is brought from outside of the area, they should be washed and inspected.*

Response 6: As it relates to impacts to flora and fauna, Appendix C of the Draft EIS specifically addresses the flora and fauna considerations of the Proposed Action and alternatives. To minimize the impacts to flora and fauna in the License Area, Section 7 of Appendix C identifies several avoidance and minimization measures, including measures to avoid the introduction of additional invasive species to the License Area, which is harmful to the watershed and to native flora which are also reflected in Section 4.4 of the EIS. We acknowledge that the County of Maui Department of Planning supports the identified mitigation measures described in Section 4.4 of the EIS. Please note that the discussion of these avoidance and mitigation measures has been expanded on as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –

Dear Mr. Matsukawa and Mr. Hirokawa:

SUBJECT: COMMENTS ON DRAFT EIS FOR EAST MAUI WATER LEASE (PAF 19-335)

In accordance with Maui County Council Resolution 19-176, I am transmitting comments on the Draft Environmental Impact Statement for the Proposed Lease for the Nahiku, Ke`anae, Honomanū, and Huelo License Areas, also known as the Draft EIS for the East Maui Water Lease, as referenced in "The Environmental Notice," September 23, 2019, Office of Environmental Quality Control. The Council is not taking a position.

The statements and questions contained in the attached document were collected during the following public meetings:

- the Maui County Council on October 18, 2019;
- the Council's Environmental, Agricultural, and Cultural Preservation Committee on October 15, 2019; and
- the Council's Environmental, Agricultural, and Cultural Preservation Committee on October 7, 2019.

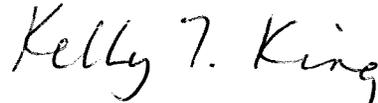

On the Council's behalf, I request due consideration of these statements and questions and a time extension to allow for additional public comment.

Earl Matsukawa and Ian Hirokawa
November 5, 2019

Scott Glenn, Director, Office of Environmental Quality Control
Mark Vaught, Operations Manager, East Maui Irrigation Company, Limited

Statements and Questions on:
DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR
EAST MAUI WATER LEASE
Maui County Council Resolution 19-176

Simon Russell, East Maui resident:

- Please provide verification that the current IIFS are being met by providing monthly records of stream flow for the streams contained in the IIFS requirements.
- Please provide a detailed description of the governance structure, decision-making ability, and ownership of EMI, Mahi Pono, and A&B.
- The landowner is the one who is supposed to do the EIS. In this case, the landowner is the State of Hawaii; therefore the State DLNR should be submitting the EIS.
- Provided that a for-profit, foreign-owned entity will own the EMI system, what assurance is there that the water will be adequately managed as a public trust?
- What is the dollar value of 65.86 million gallons per day if sold at the County of Maui rates for:
 - o Agriculture?
 - o Drinking water?
- Please provide a clear chain of land title under Hawaiian Kingdom law from the Kuleana Act of 1850 to the present “ownership” of the Crown Lands claimed by the applicant.
- Under whose authority was the land contained within the DEIS purchased, sold, or leased?

Tom Bacon, East Maui resident:

- Please provide a phased plan and year-by-year timeline detailing each proposed activity by Mahi Pono and each activity’s water-use needs
- Provide “performance indicators” and associated benchmarks within the plan.

Chris Gaardner, East Maui resident:

- The farm plan does not adequately justify the water needs put forth in the DEIS, and the farm plan does not provide sufficient detail to adequately assess its merits
- 10-12 years required to “remediate” the land. What water is needed for this to occur?
- The DEIS does not adequately integrate climate change scenarios
- What percentage of the total amount of water being asked for does each of the following represent:
 - o Kula Agriculture Park?
 - o Nahiku residents?
 - o Upcountry Maui domestic use?
 - o DHHL projects?

Lucienne de Naie, Ha`iku Community Association:

- Traditional and cultural practices were not addressed for each ahupua`a impacted by the lease.
- Representatives from Huelo shared their mana`o with the social-impact assessment.
- Can the document only be utilized by A&B, or could this EIS be utilized by the Department of Water Supply, an independent water utility, or other entity that would like to put forth a bid for the water lease at public auction?
- Is this EIS only for one bidder? It isn’t an open bidding process if there is only one bidder.
- The EIS assumes that the “natural stream conditions” are those that have been in existence following the diversion of 40-50 streams over a 100-year period. There is no data represented on pre-diversion conditions. Impacts cannot be adequately assessed without this data. There is a shifting baseline where conditions are assumed as normal when in fact they represent degradation of the natural ecosystems over time. Streams are deemed biologically unimportant based on their current post-diversion conditions, not on what their conditions should be assuming a more connected and functional pre-diversion ecosystem. (prior to the 1870s)
- The DEIS assumes that the 22 streams with IIFS addresses all cultural and environmental concerns
- 13 streams were left out of the IIFS process, and the impacts of these areas and the communities who live along them is completely unknown.
- The impacts of dams and diversion structures have not been assessed for fish passage.

- DHHL's allocation will belong to EMI until DHHL needs it. DHHL lands are legally entitled to this, and this water needs to be set aside.
- The DEIS states that a watershed-management plan will come at a later date. EMI is waiting for the State to conduct this plan. There is no assurance that this will happen within a reasonable time frame. This plan is an essential component of mitigating potential impacts associated with the spread of invasive species and loss of sensitive native habitat.
- Old agreements (1940s and '50s) included management plans
- The East Maui Watershed partnership has left out the local community
- Repurposing of reservoirs and water-storage infrastructure is touted in the DEIS as being impossible based on cost constraints. This option needs to be explored and outlined in the DEIS.
- There are massive high-flow storm events because of climate change, and these events need to utilize the existing infrastructure effectively.
- The "ownership change" alternative was dismissed because it is speculative, and the change in ownership will "not enhance environmental quality." This is not true.
- There needs to be a truthful analysis of ownership options.
- There is no assessment of the current conditions of the 100-year-old system and how it could be redesigned for the current century, or if aspects of it are even necessary.
- The future wastewater plant planned for Central Maui was not included in the DEIS as a potential water source to the central valley
- Please provide a detailed inventory of all available water sources to the central valley.
- Please provide detailed EMI infrastructure water-loss and -leakage statistics.

Albert Perez, Maui Tomorrow:

- There is a huge need for stream gauges in the lease area. We have very few gauges currently. There should be a gauge above and below each diversion so that we know how much is going into the ditches and tunnels.

Norman Franco, Board of Water Supply:

- Looked at comprehensive alternatives to what is the present system:
- One example is from Arizona, where a farmer makes a request for a certain number of gallons, and the system releases that exact amount to the farmer.

- There is a huge amount of waste and not good management of the resource that we have. The DEIS does not make note of any of this waste, or provide options for better management of the EMI system to increase conservation and better optimize the valuable water resource.
- It's important to note that the ditch is an "easement." You're buying the easement, not the land that A&B owns. The cost should be understood by an appraisal when considering purchasing the system.

Eva Blumenstein, Department of Water Supply:

- Prep notice for 2016 recommendations:
 - o Address the interaction between groundwater in the ditch area and in the central valley
 - o Costs should be included (O&M, capital costs, etc.)
- The Water Use and Development Plan:
 - o Diversify the sources (recycled water, climate adapted crops, conservation)
- Gravity-fed surface water is the most cost-effective from the County's perspective.

Caleb Rowe, Department of the Corporation Counsel:

- 30-year-lease application to BLNR
 - o Continued use of the diversions
- IIFS before CWRM
 - o CWRM sets how much water needs to be left in the streams to allow for biodiversity, cultural activities, and view plains.
 - o 27 streams received IIFS, and the ruling was not appealed to the Supreme Court (first in history)
 - o IIFS can be changed at the behest of the community
- BLNR can use CWRM's IIFS numbers, but they do not have to. They could impose their own determinations for the 13 streams that do not have an IIFS.
- Currently in the courts over the 2019 "revocable permits." The contested-case hearing was waiting for the DEIS to be completed.

Zack Williams, East Maui resident:

- There haven't been any studies conducted that explain why there is no connectivity between the mountain and the ocean at some of the lower - altitude streams, referencing Nahiku and Makapipi streams.

- EMI should allow for bids on improving and upkeeping their tunnels and gates, especially in Nahiku.
- The impacts to groundwater from diversion systems are not addressed in the Draft EIS.
- The Nahiku portion of EMI's water diversion should be condemned.

Joss Akoi, East Maui resident:

- Social and community impacts need to be further addressed in the Draft EIS.
- There isn't enough water for the Kuleana farmers who were once ensured water rights by Prince Jonah Kūhiō Kalaniana'ole. Hawai'i's history needs to be better documented and considered.

John Longmire, East Maui resident:

- Native Hawaiian practices and reliance on the streams will be affected if the water lease is granted; however, studies and concerns regarding these potential impacts are not adequately documented in the Draft EIS.
- Family's property borders an EMI easement, and because of this, we have encountered barriers to development of the property. Impacts to smaller family properties, and identifying which properties, should be acknowledged so that people are aware if they may be or are already implicated.

Councilmember Michael J. Molina:

- The total amount of water to be diverted from non-restored streams should be identified. The percentage of water to be diverted from non-restored streams should also be disclosed.
- The number of streams and the names of the streams where water is to be diverted should be defined.
- The amount of water to be diverted from partially restored streams should be disclosed.
- The Proposed Action of the Draft EIS states: "The amount of water allowed to be diverted by the Water Lease will be significantly less than the amount diverted for sugar cultivation."
 - o There should be a comparison drawn between the amount of water proposed to be diverted compared to the water diverted for sugar.
- Mahi Pono should be a party to this proposed Draft EIS and water lease since they will be directly benefitting from the diversion of these waters.

- The Draft EIS states: “The Water Lease is to be awarded by public auction.”
 - o The process for public auction and awarding of the lease should be defined.
- The Draft EIS states: “The content and parameters of a watershed management plan related to the proposed Water Lease are unresolved at this time but will be resolved before BLNR can issue the Water Lease.”
 - o The “content and the parameters of the watershed management plan” that has yet to be “resolved” should be outlined and defined.
 - o The specific timing for resolving the parameters of the watershed-management plan should be noted as well. Resolution before BLNR is too vague and too close to awarding of lease.
- The Draft EIS states: “The Water Lease is also subject to the rights of the DHHL to reserve water sufficient to support current and future homestead needs.”
 - o The amount set aside for the DHHL reserve that should be approximated in a specific water demand cannot be provided at this time.
- The use of reclaimed and recycled wastewater was dismissed because of construction of transmission pipelines and potential impacts to native Hawaiian birds. This matter should be explored further using other transmission possibilities, such as tankers.

Councilmember Tamara Paltin:

- The lease was issued so long ago, and with no treaty of annexation, was it ever valid in the first place, and should we even be considering renewing it knowing what we know now?
- To ask for a 30-year lease of a public trust without any reference to timeframes, deliverables, or performance requirements does not seem appropriate.
- Why hasn't the applicant engaged with the County? There have been several invitations to public meetings, letters, and requests for information from the applicant that have been ignored.
- An alternative that has not been explored is the potential to utilize R-1 water from the Wailuku-Kahului Wastewater Reclamation Facility to satisfy irrigation needs now or in the future.

Other discussion:

- Please provide stream-gauge measurements of stream flows upstream and downstream of each diversion for each stream contained within the area of the Draft EIS.
- The DEIS refers to “Base Conditions” as those that occurred during full diversion during sugar cane cultivation.
- Annually ~26% of the Upcountry water supply is being provided by the water contained in this diversion (Kamole and the East Maui Lease areas).
- There are development tunnels that are counted as groundwater, not surface water.
- Climate-appropriate crops are not put forth as an alternative.
- What is the exact area that is going to be served by the water in this diversion (including parcels and CPRs)?
- Is the diverted water going to be supplied to A&B-owned properties and CPRs in the Central Valley?
- The DEIS makes reference to a “watershed plan.” Will this plan be drafted by the applicant, or does the applicant plan to utilize the existing watershed plan that is used by the East Maui Watershed Partnership?
- If the applicant plans to utilize the watershed plan currently used by the East Maui Watershed Partnership, how will downstream issues below the jurisdiction of the EMWP be adequately addressed?

Shay Chan Hodges, Board of Water Supply:

Please see following written testimony, dated October 4, 2019.

Aloha:

As requested by Council Member Shane Sinenci's office, I am providing your committee with research that the TIG has conducted so far.

These notes should not be construed as representing conclusions or recommendations of the TIG, and are provided in the public interest for discussion purposes. We look forward to answering questions that you may have regarding our research on this topic.

I. TIG Investigation Background:

Stated Purpose of the Investigation:

Explore the Feasibility of Purchasing and Maintaining the EMI Water Delivery System and Examine Other Alternatives for Ensuring That The People of Maui County Have Authority Over the Delivery of Water, Which is A Public Trust

Attempts to Access Information on Behalf of the Public:

Over the last several months the Maui County Board of Water Supply (BWS) has had several discussions regarding the role of Mahi Pono in the community. In a letter approved unanimously by the Board on September 19, 2019 to be sent to Mahi Pono Operations Manager Grant Nakama, contingent upon approval by Mayor Michael Victorino, the BWS stated the following:

...the [Maui County] Board [of Water Supply] has been extending invitations for Mahi Pono, LLC to attend one of our board meetings since March. We are very eager to have a continued dialog between the Board and Mahi Pono as we continually get testimony submissions and questions from the Maui community on water and land use subjects that are beyond our purview. A dialog between the Board and Mahi Pono can help mitigate any falsely placed frustrations throughout the community that are generated from the perceived lack of transparency from the Board when we don't have the answers to provide them.

As a Board that is dedicated to addressing matters related to safeguarding Maui residents' access to water, we are very interested in developing a clear vision of the island's total water resources and current and future demand. To that end, the Board has recently reached out to all private water purveyors and extended invitations to meetings. These invitations have been extended in order to gain an inclusive picture of the island water resources and delivery options as well as to see if there are untapped opportunities for County and private water purveyors to support one another.

Based on statements made in your July 1 letter and discussions during recent meetings, the Board would still welcome your attendance at our next meeting. If that

cannot be arranged, we would like to extend some follow-up questions regarding Mahi Pono's current and future plans as they relate to water use. Having some answers to these questions that we pose here will help us to communicate with the wider Maui community that has been addressing the Board. For example: In your July 1 letter, you state: **"We have always been committed to supplying the County of Maui – and by extension, the Upcountry Maui community – with water from the EMI system. Having said that, our ability to supply water is 100% dependent on our right to legally access and deliver water."** You further state, "That said, if a [Revocable Permit] is successfully obtained – whether by A&B, EMI or by Mahi Pono – then the County will continue to receive water for the Upcountry Maui community." We appreciate the clarity of this statement but the follow up to this is what will happen if Mahi Pono does not obtain a Revocable Permit to divert water?

"We would greatly appreciate any clarity that Mahi Pono can provide on this list of questions that has been generated by or presented to the Board:

- **If Mahi Pono does not obtain a Revocable Permit, will Mahi Pono be able to still commit to working with the County of Maui to ensure affordable access to water for upcountry Maui residents?**
- **Since the water that flows from the Wailoa Ditch to the Kamole Treatment Plant is maintained by Mahi Pono and EMI, would the lack of a Revocable Permit cease that ditch maintenance and flow?**
- Is Mahi Pono interested in exploring an agreement to provide water that is harvested from its own lands to the County's Kamole Water Treatment plant?
- Is Mahi Pono willing to consider shared management of the Wailoa Ditch and other ditch systems? The current condition of the ditch system and the cost of maintenance/repairs that are needed would help clarify the monetary constraints of providing water to the Kamole Water Treatment plant, and
- If the water leases are obtained by EMI, what portion would go to Mahi Pono lands and what portion would go to remaining A&B lands, many of which are entitled for development? Are there other agreements besides the original sales agreement between Mahi Pono and A&B?"

(Bold added for emphasis, July 1, 2019 Grant Nakama letter and BWS draft letter attached, Appendices 1 and 2)

As noted in the letter, the Board of Water Supply has been reaching out to Mahi Pono since March, 2019. The only communication received from Mahi Pono was the letter referred to above from Mr. Nakama to Director Jeff Pearson, which Mr. Pearson has stated was intended to be shared with the BWS.

As a result of growing concerns about communication and transparency, a Temporary Investigative Committee to explore options for ensuring access to water was approved on July 18, 2019, including the following committee members:

- Water Board Chair Shay Chan Hodges
- Board Member Norman Franco
- Board Member Antoinette Eaton
- Board Member Joseph Aquino

Norman Franco was approved to be Chair of the TIG, Shay Chan Hodges was approved to be Vice Chair.

On July 23, 2019, Joseph Aquino resigned from the TIG due to work responsibilities.

Scope of investigation:

As approved on July 18, 2019, during its investigation, the temporary investigative group (TIG) may:

- a. Conduct interviews and discussions with County of Maui personnel related to the delivery of water to Upcountry and Central Maui.
- b. Conduct interviews and discussions with State of Hawaii personnel related to the delivery of water to Upcountry and Central Maui.
- c. Conduct interviews and discussions with anyone whom the TIG determines has the knowledge, expertise and experience necessary to assist TIG members in increasing their understanding of the scope, operations and maintenance of the EMI Water Delivery System as well as the costs related to the purchase or condemnation of the EMI water delivery system and the cost of its maintenance, including, if necessary, the purchase or condemnation of relevant Mahi Pono lands.
- d. Conduct interviews and discussions with anyone whom the TIG determines has the knowledge, expertise and experience necessary to assist TIG members in increasing their understanding of potential financial mechanisms and organizational structures necessary for the acquisition and governance of the EMI Water Delivery System, in order to promote system sustainability, ensure fiscal integrity, maximize the public welfare and maintain the public trust.
- e. Consult with representatives and stakeholders with diverse expertise relating to the TIG investigation.
- f. Review documents, contracts, studies and other written information relevant to the investigation.

Urgency of Investigation:

Mahi Pono's Intentions per the Draft EIS

On September 23, 2019, the East Maui Irrigation System (EMI) and Alexander & Baldwin (A&B) Draft Environmental Impact Statement (DEIS) for the *Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomano, and Hue/a License Areas*¹, situated at TMK Nos. (2) 1-2- 004:005, 007 (por.), 1-1-002:002, 1-1-001:044, 1-1-001:050, 2-9-014:001, 005, 011, 012, 017 in the Makawao and Hana Districts, on the island of Maui was released **to the public** by the Department of Land and Natural Resources.

The 2,700 page Draft Environmental Impact Statement provides a great deal of information regarding costs and plans, and is available online (see footnote). It is referenced throughout this report as "DEIS" with accompanying page numbers.

This document answers some of the questions posed by the Board. For example:

"Without the Water Lease, even if EMI could find it economically feasible to continue maintaining the EMI Aqueduct System to divert non-governmental water for diversified agriculture in Central Maui, **there may not be enough water to allocate much or any to the MDWS.** This lack of water would exacerbate the effects of drought when other surface water sources are unreliable for the KAP and the Nāhiku, this could eliminate their primary source of water. **Insufficient water delivered to the County through the EMI Aqueduct System could have significant effects on health and safety of those who currently rely on that water delivery.**"

(Bold added for emphasis, DEIS, *Page xiii, Relationship Between Local Short-term Uses of Humanity's Environment and the Maintenance and Enhancement of Long-Term Productivity*)

"The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore **if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate.** Under the Reduced Water Volume alternative, depending on the amount of water authorized under the Water Lease, the MDWS may receive no water from the Wailoa Ditch or some amount up to 7.1 mgd. **The greater the reduction in the amount authorized under the Water Lease, proportionally less water will be available to the MDWS.**"

(Bold added for emphasis, DEIS, *Page 3-5, 3.2 Alternative Analysis 3.2.1 Reduced Water Volume Alternative*)

¹ http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2019-09-23-MA-DEIS-East-Maui-Water-Lease.pdf

The DEIS describes the ownership relationship of EMI, Mahi Pono, and A&B in this way:

“the EMI Aqueduct System is owned and operated by the EMI. EMI was previously a wholly owned subsidiary of A&B. In February, 2019, MP EMI, LLC, became a co-owner of EMI. In addition to becoming the co-owner of the EMI Aqueduct System, as noted above, Mahi Pono acquired former sugarcane and watershed lands, including the Central Maui agricultural fields, from A&B in December 2018. Agricultural operations are centralized under Mahi Pono, LLC.” (DEIS, Page 1-2, The EMI Aqueduct System.)

It is unclear why Mahi Pono, a part-owner of the EMI Aqueduct system, is not a named party on the Draft EIS if Mahi Pono is intending to be a potential lessee. For the purposes of this document, the BWS TIG is referring to EMI/Mahi Pono as jointly responsible for any statements in the Draft EIS.

BWS TIG Obligations to the Public

The Board of Water Supply approved convening a “Temporary Investigative Committee to examine Alternatives for Ensuring That The People of Maui County Have Authority Over the Delivery of Water, Which is A Public Trust” in July, 2019, with no specific deadline for completion.

However, because Mahi Pono has not committed to working with the County of Maui to ensure affordable access to water for Upcountry Maui residents if a revocable permit or lease is not approved, and Mahi Pono/EMI has stated in the Draft Environmental Impact Statement that “if no Water Lease is issued, it is assumed that the delivery of water to the [Maui Department of Water Supply] would terminate,” and given that -- as stated in the DEIS -- “insufficient water delivered to the County through the EMI Aqueduct System could have significant effects on health and safety of those who currently rely on that water delivery,” it is clear to TIG members that actions to reduce reliance on a private company operating the EMI Delivery System represent a public health imperative and need to be taken immediately.

II. How the EMI System Impacts East Maui & Upcountry Maui:

Description of the EMI System Per the Draft Environmental Impact Statement:

The EMI Aqueduct System was constructed in phases, beginning in the 1870s and extending to its completion, as it currently stands, in 1923. It consists of approximately 388 separate intakes, 24 miles of ditches, and 50 miles of tunnels, as well as numerous small dams, intakes, pipes, 13 inverted siphons and flumes. **The EMI Aqueduct System collects surface stream water from approximately 50,000 acres of land (Collection Area), of which approximately 33,000 acres are owned by the State of Hawaii (which includes lands within Nāhiku, Ke‘anae, Honomanū and Huelo) (License Area)², and the remaining approximately 17,000 acres which are privately owned by EMI and Mahi Pono.³**

The EMI Aqueduct system starts at Makapipi Stream, in the Nahiku portion of the License Area, with the Koolau Ditch. The Koolau Ditch traverses westward across the Ke‘anae License Area and into the Honomanū License Area where it crosses paths with the Spreckles Ditch. This is where streams had multiple diversions at different levels to supply water to the EMI Aqueduct System. Separating higher elevation ditches allows them to maintain the very slight slope necessary to convey flows by gravity over long distances to irrigate higher elevation fields. This avoids the cost of energy required to pump water up from ditches delivering water at lower elevations. As the system continues westward, the Koolau Ditch transitions at the boundary between the Honomanū and Huelo portions of the License Area to the Wailoa Ditch. Makai of the Koolau/Wailoa Ditch, are the Manuel Luis and the Center Ditch. At Waikamoi Stream, the New Hamakua Ditch begins, running parallel to the Wailoa Ditch, but at a lower elevation.⁴

The Spreckles Ditch terminates its mauka segment at Waikamoi Stream, and begins its makai segment at Ka‘aiea Stream, until it converges with the Lowrie Ditch at Nili‘ilihaele Stream. Makai of Lowrie Ditch is the Haiku Ditch. At Honopou Stream, the water collected within the License Area by the EMI Aqueduct System exits the License Area. Crossing this western boundary of the License Area in descending elevation are the Wailoa Ditch, the New Ditch, the Lowrie Ditch, and the Haiku Ditch. West of Honopou Stream, the EMI Aqueduct System traverses land that was largely owned by A&B and is now largely owned by Mahi Pono. Additional flows from streams located on this land are diverted by the EMI Aqueduct System until it crosses Maliko Gulch beyond which there are no stream diversions. Crossing Maliko Gulch in descending elevation are the Wailoa Ditch, Kauhikoa Ditch, Lowrie Ditch, and the Haiku Ditch.⁵

² DEIS, Page 1-2

³ DEIS, Page 2-4

⁴ DEIS, Page 2-4

⁵ DEIS, Page 2-4

Current Diversion by the EMI Delivery System As Stated in the Draft EIS:

Currently, the EMI Aqueduct System is only diverting approximately 20 mgd. As a result, very little surface stream water is currently being diverted relative to what would be allowed should the Water Lease be awarded per the Proposed Action. However, the amount of water that may be diverted should the Water Lease be issued is substantially less than the amount that was diverted during normal sugar production. For example, in 2006 it is estimated that the EMI Aqueduct System delivered approximately 156.69 mgd at Maliko Gulch, whereas under the CWRM D&O, it is estimated that the delivery at Maliko Gulch will be approximately 92.32 mgd (Akinaka, 2019).⁶

Description of Community Concerns as Relayed at Focus Group Per DEIS:

According to the DEIS, 4.7.2 Social Characteristics (Page 4-135):

A focus group with residents and farmers from Huelo and Ha 15, 2018 at Hale Akua in Huelo. Most of these participants live in the Huelo watershed area and many live and farm in areas adjacent to streams that are subject to the CWRM's and D&O.

Also, participants said that EMI personnel do not notify residents in the area when the gates open to allow downstream flow. The sudden onrush of stream water has endangered several people who happened to be in/near the stream at that time.

It was noted that, with the closing of the sugar plantation, the low level of maintenance has deteriorated even further given the reduction of EMI staffing to, reportedly, about eight people.

A second major concern with this group is fairness in how they, as a community, have been treated in two ways. First, they reported of the 25 streams in the petition before the CWRM, only three streams in the Huelo watershed were considered kalo streams and designated for full flow. While they agreed with such designation in other watersheds, they felt more streams in their area should have been considered.

Another fairness related concern raised by the group is that residents and farmers in Huelo and streams. Except for those whose properties have deeds allowing stream water access via pipes, most cannot access stream water. They cannot use the water for agriculture or domestic uses. Participants noted that they are off the electricity grid, and they are very interested in using stream flow for hydroelectricity. It was reported that there have been drought times in which residents had to truck in water even though they live next to streams. It was also said that those who were fortunate to have wells on their property share their water with neighbors during these times.

⁶ DEIS, Page 2-8

An issue often raised in the November 2018 focus group sessions was the reportedly poor condition of the EMI Aqueduct System. Interviewees also discussed this topic from the perspective of reducing water losses. They said that the reduction of water losses would reduce the amount of water required for agricultural operations.

These interviewees wanted to know how Mahi Pono will ensure that continued use of the EMI Aqueduct System will be monitored and operated for efficient use of water, which is valued as a public trust, an integral environmental resource, and essential for healthy ecosystems.

Interviewees pointed out that, even though the CWRM D&O restored several streams in East Maui, the social and cultural effects of historical and significant stream diversions have yet to be rectified. This belief was reiterated several times in the November 2018 focus groups and expressed by those interviewed.

While there has been interaction between Mahi Pono and East Maui residents, there still needs to be acknowledgement of past wrongs and a “path to healing” that will allow residents and the new landowner to have a constructive relationship.

Those interviewed understood that Mahi Pono is not responsible for whatever occurred during A&B’s tenure. Mahi Pono inherited a legacy that developed for over one hundred years. Nevertheless, to move forward as an integral part of the Maui community, Mahi Pono needs to “make pono” with East Maui so that everyone can move forward. One person said, “There needs to be apology, repentance and reparation.”

Description of EMI System Per Dept of Water Supply Draft Water Use & Development Plan for Ko`olau and Central Sectors:

Excerpted from the Maui Island Water Use And Development Plan Draft, Part III Regional Plans, Ko`olau Aquifer Sector Area (ASEA)⁷:

Transport of Stream Water from East Maui

The EMI collects surface water from the [Ko`olau] sector and delivers it to Hawaiian Commercial & Sugar’s (HC&S) Central Maui cane fields. Some of the water is also used to generate electrical power. **A relatively small amount of water is used for residential and agricultural use by the DWS for its Upcountry Maui Water Systems, which include the Upper Kula and Lower Kula Water Systems.** The EMI ditch system, which began construction in 1876, is the nation’s largest privately built and operated water system; it consists of approximately seventy-five (75) miles of ditches, tunnels, siphons, flumes, and reservoirs. The Ko`olau Department of

⁷ <https://waterresources.mauicounty.gov/DocumentCenter/View/223/Draft-Plan-Section-III-Chapter-17-PDF?bidId=>

Agriculture’s AWUDP (2004) listed the average delivery at 165 mgd with a delivery capacity of 435 mgd⁸.

Wailoa Ditch	195 mgd
New Hamakua Ditch	100 mgd
Lowrie Ditch	70 mgd
Ha`ikū Ditch	70 mgd
Total Capacity	435 mgd

In drought conditions, both the Lower and Upper Kula systems require supplemental surface water from Kamole Weir and groundwater pumped up to 4,000 feet. Under current agreement with EMI, MDWS receives 12 mgd from the Wailoa Ditch with an option for an additional 4 mgd. During periods of low flow, MDWS will receive a minimum allotment of 8.2 mgd with HC&S also receiving 8.2 mgd, or prorated shares if less water is available. Proposed amended IIFS could restrict Wailoa ditch off stream uses so that less than 7 mgd is available a few days a year. When more than 7 mgd is available under non-drought conditions, the proposed restored amount would come from EMI’s share of the 16.4 mgd. The 2017 Proposal and the current allocation between MDWS and EMI would allow sufficient ditch use for MDWS to meet current demand on the Upcountry system. Under normal flow, exceeding 16 mgd at Wailoa Ditch, and under an allocation of up to 12 mgd for MDWS, projected future demand of 16.4 mgd could also be met. Treatment of more than 6 mgd at the Kamole Weir will require expansion of the water treatment facility and storage construction. Future demand on the Upcountry system as a whole is addressed in the Central aquifer sector report.⁹

Water Use Maui Department of Water Supply Upcountry System

MDWS relies on three surface water sources, one of which is delivered by EMI through the Wailoa Ditch, and the other two through two MDWS higher elevation aqueducts maintained by EMI that transport water to Olinda and Kula, under a contractual agreement originated under the 1973 East Maui Water Agreement and subsequent agreements. MDWS and EMI diverts water from Ko`olau ASEA, conveyed to treatment plant facilities located in Ko`olau ASEA (Piiholo Water Treatment Facility) and the Central ASEA (Olinda and Kamole Weir Water Treatment Facilities)¹⁰.

Water Treatment Facility	Elevation	Conveyance System	Production Capacity	Average Production
Olinda	4,200 feet	Upper Kula Flume	2.0 mgd	1.6 mgd
Piiholo	2,900 feet	Lower Kula Flume	5.0 mgd	2.5 mgd
Kamole-Weir	1,120 feet	Wailoa Ditch	6.0 mgd	3.6 mgd

⁸ Ko`olau WUDP, Page 22

⁹ Ko`olau WUDP, Page 123

¹⁰ Ko`olau WUDP, Page 119

Excerpted from the Maui Island Water Use And Development Plan Draft, Part III Regional Plans, Central Aquifer Sector Area (ASEA):¹¹

The Olinda facility diverts water at the upper Waikamoi Flume from the Waikamoi, Puohokamoa, and Haipuena Streams. Water is stored in two 15 million gallon reservoirs and one 100-million gallon reservoir. The Piiholo facility diverts water from the Waikamoi, Puohokamoa, Haipuena Streams and Honomanu streams into a 50-million gallon reservoir. The Kamole-Weir facility relies on EMI diversions from eastern most Makapipi stream to the western most Honopou stream.

The Upcountry system spans Ko`olau and Central aquifer sectors, ...and serves about 35,200 people. MDWS also serves non potable water to 31 farm lots at the Kula Agricultural Park (KAP). Current water use at the KAP is about 0.4 mgd. About 80 – 90 percent of the delivered water comes from surface water sources and the remaining portion from basal aquifer wells. Haiku Well and Kaupakalua Well are located in the Ko`olau ASEA, Hamakuapoko Well 1 & 2 and Po`okela Well are located in the Central ASEA. The combined surface and groundwater source production capacity is 17.9 mgd, 13 mgd from surface water and 4.9 mgd from groundwater. Accounting for system and operational limitations, and use restrictions from Hamakuapoko wells, the reliable capacity is 9.1 mgd. Current water use averages 7.9 mgd within a range of 6 – 10 mgd.

The DOH divides the MDWS Upcountry System into three separate systems: Upper Kula; Lower Kula and the Makawao systems, although all three are interconnected.

MDWS Makawao/Upcountry Water System (PWS 213)

The MDWS Makawao/Upcountry System, also referred to as Makawao District by the DOH, generally serves the area extending from Ha`iku, Makawao, and Pukalani to Hali`imaile/Pa`ia. The system has 6,680 meters and serves about 28,702 people. The sources of water are primarily from surface water imported from East Maui (80%) and well water (20%) from the Haiku and Makawao aquifers. Surface water from the Wailoa Ditch, generated in the Ko`olau ASEA, is treated at the Kamole Water Treatment Facility (WTF). The facility uses micro-filtration technology and is the largest surface water treatment facility on Maui. It has four booster pumps to move water up to the 2,800 foot elevation, where it can be pumped to the highest service areas at 4,500 feet. Historically, the Kamole WTF is the primary source of water for nearly all of Upcountry during times of drought. There is no raw water storage at the WTF.

MDWS Lower Kula/Upcountry Water System [PWS 247]

The MDWS Lower Kula/Upcountry System, also referred to as Lower Kula District by the DOH, generally serves the area extending from Kula Kai to Omaopio to mid and lower Kimo Drive areas. The system has 1,064 meters and serves about 3,192 people. The sources of water are primarily from surface water imported from East Maui treated at the Piiholo WTF. The facility

¹¹ <https://waterresources.mauicounty.gov/DocumentCenter/View/221/Draft-Plan-Section-III-Chapter-15-PDF?bidId=>, Page 45, 46

uses direct filtration technology. Granular activated carbon and air stripping treatments were added in 2015 to reduce disinfection-byproducts in the water supply. The system can be supplemented with groundwater from Makawao aquifer.

MDWS Upper Kula/Upcountry Water System [PWS 215]

The MDWS Upper Kula/Upcountry System, also referred to as Upper Kula District by the DOH, generally serves the area extending from Upper Kula to Kula Highlands to Kama`ole to Upper Olinda-Piihola to Kula Glen to Ulupalakua-Kanaio. The system has 2,346 meters and serves about 7,038 people. The source of water is primarily from surface water from Waikamoi treated at the Olinda WTF. The facility uses micro-filtration technology. Disinfection is provided by anhydrous ammonia, blended with chlorine to form chloramines. Water is stored in 30 MG Waikamoi Reservoirs and the 100 MG Kahakapao Reservoirs.

Future Water Use MDWS Upcountry System

Based on growth rates and the socio-economic forecast referenced in the Maui Island Plan, the population Upcountry is projected to grow by about 8,424 to a total of about 43,675 people by 2030. Projected water demand for the base, low and high growth scenarios are shown below.

Water losses due to leaks, seepage, evaporation and other inefficiencies in the treatment, conveyance, distribution and storage of water range widely depending on storage and source transmission system age, length, type and many other factors. To account for water losses and determine source needs for Upcountry, water produced, rather than water billed is used as basis to determine source needs. For the Upcountry system, water losses average 20%.¹²

Table 16-56 Projected Consumption and Production MDWS Upcountry District System, Base, High and Low Scenarios (mgd)

	2014	2035 Base	2035 High	2035 Low
Consumption	6.26	7.02	7.57	6.42
Production	7.61	8.53	9.20	7.80

*Excludes Kula Ag Park

Upcountry Meter List

In 1993, the MDWS determined that the existing Upcountry water system was found to have insufficient water supply developed for fire protection, domestic and irrigation purposes to add new or additional water services without detriment to those already served.

¹² Ko`olau WUDP, Page 121

MDWS created a list of Upcountry properties, by date of application, who requested new and additional water service. In 2002, an administrative rule “Water Meter Issuance Rule for the Upcountry Water System”, Title 16, Chapter 106 was created. The rule outlined the procedure for processing applications for water service. New applicants were continually added to the list until provisions were codified in 2013 so that no new applications were accepted after the 2013 provisions became effective. A 2015 ordinance provided certain fire protection exemptions. Still, about half of meter offers are declined presumably due to the expense of required system improvements. The Priority List is estimated to represent an additional 3.7 – 7.3 mgd demand on the Upcountry system as a whole. There are about 1,800 requests for 4,300 meters (excluding those that did not accept a reservation offered, accepted a reservation, or where a meter was installed) for 1,900 dwelling units and a nominal number of commercial units. About two-thirds of the remaining requests are located outside designated growth areas. There remains uncertainty over the number and timing of new meters as well as occupancy.

Sources for requests in Haiku are primarily served by basal wells with sufficient backup capacity to reliably add new services. Sources for requests on the Lower and Upper Kula subsystems are East Maui streams in the Waikamoi area that are subject to Instream Flow Standards and vulnerable to drought. Groundwater from Po`okela Well in Makawao aquifer can supplement the Lower and Upper Kula subsystems. There remains uncertainty over the number and timing of new meters as well as occupancy.

Providing reliable capacity to satisfy the Priority List could be accomplished in alternative ways:

1. Develop basal wells to provide reliable capacity and assume significantly higher cost of service due to energy required to pump up to 4,000 foot elevation
2. Separate the Priority List by service area and source, so that subsystems with adequate and reliable capacity are prioritized over subsystems reliant on surface water.
3. Public-private partnerships to develop source and infrastructure that benefit end users of the same subsystem.

Altering the priority list processing would require code changes and would without doubt cause opposition by applicants that would not benefit from such changes. The recommended strategy is assessing the various options of restructuring and processing the list while moving forward with needed source development.

Strategy #2: Assess alternative options to restructure and process the existing Upcountry Meter Priority List to improve processing rate and adequate source development. Lead agency is MDWS. ¹³

¹³ Central WUPD, Page 106-107

II. Strategies for Creating and Conserving Fresh Water Capacity

Hawaii Fresh Water Blueprint for Action:

Excerpted from website:¹⁴

Hawai'i has been blessed with consistent rainfall, advantageous geology, and high-quality drinking water stores for centuries. **Recent findings, however, have raised concern about long-term fresh water security for our Islands. University of Hawai'i and other scientists have documented troubling trends including reduced rainfall, higher evaporation rates, and declining stream flows in recent decades.** These findings, coupled with the demand of an ever-increasing population, suggest that Hawai'i is entering an era of fresh water uncertainty.

The Hawai'i Fresh Water Initiative (Initiative) was launched in 2013 to bring multiple, diverse parties together to develop a forward-thinking and consensus-based strategy to increase water security for the Hawaiian Islands. Organized by the independent, nonprofit Hawai'i Community Foundation (HCF), the Initiative relied on a blue ribbon advisory panel of individuals (Hawai'i Fresh Water Council or Council) with deep knowledge of water and a collaborative spirit to articulate a vision for a more secure and sustainable water future based on shared values, and shared sacrifice. This Blueprint is the result of their work, and provides Hawai'i policy and decision-makers with a set of solutions that have broad, multi-sector support in the fresh water community that should be adopted over the next three years to put Hawai'i on a path toward water security. The Blueprint also builds on the good work, findings, and recommendations over the years by preceding stewards of Hawai'i's most important resource.

Goal: The Fresh Water Council distilled nearly two years of research and analysis into a single goal: creating 100 million gallons per day (mgd) in additional reliable fresh water capacity for island by 2030.

To achieve the ambitious goal of 100 mgd in additional fresh water capacity, the group outlined three aggressive water strategy areas and individual targets that the public and private sectors must work together to achieve by 2030:

1. **Conservation:** Improve the efficiency of our population's total daily fresh groundwater water use rate by 8% from the current 330 gallons per day/person to 305 gallons per day/person. By 2030, this goal will provide 40 mgd in increased water availability.

¹⁴ https://www.hawaiicommunityfoundation.org/file/cat/Fresh_Water_Blueprint_FINAL_062215_small.pdf, Page 3

2. **Recharge:** Increase Hawai'i's ability to capture rainwater in key aquifer areas by improving storm water capture and nearly doubling the size of our actively protected watershed areas. By 2030, this goal will provide 30 mgd in increased water availability.
3. **Reuse:** More than double the amount of wastewater currently being reused in the Islands to 50 mgd. By 2030, this goal will provide an additional 30 mgd in increased water availability.

Initiative Principles¹⁵

The following shared principles were adopted by the Council as they forged consensus to adopt the policy recommendations listed in this section.

- *Water is a complex issue that demands a comprehensive set of solutions.**
- *Solutions will come from many different sectors, and a good solution in one geographic area may not be appropriate for another area.
- *Solutions should focus on financial sustainability and cost effectiveness.**
- *Better information and access to accurate data facilitates good decision-making.**
- *Entering an era of climate unpredictability argues for more aggressive gathering and monitoring of water data than currently occurs.**
- *"Applied" and/or "targeted" education efforts are more effective than general outreach and awareness campaigns.
- *Water is as important to our economy and culture as it is to our ecology.**
- *The current price of water in Hawai'i does not reflect its "true cost."**
- *Any successful supply solution must provide for Hawai'i's broad spectrum of water uses.**
- *Hawai'i is better-positioned than many other geopolitical bodies to meaningfully address long-term fresh water sustainability.
- *Native Hawaiian cultural traditions place a high value on water and can provide guidance on how best to steward water.**
- *Public Trust doctrine and our state water code provide an adaptable framework.**
- *There is an urgency to the fresh water supply issue that is not widely evident to the public.**
- *Costs to address fresh water supply will rise with each year of delay.**
- *The nexus between water and energy is clear and compelling.**

¹⁵ Fresh Water Blueprint, Page 13

Maui Strategies for Addressing Impacts of the Climate Crisis:

From the Central ASEA Draft Water Use and Development Plan¹⁶:

Issue and Background: Data and research suggest that Hawai'i should be prepared for a future with a warmer climate, diminishing rainfall, declining stream base flows, decreasing groundwater recharge and storage, and increased coastal groundwater salinity, among other impacts associated with drought. Reliance on surface water will become more uncertain in a future of longer droughts and varying rainfall. No streamflow projections are available for the coming century but projections include a decline in base flow and low flows, with stream flows becoming more variable and unstable (flashy), especially in wet years. Groundwater recharge decreases in drought but local impact from climate change has not been projected to date.

The Central ASEA is especially vulnerable due to water resources used:

- Upcountry region and agriculture dependent on surface water as primary resource.
- Irrigation and other non-potable wells in Paia and Kamaole aquifer coastal areas are subject to sea-level rise

In consistency with the *Climate Change Adaptation Priority Guidelines*, water purveyors should increase resilience and reduce vulnerability to risks related to climate change. Chapter 12 Island Wide Strategies in this plan include the following strategies that can mitigate impacts from climate change:

1. Continue Maui County financial support for watershed management partnerships' fencing and weed eradication efforts (Chapter 12.3, Strategy#1). The Central ASEA is heavily dependent on forested watersheds in the Wailuku and Ko'olau hydrologic units to provide fresh water supplies.
2. Demand side conservation measures, such as water conserving design and landscaping in new development, incentives for efficient irrigation systems, landscape ordinance and promoting xeriscaping in dry areas will increase tolerance for prolonged droughts. (Chapter 12.3 Strategies # 13, 14, 15, 17)
3. Promote alternative resource incentives, such as greywater systems and rainwater catchment to supplement conventional resources. Incentives for green infrastructure and use of alternative water sources are needed to ensure such upfront investments in new development. (Chapter 12.3 Strategies# 20 and 21)
4. Diversify supply for agricultural use to increase reliability. Under extended droughts and low stream flows, diversified agriculture on HC&S lands will compete with priority public trust uses for surface water. Planned extension of R-2 recycled water from the Kahului WWTF to HC&S fields can supplement groundwater from the Central aquifer sector. (Chapter 12.3 Strategy #51).

¹⁶ Central WUDP, Page 124

5. Expand requirements for new development to connect to recycled water infrastructure, promote closer collaboration between MDWS and MDEM to utilize Drinking Water State Revolving Funds to maximize recycled water use. (Chapter 12.3 Strategies # 61 and 62)
6. Explore and promote opportunities for large volume stormwater runoff for agricultural irrigation. (Chapter 12.3 Strategy # 66)

From the Ko`olau ASEA Draft Water Use and Development Plan:

The concerns regarding climate change in the Ko`olau aquifer are more general. References include:

- Improving the understanding of the concepts of "precautionary planning" to reduce and adapt to the effects of drought and climate change upon water resource availability and quality is important.¹⁷
- Understanding potential impact of climate change adds to uncertainty in long-term groundwater availability. The primary responsibility to determine potential impacts on water resource availability lies with the State CWRM who in turn relies on studies and predictions by the scientific community and other agencies. Water purveyors need guidance how to mitigate and adjust to potential changes in groundwater availability.¹⁸
- Strategy #3: Support collaborative hydrogeological studies to inform impact from climate change and future well development on groundwater health for Haiku and Honopou aquifers.¹⁹

Upcountry Conservation:

The Upcountry region has experienced voluntary and mandatory conservation measures for decades, primarily in dry season when the MDWS Upcountry System reservoir levels are low. Reliance on surface water and constraints in developing additional groundwater causes the system to be vulnerable to droughts.

Demand Side Conservation Measures

Demand side conservation strategies recommended in Section 12.2 that would target outdoor uses of potable water include comprehensive water conservation ordinance to include xeriscaping regulations, landscaping and water efficient irrigation system incentives.

¹⁷ Ko`olau WUDP, Page 4

¹⁸ Ko`olau WUDP, Page 104

¹⁹ Ko`olau WUDP, Page 105

In evaluating cost-effectiveness, MDWS compared the costs to develop and deliver new sources of water to meet future demand with the savings attributed to conservation.

A preliminary analysis of the proposed conservation measure portfolio outlined in Section 12.2 shows that doubling current investments (MDWS annual FY14 – FY17 conservation budget, excluding leak detection is \$170,000) would result in net capital and operational savings. The potential for a net savings is expected for both the MDWS Central System and the Upcountry System due to the need for new source development.

Recommended demand side conservation measures at all levels and type of use for public water systems are outlined in table 13-1 (strategies # 10 – 25). There is an opportunity to design and implement conservation measures in new housing development throughout planned growth areas. The recommended conservation Strategies #17, 22 and 25 outlined in Table 13-1 are implemented in the design and build phase and are especially appropriate in planned growth areas:

- Revise county code to require high efficiency fixtures in all new construction. Develop a comprehensive water conservation ordinance to include xeriscaping regulations.
- Revise County Code: Water conserving design and landscaping in new development (xeriscaping targets dry areas).
- Revise County Code and/or incentivize water- efficient building design that integrates alternative sources (grey water, catchment).

Supply Side Conservation Measures

The sustainable and efficient use of water resources, as well as the capacity and integrity of water systems, can be improved by accounting for water as it moves through the system and taking actions to ensure that water loss is prevented and reduced to the extent feasible.

A water audit provides a data driven analysis of water flowing through a water system from source to customer point-of-service and is the critical first step in determining water supply efficiency and responsible actions to manage and reduce water loss consistent with available source, operational and financial resources. Public water systems serving a population of 1,000 or more and those within water management areas regardless of population served are required to submit annual water audits beginning July 1, 2020. Except for the MDWS systems, there are no large public water systems in the aquifer sector subject to the requirement. The fiscal year 2017 audit for the Upcountry system revealed that apparent water losses are often due to data gaps between the amount of water withdrawn at the source, treated, stored and billed. The results will guide MDWS data collection, maintenance and repair programs.

Input from the WUDP public process and issues identified in the community plans relate to water shortages and conservation²⁰:

- Reliance on surface water Upcountry makes the system vulnerable to drought conditions
- Voluntary and mandatory water use restrictions imposed on residential and agricultural users during droughts often negatively impact the productivity of farmers
- Promote conservation of potable water through use of treated wastewater effluent for irrigation.
- Reuse treated effluent from the County's wastewater treatment system for irrigation and other suitable purposes in a manner that is environmentally sound.
- Provide incentives for water and energy conservation practices.
- Promote energy conservation and renewable energy.
- Incorporate drought-tolerant plant species and xeriscaping in future landscape planting.

Qualitative criteria to evaluate and measure resource strategies against this planning objective include:

- Per capita water use decreased
- Potable and irrigation systems water loss decreased
- Community water education increased
- Incentives for water conservation increased
- Renewable energy use increased

East Maui Watershed Management:

East Maui watersheds are predominately vegetated by native Hawaiian rainforest. The plants there evolved over millions of years into the most efficient water collection system for our island's geography. It works in layers – tall 'ōhi'a and koa trees provide a canopy for shorter trees, while shrubs and ferns fill in underneath, and a thick layer of mosses and leaf litter complete the floor. These layers act like a giant sponge, slowing down heavy raindrops and soaking up water for slow release into underground aquifers. Even during droughts, our watersheds can produce water, pulling water out of the clouds by collecting fog drip. This uniquely evolved, specialized forest is the key to Maui's healthy water supply harbor endemic and rare native plant and bird species. The main threats to the native forest and ecosystems are habitat loss and alterations due to feral ungulates (pigs, deer, goats) and invasive plants. These are detrimental both to biodiversity and water supply.

Active management to ensure protection and preservation of these important watershed lands occur on federal, state and community levels.²¹

²⁰ Central WUDP, Page 102

Central Draft Water Use and Development Plan²²:

Issue and Background: Most land within this hydrologic unit are water resource “import” areas, rather than “export” areas in the sense that population and agricultural operations rely on water resources from adjacent watersheds. Watershed management in both types of watersheds are important. The Department of Land and Natural Resources has identified “Priority Watershed Areas” which are areas of highest rainfall and resupply, based on climatic conditions that provide high recharge and fog capture. Currently protective measures are focused in these priority areas above the 3,000 foot elevation with direct benefit to makai lands and the nearshore environment. The East Maui Watershed Partnership (EMWP) manages most of the forested upper critical watersheds of Ko`olau aquifer sector. Ongoing efforts include ungulate control through fence construction, retrofitting and regular trap checks weed management, monitoring, and human activities management through outreach and education. On the dry side of Haleakala, the Leeward Haleakala Watershed Restoration Partnership (LHWRP) works towards restoring the disturbed landscape where once dryland forests captured rain and fog that recharged the freshwater supply. The Maui Invasive Species Committee (MISC) targets pest animals and plant species to prevent their influx and establishment in the mauka critical watersheds. Their efforts occur throughout the Central ASEA in rural and agricultural regions as needed.

The Makawao-Pukalani-Kula Community Plan states as objectives:

- *Recognize the importance of the forested watershed areas and that their health and well-being are vital to all the residents of the Upcountry area.*
 - *Explore a comprehensive reforestation program to increase and catch more rainwater for the Upcountry area.*
-

The objectives support the ongoing efforts by EMWP, LHWRP and MISC. State and county agencies as well as private purveyors can provide financial support and participation in watershed protection partnerships and reforestation programs. Strategies for watershed management in Ko`olau is addressed in the Ko`olau ASEA Report, Chapter 16.8.1. Management efforts on leeward Haleakala is addressed in the Kahikinui ASEA Report, Chapter 18.8.1

²¹ Ko`olau WUDP, Page 99

²² Central, WUDP, Page 100, 101

Nexus Between EMI Delivery System & East Maui Watershed:

<p>A detailed environmental and cost analysis of Watershed Management and Restoration building on the Water Use and Development Plan is needed.</p>	<p>In order to ensure optimum implementation of any recommendations, agreements with landowners and considerations of land purchases would be required.</p>
<p>The Hawaii Fresh Water Initiative calls for investment in watershed protection statewide as a crucial step for water security. Consistent, reliable public funding is the most difficult and important part of watershed protection and storm water capture.²³</p>	<p>One recent University of Hawai'i Economic Research Organization (UHERO) study estimated that investing \$43.2 million in watershed restoration work in the Ko'olau mountains could result in over \$900 million in actual realized water value for O'ahu.²⁴</p>
<p>Current commitments to management and restoration by Maui County are extremely low.</p> <p>Watershed Partnership Annual Contributions?</p>	<p>2020 Budget: less than \$2 million (\$1 million according to WUDP)</p>
<p>Various computer climate models predict divergent precipitation futures for Hawai'i, although there seems to be common agreement that our rainfall future will be increasingly extreme and inconsistent. There is also high variation throughout the islands in terms of each watershed's ability to catch and hold water. In sum, the question is not whether Hawai'i will have water in the future, but rather will Hawai'i continue to have an affordable, predictable supply in the places we need at the times that we need for a growing population?"²⁵</p>	<ul style="list-style-type: none"> • Rainfall in Hawai'i decreased by 18% over a 30 year period in Hawai'i from 1978 to 2007. • Annual "tradewind days" have declined 28% from 291 days in 1973 to 210 days in 2009, resulting in less rain and recharge of aquifers. • Hawai'i has been feeling the impact of prolonged drought. In the summer of 2013, 75% of Hawai'i's land area was "Abnormally Dry." • Groundwater provides 99% of the state's domestic water use and in several key areas groundwater levels have been dropping. • Increased temperatures associated with global warming mean increased evaporation for surface water and soil moisture. <p>Certain invasive plant and tree species have higher evapotranspiration rates than native species in Hawai'i. Hawai'i forests are increasingly encroached on by invasives.²⁶</p>
<p>There are no specific commitments to Management and Restoration of the East Maui Watershed by Mahi Pono/EMI in the Draft EIS</p>	<p>Page 2-2, DEIS: Under the Proposed Action, it is anticipated that EMI and/or Mahi Pono will continue to pursue watershed management activities."</p>
<p>Commitments to providing water for taro farming are crucial to the care of the watershed.</p>	<p>For centuries after their arrival from Polynesia, Native Hawaiians divided the land into <i>ahupua'a</i> — subdivisions running from the ocean to the mountains, roughly defined by their watersheds. Fresh water flowed through complex ditch systems called <i>'auwai</i>, often toward taro <i>lo'i</i>, where it supported the cultivation of hundreds of variety of taro—a dietary mainstay for the population. Intact native forests in the <i>wao akua</i>, along</p>

²³ Fresh Water Blueprint, Page 13

²⁴ Fresh Water Blueprint, Page 7

²⁵ Fresh Water Blueprint, Page 5

²⁶ Fresh Water Blueprint, Page 5

	with diversion systems of 'auwai and lo'i in the lowland areas slowed down water down and increased aquifer recharge in each watershed. ²⁷
8. State Department of Agriculture is providing \$4.5 million in 2020 to support local agriculture (currently a one-time allocation).	Supports the plans, design and construction for to rebuild auwai in Ke'anae-Wailuanui and similar rural water infrastructure projects, which indirectly helps the watershed by supporting lo'i (see above).

General Resource Management:

Planning objectives related to resource management identified in the WUDP update public process include:²⁸

- Watershed protection and its prioritization, including invasive alien plant control, ungulate control, and reforestation via watershed partnership programs
- Maintaining access to lands for gathering, hunting and other native Hawaiian traditional and customary practices
- Improving the understanding of the concepts of "precautionary planning" to reduce and adapt to the effects of drought and climate change upon water resource availability and quality
- Consultation and coordination with Native Hawaiian community/moku and local experts on resource management and invasive species removal

The Hāna Community Plan reflects regional issues expressed at the community WUDP meetings. Policies related to water resource management include:

- Protect, preserve and increase natural marine, coastal and inland resources, encouraging comprehensive resource management programs
- Ensure that groundwater and surface water resources are preserved and maintained at capacities and levels to meet the current and future domestic, agricultural, commercial, ecological and traditional cultural demands
- Recognize residents' traditional uses of the region's natural resources which balance environmental protection and self-sufficiency
- Discourage water or land development and activities which degrade the region's existing surface and groundwater quality
- Encourage resource management programs that maintain and re-establish indigenous and endemic flora and fauna
- Protect, restore and preserve native aquatic habitats and resources within and along streams

²⁷ Fresh Water Blueprint, Page 9

²⁸ Ko'olau WUDP, Page 99

- Ensure that the development of new water sources does not adversely affect in-stream flows
- Increase water storage capacity with a reserve for drought periods.
- Improve the existing potable water distribution system and develop new potable water sources prior to further expansion of the State Urban District boundary or major subdivision of land in the State Agricultural or Rural Districts.
- Ensure adequate supply of groundwater to residents of the region before water is transported to other regions of the island.

Key issues for the Ko`olau region were identified in public meetings held in Hāna over 2016. Community concerns overlap with those of the Hāna aquifer sector and relate to watershed management and participation by the local community; maintenance of traditional resource management using the ahupua`a system and ensuring that traditional and customary practices are safe guarded. Community members state that younger generations are returning to Ko`olau and Hāna to establish taro lo`i. Other key issues for the region focus on providing affordable water for future needs, providing for taro lo`i and other public trust uses during droughts, and managing resources in a sustainable way.

Due to resource interdependencies, East Maui (Hāna and Ko`olau ASEAs) community concerns are also related to the primary concerns of Makawao-Pukalani-Kula residents, which center on the limited development of water resources and a distribution system to meet the needs of the region. The proper allocation of water resources is considered essential to, in order of priority:

(1) preserve agriculture as the region’s principal economic activity, promote diversified agricultural activities, and effectively encourage the development of Department of Hawaiian Home Lands (DHHL) parcels; and

(2) However, water use in the Upcountry region is recognized as having impacts on the streams of East Maui and the agricultural activities of the central valley.

A comprehensive water management strategy must be developed to strike a balance between the various interests and accommodate environmental, agricultural and on Upcountry and East Maui water issues as they relate to each other and the Central Maui ASEA.²⁹

²⁹ Ko`olau WUDP, Page 98

III. Native Hawaiian Land & Water Rights

Ko`olau Water Use and Development Plan, DHHL Maui Island Plan:

The Hawaiian Homes Commission adopted its Maui Island Plan as the overarching planning document in 2004. The Department of Hawaiian Homelands (DHHL) East Maui planning region encompasses three tracts totaling 985 acres: Ke`anae, Wākiu, and Wailua. All three tracts are within the Hāna Community Plan designated Area. However, only Ke`anae (150.6 acres) and Wailua tracts are within the Ko`alau ASEA, covering 242 acres the State Land Use Commission has mostly zoned Agriculture, with a very small percentage zoned Conservation. The County zoning and Community Plan designations for the lands is Agricultural. For the Ke`anae tract, Two acres of community use is proposed on the makai property, and 32 three- acre agricultural lots are proposed on 57 acres of the mauka property. The chosen DHHL project for the Wailua tract proposes 28 acres of subsistence agricultural use, 52 acres of General Agricultural use and 10 acres of Conservation.³⁰

Central Water Use and Development Plan DHHL Water Resources:

Due to the extensive Department of Hawaiian Homelands (DHHL) land holdings and their plans to further develop the area for Native Hawaiian habitation and farming activities; adequate water supply is becoming increasingly important for Native Hawaiians to resettle and facilitate their cultural practices in the area. DHHL lands are occupied by Native Hawaiians who are assumed to live the full-range of traditional Native Hawaiian cultural practices based on their ability to implement the knowledge of their heritage. Upcountry Maui (Keōkea/Waiohuli, Ulupalakua, Kualapa) has over 6,000 acres of DHHL lands.

The Makawao-Pukalani-Kula Community Plan section, "Identification of Major Problems and Opportunities of the Region Problems," cites "limited development of water resources and distribution system to meet the needs of the region as a primary concern," and notes that "The proper allocation of water resources is considered essential to encourage the development of Department of Hawaiian Home Lands (DHHL) parcel."³¹

Keōkea/Waiohuli – Priority Tract

According to the DHHL Maui Island Plan, with adequate water and funding, this area has the potential to be the largest homestead region on Maui. Over 6,000 acres of DHHL land are located below Kula Highway on the slopes of Haleakala. A 70-unit farm lot subdivision at Keōkea was planned prior to the *Maui Island Plan*. A second phase of 343 residential lots can be implemented using allocations from the existing water system if planned in the mid-section of the tract between existing residential lots and the Keōkea farm lots. An additional 768

³⁰ Ko`olau WUDP, P. 43

³¹ Central WUDP, Page 30

residential lots are proposed for future residential homesteads at Waiohuli pursuant to the development of an on-site production well.

Kualapa

Located along Kula Highway south of Ulupalakua near Kanaio, this tract does not have immediate development potential due to infrastructure constraints. The water system is old and undersized and is not able to accommodate any further growth; and extensive off-site improvements would be needed to support residential development.

Kula Residence Lots

The Kula Residence Lots subdivision is located in the northern portion of the Keōkea-Waiohuli homestead area (yellow on the accompanying map). The subdivision will include a total of 420 lots developed to Rural Residential half-acre standards.

Future DHHL Development

DHHL has long range conceptual plans for about 1,100 more residential lots in the area below the latest developments. The future subdivisions are envisioned to include community facilities, a school site, parks, archaeological preserves, and open space. These future plans are dependent on the development of water, wastewater, road improvements, and funding. The timeframe for these developments is beyond 2020.

Excerpts from Draft EIS Relating to DHHL Lands:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for K kea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its K kea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.³²

IV. Considerations RE: Purchasing & Maintaining EMI System

The Maui County Board of Water Supply Temporary Investigative Committee has conducted interviews and discussions with various individuals in the community with knowledge, expertise and experience who have increased TIG members' understanding of the scope, operations and

³² DEIS, Page 2-4

maintenance of the EMI Water Delivery System as well as the costs related to the purchase or condemnation of the EMI water delivery system and the cost of its maintenance, and the purchase or condemnation of relevant Mahi Pono lands.

The BWS TIG has also reviewed various documents related to the above.

General Considerations

In response to community research, the BWS TIG learned that there are many members of the community who have been considering the option of purchasing the East Maui water delivery system and/or watersheds and had already begun their own analyses prior to the establishment of the TIG.

For Example the East Maui H2O Roundtable discussed the following:

<p>East Maui H2O Roundtable, convened by Sustainable Living Institute of Maui, June 2018, Break-out group on Financing strategies for East Maui Watershed and Water systems.</p>	<p>Participants: <i>ALLISON COHEN (Nature Conservancy)</i> <i>GLADYS BAISA (DWS DIRECTOR at the time)</i> <i>CARL FREEDMAN (economic analyst on water and energy policy)</i> <i>DAVID FISHER (Economist and business advisor)</i> <i>CAROL REIMAN- A&B Public relations head</i> <i>WARREN WATANABE- maui farm bureau</i> <i>LUCIENNE DE NAIE - Sierra Club Maui/ east Maui resident</i> <i>HUGH STARR- ag property specialist/ water researcher</i></p>
<p>Price tag depends on needed systems improvements and community priorities. Costs associated with watershed and ditch system (not County water treatment systems) include:</p> <ul style="list-style-type: none"> • <i>ditch system upkeep and maintenance</i> • <i>watershed management and restoration activities</i> • <i>monitoring gear / programs</i> • <i>alternative water sources</i> • <i>needed studies and plans</i> • <i>system modifications/ expansions</i> • <i>OHA/DHHL share</i> 	
<p>Funding Sources:</p> <ul style="list-style-type: none"> • System users • Private sector funding • International & local bonds • Social impact investors interested in : <ul style="list-style-type: none"> • sustainability • education • carbon offset • adopt a tree programs 	<ul style="list-style-type: none"> • NGO investors (charitable foundations) • Corporate sponsors • County • Federal appropriations (climate impact mitigation funds?) - USFWS/ USDA/ EPA- GRANTS • USGS programs and projects • State - Legislature plus CWRM/ OHA/ DHHL
<p>Determine pricing structure for portion of funding coming from potential water system users:</p> <ul style="list-style-type: none"> • DWS: potable system & ag parks 	

- A&B or successor- farming leases /hydropower
- taro farmers/ kuleana farmers
- Hui partition holders in Huelo
- Maui Gold pineapple
- Ranches
- Recreational users PUC would need to regulate the prices set & PUC bases decision on cost, not “value”

SIDEBAR: AG WATER RATES

- Charging 3 cents per 1000 gal , 100 mgd would cost \$1 million
- Upcountry farmers currently pay \$1.10/ 1000 gal at the County Ag park
- State irrigation district (hawaii island) charges 20 cents/ 1000 gal.

Condemnation Requirements (Per Maui County Corp Counsel)

In an August 2, 2017 transmittal from then-Corporation Counsel Pat Wong to then-Council Member Elle Cochran, advices is provided on the process for initiating condemnation proceedings by the County of Maui. Mr. Wong cites the following sections of the Hawaii Revised Statutes (HRS):

§46-1.5 (6) Each county shall have the power to exercise the power of condemnation by eminent domain when it is in the public interest to do so;

§46-61 Eminent domain; purposes for taking property. Each county shall have the following specific powers: To take private property for the purpose of establishing, laying out, extending and widening streets, avenues, boulevards, alleys, and other public highways and roads; for pumping stations, waterworks, reservoirs, wells, jails, police and fire stations, city halls, office and other public buildings, cemeteries, parks, playgrounds and public squares, public off-street parking facilities and accommodations, land from which to obtain earth, gravel, stones, and other material for the construction of roads and other public works and for rights-of-way for drains, sewers, pipe lines, aqueducts, and other conduits for distributing water to the public; for flood control; for reclamation of swamp lands; and other public uses within the purview of section 101-2 and also to take such excess over that needed for such public use or public improvement in cases where small remnants would otherwise be left or where other justifiable cause necessitates the taking to protect and preserve the contemplated improvement or public policy demands, the taking in connection with the improvement, and to sell or lease the excess property with such restrictions as may be dictated by considerations of public policy in order to protect and preserve the improvement; provided that when the excess property is disposed of by any county it shall be first offered to the abutting owners for a reasonable length of time and at a reasonable price and if such owners fail to take the same then it may be sold at public auction.

§46-62 Eminent domain; proceedings according to chapter 101. The proceedings to be taken on behalf of the county for the condemnation of property as provided in section 46-61, shall be taken and had in accordance with chapter 101, as the ame may be applicable.

§101-13 Exercise of power by county. Whenever any county deems it advisable or necessary to

exercise the right of eminent domain in the furtherance of any governmental power, the proceedings may be instituted as provided in section 101-14 after the governing authority (county council, or other governing board in the case of an independent board having control of its own funds) of the county has authorized such suit by resolution duly passed, or adopted and approved, as the case may be. The resolution, in the case of the city and county of Honolulu or an independent board thereof, shall, after its introduction, be published in a daily newspaper with the ayes and noes, once (Sundays and legal holidays excepted) at least three days before final action upon it, and in the case of any other county or an independent board thereof, be published in a newspaper with the ayes and noes, at least one day (Sundays and legal holidays excepted), before final action upon it.

§101-14 Plaintiff. The attorney general of the State may, at the request of the head of any department of the State, or as otherwise provided by law, institute proceedings for the condemnation of property as provided for in this part. Any county may institute proceedings in the name and on behalf of the county for the condemnation of property within the county for any of the purposes provided in this part which are within the powers granted to the county.

Section 4-2(7) of the Revised Charter of the County of Maui (1983) states: "Resolutions authorizing in eminent domain shall be adopted as provided by law."

Maui County Code Section 3.44.O15(E) states: "The council may authorize proceedings in eminent domain by resolution. Any proceedings so authorized are subject to the requirements of chapter 101, Hawaii Revised Statutes."

The remainder of HRS chapter 101 sets forth the process for completing condemnation proceedings. In summary, after the Council passes a resolution, the County is required to file a complaint in Circuit Court and provide notice of the action to all owners of the property. The County will be required to compensate the property owners for the property taken, and if the parties cannot agree on compensation, the Court will hold a trial on the issue.

Prior to drafting the resolution, the County should obtain a title report for the property, as well as an appraisal of the property's value. The appraised value of the property should be included in the County's budget. The resolution itself should authorize the Department of Corporation Counsel to initiate condemnation proceedings, specifically describe the property, state the public purpose proposed for the property, and authorize Corporation Counsel to deposit money equivalent to the estimated value of the property to obtain immediate possession, if applicable. It is also advisable for the Council work closely with the County department that will be responsible for oversight of the property throughout the condemnation proceedings.

In your request, you discuss the possibility of condemnation of the structures but not the land within the proposed property. Owning the structures without owning the land would limit the County's control of the land to effectuate the purpose of the condemnation.

Please see Appendix 5 for a copy of the transmittal.

In an email request from Board of Water Supply Chair and TIG Vice Chair Shay Chan Hodges, Corporation Counsel Caleb Rowe, stated the following:

"In general, when a condemnation occurs, the governmental body undertaking the condemnation must pay "fair market value" of the property taken. The Hawaii Supreme Court in its decision in Honolulu v. Collins (attached) specifically states that the value of use of water derived from the land shall be considered in a determination of fair market value ("this land has a special value as water producing land. The owners, therefore, are entitled to compensation according to its value as such.")

The calculation of damages would be a little weird for this one since the system is technically on state land and the rights to the water are entirely speculative (dependent on the RP from BLNR). Still, some consideration of the value of water would likely be deemed appropriate in a determination of fair market value."

See Appendix 6 for a copy of Honolulu vs. Collins.

Fair Market value of the EMI System

Market Value in 2018	Based on one-year old purchase price
1. Price paid by Mahi Pono in 2018:	\$5.4 million per the purchase and sales agreement with Mahi Pono Holdings as reported by Maui Time, \$5,442,333.48 per EIS.
2. Assuming that Mahi Pono did its due diligence and \$5.4 million was a fair price for the system last year, has the value increased or decreased since the time of purchase?	<p>Due to the reduction in agriculture, there has been reduced use of the aqueduct system over the last three years, and thus a reduction in EMI staff (as confirmed by Kamole Treatment Plant staff). It is likely that changes in delivery system use combined with less maintenance of ditches and the watershed would have a negative impact on the overall condition of the system.</p> <p>Central WUPD, Page 104: Public concerns were voiced over the EMI system falling into disrepair, inefficiencies due to unlined storage reservoirs and system losses. In the East Maui Streams Contested Case, system losses were assessed to about 22 percent. As sugarcane cultivation is transitioned to other uses, EMI continues to maintain the system and keeping the main ditches functional even with reduced volume flow. CWRM in its June 2018 decision encourages HC&S to seek to make its storage and delivery of water to its fields more efficient to increase the productive yield of the irrigation water from East Maui.</p>

True Value of the EMI System

Current condition of the EMI System:	
<p>1. Comprehensive information from EMI/Mahi Pono about the condition of the delivery system would be extremely useful to the community, not just for the purposes of determining market value, but for assessing overall impacts on the ecosystem, health, safety, and traditional and customary practices.</p> <p>The BWS TIG requested a copy of a safety analysis conducted by Oceanit a few years ago from EMI that might have provided valuable information about the state of the system, as well as recommended improvements. EMI/A&B declined to provide a copy of the report.</p>	<p>Based on the draft EIS, it is unclear what the current condition of the EMI system is. One statement indicates that there WILL be maintenance but does not clarify what the current maintenance is.</p> <p>Page 3-15, Draft EIS: "ongoing maintenance and operation of the EMI Aqueduct System is expected to take place under all alternatives, to the extent operations and maintenance of the system is financially feasible."</p> <p>Page 802, DEIS: "The development and improvement of</p>

<p>BWS TIG requested a tour; which has not been scheduled by EMI yet.</p>	<p>the EMI Aqueduct System over time has cost nearly \$5,000,000, compared to its modern assessment of nearly \$200,000,000 to create a comparable system.”</p>
<p>2. Community Members provided feedback about the condition of the EMI Delivery System and the impacts on safety at focus groups convened for the Draft EIS.</p> <p>Page 4-121, DEIS: <i>Mr. Hau states that the EMI Aqueduct System requires mapping that shows the 388 intakes, ditches, dams, pipes, and flumes. Each diversion should be located and identified accurately with GPS coordinates. Elevations should also be recorded. The amount of water moving through the system should be measured at specific locations within the EMI Aqueduct System as well.</i></p>	<p>Page 4-135,DEIS: <i>As landowners and farmers downstream of the EMI Aqueduct System, two major concerns emerged among participants. First, many reported that the EMI Aqueduct System is not maintained in a manner that was safe for people in the area and located downstream. Focus group participants said that portions of the ditch area are so overgrown with vegetation that people visiting the area are injured if they stumble upon or fall into ditches and flumes that are not readily visible. Two bridges on State land often flood in this wet season, and people cannot drive to their residences until the water level subsides. It was felt that the bridges are unsafe because of a lack of maintenance.</i></p> <p><i>Also, people who visit popular areas in the vicinity of the State Forest Reserve, such as Twin Falls (which is partially within License Area; the upper falls are within the License Area but, the area that is frequently visited is outside the License Area), and area trails, noted that these areas are subject to overgrown landscaping and flash flood conditions. Participants noted that neither EMI nor the State has participated in maintenance of the EMI Aqueduct System and trails in this area, even though this area attracts residents and visitors alike.</i></p>

Operating Costs

Breakdown of Operations Per EMI/A&B:	Page 4-150, Draft EIS:
1. Personnel	EMI is expected to employ a staff of 17 people with a payroll of \$0.8 million. Total direct and indirect jobs is 24, with an associated payroll of \$1.1 million.
2. Operations	EMI's operating cost under the Proposed Action would be \$0.068 per kgal, which is higher than the current MDWS payment to EMI of \$0.06 per kgal. <i>(Includes personnel above and annual maintenance)</i> the 2030 water service fee rate is estimated to be \$0.10, which has been calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, EMI would receive an estimated \$268,000 in 2030 from the MDWS
3. Taxes	GET revenue would be estimated at \$37,000 while payroll tax would be \$45,400 per year
4. Payments to DHHL and OHA	\$169,300 would be disbursed to OHA and \$254,000 would be set aside for the DHHL
5. State Leases	Based on appraisal.
6. Total operations	Page 2-1, DEIS: Total operational costs for labor, fringe benefits, materials, professional services, taxes, maintenance, anticipated rental payments to the State for the Water Lease, and other expenses are projected to be approximately \$2.5 million per year (Munekiyo, 2019).

Opportunities for Direct Cost Savings Through Improved Maintenance

Engineering study of the EMI system that assesses the cost-benefit of mitigating 20% losses is needed.	What are the funding options available for environmental assessments?
1. Given the amount of water that is lost through leakages on a regular basis, what would the savings be of proper repair and maintenance to the owner of the system, and would that savings offset any of the R&M costs?	Ko'olau WUDP, Page 121: "...water losses due to leaks, seepage, evaporation and other inefficiencies in the treatment, conveyance, distribution and storage of water range widely depending on storage and source transmission system age, length, type and many other factors...To account for water losses and determine source needs for Upcountry, water produced, rather than water billed is used as basis to determine source needs. For the Upcountry system, water losses average 20%. " USGS Civil Engineer/Hydrologist Matt Rosner is willing to come to Maui to measure stream flow and ditch flow at the 27 contested stream areas
2. What would the estimated increased availability of water to Upcountry residents be as a result of proper repair and maintenance?	
3. What would the impact be on overall East Maui stream restoration if less water needed to be diverted to supply Upcountry Maui?	

Opportunities for Indirect Cost Savings through Mitigating Health and Safety Risks

Health and Safety Considerations and Concerns, including Climate Crisis Impacts	In addition to direct costs, the County should look at other considerations that affect the well-being of Maui residents.
1. What are the safety concerns that would affect the community at large if the system is not properly maintained, regardless of ownership?	Page 3-14, DEIS: <i>Impact to historic properties. Components of the aqueduct system that deteriorate and begin to fail, such as broken ditch walls or collapsed tunnels, have the potential to alter natural drainage patterns and increase erosion in downstream areas that are outside of established stream channels. These areas have the potential to contain surface and subsurface historic properties that could be affected by flooding and erosion. (Mason Architects, 2019).</i>
2. What are the health and social effects on East Maui residents, including community impacts for intergenerational farmers returning to the valleys that have been without water for over a hundred years, if EMI Delivery system is not maintained optimally?	This would require a thorough study of the impacts of access to water on farmers and communities from a socio-economic perspective, looking at potential impacts of returns to East Maui.
3. How does maintenance of the EMI Delivery System impact Climate Crisis safety concerns with regard to flooding? <i>(Steps to be taken regarding climate crisis mitigation over the next thirty years were not in the DEIS although climate change is mentioned as a factor.)</i> Page 802, DEIS: The development and improvement of the EMI Aqueduct System over time has cost nearly \$5,000,000 , compared to its modern assessment of nearly \$200,000,000 to create a comparable system. <i>Long term improvements will be a fraction of the replacement cost of less than \$200 million (as estimated by the DEIS)</i>	Page 4-72, DEIS: <i>Climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. With several streams being within East Maui, greater, episodic rainfall could increase stream flows and possible exceed the capacity of the EMI Aqueduct System as discussed in Section 4.3.1. The Modified Lease Area alternative could present risks to public safety if unfettered public access within the License Area meant more people could be put at risk due to stream flooding.</i>

Opportunities to Support Economic Development As Defined by the Community

The EMI Delivery System and Economic Development	The County should look at how public ownership would further support value-aligned economic options as defined by East Maui residents.
1. An analysis of the economic and social value of a well-maintained aqueduct system that supports local farming regardless of state laws governing stream flow standards would allow the County, if it were the owner, to support multiple stakeholder needs from a variety of perspectives.	Summary, Page 58, DEIS: <i>At full development, East Maui farms would produce about 1.0 million pounds per year of taro and about 400,000 pounds per year of other crops, resulting in \$2.9 million in direct and indirect sales per year. Farms would support a total of 21 direct and indirect jobs.. (Munekiyo, 2019).</i>
The impact of eliminating water loss on streams and waterfalls could be looked at from the visitor industry perspective.	What would loss of waterfalls impact be on tourism dollars?

Economic and Other Benefits of Accountability Regarding Streams Flows

<p>Although a number of legal decisions have supported the return of water to streams, there is a lack of funding for monitoring and enforcement</p>	<p>Public ownership of the water delivery system would provide transparency, accountability, and multiple remedy options to the public if laws are not followed.</p>
<p>1. As noted above, maintaining water in the streams has an impact on the watershed. There is also local and global environmental, community, tourism, energy, food security, and cultural value to being able to ensure that streams are being restored as ordered by the State.</p>	<p>The Code (HRS § 171C-3) defines “instream use” as: beneficial uses of stream water for significant purposes which are located in the stream and which are achieved by leaving the water in the stream. Instream uses include, but are not limited to:</p> <ol style="list-style-type: none"> 1. Maintenance of fish and wildlife habitats; 2. Outdoor recreational activities; 3. Maintenance of ecosystems such as estuaries, wetlands, and stream vegetation; 4. Aesthetic values such as waterfalls and scenic waterways; 5. Navigation; 6. Instream hydropower generation; 7. Maintenance of water quality; 8. The conveyance of irrigation and domestic water supplies to downstream points of diversion; and, 9. The protection of traditional and customary Hawaiian rights.
<p>2. If the water delivery system were publicly owned, there are more avenues already in place for pursuing robust and authentic engagement with East Maui families regarding care of diversion paths, including a community-based system of repair and maintenance (kuleana) which supports ongoing communication and relationship building.</p>	<p>Koʻolau WUDP, Page 15: There are 36 streams in the Koolau ASEA, that are classified as perennial. Of these streams, 31 are considered continuous and 5 are considered intermittent. The CWRM database indicates that there are 323 declared stream diversions in the Koʻolau ASEA and 11 gauges, of which, only three are “active.” Most of these diversions belong to the East Maui Irrigation Company (EMI).</p>
<p>3. Because EMI/Mahi Pono is requesting a 30-year lease, there will be no opportunities for the community to demand accountability until 2050, long after intense effects of climate change have impacted Maui.</p>	<p>Page 4-121, DEIS: In addition, Mr. Hau relayed via email that he recommends a five-year lease with constant updates due to the fact that the project description lacks information on the amount of water flowing through the EMI Aqueduct System and the actual amount of water collected at each diversion and/or ditch without the factor of climate change accounted for.</p>

Community Security Benefits

<p>In addition to weighing the cost/benefits of owning the EMI Aqueduct System in the context of providing domestic water to Maui residents, the County needs to consider the long-term benefits of having control over its water supply over the next 30 years.</p>	<p>How does control of the delivery system combined with the fact that water is a public trust support proactive access to water and system improvements?</p>
<p>If the County of Maui owns the EMI Delivery system, given that Act 126 specifically allows for the continued diversion of water to serve Upcountry Maui, it seems very likely that the County would be in a strong position to receive a long-term lease from DLNR. Having its own long-term lease would release the County from dependence on a private company for the health of the community.</p>	<p>Issuance of a long-term lease of State land from the Board of Land and Natural Resources pursuant to Hawai'i Revised Statutes (HRS) Section 171-58(c) would provide <i>the "right, privilege, and authority to enter and go upon"</i> state-owned license areas <i>"for the purpose of developing, diverting, transporting, and using government-owned waters"</i> including the right to go upon those State lands to maintain and repair existing access roads and trails used in connection with the privately owned water aqueduct system.</p>
<p>According to Director Jeff Pearson at the September 19, 2019 Meeting of the Board of Water Supply, the County of Maui would not be able to apply for a revocable permit or lease unless it owned the "diversion." As the owner of the EMI delivery system, the County would be able to apply for a lease.</p>	<p>Director Pearson made this statement in response to a recommendation by Senator Kai Kahele that Maui County apply for an RP immediately. Per Senator Kahele, the county is a domestic water provider, its rights are constitutionally protected. If they have an RP or a long term lease, no matter who runs the transmission system, they can always get water for Kamole. See attached Appendix #3</p>
<p>Having ownership of the system and its own Lease, the County of Maui would be able to ensure the public safety and support public access to the area as needed.</p>	<p>Page iii, DEIS: The Water Lease will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow continued operation of the EMI Aqueduct System.</p> <p>Beyond access to domestic water, there are also health and safety issues related to Climate Change for Upcountry Maui. Page 473, DEIS: Changes in precipitation may affect Upcountry Maui's ecosystems and communities include flooding, erosion, drought, and fire.</p>
<p>Because the County is a public entity, ownership of the delivery system combined with a long-term lease would provide access to public funding for maintenance of the system and restoration of wetlands that a private owner can't access.</p>	<p>A current example is the Department of Agriculture which is providing \$4.5 million in help restore stream access. The DoA cannot use the funds on private lands, such as EMI/Mahi Pono lands. Similarly, USDA and other funding that could be used to repair the EMI delivery system, could only be accessed if the system were owned by a public entity.</p>
<p>Public ownership of the delivery system – particularly if combined with lands owned by the County of Maui – would allow for more comprehensive systems oriented solutions to water needs by combining renewable energy, bio-fuel, farming plans that are tailored to</p>	<p>Water and farming plans that integrate analysis of use of curtailed wind energy for water pumping in agriculture and municipal systems can reduce agricultural water needs, lower energy costs for pumping water upcountry, and potentially increase stream flows. (Examples: A</p>

community needs, and efficient water systems.	Systems Approach for Investigating Water, Energy, and Food Scenarios in East-Central Maui ³³)
Public ownership would also allow for mechanisms that require a Water Management Plan, modeled on the Water Use and Development Plan, but with teeth.	Page 4-145, DEIS: <i>Interviewees stressed that Mahi Pono should implement a Water Management Plan. The Plan should outline improvements to the EMI Aqueduct System, including brush fire prevention and relate water needs to specific crops.</i>
Public control over water delivery systems and watershed areas would support proactive and integrated efforts to ensure an affordable and predictable supply of water.	Board of Water Supply, City and County of Honolulu, 2016 Master Plan, 6.2 Sustain³⁴ The BWS manages thousands of acres of watershed area on O’ahu to protect and preserve 212 separate potable water sources, the combination of 194 individual groundwater wells, 13 active potable water tunnels, and 5 shafts. The BWS’s proactive efforts to manage and protect the watersheds include limiting access and development, combatting invasive animals and plants, promoting healthy forests, and encouraging customer water conservation to reduce the amount of water withdrawn from the environment. These BWS efforts are discussed in more detail in Section 4, Water Supply Sustainability.
Public or quasi-public ownership of the water delivery system would enable the public to ensure that workers are paid a living wage.	Public employees would have to belong to the union.
Public ownership of the EMI water delivery system would provide an opportunity to move towards reparations for the Native Hawaiian families who have not had access to their streams for over 100 years. Unlike local government, which exists to meet the needs of its citizens, a private entity – particularly one that is funded by an institutional investor with obligations to pension fund beneficiaries – will never be able to put environmental and cultural ahead of maximizing revenues.	Per the WUDP: Historically, great efforts were made to allocate water for all needs on Maui. Today, native Hawaiians are challenged with the negative consequences of resource "ownership," with "owners" sometimes lacking sensitivity or requirements to share with others. Perhaps past strategies of sharing distribution and timing of water flows can be adopted in order for all water users to be supplied with this important resource. Consortiums of water partners have been discussed as options to ownership and management of the East Maui Irrigation water system. ³⁵
As noted at the beginning of this document, the impetus for forming the Temporary Investigative Group grew out of the fact that Mahi Pono has not been responsive to the Community, nor has the company responded to requests by the Board of Water Supply for engagement. According to Water Department Director Jeff Pearson, he has continually encouraged Mahi Pono representatives to respond to the Water Board. Even though Director Pearson and the Maui County Administration have lobbied the State Legislature and will	<i>Page 4-141 of the DEIS:</i> <i>It is recommended that interest groups, or stakeholder groups, are clearly defined so that there is recognition of who will be affected by the proposed Water Lease. Groups should include geographic communities, environmental, agriculture and business interests, and public agencies. Each group would be encouraged to reach consensus on their own needs, concerns, opportunities and possible solutions.</i> <i>It is recommended that interest groups are equitably</i>

³⁴ <https://boardofwatersupply.com/bws/media/files/water-master-plan-final-2016-10.pdf>

³⁵ Ko’olau WUDP, Page 39

<p>be lobbying the Department of Land and Natural Resources to support EMI/Mahi Pono application for a long-term lease, Mahi Pono has not been compelled to meet with the only volunteer board that advises the Mayor and County Council on matters related to water.</p>	<p><i>represented in a “Core Working Group” that would serve as a forum for exchanging ideas and collaborative efforts, as well as provide feedback and suggestions to Mahi Pono. Each member of the Core Working Group would be expected to reach out to their own networks to extend the discussion beyond the Core Working Group. While there would likely be strong differences in perspectives and opinions, the Core Working Group would need to find ways to establish core principles, common ground and manageable solutions.</i></p> <p><i>The fundamental value that will help bring people to the same table is trust. The Proposed Action has elicited skepticism and distrust over many decades, and these feelings prevent willingness for participating in mediation and collaboration. While developing trust among the various groups will be challenging, the first step is transparency. Being open about intent, plans, and activities can begin to establish credibility and open the door to dialogue.</i></p>
---	---

Risks of leaving access to the public trust in private hands

<p>The County also needs to consider the risks of an outside privately-owned entity that has an obligation for a 10% annual rate of return controlling Maui’s future water supplies.</p>	<p>Any considerations that do not improve the corporation’s bottom line are not likely to be considered unless the corporation were to become a Sustainable Business Corporation under Hawaii State Law or make other commitments in writing.</p>
<p>Lack of water for upcountry if EMI/Mahi Pono don’t get long-term leases.</p>	<p>Page xiii, DEIS: Without the Water Lease, even if EMI could find it economically feasible to continue maintaining the EMI Aqueduct System to divert non-governmental water for diversified agriculture in Central Maui, there may not be enough water to allocate much or any to the MDWS. This lack of water would exacerbate the effects of drought when other surface water sources are unreliable for the KAP and the Nahiku, this could eliminate their primary source of water. Insufficient water delivered to the County through the EMI Aqueduct System could have significant effects on health and safety of those who currently rely on that water delivery.</p>
<p>As climate change creates more uncertainty and extreme impacts on residents, it is dangerous to assume a private company will take responsibility for potential losses (PG&E, bankrupt...)</p>	<p>Page 3-11, DEIS: Climate change may cause a decline in rainfall in Upcountry Maui. Any alternative that may result in less water being delivered through the EMI Aqueduct System to the MDWS for use in the Upcountry Maui Water System could increase periods of intense water shortages in Upcountry Maui.</p>
<p>As noted previously, Mahi Pono and its investor, PSP are required to earn a 10% annual return on their investment. It is not wise to assume that they will put the health and</p>	<p>Associated Press, 2015: “As California enters its fourth year of drought and imposes the first mandatory statewide water cutbacks on cities and towns, the \$6.5</p>

<p>safety of Maui residents before their own profits when they've invested \$260 million. Furthermore, as an entity from out of state with no local ties, there is no social reason for accountability.</p>	<p>billion almond crop is helping drive a sharp debate about water use, agricultural interests and how both affect the state's giant economy."³⁶</p>
<p>In terms of supporting agriculture, it is important to differentiate between export and food security corps; how specific agricultural practices impact the climate crisis; whether the specific economic activity results in good jobs for Maui residents; and or whether it will exacerbate the housing crisis by importing workers.</p>	<p>Because EMI System is currently owned by a company that is required to provide retirement benefits to pension fund beneficiaries, the company cannot consider Maui County food security ahead of export profits, nor can they consider native Hawaiian subsistence farming ahead of domestic or export profits.</p>

In Summary: Determining Costs and Benefits of Purchasing EMI System

- 1) A thorough engineering and cost analysis of the current EMI Delivery system is needed to determine the EMI System’s true value as a stand-alone or partial system (and the various permutations thereof), in conjunction with improvements. This analysis needs to provide reliable information about:
 - What parts of the system are usable and what is the cost and value of repair, particularly in light of the “natural downsizing” currently taking place;
 - Based on the domestic water use needs in Upcountry Maui and the condition of various aspects of the EMI system, what would be the most cost-effective strategy for partial purchase and use of the EMI system?
 - What are the options for condemning parts of the system and/or small tracts of land?
 - What are the benefits, if any, of purchasing specific ditch systems, such as only the Wailua Ditch System?
- 2) Estimates of socio-economic benefits of increased farming in East Maui;
- 3) Estimate of potential cost savings from reduced reliance on Wailoa Ditch if the County had increased access to other diversions on the EMI system;
- 4) Estimate of potential cost savings from improved health, safety, and other socio-economic indicators for East Maui residents who rely on the streams for farming and other cultural and recreational practices.
- 5) Annual costs of maintaining the EMI System.
- 6) Potential revenues based on domestic water and agricultural water sales.

³⁶ <https://www.businessinsider.com/the-65-billion-almond-crop-is-driving-the-sharp-debate-about-california-water-use-2015-4>

V. Alternative Water Sources

Overview of Water Source Planning:

Excerpted from the Maui Island Water Use And Development Plan Draft, Part Iii Regional Plans, Ko`olau Aquifer Sector Area (ASEA)³⁷:

Conventional water sources include groundwater (wells and tunnels) and surface water (stream diversions). Region specific planning objectives related to ground and surface water use and development identified and confirmed in the WUDP update public process include:

- Improving the understanding of the concepts of "precautionary planning" to reduce and adapt to the effects of drought and climate change upon water resource availability and quality
- Adapting future populations to local water resource conditions, integrating conservation and the use of alternative resources
- Water needs of DHHL in the Ko`olau should be considered in general and in accordance with the 2017 State Water Projects Plan

Planning objectives related to groundwater and surface water source use and development identified to apply island wide include:

- Manage water equitably
- Provide for Department of Hawaiian Homelands needs
- Provide for agricultural needs
- Protect cultural resources
- Provide adequate volume of water supply
- Maximize reliability of water service
- Minimize cost of water supply
- Increase water storage capacity with a reserve for drought periods.
- Ensure that adequate water capacity is available for domestic needs of the region.
- Ensure that the development of new water sources does not adversely affect in-stream flows.
- Improve the existing potable water distribution system and develop new potable water sources prior to further expansion of the State Urban District boundary or major subdivision of land in the State Agricultural or Rural Districts.
- Ensure adequate supply of groundwater to residents of the region before water is transported to other regions of the island.

³⁷ Ko`olau WUPD, Page 103

Potable Groundwater Development:

From Ko`olau WUDP:

The amount of groundwater that can be developed is limited by the amount of natural recharge and aquifer outflow that contribute to streamflow and to prevent seawater intrusion, established as sustainable yield. Because delineation of aquifer sectors and systems in some cases are based on limited hydrologic information, areas for potential groundwater development must be assessed on its own merits to determine any additional needs for hydrologic studies and interaction with surface water and other sources.

Understanding potential impact of climate change adds to uncertainty in long-term groundwater availability. The primary responsibility to determine potential impacts on water resource availability lies with the State CWRM who in turn relies on studies and predictions by the scientific community and other agencies. Water purveyors need guidance how to mitigate and adjust to potential changes in groundwater availability.

Other constraints on groundwater availability include access and cost. Conveyance from high yield aquifers in remotely located watersheds to growth areas can be difficult and expensive due to topography and distance. Basal well development at high elevations, such as Makawao aquifer above 1200 feet would result in high pumping costs, just in terms of pumping water from the water table to ground elevation.

Potential effects of groundwater development on streamflow and on the quality of water pumped from existing wells in a region can be evaluated by robust hydrologic studies and models. Joint funding and collaboration between the municipal and private purveyors, CWRM and the U.S. Geological Survey would focus studies to maximize benefits and prevent conflicts in water development and designation. Aquifer systems in Ko`olau are not extensively studied, as indicated by CWRM's confidence rating in establishing sustainable yield. Haiku aquifer has sufficient yield to serve regional demand and support development of planned growth areas outside Ko`olau. It is recommended that CWRM prioritize hydrological studies and groundwater modeling in Haiku and Honopou regions to guide private and public well development and ensure potential impacts on surface water is addressed first.³⁸

Additional points from Central WUDP:

Other constraints on groundwater availability include access and cost. Conveyance from high yield aquifers in remotely located watersheds to growth areas can be difficult and expensive due to topography and distance. The Central ASEA consist of the driest regions on Maui, with annual rainfall generally less than 50 inches. Population centers and growth rely on groundwater

³⁸ Ko`olau WUDP, Page 104

imports from the Wailuku ASEA and the Ko'olau ASEA where rainfall and groundwater recharge are substantially higher. ³⁹

<p>In order to determine whether development of wells in East Maui should be considered as an alternative to surface water, yield, aquifer capacity, and energy cost need to be studied.</p>	<p>Central WUDP, Page 112: Strategy #4 Explore East Maui well development in combination with Makawao aquifer basal groundwater to meet projected demand on the MDWS Upcountry System. Initiate a hydrologic study to determine any negative impact on existing ground and surface water sources, stream flow and influences from dikes. Potential yield is more than the needed 6.3 mgd (potentially in addition to development for the MDWS Central System). Lead agencies would be CWRM and MDWS and hydrologic study to be completed by USGS.</p>
<p>Current inventory of wells in East Maui: The Ko'olau ASEA includes 149 wells, of which 131 are considered "production" wells, the remainder (18) are classified as "unused" (9), observation (2), and seven classified as "other" that do not produce water. The 131 production wells include County municipal (4), private public municipal (3), domestic (59), agricultural (crop use[39]), agricultural (1), agricultural (aquatic plants & animals use [1]), one agricultural (livestock and pasture use), three agricultural (ornamental & nursery plants use), 15 irrigation, and seven irrigation (landscape/water features use).</p> <p>CWRM pumpage reports for 2014 show that pumpage for the Ko'olau ASEA was approximately 0.92 MGD with County Municipal wells accounting for 0.878 MDG (95.81 percent of total sector pumpage), Municipal Private Public wells accounting for 0.015 MDG (1.63 percent of total sector pumpage), Agriculture wells accounting for 0.014 MGD (1.53 percent of total sector pumpage), Domestic wells accounting for 0.008 MGD (0.86 percent of total sector pumpage), and irrigation wells accounting for 0.0017 MGD (0.19 percent of total sector pumpage). However, it is likely that domestic use is underreported.</p>	<p>Page 4-59, DEIS: <i>While no groundwater is transferred from the Ko'olau Aquifer Sector, surface water is conveyed from the sector to the Central Aquifer Sector via the EMI Aqueduct System. Since surface and groundwater interchange depends on the underlying geology, the increase in surface flow since the cessation of sugar cultivation in 2016 also contributes to an increase in groundwater in East Maui.</i></p> <p>Page 3-9, DEIS: <i>There may be a connection between decreased stream diversions and increased groundwater. However, the current pumpage of wells in the four aquifers in East Maui (Ha'iku, Honopou, Waikamoi, and Ke'anae of the Ko'olau Aquifer Sector) is well below the SY (Sustainable Yield.)</i></p> <p>Page viii DEIS: naturally running low during seasonally dry weather conditions. Hence, the amount of water that can be diverted during dry weather conditions would be substantially less than when sugar was being cultivated. As a result, dependence on groundwater resources during such conditions may increase and/or water conservation measures may be required. Future climate change could also exacerbate the frequency and length of periods of low rainfall.</p>

³⁹ Central WUPD, Page 105

<p>Cost of well development and operation: Wells are more expensive than surface water due to energy costs for development and pumping, but costs can be mitigated with solar, wind, hydro-pumped storage, particularly if the Department has access to land.</p> <p>In order to comprehensively compare costs, all factors described previously in this report related to repair and maintenance of the EMI Aqueduct System, combined with the environmental, safety and cultural benefits of EMI ownership would need to be compared to well development costs.</p> <p>Any well development plan should include scenarios that utilize renewable energy, the costs of the development of which would also need to be calculated. However, agreements with MECO and the benefits of bringing the State to its goal of 100% renewable energy by 2045 would also need to be factored in.</p> <p>Page 110 WUDP: Explore new basal well development in the Makawao aquifer to accommodate growth Upcountry and add reliable new source. Potential yield is up to 3 mgd. Lead agency is MDWS, DLNR and/or public/private partnerships.</p>	<p>Page 3-2 to 3-3, DEIS: “a single well is normally allowed to pump about 1 mgd within its area”</p> <p>Given current figures regarding Kamole Treatment Plant needs, 3 to 7 wells would need to be developed. Each well site would have an estimated development cost of \$6 million. (Akinaka, 2019).</p> <p>The cost of planning, obtaining permits for, and constructing 7 wells would be approximately \$13 million. Added to this cost would be transmission pipes, additional pumping and related energy consumption to reach higher elevations, and reservoirs.</p> <p>Page 110, WUDP: The 2013 MDWS study estimated well development at 2,050 foot elevation and related booster pump and transmission line to about \$8.4M and a 20-year cost of \$2.90 per 1,000 gallons for development of 1.2 mgd pump capacity, normally run at 0.8 mgd source capacity. The study only evaluated a scenario with one well in Makawao aquifer and in combination with well development outside Makawao aquifer.</p>
<p>Central WUDP, Page 109: Adding 20% to projected 2035 demand of 8.53 mgd for Upcountry is 10.23 mgd. With the addition of the Priority List demand of 7.3 mgd, total demand is 17.54 mgd. Available source capacity is 11.2 mgd, which would require the balance 6.34 mgd to be developed. (includes 7.0 Surface Water)</p> <p>8.53 mgd 2035 Municipal Demand + Peak Factor 20% = 10.23 mgd + Upcountry Meter Priority List 7.3 mgd = 17.54 mgd</p> <p>- 11.2 mgd Available Source Capacity = 6.34 mgd Source Needed</p>	<p>Page 3-17: DEIS:</p> <p>If the MDWS has to replace the 7.1 mgd supplied by the EMI Aqueduct System, and in addition develop to the 7.95 mgd projected to be needed to meet future water demands, the MDWS would need to develop 15.05 mgd of new water source. It is estimated that the life- cycle unit cost to develop those necessary wells and reservoirs for Upcountry Maui is \$38 per kgal. This would translate to \$2.6 billion, compared to \$1.2 billion under the Proposed Action.</p>

Other Sources of Potable and Non-Potable Water

Other Water consumption varies seasonally, with the low demand months generally reflecting lower outdoor irrigation demands. For MDWS systems, the seasonal fluctuations indicate the potential for outdoor water conservation as well as ways to offset use of potable water for non-potable needs. These conditions are likely to also apply to all public water systems that serve community needs.

Reservoirs: Are there studies showing current reservoir capacity and optimum inventory for an efficiently integrated storage system?	What is a private owner's obligation to the public with regard to maintaining storage for health and safety reasons?
<p>Central WUDP, Page 123: In summary, reservoir and treatment plant expansion would have multiple benefits:</p> <ol style="list-style-type: none"> 1. Improve reliable capacity 2. Economical water supply that minimized expensive groundwater pumping costs 3. Defer source development in Haiku aquifer in light of uncertainties related to the East Maui Consent Decree 4. Recharge regional groundwater in wet season when maximizing use of stormflow from rainfall <p>If financing can be secured, raw water storage construction presents an economic strategy compared to basal well development. If a string of basal wells and extensive transmission would be added to the MDWS Upcountry System during the same time frame as a reservoir, the economic benefit would be significantly diminished. Both resource strategies have long implementation time frames and can be adjusted over time. Should development of basal source in the Makawao aquifer produce adequate yield and quality, additional wells in Haiku aquifer OR expanded surface water storage and treatment will meet projected demand. Uncertainties in future stream flow must be weighed against increased reliability and cost of basal well development. Maximizing affordable surface water use in wet season must be weighed against "over building" expensive wells and infrastructure that is not used to capacity.</p> <p>On Oahu, the BWS also operates brackish and recycled water nonpotable water systems for irrigation and industrial use in 'Ewa, Mākaha, and Hālawa Airport. The BWS owns and maintains five dams or open reservoirs. Four reservoirs in Nu'uuanu are now used solely for flood control, and the fifth, Mauna 'Olu reservoir, stores nonpotable water used for irrigation. The four Nu'uuanu reservoirs may be used for stormwater capture, infiltration, or hydropower in the future.⁴⁰</p>	<p><i>Central WUDP, Page 124: Strategy #8: Pursue hydrologic studies needed to explore the Haiku aquifer and an updated ditch flow analysis to optimize raw water storage and treatment plant capacity at Kamole Weir in order to expedite the most feasible new source. Raw water storage and Kamole Water Treatment Facility expansion are contingent on a long term agreement with A&B Properties allocating adequate surface water for the MDWS Upcountry System. Lead agency is MDWS.</i></p> <p>This strategy supports multiple planning objectives, including to seek expanded municipal withdrawal from the lowest cost source to serve the Upcountry region and to increase water storage capacity with a reserve for drought periods.</p> <p><i>Central WUDP, Page 104, Water Loss Mitigation:</i> Explore funding and conduct a cost benefit analysis of improvements to the EMI non potable conveyance system to mitigate losses and preserve existing reservoirs at risk of decommissioning. County of Maui and A&B Properties/EMI Company in partnership would lead initiatives. Priority components and associated costs TBD.</p> <p><i>Page 3-4, DEIS:</i> EMI Aqueduct System has eight reservoirs, mostly along the lower ditch systems, and the Central Maui field irrigation system has 48 major reservoirs. The combined storage capacity of these existing reservoirs is approximately 1,344 mg (Akinaka, 2019). Most of these reservoirs, however, have not been used since the closure of sugar in 2016 and others have not been used because they do not meet dam safety requirements. As a result, many will require extensive upgrades to put them back into service. These upgrades could cost between \$50 – 100 million (Akinaka, 2019). Obtaining permits to upgrade and repair these reservoirs will also be challenging due to current dam safety requirements. Assuming that the existing reservoirs can be restored to their full capacity of 1,344 mg, and the amount of flow available for irrigation under the Proposed Action is approximately 92.32 mgd, then the existing reservoirs could provide about 16 days of storage</p>

<p>Recycled Water</p> <p>The State of Hawai'i defines R-1 water as the highest-quality recycled water; it has undergone filtration and disinfection to make it safe for use on lawns, golf courses, parks, and other areas used by people. R-2 recycled water can only be used under restricted circumstances where human contact is minimized.</p>	<p>Central WUDP, Page 57: Wastewater generated within the Central ASEA is treated at the Kahului Wastewater Reclamation Facility (WWRF), east of Kahului Harbor, and the Kihei WWRF. No wastewater serves East Maui or Upcountry?</p>
<p>Rainwater Catchment:</p> <p>WUDP: Rainwater catchment is the collection of rainwater from a roof or other surface before it reaches the ground.</p> <p>Rainwater catchment systems are not regulated by the Department of Health, making estimates of their use difficult. No inventory of installed catchment systems throughout the island is available.</p> <p>Central WUDP, Page 129: Rain barrel incentive programs are included in recommended demand side conservation strategies and the MDWS conservation program.</p> <p>Catchment systems for agricultural uses have historically played an important role Upcountry. Support for increased adaptation to natural ambient rainfall and climate adapted crops is consistent with the objective to use appropriate water quality for appropriate uses.</p>	<p>Koolau WUDP, East Maui: On average, USGS data indicates rainfall ranges from 101-454 inches per year, making the Ko'olau ASEA Maui Island's rainiest ASEAs and one of the wettest places in Hawai'i. The heaviest rainfall is in the Ke'anae ASYA, where it rains as much as 454 inches per year. The cooler, dryer upper elevations may have as little as 101 inches of rain per year. Rainwater catchment is not as reliable a conventional water resource because it is extremely sensitive to the climate; however, rainwater catchment is a viable option in this region.</p> <p>Central WUPD, Upcountry and Central, Page 56: Rainfall averages 15 inches along the southern coastline on Haleakala, and it increases to 70 inches as one moves eastward and into higher elevations. Rainfall catchment systems occur in the eastern part of the hydrologic unit, from Makawao and Olinda and also scattered throughout Kula. There is no official inventory of catchment systems but it is an important supplemental resource for non-potable purposes. Catchments systems using potable treatment technologies have been installed Upcountry due to water meter limitations imposed by the Upcountry Meter Priority List.</p>
<p>Stormwater reuse:</p> <p>The Fresh Water Council believes that a critical element of protecting long-term water security in the Hawaiian Islands is to aggressively increase our ability to capture rainfall and surface storm water. Our underground fresh water supply can be restored with: 1) reduced pumping from the aquifers; 2) increased rainfall; and/or, 3) increased effective recharge. ⁴¹</p> <p>Central WUPD, Page 129: Stormwater capture and use can provide multiple mitigating effects on</p>	<p>There is no reported stormwater reuse within the Ko'olau ASEA, although a limited number of development projects may have stormwater controls incorporated into project design to reduce runoff and its effects.</p> <p>Stormwater reuse at the parcel scale may also provide an opportunity to offset landscape and other irrigation demand of projects or households.</p> <p>Central WUPD: There is no reported stormwater reuse in the Central ASEA, although some</p>

⁴¹ Fresh Water Council, Page 13

<p>climate change, including off-setting potable supply for irrigation needs; recharging low level and more brackish portions of the region’s aquifers; and mitigating sediment runoff reaching the nearshore marine environment and reefs.</p> <p>Central WUDP, Page 58: Capture and reuse of stormwater runoff is an under-utilized water resource that provides an opportunity to reduce reliance on groundwater and surface water for landscape irrigation, especially when incorporated into the design of development projects in order to minimize infrastructure costs.</p>	<p>development projects may have stormwater controls incorporated into project design to reduce runoff and its effects. The <i>Hawai’i Stormwater Reclamation Appraisal Report, 2005, and Study Element 3: An Appraisal of Stormwater Reclamation and Reuse Opportunities in Hawai’i</i>, September 2008, screened and identified four projects on Maui within the final ranking, which might provide opportunities to augment agricultural irrigation water that is diverted currently from Maui streams, in addition to providing other benefits:</p>
<p>Desalination:</p> <p>Desalination of ocean or brackish water was studied as an option in the 2013 MDWS study, Maui Island Water Source Development Options for the Central MDWS system, but an assessment has not been conducted for the Ko’olau ASEA, and there are presently no desalination projects within. There are no desalination projects in the Central ASEA.</p>	<p>One major cost to operate a desalination plant is the high energy demand of the process, and the disposal of the brine liquid byproduct creates logistical and environmental challenges that also increase cost. As desalination technology advances and energy costs decrease, brackish and ocean water desalination should continue to be evaluated for their potential as effective future water supply alternatives.</p>

VI. Ensuring Access to the Public Trust:

<p>While ownership of parts or the full EMI Delivery System, as well as ownership of land parcels are obvious avenues for ensuring access to the public trust, other remedies should also be explored.</p>	<p>What are the legal actions that can be taken besides condemnation?</p>
<p>Negotiate new Domestic water use Agreements with EMI/Mahi Pono:</p> <p>As noted in the DEIS, “EMI agreements with the MDWS provide that water supplied to the MDWS is contingent upon the Water Lease being issued...Currently the MDWS is being charged 6¢ per 1,000 gallons to receive East Maui surface water for the KAP and other Upcountry Maui farm areas.”</p> <p>In the past, EMI was required to maintain the roads and trails, maintain the delivery system, and leave enough water in streams for downstream domestic</p>	<p>One key way to safeguard the public is to negotiate new agreements with EMI/Mahi Pono that:</p> <ol style="list-style-type: none"> 1) Remove contingency of access to the public trust on a private company receiving permits/leases from BLNR. 2) Require a minimum level of repair and maintenance of the Ditch System by EMI/Mahi Pono to ensure the health and safety of the community. 3) Require that EMI/Mahi Pono reduce leakages in the delivery system to optimize water use, thereby

<p>water users and Kuleana users, and they were required to post a \$100,000 performance bond.⁴²</p>	<p>increasing amount of water going to the Kamole Treatment Plant, and decrease the amount of water diverted from streams.</p> <p>4) Require a minimum investment in the care of the watershed and other environmental responsibilities, that includes partnerships with stakeholders.</p> <p>Can the county require water conservation from an environmental perspective – for example a kind of carbon tax – wasted water tax?</p>
<p>State Irrigation System</p>	<p>WUPD (Central)⁴³ A non-potable State water system exists within the Polipoli State Recreation area. The Polipoli Springs State Recreation Area water system is located in the Kahikinui Forest Reserve, overlying the Kama`ole Aquifer. The water system is owned and operated by the State of Hawai`i and managed by the DLNR-State Parks. The water system serves a park cabin and campground area. The non-potable source for the water system is an unnamed spring. The spring water flows through a 1-1/2-inch pipe to the campground area. The estimated water demand is 0.002 mgd. Information to determine the stream diversion capacity is not available and flow measurements are not recorded. System source capacity adequacy could not be determined. Future water demands for the park are unknown.</p>
<p>Ownership can take multiple forms. Parts or all of the EMI Water Delivery System:</p> <ul style="list-style-type: none"> • Can be owned and operated by the County of Maui, regulated by the PUC. • Can be owned and operated by a Maui Water Authority (A Quasi-public organization) that would protect, regulate and develop future water systems for Maui County holding to the concept that water is a public trust with Hawaiian water rights having priority over all other end users of this public commodity. The PUC would regulate the rates to charge private and commercial consumers and the County of Maui. • Can be owned by a public-private partnership, similar to above, possibly incorporated as a Public Benefit Corporation (in order to explicitly commit to serving the public good), and regulated by the PUC. • Can be owned and operated by a co-operative. 	<p>Page 4-140, DEIS: <i>Another theme, expressed primarily in the Kula / Pukalani focus group, was that water is a public trust, and should not be controlled by a single private corporation. They suggested a restructuring of public utilities to include a water utility that would be administered similar to the current electricity in the public utility structure. Further, profit made from use of this public trust should be invested in public need.</i></p>
<p>Purchase of parts or all of the EMI Water Delivery System and systems that connect to Kamole Weir</p>	
<p>Purchase of the EMI Water Delivery System and</p>	

⁴² Land Lease Bearing, General Lease #3578, 1959, Pages 3,4, 15,16

⁴³ Central, P. 49

Mahi Pono Lands:

Access to Mahi Pono land would allow the County or "Maui Water Authority" to implement a comprehensive Water Management Plan that includes care of the watersheds, comprehensive support for East Maui practices, renewable energy options, supporting proactive and integrated efforts to ensure an affordable and predictable supply of water combined with flexibility with regard to revenue generation that is not dependent on water consumers.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas
RE: PAF 19-335

Dear Councilmember Kelly T. King:

Thank you for comments dated November 5, 2019 (ref. PAF 19-335) regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns, which include a collection of statements and questions that you identified as being collected during three public meetings (Maui County Council on October 18, 2019 and the Council's Environmental, Agricultural, and Cultural Preservation Committee on October 7 and 15, 2019). These comments and concerns have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of these comments has been appended to the Final EIS in Appendix N.

We note that in your comment letter you requested "a time extension to allow for additional public comment." The period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai‘i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Simon Russell, East Maui resident:*

Please provide verification that the current IIFS are being met by providing monthly records of stream flow for the streams contained in the IIFS requirements.

Response 1: Providing verification of compliance with the Interim Instream Flow Standards (IIFS) is outside the scope of the EIS. The IIFS required under the Commission on Water Resources Management (CWRM) Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O) is a separate process from the Water Lease process, as discussed in Section 1.3.3 of the Draft EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Please note, however, that as required by the CWRM D&O, EMI submitted a report to the CWRM one year following the date of the issuance of the D&O that outlined and discussed:

1. Modifications to diversions to meet the amended IIFS.
2. Water deliveries at Honopou Stream and Māliko Gulch, and any changes EMI ascribes to the amended IIFS.
3. Changes in stream diversions and ditch settings as Mahi Pono’s irrigation requirements increase.

In addition, the requirements of the current East Maui revocable water permits specify that quarterly reports to the BLNR are required. These reports are mandated to include a statement of compliance with the IIFS. Since the CWRM D&O was issued, EMI has been working closely with the CWRM staff on the implementation of the ordered IIFS. The IIFS are being met for all License Area streams. It is expected, and the EIS takes into account, that compliance with the IIFS requirements under the CWRM D&O will also be required under the Proposed Action.

Comment 2: *Please provide a detailed description of the governance structure, decision-making ability, and ownership of EMI, Mahi Pono, and A&B.*

Response 2: Providing a detailed description of the information you requested is outside the scope of the EIS. Please refer to Response #1 above regarding the scope of the EIS. The management and relationships among the entities you listed are beyond the scope of the EIS, as those issues are not relevant to the analysis of environmental impacts. Any entity that is awarded a Water Lease will be required to comply with the terms of the lease.

Comment 3: *The landowner is the one who is supposed to do the EIS. In this case, the landowner is the State of Hawaii; therefore the State DLNR should be submitting the EIS.*

Response 3: As discussed in Section 1.4 of the Draft EIS, by order dated July 8, 2016 the Board of Land and Natural Resources (BLNR) directed A&B to proceed with the preparation of an EIS. Prior to that, BLNR, by order dated April 14, 2016, had directed A&B to commence the EIS process and to provide a scope of work for the preparation of an environmental review document pursuant to Chapter 343, HRS. The BLNR instructed that the scope of work should distinguish between those matters that can be undertaken prior to the CWRM decision on the petitions to amend the IIFS, and those matters that require the final CWRM IIFS decision. On June 9, 2016, A&B submitted to the BLNR a Scope of Services for the Preparation of a Chapter 343, HRS Environmental Impact Statement for the Proposed Lease for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. A copy of the BLNR order, as well as the approved scope of work, is enclosed as Attachment #1 for your reference.

Comment 4: *Provided that a for-profit, foreign-owned entity will own the EMI system, what assurance is there that the water will be adequately managed as a public trust?*

Response 4: Regardless of who owns the EMI Aqueduct System and who is awarded the subject State Water Lease, the processes governing the use of the water are subject to the Public Trust Doctrine. The Proposed Action (the issuance of a 30-year Water Lease by BLNR), requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai'i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. The dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease. As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action as shown on pages 1-25 to 1-27.

Comment 5: *What is the dollar value of 65.86 million gallons per day if sold at the County of Maui rates for:*

- *Agriculture?*
- *Drinking water?*

Response 5: The County of Maui assesses water service fees based on 18 different use classifications (i.e., agricultural, single-family, multi-family, industrial, etc.). The average water service fee rate Countywide is cited at \$4.00 per 1,000 gallons or rather, per “kgal” as discussed in Section 4.7.3.3 of the Draft EIS. Agricultural water rates are \$1.10 per kgal for potable water and \$1.00 per kgal for non-potable water, as discussed in the report titled East Maui Water Lease: Agricultural and Related Economic Impacts, which is provided as Appendix I of the EIS. Residential and general rates for other water consumers range from \$2.05 to \$6.55 per kgal under normal conditions (when there are no water shortages). These rates are intended to cover the cost of operating and maintaining the County of Maui Department of Water Supply (MDWS) source and distribution facilities. If calculated by millions of gallons a day (mgd), the value of 65.86 mgd of water would range from \$65,860 per day at a rate of \$1.00 per kgal (non-potable agricultural water) to \$431,383 per day at a rate of \$ 6.55 per kgal (residential and other non-agricultural). However, please note that these “values” are not comparable to the potential lease rent to be charged by the State for the proposed Water Lease, as the State rent is for raw water, that is water at the source, within the East Maui watershed, not water delivered to one’s door, which is what the MDWS “values” you have requested represent. Water provided by MDWS, at MDWS rates, provides water to the place of use--one’s home, business, farm, etc. The rates to the consumer includes infrastructure operation and maintenance, existing debt service obligations, capital spending for system sustainability, etc. None of these factors are applicable to the Water Lease, which again, is water at source only.

Comment 6: *Please provide a clear chain of land title under Hawaiian Kingdom law from the Kuleana Act of 1850 to the present “ownership” of the Crown Lands claimed by the applicant.*

Response 6: Providing the land title information you requested is outside the scope of the EIS. Please refer to Response #1 above regarding the scope of the EIS. The Applicant does not claim ownership of the proposed License Area. Also note that under the 1938 Agreement between A&B / EMI (referred to as “the Company” within the 1938 Agreement) and the Territory of Hawai‘i, which has been added to the Final EIS as Appendix R, acknowledges EMI’s ownership of the EMI Aqueduct System. Pursuant to the 1938 Agreement, the Territory of Hawai‘i (now the State) granted perpetual easements to EMI for those portions of the EMI Aqueduct System located on State lands. See EIS Section 3.3, which has been updated in the Final EIS to further discuss rights the EMI Aqueduct System has to a limited amount of water collection irrespective of any Water Lease. See pages 3-24 to 3-25 of the Final EIS.

As described in Section 2.1.2 of the Draft EIS, the EMI Aqueduct System spans both State-owned and EMI-owned lands and is an integrated system. Relative to the proposed Water Lease, the Collection Area for the EMI Aqueduct System covers approximately 50,000 acres, of which

33,000 acres are owned by the State and 17,000 acres are privately owned. See Draft EIS Figure 1-1 (EMI Aqueduct System Collection Area). The EMI Aqueduct System also collects water from purely private lands located to the west of the Collection Area, as noted in Figure 1-1. As mentioned above, under the 1938 Agreement, the State and EMI each granted to the other “perpetual” easements to those portions of the EMI Aqueduct System located on the other’s land. The duration of these “perpetual” easements was stipulated to last until the termination of the 1938 Agreement. The 1938 Agreement is still in place and valid. The State may, but is not obligated to, terminate the 1938 Agreement only if the licenses are offered at auction but EMI fails to bid. EMI may, but is not obligated to, terminate the 1938 Agreement if the State fails to offer the licenses at auction. Thus, if no license is offered at auction, the 1938 Agreement provides that EMI may still collect water derived from the EMI owned portions of the Collection Area and, utilizing the easement granted to it in the 1938 Agreement, transport it across the portions of the EMI Aqueduct System that transverse State lands.

The 1938 Agreement defines the “Territory” to include its “successors” (i.e., the State). EMI has not failed to bid at any auction of licenses, so the condition precedent for the State to have the right to terminate has not occurred. While the State has not yet offered the licenses at auction, EMI has not exercised its right to terminate and is instead a proponent of the Proposed Action which would lead to the licenses being offered at auction for the purpose of the continued integrated operation of the EMI Aqueduct System. Neither party has terminated the 1938 Agreement.

Comment 7: *Under whose authority was the land contained within the DEIS purchased, sold, or leased?*

Response 7: Your Comment #7 above is unclear as you do not specifically discuss which “land” you are referring to or explain what manner of authority you mean. The EIS discusses three overall regions as mentioned in Chapter 4 of the EIS; East Maui, Upcountry Maui, and Central Maui. That section has been slightly modified in the Final EIS, as shown on pages 4-1 to 4-2, and relevant text has also been incorporated into pages iii to iv of the Executive Summary of the EIS. Essentially, within the EIS, “East Maui” refers to the proposed License Area, the water Collection Area, and areas generally makai of the EMI Aqueduct System, including the Nāhiku community. The Upcountry Maui area referred to in the EIS is generally the area serviced by the portion of the Upcountry Maui Water System that gets water from the Kamole-Weir, Olinda, and Pi‘iholo water treatment plants (WTP). For the purposes of the EIS, the term Central Maui, for the purposes of projecting full implementation of the Proposed Action and related diversified agricultural plan, refers to the approximately 30,000 acres of agricultural land that had been cultivated with sugarcane for over a century utilizing water from the EMI Aqueduct System. Geographically, what is referred to as Central Maui encompasses approximately 36,000 acres,

but approximately 6,000 acres is comprised of uncultivated areas, including roads, gulches, and patches of uncultivated land.

Regarding East Maui, the License Area, which encompasses approximately 33,000 acres, is owned by the State of Hawai'i as discussed in Section 1.1 of the Draft EIS. This is the area that would be subject to the Water Lease issued by the BLNR. The EMI Aqueduct System is situated on easements across the License Area as described in Response #6 above. The remaining 17,000 acres of the Collection Area is private land.

Regarding Upcountry Maui, this includes various landowners, including land owned by the County. The Kula Agricultural Park (KAP), comprised of approximately 445 acres, is owned by the County of Maui and is managed by the County's Office of Economic Development. Moreover, in 2018 the County acquired approximately 262-acres of land from A&B to be used for the expansion of the KAP. More information regarding the KAP expansion has been added to Section 2.1.3.2 of the Final EIS as shown on pages 2-20 to 2-21.

Mahi Pono acquired the Central Maui lands from A&B in December 2018 as discussed in Section 1.1 of the EIS

Comment 8: Tom Bacon, East Maui resident:

Please provide a phased plan and year-by-year timeline detailing each proposed activity by Mahi Pono and each activity's water-use needs

Response 8: The Mahi Pono farm plan is identified in the EIS as a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community. This is explained in Section 2.1.4 of the EIS as follows:

Mahi Pono's farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation. All of these things must be considered when developing an evolving and feasible diversified agricultural plan for Central Maui.

Another factor in developing the farm plan is to be sensitive to the existing local farming community. Mahi Pono does not want to displace local farmers by planting competing crops or artificially accelerating the ramp-up of operations, both of which could have the potential to drive local farmers out of the market. Mahi Pono's goals for its diversified farm plan will be guided by its core principles of using reasonable and environmentally responsible "best management practices", planting non-GMO crops, and growing food for local consumption.

Mahi Pono's farm plan and its impacts are based on a production timeline of full operations by 2030. It is explained in Section 2.1.5 of the EIS that it will take approximately 10 years for Mahi Pono and its lessees to remove volunteer sugarcane and weeds, amend soils, install field improvements, build warehouses and other structures accessory to its agriculture use, and plant crops. The predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. At full operations, the Mahi Pono farm plan is anticipated to consist of the following as presented in Section 2.1.4 of the Draft EIS:

The Mahi Pono farm plan assumes the following:

- *The total surface water available for use after system losses (approximately 22%) is estimated to be approximately 65.88 mgd.*
- *Surface water can be supplemented by a brackish groundwater amount equal to 20 percent of surface water. Taking into account the CWRM D&O, it is estimated that there could be up to 16.47 mgd of brackish groundwater used in the Central Maui agricultural fields. (Plasch, 2019)*
- *Under the CWRM D&O, the total water available for use on the Central Maui agricultural fields after system losses is approximately 82.35 mgd*
- *That total amount of water will be delivered to approximately 30,000 acres. Of those 30,000 acres:*
 - *Approximately 15,950 acres would be used for farming, including 12,850 acres for orchard crops and 3,100 acres for other crops.*
 - *Approximately 13,800 acres would be used for pasture, of which about 4,700 acres would be irrigated.*
 - *Approximately 250 acres would be used for green energy, such as a solar farm.*

Because there is insufficient surface water to support the entire farm plan, brackish groundwater will also be used. . .

This farm plan would consist of the following:

- *Approximately 20,650 acres of irrigated farm land, including 12,850 of orchard crops, 600 acres of tropical fruit, 1,200 acres of row and annual crops, in addition to a community garden and limited non-GMO energy crops.*
- *Approximately 13,800 acres of cattle pasture, comprised of 4,700 acres of irrigated pasture, and 9,100 acres of unirrigated pasture. This should fit the proposed model of grass-finishing on irrigated pasture. The unirrigated acreage is less than 10,000 acres, which helps ensure that that the entire area devoted to unirrigated pasture will remain productive.*

However, please note that Table 2-1 of the Draft EIS (Table 2-2 of the Final EIS) that was incorporated into Section 2.1.4 has been updated with more precise water usage numbers as shown on page 2-29 of the Final EIS. Moreover, please note that Section 2.1.4 of the Final EIS has been revised to reflect current and near-term expected water use as shown on pages 2-30 and 2-32, which details average water being diverted from East Maui streams through the EMI Aqueduct System and how that water will be used.

It important to note that as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet the needs of the approved water uses, including the MDWS and of Mahi Pono's agricultural operations in Central Maui.

The EIS also acknowledges that, should the Water Lease be issued, the Department of Hawaiian Home Lands (DHHL) has rights to reserve water source for use on its homestead lands. See EIS Section 2.1.1. For the purposes of the impact assessment, the farm plan described in the EIS assumes use of all of the water that could be diverted from East Maui streams after compliance with the CWRM D&O. However, the EIS also acknowledges that the water use granted under the proposed Water Lease is subject to DHHL's reservation. In which case Mahi Pono could be obligated to reduce elements of its farm plan, and thus the availability of crops, to accommodate the DHHL's water allocation under the current IIFS. Consistent with the analysis provided in the Agricultural and Related Economic Impacts report (EIS Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture. The Reduced Water Volume alternative described in Chapter 3 of the EIS provides an assessment of the impacts of less water being made available for the farm plan in the Central Maui agricultural fields.

Comment 9: *Provide “performance indicators” and associated benchmarks within the plan.*

Response 9: Your comment is acknowledged, however we cannot discern what you mean by "performance indicators" or "associated benchmarks." Mahi Pono's farm plan will continue to put the Central Maui agricultural lands into agricultural cultivation and the acres under cultivation have increased since the publication of the Draft EIS as noted in Section 2.1.4 of the Final EIS as shown on page 2-30. Mahi Pono expects to continue expanding cultivation in a manner that responds to the ever-changing agricultural market demands and other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community. Moreover, as mentioned in Response #8 above, that as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet the needs of the approved water uses, including the MDWS and of Mahi Pono's agricultural operations in Central Maui.

Comment 10: *Chris Gaardner, East Maui resident:*

The farm plan does not adequately justify the water needs put forth in the DEIS, and the farm plan does not provide sufficient detail to adequately assess its merits

Response 10: We respectfully disagree with Comment #10. As described in Response #8 above, the Mahi Pono farm plan is expressly intended to be a flexible plan that remains fluid and therefore responsive to ever-changing conditions in order to make for a feasible farming operation. Mahi Pono's current plans for Central Maui envision cultivating a broad range of food and non-food crops for local consumption by State of Hawai'i residents and visitors. Mahi Pono's farm plan and its impacts are based on a production timeline of full operations by 2030. The calculations of future water requirements (year 2030) are presented in Table 2-2 of the Final EIS and Table 3 of Appendix I (the East Maui Water Lease: Agricultural and Related Economic Impacts report), based on calculations provided by Akinaka and Associates of the amount of water available after implementation of the CWRM D&O. The average demand of water in gallons per acre per day for each projected type of crop is discussed in Table 2-1 of the Draft EIS, which is now Table 2-2 of the Final EIS, entitled "Mahi Pono Farm Plan." We also note that Table 3-1 of the EIS provides a description of the Mahi Pono farm plan in the event that no Water Lease is issued.

Comment 11: *10-12 years required to “remediate” the land. What water is needed for this to occur?*

Response 11: Your comment regarding 10-12 years required to “remediate” the land is unclear. Nowhere in the EIS or the technical studies is this stated. Section 2.1.5 of the EIS states:

An estimated 10 years will be required for Mahi Pono and lessees to remove volunteer sugarcane and weeds from the approximate 30,000 acres, amend soils, install field improvements, build warehouses and other structures, and plant crops.

This is also reflected in the technical study provided as Appendix I (Agricultural and Related Impacts). However please see Response #8 for the current and near-term agricultural activities and water uses. As the farming and agricultural uses expand, water needs will increase. Water required during the early years of the farm plan is anticipated to be less than that at full operations and will include water to control dust and to irrigate temporary ground-cover crops. As noted in Response #8 above, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet the needs of the approved water uses, including the MDWS and of Mahi Pono's agricultural operations in Central Maui.

Comment 12: *The DEIS does not adequately integrate climate change scenarios*

Response 12: The EIS includes the most recent information regarding climate change within its analysis. As discussed in Section 4.3.1 of the Draft EIS:

Regular trade winds are key in driving the Hawai‘i’s hydrological cycle, generating rainfall which helps maintain Maui’s water supply. However, a recent study showed that Hawai‘i’s trade winds have decreased in frequency by approximately 30% over the past 37 years, from 291 days per year in 1973, to 210 days per year in 2009 (Garza et. al, 2012). The decrease in the trade winds could have serious implications for the Hawaiian Islands, including adversely impacting local agriculture, native ecosystems and endangered species, and the State’s limited freshwater supply.

Overall, the State of Hawai‘i is experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade

winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014)...

Regarding East Maui:

Climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. Such rainfall patterns increase the amount of stormwater runoff flowing through the region, including through the streams within the License Area that reach the shoreline. The expected climatic changes in precipitation patterns and streamflow will influence the quantities and concentration of stormwater runoff entering the nearshore environments and coastal waters, resulting in increased sedimentation, impacting coral reefs. However, because of the continuous wave energy in shore areas in East Maui, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species. (SE & MRC, 2019).

Regarding Upcountry Maui:

Upcountry Maui covers a large range of elevation and area. The average temperature varies at different elevations. As elevation increases, the average temperature decreases. The Leeward side of Upcountry Maui is mostly dry and sunny. The Windward Side of Upcountry Maui tends to be wetter than the Leeward Side. Average annual rainfall ranges from 16-20 inches per year on the Leeward Side to more than 240 inches per year on the Windward Side (Draft Maui Island Water Use and Development Plan, March 2019). The KAP receives an average amount of total rainfall of 15 to 25 inches per year.

Climate change trends may increase the potential for altered habitats and conditions. Warming air temperatures could cause ecosystems to shift upslope and decline in size. Changes in precipitation may affect Upcountry Maui's ecosystems and communities include flooding, erosion, drought, and fire. Changes vary from island to island, and even valley to valley. The overarching trend for the State has been a decrease in total rainfall. A decrease in total rainfall, without a reliable source of water delivery, would increase the demand for water in Upcountry Maui for both domestic and agricultural purposes. The demands of water could be potentially minimized through the implementation of water conservation measures, however, the extent to which such efforts would serve to counter reduced levels of water service is uncertain.

Regarding Central Maui:

Central Maui's climate is typical of Leeward coastal lowlands receiving little rainfall annually, and is relatively dry. The northeast areas receive more rain than the central and southern areas of Central Maui. The average annual rainfall ranges from less than 10 inches in the southern part of the isthmus to over 40 inches in the northeastern areas. Central Maui receives considerable amounts of sunshine, with average daily insolation ranging from slightly less than 450 calories per square centimeter per day in mauka areas to over 500 calories near Kahului.

Climate change trends may suggest an increased potential for the agricultural fields in Central Maui to experience longer, more intense, periods of drought. The overarching trend for the State has been a decrease in total rainfall. A decrease in rainfall would result in less water being conveyed to the agricultural fields. The water conveyed to the agricultural fields in Central Maui also plays a major role in the recharge of the Central Maui aquifer. Periods of prolonged and intense drought would further strain the aquifers in Central Maui that depend upon the water conveyed through the EMI Aqueduct System for recharge.

Note that Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown on pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed, as well as a study published by the United States Geological Survey (USGS) in 2019 as shown on pages 4-89 to 4-90 for East Maui, pages 4-92 for Central Maui, and noted in Section 4.2.2 of the Final EIS as shown on page 4-71 for East Maui and page 4-76 for Central Maui.

Hence, the EIS recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall. However, as noted in the USGS report cited in

pages 4-89 to 4-90 of the Final EIS, East Maui could see an increase in rainfall due to future climate change trends.

Comment 13: *What percentage of the total amount of water being asked for does each of the following represent:*

- *Kula Agriculture Park?*
- *Nahiku residents?*
- *Upcountry Maui domestic use?*
- *DHHL projects?*

Response 13: Regarding the total of water estimated to be available for diversion is described in Section 2.1.2 of the EIS. Specifically, Section 2.1.2 of the EIS states:

With the issuance of the Water Lease under the Proposed Action, the EMI Aqueduct System could divert only up to the maximum allowable amount after compliance with the CWRM D&O from streams within the License Area, which is estimated to be approximately 87.95 mgd. The EMI Aqueduct System is estimated to divert an additional 4.37 mgd from the point that it leaves the License Area at Honopou Stream and collects water from streams on privately owned land to its last diversion at Māliko Gulch. Thus, under the Proposed Action, an estimated total of approximately 92.32 mgd ~~would~~ could be conveyed to supply the MDWS for users in Upcountry Maui-and the agricultural fields in Central Maui.

Hence, a maximum of approximately 92.32 mgd of stream surface water could be conveyed through the EMI Aqueduct System under the Proposed Action.

The EIS assumes under the Proposed Action that approximately an average of 7.1 mgd of East Maui surface water is conveyed to MDWS. That amount is comprised of water from the EMI Aqueduct System that is processed at Kamole-Weir WTP and used within the Upcountry Maui Water System, and non-potable water for the KAP, which receives water from the Hamakua Ditch (an extension of the Wailoa Ditch). By contractual agreement, KAP is entitled up to 1.5 mgd from the EMI Aqueduct System. The current configuration of the KAP water system, however, requires that 3.5 mgd be made available at Reservoir 40 through the Hāmākua Ditch to enable the consumption of 1.5 mgd at KAP. However, there is a recognized need for infrastructure improvements to the reservoir and pumps that serve the KAP and use existing deliveries from the EMI Aqueduct System more efficiently. With infrastructure improvements, the water that is supplied by the EMI Aqueduct System to MDWS and used at KAP will be able to supply both the existing KAP, and the 262-acre KAP expansion area.

The MDWS serves water to a portion of the Nāhiku community. However, that water is not delivered through or sourced from the EMI Aqueduct System and therefore does not reduce the amount of water potentially available under the proposed Water Lease. The water for Nāhiku comes from EMI's West Makapipi Tunnel 2 (Well No. 4806-07), also known as the "Nāhiku Tunnel." According to the MDWS, EMI's Nāhiku Tunnel is the sole source of water for the MDWS Nāhiku Water Service Area. Per a 1973 Memorandum of Understanding, as amended, MDWS, can draw only up to 20,000 gallons of water per twenty-four hour day to serve the Nāhiku community. EMI continues to deliver water to the MDWS for the Nāhiku community pursuant to the agreement. However, that water delivery is premised upon EMI's continued receipt of permits or a lease from the State BLNR. Even though the agreement provides the MDWS a right to up to 20,000 gallons per day (gpd) per twenty-four hour day, EMI has accommodated the needs of the Nāhiku community, which have ranged between approximately 8,345 (2018) to 40,925 (2007) gpd on a daily basis, although supply of amounts over 20,000 gpd on any given day is not required under the agreement (MDWS, 2007 – 2018). Please note, the description of the Nāhiku water service from Section 2.1.3.3 of the Draft EIS, has been revised to take into account clarifications from the MDWS, as shown on pages 2-21 to 2-22 of the Final EIS and correspondence from MDWS dated July 23, 2020 to Akinaka & Associates has been added to the Final EIS as Appendix P.

Regarding DHHL projects, specific information regarding the DHHL's future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes

Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui), as shown in pages 2-4 to 2-7 of the Final EIS. This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. As explained in pages 2-4 to 2-7 of the Final EIS, the DHHL water reservation process involves several steps before a reservation amount is formally identified and approved. However, as of this time, it is our understanding that DHHL has not yet made its water reservation request to CWRM.

Comment 14: *Lucienne de Naie, Ha`iku Community Association:*

Traditional and cultural practices were not addressed for each ahupua`a impacted by the lease.

Response 14: As explained in the Cultural Impact Assessment (CIA) included as EIS Appendix F, "The License Area includes portions of the modern judicial districts of Makawao and Hāna, the traditional moku of Hāmākua Loa and Ko`olau, and the following ahupua`a (traditional land division spanning from the mountain to the sea): Honopou, Huelo, Moku papa, Waipioiki, Waipionui, Hanehoi, West Hanawana, East Hanawana, Pu`uomaile, Pāpa`a`ea, West Makaīwa, East Makaīwa, Honomanū, Ke`anae, Wailua Nui, Wailua Iki, Pa`akea, Nāhiku, and Ko`olau." Literal translations of the moku (districts) and ahupua`a place names within the License Area are listed in Table 1 of the CIA. Cultural Surveys Hawaii (CSH), the preparer of the CIA, sought consultation with with Native Hawaiian Organizations, agencies, and community members including descendants of the area, in order to identify individuals with cultural expertise/and or knowledge of the ahupua`a where the License Area is located. Please note that while traditional and cultural practices were not specifically addressed by each ahupua`a, they were discussed from a regional perspective for entire License Area, as well as listed on a stream-by-stream basis within the Cultural Impact Assessment included as Appendix F of the Draft EIS. Section 4.6 of the Final EIS has been revised to more fully describe the cultural practices and related impacts for the streams within the License Area, including the non-petitioned streams as shown on pages 4-171 to 4-254. Please note that the CIA identified practices including fishing, gathering of rocks for traditional food preparation, and knowledge of, or access to, cultural sites, including but not limited to cultural sites in the Central Maui agricultural fields of Hāmākua Poko and Hāmākua Loa, a legendary pōhaku in Wahinepe`e, and Papanene Heiau as discussed in Section 4.5 and Section 4.6 of the EIS.

Comment 15: *Representatives from Huelo shared their mana`o with the social-impact assessment.*

Response 15: That is correct. Representatives from Huelo shared their mana`o as part of the Social Impact Assessment (SIA) process. The SIA is provided as EIS Appendix G, and

summarized in Section 4.7.2 of the EIS. Huelo / Ha'ikū residents and farmers participated in focus groups held in conjunction with the preparation of the SIA, as reported in SIA Sections 4.1.2.2 and 4.2.2. Some participants live in the Huelo watershed area and generally downstream of the EMI Aqueduct System and many live and farm in areas adjacent to streams that are the subject to the CWRM D&O. Ha'ikū and Huelo impacts are entrenched in a social context. The social impact of diverting water is generational, one that has affected livelihoods, family cohesion, the ability to integrate with environment for food gathering and recreation, resource stewardship, and personal connections or disconnections with values inherent in their lifestyles.

As an outcome of these findings and others as documented in the SIA, the SIA recommended that community outreach be emphasized moving forward in conjunction with the Proposed Action. However, it is also noted that the terms and requirements of the Water Lease are at the discretion of the BLNR.

Comment 16: *Can the document only be utilized by A&B, or could this EIS be utilized by the Department of Water Supply, an independent water utility, or other entity that would like to put forth a bid for the water lease at public auction?*

Response 16: The EIS was prepared to support the application for the issuance of a long-term Water Lease for the purpose of developing, diverting, transporting and use of the State's East Maui waters through the EMI Aqueduct System for the purpose described in the EIS. The EIS also contemplates the environmental effects of variations on the Proposed Action, including scenarios where the amount of water permitted for the Water Lease is insufficient for the Mahi Pono farm plan as proposed, and for the MDWS. Thus, the EIS analyzes proposed uses of the water, but is not necessarily tied to a specific Water Lease lessee (although Section 1.3.3 of the Draft EIS explains how A&B, on May 14, 2001, requested that the State offer at public auction a long-term water lease under HRS § 171-58 for the, "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System). Hence, any party who intends to use the water in a manner consistent with the EIS analysis could, presumably, use the EIS to support a bid on the Water Lease at public auction. However, it is reasonable to assume that any other potential Water Lease lessee would also be required to meet the requirements of Chapter 343, HRS, should their proposed use of the water be inconsistent with what is presented in this EIS.

Comment 17: *Is this EIS only for one bidder? It isn't an open bidding process if there is only one bidder.*

Response 17: It is our understanding, as discussed in the EIS, that any proposed lease of water from the State will go through a public auction process. Moreover, as discussed in Response #16 above, although the Water Lease goes to public auction, it is reasonable to assume that any other potential applicant would also be required to meet the requirements of Chapter 343, HRS, unless they propose to make use of the water in a manner consistent with the EIS analysis.

Comment 18: *The EIS assumes that the “natural stream conditions” are those that have been in existence following the diversion of 40-50 streams over a 100-year period. There is no data represented on pre-diversion conditions. Impacts cannot be adequately assessed without this data. There is a shifting baseline where conditions are assumed as normal when in fact they represent degradation of the natural ecosystems over time. Streams are deemed biologically unimportant based on their current post-diversion conditions, not on what their conditions should be assuming a more connected and functional pre-diversion ecosystem. (Prior to the 1870s)*

Response 18: Please note that although it is not scientifically possible to document impacts that first took place more than a century ago during pre-diversion conditions. However, the EIS does include historical information from a time prior to the construction of the EMI Aqueduct System. For example, Section 1.3 of the EIS includes a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui. The Archaeological Literature Review and Field Inspection report (EIS Appendix E), (which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe‘e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui) provides extensive history on the East Maui area pre-contact era.

Regarding your comment about the stream baseline conditions being presented solely as post-diversion conditions, this is not correct. The Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (the HSHEP model), provided as EIS Appendix A does not deem a stream "biologically unimportant based on their current post-diversion conditions" as you claim. Additionally, there is no shifting baseline within the HSHEP model. The HSHEP model uses all available occurrences of the species across the State to predict the suitability of a stream, reach and site scale variable to each species. Using the HSHEP model, data on water depth, habitat type, substrate, and stream width can be converted into suitability criteria and estimates of overall habitat area. In addition to habitat measures, stream discharge was measured upstream and downstream of diversions to help document the proportion of flow diverted. Within the HSHEP model, if a site is dewatered, habitat suitability goes to zero. As water is returned to the site, habitat suitability will increase. These effects are consistently applied

throughout the HSHEP model so that it accounts for the relative changes in habitat suitability in response to different flow modifications.

Moreover, the Natural Condition scenario modeled in the HSHEP model provides an estimate of the amount of natural, undiverted habitat, for each of the native amphidromous stream animals. Given that it is impossible to go back in time and survey the streams prior to the 1870's and there is no data for pre-diversion conditions because there is no data prior to 1960 in the State Division of Aquatic Resources Database associated with stream surveys, this modeling scenario was created to present the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals, and therefore resulted in the maximum available habitat units predicted. The HSHEP model is summarized in Section 4.2.1 of the EIS. However, please note that Section 4.2.1 of the Final EIS has been revised, as show on pages 4-56 to 4-67, and the HSHEP model report provided as Final EIS Appendix A has been clarified.

Comment 19: *The DEIS assumes that the 22 streams with IIFS addresses all cultural and environmental concerns*

Response 19: Please note that the studies prepared for the EIS to assess cultural and environmental concerns are not limited to only the IIFS petitioned streams. The EIS and the nine technical studies associated with the EIS (see EIS Appendix A - I) cover Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. These analyses are provided for three areas, East Maui, Upcountry Maui, and Central Maui as defined within Chapter 4 of the EIS.

However, the analysis and requirements under the CWRM D&O are crucial to the environmental analysis of the proposed Water Lease because, as explained in Section 1.3.4 of the Draft EIS:

The June 20, 2018 CWRM D&O establishes a quantity of water that must remain in each stream at specified locations subject to the IIFS Petitions. The CWRM D&O does not specifically authorize or allocate amounts of water for offstream

uses. The CWRM evaluated each of the streams under the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration potential for fish and other stream animals, recreational opportunities, and scenic values. Then the streams were looked at in an integrative approach with consideration for the overall ecological ramifications of the decision. The CWRM also considered the economic ramifications of its decision on offstream uses, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture.

Hence, the CWRM D&O was used as a basis for assessing the Proposed Action, but is clearly not representative of being the sole source of assessment within the EIS.

Specifically with respect to your comment alleging that the EIS assumes all cultural concerns were resolved by the issuance of the CWRM D&O, note that the CIA acknowledges that the Proposed Action may impact Native Hawaiian cultural resources and practices and provides for several recommendations to mitigate those impacts. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o 'opu, pūpūlo 'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject

to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, shown on pages 4-158 to 4-159. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for

cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Comment 20: *13 streams were left out of the IIFS process, and the impacts of these areas and the communities who live along them is completely unknown.*

Response 20: We respectfully disagree with your comment that the non-petitioned streams within the License Area were never assessed and that the impacts from diverting these streams are completely unknown. As a point of clarification, please note that while the Draft EIS identified 13 non-petitioned streams, that information has been corrected. There are only 12 non-petitioned streams within the License Area. In the Draft EIS Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which was subject to the CWRM D&O and ordered for connectivity restoration flow status. Moreover, the Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP Model) assessed all streams within the License Area that are, or were, diverted by the EMI Aqueduct System. Other technical studies prepared for the EIS also assess impacts that span both the petitioned and non-petitioned streams and related communities. The non-petitioned streams are all within the Huelo portion of

the License Area; there are also several petitioned streams within the Huelo portion of the License Area, including streams that were ordered for full flow restoration under the CWRM D&O.

We acknowledge that the CWRM D&O did not set new IIFS for 12 streams within the License Area that are diverted by the EMI Aqueduct System as those streams were not included in the petitions filed by Native Hawaiian Legal Corporation on behalf of Nā Moku, Beatrice Kepani Kekahuna, Marjorie Wallet, and Elizabeth Lehua Lapenia. However, the CWRM D&O did take those streams into account. CWRM D&O at ii. Moreover, while 12 diverted License Area streams were not assessed pursuant to specific petitions to establish IIFS, those streams are subject to the 1988 IIFS set for the East Maui streams. Please note that the CWRM, as is evident from its website, both from its own research and in conjunction with USGS, has information on the License Area streams, including the non-petitioned streams, which information has been made available to the BLNR. Furthermore, under the revocable permits, initially annual reports, and now quarterly reports, are submitted by EMI to the BLNR, which identify the total amount of water being diverted from License Area measured at Honopou, i.e., water from both petitioned streams and non-petitioned streams. Hence, the 12 non-petitioned streams were included as part of the overall analysis of the EIS and associated technical studies. In terms of stream habitat, the HSHEP model provided as EIS Appendix A analyzed those streams to assess changes in native amphidromous stream animal habitat with respect to stream diversions which is summarized in Section 4.2.1 of the EIS in the section covering East Maui.

The HSHEP model is a spatially-referenced model with all diversions and stream segments within the License Area included. The overall summaries of stream results are derived from the impacts on stream segments above and below all major and minor stream diversions associated with the stream. The results from the HSHEP model provide an analysis of habitat impacts for petitioned and non-petitioned streams. Please refer to Appendix A of the EIS for more details regarding the HSHEP model and analysis.

One of these non-petitioned streams was also included in the analysis presented in EIS Appendix B, *East Maui Irrigation Assessment of Streams and the Ocean*, and summarized in Section 4.2.3 of the EIS regarding Coastal Waters. The study found that the effects of stream water on marine waters is minor in these habitats, which is supported by the physical processes associated with relatively small input of stream water to the vastly larger ocean environment. The prevailing condition of extreme mixing by physical forces is the most important factor in diminishing the zone of influence of stream water in the marine setting.

The study included as EIS Appendix C, *Terrestrial Flora and Fauna Technical Report*, was a regional report that analyzed impacts of the Proposed Action on the entire 33,000-acre License

Area. This report is also summarized in Section 4.4 of the EIS. The study concluded that there is the potential for impacts to the flora and fauna within the License Area due to access by EMI staff, as well as any kind of public access that may occur. Hence, it recommends a number of mitigation measures to minimize any potential impacts.

Regarding historical and archeological resources, Cultural Surveys Hawai'i (CSH) conducted the archaeological literature review and field inspection (LRFI) report included in EIS Appendix E and which is summarized in Section 4.5 of the EIS. The report included an analysis of the natural and built environment of the License Area, a comprehensive review of traditional and historic background information of the region, a review of previous archaeological studies and findings in the region, and a field inspection of the License Area focused on inspecting the areas nearest to the EMI Aqueduct System infrastructure and access roads. Based on the research and analysis conducted for the LRFI, neither the Water Lease, nor the alternatives, is expected to have impacts archaeological historic properties within the License Area because none of these actions include significant related ground disturbance. Moreover, additional field work was conducted in response to comments received to the Draft EIS, but CSH researchers were unable to locate the historical resources mentioned by those who commented. The report assumes, however, that those historical and archeological resources do exist within the License Area, and that they could be adversely impacted with public access into the area. The LRFI also provides cultural resource management recommendations based on the extensive research and analysis conducted during the study, and similar to recommendations that were made for the Waikamoi Preserve during a cultural-historical study of East Maui (Maly and Maly 2006). For example, CSH recommends that any persons who are required to enter the License Area be made aware of the potential for discovery of undocumented surface historic properties such as walls, trails, terraces, mounds, and/or caves. These structures should be avoided, protected, and reported to the SHPD. The SHPD will determine if additional mitigation is required.

Similarly, the CIA for the Nāhiku, Ke'anae, Honomanū and Huelo License Areas prepared by CSH provided as Appendix F to the Draft EIS, and as further supplemented for the Final EIS, includes a regional analysis of the entire License Area, including the non-petitioned streams and the petitioned-streams. Section 4.6 of the Final EIS has been revised to more fully describe the cultural practices and related impacts for the streams within the License Area, including the non-petitioned streams as shown on pages 4-171 to 4-254.

Earthplan conducted a Social Impact Assessment (SIA) that is included in EIS Appendix G and summarized in Section 4.7.2 of the EIS. Focus groups convened for the purposes of identifying and assessing social impacts included Huelo / Ha'ikū residents and farmers. As discussed in Response #15 above, for this area referred to in Comment #20, the social impact of diverting water is generational, and one that has affected livelihoods, family cohesion, the ability to

integrate with environment for food gathering and recreation, resource stewardship, and personal connections or disconnections with values inherent in their lifestyles.

Furthermore, economic and fiscal impacts, including agricultural related economic impacts are discussed in detail for the East Maui region. This information is included in Appendix H and Appendix I which are summarized in Sections 4.7.3 and 4.7.4 of the EIS respectively. These studies found that the Proposed Action would have little agricultural or economic impact to the East Maui region.

Specifically, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Comment 21: *The impacts of dams and diversion structures have not been assessed for fish passage.*

Response 21: We respectfully disagree with your assertion that impacts of dams and diversion structures have not been assessed for fish passage. Entrainment and passage were modeled for every diversion including all of those within the non-petitioned streams as well as the IIFS petitioned streams based on four scenarios as presented in EIS Section 4.2.1 and Appendix A of the EIS. Impacts related to dams and diversion structures are discussed in Section 4.2.1 of the Final EIS as shown on pages 4-63 to 4-67.

However, please note that work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows.

The CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. CWRM ordered in relevant part (see CWRM D&O at p. 269):

- I. It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.*
- J. This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process*
- K. The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.*

CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

However, please note that generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As long as the diversion does not remove water from the stream, does not

change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best. The presence of cement or wood near or partially within the stream channel is not inherently bad for stream animals.

Conversely, meeting the instream flow standard at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the water flowing into the diversion and back to the stream from another location in the diversion ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

The two primary conditions where diversion structures could impact native stream species are structures where diversion and ditch water still comingle or structures that create a barrier to upstream migration. A diversion structure could also impact native stream animals as they move upstream if it creates an unnatural barrier. If no wetted pathway exists, upstream passage will be stopped.

Altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns.

In summary, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts.

Comment 22: *DHHL's allocation will belong to EMI until DHHL needs it. DHHL lands are legally entitled to this, and this water needs to be set aside.*

Response 22: Specific information regarding the DHHL's future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS, and updated in the Final EIS, as discussed in Response #13 above, and shown on pages 2-4 to 2-7 of the Final EIS. If a Water Lease is issued, it will be subject to DHHL's rights to reserve water sufficient to support current and future homestead needs as provided by § 221 of the Hawaiian Homes Commission Act. As clarified in the Final EIS, for the purposes of the EIS assessment, it has been assumed that all water from the Water Lease will be available for use by the Water Lease lessee and for the MDWS allocation. However, the DHHL has cautioned that in light of the fact that no water leases have been issued under HRS § 171-58, and the manner in which reservations are to be actualized has yet to be determined, in addition to any specifications made

by the CWRM and BLNR regarding the Water Lease, a separate agreement between the lessor and the DHHL will be necessary to allow any temporary use of water reserved for DHHL. The EIS contemplates the effects of a reduction in the amount of water made available to the Water Lease lessee through the Reduced Water Volume alternative, which is described throughout Chapter 3 of the EIS. The EIS fully recognizes that the Water Lease would be subject to the DHHL rights to a water reservation.

Comment 23: *The Draft EIS states that a watershed-management plan will come at a later date. EMI is waiting for the State to conduct this plan. There is no assurance that this will happen within a reasonable time frame. This plan is an essential component of mitigating potential impacts associated with the spread of invasive species and loss of sensitive native habitat.*

Response 23: As discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown in pages 2-2 to 2-4.

Comment 24: *Old agreements (1940s and '50s) included management plans*

Response 24: It is not clear what old agreements your comment refers to. As discussed in Response #23 above, the Water Lease lessee is subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. Moreover, the existing East Maui Watershed Partnership (EMWP) Management Plan, prepared in July 2009 and amended in July 2018, has been attached as Appendix O to the Final EIS. As discussed in Section 2.1 of the Draft EIS, A&B was a founding member of the East Maui Watershed Partnership (EMWP), which was the first watershed partnership in the State of Hawai'i and which served as a model for other

watershed partnerships throughout the State. Additional information regarding the EMWP has been added to Section 2.1 of the Final EIS as shown on pages 2-3 to 2-4.

As part of satisfying HRS § 171-58(e), we understand that the DLNR will work with each individual water lessee to determine the specific management actions, based on site-specific needs, that will result in the prevention and degradation of surface water and groundwater quantity and quality within the particular water lease area. Moreover, actions to be described in a watershed management plan will be informed by existing watershed management plans (such as the EMWP Management Plan).

Comment 25: *The East Maui Watershed partnership has left out the local community.*

Response 25: Your comment implies considerations that are beyond the scope of the EIS. Please refer to Response #1 above regarding the scope of the EIS. Please note, however, that the memberships of the watershed partnerships statewide typically include the landowners relevant to that specific watershed area, rather than the general community. Notably, the EMWP Management Plan highlights the importance of the community's role in accomplishing the EMWP Management Plan's goals.

Comment 26: *Repurposing of reservoirs and water-storage infrastructure is touted in the DEIS as being impossible based on cost constraints. This option needs to be explored and outlined in the DEIS.*

Response 26: The feasibility of added water storage was assessed in the Draft EIS in Section 3.1.1.3. The "added storage" alternative discussed in Section 3.1.1.3 of the Draft EIS considered, but ultimately dismissed, the alternative of upgrading existing, but out of service, reservoirs and constructing a large new reservoir. Regulatory, environmental, and safety concerns make these options, which involve major ground disturbance activities, infeasible. However, that assessment has been further explored within the Final EIS, as shown on pages 3-11 to 3-14.

Ultimately, added storage capacity cannot serve as a substitute for a source of water, but only to assure a more consistent availability of water between periods of surplus and deficit from a source. While reservoir/storage improvements might improve the efficiency of the Central Maui Field Irrigation System, those improvements would be at the cost of providing less recharge to the underlying Central Maui aquifers, which in turn will decrease the amount of brackish well water Mahi Pono can rely on for its irrigation needs. Moreover, the reservoir/storage improvements do not constitute a discrete alternative for providing an additional source of needed water, and instead represent at best a means by which the operational efficiency of the Central Maui Field Irrigation System may be improved.

Additionally, the environmental impacts for developing new storage / reservoir facilities for the EMI Aqueduct System above Wailoa Ditch far outweigh the minimal benefits they will provide due to the fact that existing reservoirs / storage facilities are seldom full. That, coupled with the fact that the EMI Aqueduct System will be diverting less water under the proposed Water Lease than had been diverted in the past, means that most reservoir water levels are assumed to decrease even more, rendering this scenario infeasible as a means of supplementing whatever surface water is allocated under the proposed Water Lease.

Comment 27: *There are massive high-flow storm events because of climate change, and these events need to utilize the existing infrastructure effectively.*

Response 27: The EMI Aqueduct System is not designed to capture and convey high-volume freshet flows as discussed throughout the EIS. Specifically, Section 2.1.2 of the EIS states:

The EMI Aqueduct System was designed and is intended to be operated to capture and convey a major portion of the base flow from streams in the License Area to supply the former sugarcane operations in Central Maui. The EMI Aqueduct System is not designed to capture and convey short periods of high streamflow known as freshets that occur when it rains heavily in the upslope areas of the watershed. Such larger flows quickly overtop or bypass the diversions and remain in the streams. The system will only divert up to the capacity of the ditches to convey slow moving water along the very slight slopes of the ditches.

Comment 28: *The “ownership change” alternative was dismissed because it is speculative, and the change in ownership will “not enhance environmental quality.” This is not true.*

Response 28: With respect to environmental impact from the proposed Water Lease, we fail to see how the ownership of the EMI Aqueduct System alters the effects of diverting water from East Maui streams. If the system is used to divert stream water, the impacts in East Maui should remain the same. However, we acknowledge that no other entity has the background, experience, or knowledge that EMI has when it comes to operating the EMI Aqueduct System (as discussed in the EIS, EMI has been operating the system since the 1870s). Thus, alternative ownership could increase risks that would arise from lack of knowledge and experience.

Regarding the speculative nature of an ownership change, we maintain that such an alternative remains highly speculative. However, Section 3.1.2 has been updated in the Final EIS to take into account the report prepared by the County of Maui Board of Water Supply (BWS) Temporary Investigative Group (TIG) to explore options for ensuring public access to water,

including the feasibility of purchasing and maintaining the EMI Aqueduct System (the TIG Report). See pages 3-19 to 3-20 of the Final EIS. The TIG Report was made public on October 16, 2019, after the publication of the Draft EIS, and a copy of the TIG Report has been provided as Appendix Q of the EIS.

Acquisition of the EMI Aqueduct System by the County or any other public entity remains purely speculative at this time. The EMI Aqueduct System is not for sale or lease, and forced acquisition of the system is projected to be prohibitively expensive, resulting in substantial costs to the public. It is noted that the TIG Report's proposal for water rates for the Central Maui agricultural fields is nearly ten times that of what is being charged at KAP and to Upcountry agricultural users. Such a dramatic increase in water rates would have associated economic, fiscal, and social impacts, Countywide. Moreover, should the County bid for the Water Lease, it would need to utilize the water in a fashion consistent with the analysis in this EIS (or complete the necessary environmental review for any use that is not considered in this EIS). Furthermore, much of the institutional knowledge needed to properly operate the EMI Aqueduct System would be lost under any change in ownership scenario. This could reduce the efficacy of the system, result in the incapability of new ownership to properly maintain it, and possibly lead to additional and unforeseen environmental impacts that would run contrary to the perceived enhancement of environmental quality that you infer.

Comment 29: *There needs to be a truthful analysis of ownership options.*

Response 29: Alternative ownership of the EMI Aqueduct System is acknowledged within the EIS and discussed in Section 3.1.2 of the EIS. Please see Response # 28 above. As discussed in EIS Section 3.1.2, the EMI Aqueduct System is privately owned and is not for sale. Moreover, any theoretical alternative owner of the system would be subject to an independent EIS process if it sought to obtain a water lease from the State unless the water use was consistent with the existing environmental analysis. The EIS fully discloses the fact that alternative ownership was raised during public scoping for the EIS, and the Final EIS provides a more robust discussion of this scenario, taking into account the TIG Report.

Comment 30: *There is no assessment of the current conditions of the 100-year-old system and how it could be redesigned for the current century, or if aspects of it are even necessary.*

Response 30: We assume that your comment relates to the physical condition of the EMI Aqueduct System. In this regard, the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses

and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System. We also note that Appendix D of the EIS provides a Historical Structure Assessment East Maui Aqueduct System prepared by Mason Architects to provide an assessment of the historical significance of the EMI Aqueduct System.

Comment 31: *The future wastewater plant planned for Central Maui was not included in the DEIS as a potential water source to the central valley*

Response 31: Section 3.1.1.2 of the Draft EIS provides an assessment of using reclaimed water from the County's Wailuku-Kahului Wastewater Reclamation Facility (WWRF) as an alternative to the proposed Water Lease as a source of water. As discussed therein, this alternative was viewed as unreasonable due to various environmental factors and was therefore dismissed from further review. However, please note that discussion has been updated in the Final EIS to recognize, among other things, that the Kahului WWRF only has capacity for 5.5 mgd and not 7.9 mgd as stated in the Draft EIS. The updated discussion also acknowledges the County of Maui Department of Environmental Management's (DEM) desire to upgrade the Kahului WWRF plant to provide R-1 treatment capabilities in the future (as a project targeted for implementation as early as 2026-2028) but this upgrade currently has not been funded. It is noted that upgrading this facility to R-1 treatment standards is contingent upon the availability of County funding.

Section 3.1.1.2 of the Final EIS also includes a discussion about DEM's plans for a new wastewater treatment facility west of its Kahului WWRF, to be located off of Kuihelani Highway near Waiko Road and within Mahi Pono's fields in West Maui. These fields are located outside the service area of the EMI Aqueduct System. The Central Maui agricultural fields that are considered in this EIS are all east of Maui Veterans Highway. It is assumed any reclaimed water from the WWRF within the West Maui fields will remain in the area west of Maui Veterans Highway. Thus, not only is the development of this potential reclaimed water source uncertain, the proposed future WWRF would not be a reasonable replacement source of water for the Central Maui agricultural fields that Mahi Pono intends to irrigate with East Maui stream water. This discussion is shown on pages 3-9 to 3-11 of the Final EIS.

Comment 32: *Please provide a detailed inventory of all available water sources to the central valley.*

Response 32: Your Comment #32 is unclear as you do not specifically refer to which area of the Central valley is in question. Nonetheless, the Draft EIS provides a discussion of the 30,000-acre Central Maui agricultural fields and the waters available to it. At this time, the Central Maui agricultural fields are supplied by surface water that is delivered through the EMI Aqueduct

System from East Maui. The Central Maui agricultural fields can be supplementally irrigated by existing wells as discussed in Section 2.1.4 of the EIS. Draft EIS Section 2.1.4 (Central Maui Field System) explains:

In addition to the surface water imported from the EMI Aqueduct System to the Central Maui field irrigation system, the irrigation infrastructure includes fifteen brackish water wells that can supplement surface water to approximately 17,200 acres of the plantation at the lower elevations (CWRM D&O, FOF 738). These brackish wells extract groundwater from the subsurface aquifers lying beneath the agricultural lands, and which are cyclically dependent on recharge derived from the irrigation of the overlying lands by water from the EMI Aqueduct System. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water. Groundwater, however, can be delivered to 7,000 acres at higher elevations via a shared pipeline that served as a penstock line for a hydroelectric unit (CWRM D&O, FOF 739).

Draft EIS Figure 2-5 (Central Maui Infrastructure Map) (Figure 2-7 in Final EIS) identifies the wells in the Central Maui agricultural fields. However, please note that Section 2.1.4, including the related Figures, has been revised in the Final EIS to more accurately describe the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono, and clarifies that Mahi Pono has access to only 10 brackish wells, as shown on page 2-25.

The reference to 15 brackish wells was derived from the CWRM D&O, Finding of Fact (FOF) 738, as that was the number of brackish wells that A&B utilized during its sugar cane operations. However, one of the 15 wells referred to, State Well No. 5128-002, does not serve the Central Maui agricultural fields and four of the other brackish wells are on lands that are not owned by Mahi Pono. As such, Mahi Pono has access to only 10 such wells. Draft EIS Figure 2-5 (Figure 2-7 in the Final EIS) has been revised, as shown on page 2-24 of the Final EIS, to more accurately depict the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono to support its farm plan for the Central Maui agricultural fields. Figure 2-8 has been added to the Final EIS to show the water sources that can be used to irrigate within the Central Maui agricultural fields.

Section 4.2.2 of the EIS provides a description and impact assessment of the groundwater resources available for the Central Maui agricultural fields and discusses how the system losses in the Central Maui Field Irrigation System (i.e., water lost to seepage and evaporation, and including other water uses, such as water used for reservoirs, fire protection, dust control, and hydroelectric uses) allows for seepage to enter the Pā'ia, and Kahului, and Ha'ikū aquifers. See pages 4-74 to 4-77 of the Final EIS.

Comment 33: *Please provide detailed EMI infrastructure water-loss and –leakage statistics.*

Response 33: Please note that the EMI Aqueduct System does not experience system losses as noted in Response #30 above. Any water losses take place beyond the EMI Aqueduct System (i.e., past Kamole-Weir WTP) and within the Central Maui Field Irrigation System. Without the planned improvements to the Central Maui Field Irrigation System, approximately 22.7% of the water delivered to the Central Maui agricultural fields is accounted for as system losses in the Central Maui Field Irrigation System (i.e., water lost to seepage and evaporation, and including other water uses, such as water used for reservoirs, fire protection, dust control, and hydroelectric uses). Seepage loss within the Central Maui Field Irrigation System is recharged back into the groundwater in the Central Maui Aquifer System.

Comment 34: *Albert Perez, Maui Tomorrow:*

There is a huge need for stream gauges in the lease area. We have very few gauges currently. There should be a gauge above and below each diversion so that we know how much is going into the ditches and tunnels.

Response 34: EMI has 12 gauging stations located in several ditch locations across the License Area to monitor and manage East Maui ditch deliveries. These gauges measure the flow in the ditches only, using a system that includes optical encoders with float tape and data loggers. It is not feasible to measure flow in the streams, as there are limited areas that contain the necessary control points to accurately measure streamflow. EMI's 12 gauging stations includes seven gauges that were formerly operated and maintained by the USGS to calculate the total amount of water diverted from each of the four sections of the License Area. Those gauges were also in the ditches, not on individual streams. Due to USGS cost cutting, in 1986 EMI took over the responsibility of operation and maintenance of those seven former USGS gauges. At that time, the State began assessing a flat rental fee rather than one based on the specific amount of water collected in each separate section of the License Area. EMI contracts with the USGS to conduct quarterly discharge measurements to verify the accuracy of the gauges at the Honopou boundary of the License Area, which measure the total water withdrawn from the Collection Area.

It is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gauges to wash away. As noted in the CWRM D&O FOF 50, EMI takes measurements at the boundary of each section of the License Area and at its gauging stations at Maliko Gulch. However, for the purpose of measuring the

aggregate flow from entire License Area, the measurements taken at the Honopou boundary were used.

Comment 35: *Norman Franco, Board of Water Supply:*

Looked at comprehensive alternatives to what is the present system: One example is from Arizona, where a farmer makes a request for a certain number of gallons, and the system releases that exact amount to the farmer.

Response 35: The Mahi Pono farm plan will make an efficient use of water. Mahi Pono expects to invest over \$20 million to increase the efficiency of its Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to Section 2.1.4 of the Final EIS as shown on page 2-25. It should also be noted that the amount of water diverted at any given time through the EMI Aqueduct System will be only what is needed to meet actual needs.

Comment 36: *There is a huge amount of waste and not good management of the resource that we have. The DEIS does not make note of any of this waste, or provide options for better management of the EMI system to increase conservation and better optimize the valuable water resource.*

Response 36: Your Comment #36 is unclear as you state that there is a huge amount of waste but do not explain what is being wasted or how this waste is taking place. Through the public comment process on this EIS, many have made the assertion that water is being wasted. As it relates to the EMI Aqueduct System, as discussed in Response #30 above, the USGS report ("Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)"), indicates that the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System.

As discussed in Response #33 above, approximately 22.7% of the water delivered to the Central Maui agricultural fields is accounted for as system losses in the Central Maui Field Irrigation System (i.e., water lost to seepage and evaporation, and including other water uses, such as water used for reservoirs, fire protection, dust control, and hydroelectric uses). Seepage loss within the

Central Maui Field Irrigation System is recharged back into the groundwater in the Central Maui Aquifer System.

Regarding your comment about options for better management, in making decisions regarding the proposed Water Lease, we note that surface water, being a public trust resource, means that the Proposed Action requires the BLNR, as the public trustee of the water sources proposed for Water Lease to comply with the State of Hawai'i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. The dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

Comment 37: *It's important to note that the ditch is an "easement." You're buying the easement, not the land that A&B owns. The cost should be understood by an appraisal when considering purchasing the system.*

Response 37: Please note the ditch (i.e. EMI Aqueduct System) is not an "easement" as you indicated. The 1938 Agreement between A&B/EMI (referred to as "the Company") and the Territory of Hawai'i, which has been added to the final EIS as Appendix R, acknowledges EMI's ownership of the EMI Aqueduct System. Pursuant to the 1938 Agreement, the Territory of Hawai'i (now the State) and EMI each granted to the other "perpetual" easements to those portions of the EMI Aqueduct System located on the other's lands per certain conditions. Hence, any purchase of the EMI Aqueduct System would include, amongst other matters, the cost of all infrastructure, as well as an interest in the land through which the EMI Aqueduct System passes.

Comment 38: *Eva Blumenstein, Department of Water Supply:*

Prep notice for 2016 recommendations:

- *Address the interaction between groundwater in the ditch area and in the central valley*
- *Costs should be included (O&M, capital costs, etc.)*

Response 38: The interaction of groundwater in the ditch area, by which we mean the East Maui License Area, and the central valley, by which we mean the Central Maui agricultural fields, is discussed in Section 4.2.2 of the EIS, which is the section that assesses groundwater, discusses interaction of groundwater in both East Maui and Central Maui.

The EIS explains that East Maui is within the MDWS's Ko'olau Aquifer Sector which includes four aquifer systems: Ha'ikū, Honopou, Waikamoi, and Ke'anae. While no groundwater is transferred from the Ko'olau Aquifer Sector, surface water is conveyed from the sector to the Central Aquifer Sector via the EMI Aqueduct System. Since surface and groundwater interchange depends on the underlying geology, the increase in surface flow since the cessation of sugar cultivation in 2016 also contributes to an increase in groundwater in East Maui.

Specifically, as stated within Section 4.2.2 of the EIS regarding potential impacts to East Maui from the proposed Water Lease:

Groundwater levels are expected to be greater than historic levels due to increased recharge from stream restoration actions under the CWRM D&O. Moreover, according to a USGS publication (2019) on estimating the groundwater of Maui through 2035, the Ko'olau Aquifer System is expected to see an increase in groundwater from recharge rates due to changes in rainfall patterns from future climate change trends. Thus, even lesser impacts to East Maui groundwater are anticipated as a result of the Proposed Action.

While the Central Aquifer Sector has generally low SY numbers for groundwater pumpage, it is important to note that calculations of SY do not factor in recharge from the surface water diversions. Under the Proposed Action, the wells in Central Maui are not expected to yield as much as when sugar was cultivated in the Central Maui agricultural fields. Significant recharge did occur for the Central Maui aquifers when sugar was in cultivation as a result of the seepage / system losses from the Central Maui Field Irrigation System which allowed for high pumpage rates exceeding the SY. Thus, under the Proposed Action, it is assumed that at full operation of the Mahi Pono farm plan the Central Maui Field Irrigation System losses would continue to add to the recharge the Central Maui aquifers, but in an amount that is less than when sugar was cultivated. Additionally, the salinity of the water in the 10 wells available to Mahi Pono is likely to increase, also as a result of the lower level of aquifer recharge. Furthermore, when sugar was cultivated, the 70 mgd of brackish water used by HC&S was sourced from 14 wells, but Mahi Pono only has access to 10 wells.

Regarding your comment about the operation and maintenance (O&M) costs associated with running the EMI Aqueduct System, these are included in the Economic and Fiscal Impact Study

(Appendix H) report and discussed in Section 4.7.3.1 of the Draft EIS. As stated in Section 4.7.3.1.d of the Draft EIS, “*Due to the nature of the EMI Aqueduct System, the operational costs are largely fixed, with minimal variable costs.*” Total operational costs for labor, fringe benefits, materials, professional services, taxes, maintenance, anticipated rental payments to the State for the Water Lease, and other expenses are projected to be approximately \$2.2 million per year (Munekiyo, Updated 2020).

Comment 39: *The Water Use and Development Plan:*

- *Diversify the sources (recycled water, climate adapted crops, conservation)*

Response 39: The intent of your Comment #39 is unclear. Regarding the Water Use and Development Plan, however, please note that this document was used widely as a reference throughout the EIS. f

As for potential diversification of water sources, please note that Chapter 3 of the Draft EIS identified alternatives that have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului WWRf, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were discussed, but ultimately not assessed to the same degree as (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Moreover, based on comments received on the Draft EIS, the assessment of those water source previously considered but ultimately dismissed from review has been further expanded within the spectrum of alternatives presented in the Draft EIS. See pages 3-2 to 3-19 of the Final EIS.

Your comment about conservation in terms of diversification of source is unclear. However, we note that Mahi Pono expects to invest over \$20 million to increase the efficiency of its private Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from Kamole-Weir). As a part of this upgrade Mahi Pono's irrigation engineering team is also designing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycle and re-use all water used in Mahi Pono's processing plants; and (3) integrate various live technology feeds to constantly monitor plant, soil, and tree health.

It is unclear what is meant by climate-appropriate crops, however, please note that all the crops in the Mahi Pono farm plan are well suited for the climate in Central Maui. However, it should be noted that Mahi Pono has implemented several water saving strategies for the Central Maui agricultural fields, including the following:

- Planting windbreaks in the fields.
- Incorporating significant uses of weed mat along plant lines, which will reduce evapotranspiration and erosion.
- Mowing rather than plowing inter-rows to preserve organic matter and keep cover to prevent soil erosion.
- Operating within the terms of a Conservation Plan from NRCS, which includes swales and diversions for erosion protection,
- Practicing rotational grazing of livestock,
- Planting permanent tree crops that will develop canopies that will assist with soil moisture retention and reduce evapotranspiration.

This information regarding water saving strategies has been added to Section 2.1.4 of the Final EIS, as shown on pages 2-25 to 2-27.

Comment 40: *Gravity-fed surface water is the most cost-effective from the County's perspective.*

Response 40: We concur with your Comment #40 above. Typically gravity surface diversion systems are cost-effective as they do not need to use energy to pump the water. Conversely pumping water to higher elevations requires a lot of energy which can be costly when required. The EMI Aqueduct System is a gravity-fed water delivery system.

Comment 41: *Caleb Rowe, Department of the Corporation Counsel:*

30-year-lease application to BLNR

- o *Continued use of the diversions*

Response 41: We concur that under the Proposed Action (issuance of a long-term Water Lease) the EMI Aqueduct System would continue to divert water from the License Area.

Comment 44: *IIFS before CWRM*

- o *CWRM sets how much water needs to be left in the streams to allow for biodiversity, cultural activities, and view plains.*
- o *27 streams received IIFS, and the ruling was not appealed to the Supreme Court (first in history)*
- o *IIFS can be changed at the behest of the community*

Response 44: We concur that the IIFS under the CWRM D&O establishes a quantity of water that must remain in the streams at specified locations, as discussed in Section 1.3.4 of the Draft EIS:

The June 20, 2018 CWRM D&O establishes a quantity of water that must remain in each stream at specified locations subject to the IIFS Petitions. The CWRM D&O does not specifically authorize or allocate amounts of water for offstream uses. The CWRM evaluated each of the streams under the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration potential for fish and other stream animals, recreational opportunities, and scenic values. Then the streams were looked at in an integrative approach with consideration for the overall ecological ramifications of the decision. The CWRM also considered the economic ramifications of its decision on offstream uses, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture.

Theoretical models of un-diverted total and base flows were used in the majority of the streams to set the IIFS. The IIFS is a numeric flow rate, measured in cubic feet per second (cfs) that must remain in the stream at a certain location. The CWRM used a median base flow (BFQ₅₀) to make their decision, which is an amount of stream flow that can be expected to be found in the stream at least 50% of the time. Base flow is a smaller component of the stream's total flow. Total flow includes water input from normal rainfall and storm events. Depending on the location, the base flow standard can vary, therefore it is typically measured at a lower elevation downstream that is more accessible.

To set the IIFS, the CWRM grouped the streams into four broad categories with different objectives and management strategies: (i) conveyance of water to kalo growing areas for community use; (ii) water for streams with high biological value, (iii) water for streams that have barriers to biological or ecological improvements, and (iv) noninstream use of water for municipal and agricultural uses. (See Figure 1-3).

Only two of the petitioned streams that are diverted by the EMI Aqueduct System (Waia'aka and Wahinepe'e Streams) did not have their IIFS amended. Twelve diverted streams within the License Area were not subject to any petitions (the non-petitioned streams) and therefore maintain their status quo flow standards.

Regarding your comment that CWRM set IIFS for 27 streams, please note as discussed in Section 1.3.4 of the Draft EIS, the CWRM found that there were 24, not 27, streams that were the subject of the contested case. The difference being that (i) Waikani is not a stream but a waterfall of Wailuānui Stream; (ii) Alo is a tributary of Waikamoi Stream; (iii) Pua‘aka‘a is a tributary of Kopili‘ula Stream; and (iv) Pi‘ina‘au and Palauhulu are separate streams that join together before reaching the ocean (CWRM D&O, FOF 56). You are correct that no party appealed the CWRM D&O.

For clarification, the State Water Code, HRS Chapter 174C, dictates the process and criteria for amending the IIFS for streams.

Comment 43: *BLNR can use CWRM’s IIFS numbers, but they do not have to. They could impose their own determinations for the 13 streams that do not have an IIFS.*

Response 43: Your Comment #43 above is unclear. The CWRM D&O is a separate action that must be complied with regardless of the issuance of the Water Lease. However, the BLNR has the authority develop the terms and conditions of the Water Lease, which could theoretically have its own water diversion restrictions on streams, including those that were not subject to the CWRM D&O. The BLNR, however, does not have the authority to establish any new IIFS.

Comment 44: *Currently in the courts over the 2019 “revocable permits.” The contested case hearing was waiting for the DEIS to be completed.*

Response 44: Your comment is unclear. However, it is acknowledged that there are pending lawsuits on the various revocable permits. There is also a pending contested case hearing on the request from 2001 that the BLNR issue a water lease at public auction. An EIS must be completed before the Water Lease matter can move forward.

Comment 45: *Zack Williams, East Maui resident:*

There haven’t been any studies conducted that explain why there is no connectivity between the mountain and the ocean at some of the lower-altitude streams, referencing Nahiku and Makapipi streams.

Response 45: To clarify, Makapipi Stream is located in the Nāhiku area, but we are unaware of a stream referred to as Nāhiku Stream. Please note that pursuant to the CWRM D&O, Makapipi Stream has been fully restored as noted within Section 1.3.4 of the Draft EIS. Therefore, connectivity is not an issue.

Comment 46: *EMI should allow for bids on improving and upkeeping their tunnels and gates, especially in Nahiku.*

Response 46: Your comments are acknowledged. However, this is outside the scope of the EIS. Please refer to Response #1 above regarding the scope of the EIS. For clarification, please note that the description of the Nāhiku water service from Section 2.1.3.3 of the Draft EIS, has been revised to take into account clarifications from the MDWS after the publication of the Draft EIS. See pages 2-21 to 2-22 of the Final EIS. The water provided to the MDWS for Nāhiku is not provided from the EMI Aqueduct System or the water requested for the Water Lease. As confirmed by MDWS, the Nāhiku Tunnel is the sole source of water for the MDWS Nāhiku Water Service Area. It is also our understanding that EMI developed and owns the Nāhiku Tunnel. Per a 1973 Memorandum of Understanding, as amended, MDWS can draw up to 20,000 gallons of water per twenty-four hour day to serve the Nāhiku community. EMI continues to deliver water to the MDWS for the Nāhiku community pursuant to the agreement. However, that continued delivery is premised upon EMI's continued receipt of permits or a lease from the State BLNR.

Regarding the upkeep and maintenance of the EMI Aqueduct System, as discussed in the Section 2.1.2 of the Final EIS as shown on page 2-7, under the Proposed Action, EMI's "maintenance and repair" involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. EMI's maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System.

Comment 47: *The impacts to groundwater from diversion systems are not addressed in the Draft EIS.*

Response 49: We disagree with your comment that groundwater impacts were not addressed in the Draft EIS. Section 4.2.2 (Groundwater) of the Draft EIS addresses the impacts of the Proposed Action to groundwater. Due to the age of the diversions of the EMI Aqueduct System, we do not know of any past studies that show the condition of the aquifer in East Maui prior to the diversions being constructed. However, the current sustainable yield in the Ko'olau Aquifer System, which underlies East Maui, is 152 mgd. This has been clarified in Section 4.2.2 of the Final EIS, as shown on pages 4-69 to 4-71.

This sustainable yield number is high due to climatic conditions topography and geology of the area. The surface geology of East Maui is comprised of highly permeable lava flow remnants of

the Hāna Volcanic Series, which allows rainfall to easily penetrate and recharge groundwater bodies in the region. Under the Proposed Action, groundwater levels, in general, are expected to be greater than historic levels in the Ko‘olau Aquifer Sector due to increased recharge from stream restoration actions under the CWRM D&O. Therefore, adverse impacts to groundwater and the aquifer in East Maui are not anticipated. Moreover, a USGS report published in 2019 identifies certain aquifer sectors and aquifer systems that will experience either increases or decreases due to climate projections. In the scenarios presented in the USGS report, the aquifer systems in the Ko‘olau Aquifer Sector are projected to see some of the largest increases in recharge. Please see page 4-71 and pages 4-89 to 4-90 of the Final EIS.

Regarding the impacts to groundwater in Central Maui from the stream diversions in East Maui, the above mentioned USGS (2019) report anticipates that there will be decreases in recharge due to changes in rainfall patterns from future climate change trends. However, as discussed in Section 4.2.2 of the Draft EIS:

SY does not account for water transfers, including surface water conveyed to the Central Maui Aquifer Sector from the Ko‘olau Aquifer Sector by the EMI Aqueduct System. Such imported water for irrigation flowing past the root zone of crops enters the aquifer from which it can be pumped and reused. According to the Draft Maui Island Water Use and Development Plan (March 2019), the “impact on ‘available’ groundwater that can be extracted from the Kahului and Pā‘ia aquifers from irrigation return flow is highly uncertain since the cessation of sugarcane cultivation in 2016” (p. 18). The plan further notes that there are no monitoring wells in the Central Aquifer Sector to gage water level changes over time. Nevertheless a simulated scenario in a 2008 USGS study suggests that the complete removal of irrigation return recharge would decrease water levels and increase salinity in the Central Maui Aquifer Sector (Akinaka, 2019).

Hence, the Central Aquifer Sector has generally low SY numbers. However, the numbers do not take into account the recharge that occurs from system losses (i.e., water lost to seepage and evaporation, and including other water uses, such as water used for reservoirs, fire protection, dust control, and hydroelectric uses) from the Central Maui Field Irrigation System within the Central Maui agricultural fields. Some portion of this seepage would enter the Pā‘ia, and Kahului, and Ha‘ikū aquifers, and some amount of the water used for irrigation would seep past the root zone and also enter the aquifers. Little is known about the exact relationship between the irrigation return water and how much could be reused as groundwater. However, the use of East Maui surface water to irrigate the Central Maui agricultural fields has long supplemented the underlying aquifers, and a similar relationship will continue under the Proposed Action, essentially constituting a beneficial impact to the Central Maui aquifers, particularly the Pā‘ia

and Kahului aquifers, albeit at a smaller scale than when sugarcane was being cultivated and more East Maui water was imported into Central Maui. Thus, under the Proposed Action, it is assumed that at full operation of the Mahi Pono farm plan, system losses within the Central Maui agricultural fields would add to the recharge of the aquifers underlying the Central Maui agricultural fields as discussed in Section 4.2.2 of the Final EIS regarding Central Maui groundwater, updated as shown on pages 4-74 to 4-77.

Comment 48: *The Nāhiku portion of EMI's water diversion should be condemned.*

Response 48: Your comment is unclear, but condemnation suggests governmental acquisition of a portion of the EMI Aqueduct System. The purpose of such acquisition is unclear within the context of water for Nāhiku. As discussed in Response #46 above, according to MDWS, the Nāhiku Tunnel is the sole source of water for the MDWS Nāhiku Water Service Area. It is also our understanding that EMI developed and owns the development tunnel that is the source of the water. Per a 1973 Memorandum of Understanding, as amended, MDWS can draw up to 20,000 gallons of water per twenty-four hour day to serve the Nāhiku community. EMI continues to deliver water to the MDWS for the Nāhiku community pursuant to the agreement. However, that water delivery is premised upon EMI's continued receipt of permits or a lease from the State BLNR. Even though the agreement provides the MDWS a right to up to 20,000 gpd per twenty-four hour day, EMI has accommodated the needs of the Nāhiku community, which have ranged between approximately 8,345 (2018) to 40,925 (2007) gpd on a daily basis, although supply of amounts over 20,000 gpd on any given day is not required under the agreement (MDWS, 2007 – 2018).

Comment 49: *Joss Akoi, East Maui resident:*

Social and community impacts need to be further addressed in the Draft EIS.

Response 49: The Draft EIS contains a robust discussion about social and community impacts based upon work done by Earthplan as documented in the SIA (EIS Appendix G) and summarized in Section 4.7.2 of the EIS. It is not clear from your comment what information you believe is missing from those reports. Potential impacts and recommended mitigations on social impacts identified in the SIA are discussed fully in detail in Section 4.7.2 of the EIS which has been expanded on to include a discussion related to cumulative social impacts. Specifically, Section 4.7.2, as it relates to East Maui states:

East Maui residents, farmers and cultural practitioners have been advocating for the reduction of stream diversions and the return of full stream flows. Focus group participants and interviewees stressed that previous water leases have had

significant impact on their culture, social well-being and generational ability to thrive in East Maui. While the CWRM D&O addresses or mitigates that impact to some degree, the proposed Water Lease would still affect streams in their area...

Two areas of mitigative measures are recommended for consideration, should the proposed Water Lease be granted by the BLNR. These measures are intended to establish an ongoing working relationship between the community, Mahi Pono and EMI, and related public agencies, as well as continue resolution with East Maui communities.

It is recommended that interest groups, or stakeholder groups, are clearly defined so that there is recognition of who will be affected by the proposed Water Lease. Groups should include geographic communities, environmental, agriculture and business interests, and public agencies. Each group would be encouraged to reach consensus on their own needs, concerns, opportunities and possible solutions.

A starting point for identifying stakeholder groups could be the interviewees and focus group participants that participated in Earthplan's SIA and their networks.

It is recommended that interest groups are equitably represented in a "Core Working Group" that would serve as a forum for exchanging ideas and collaborative efforts, as well as provide feedback and suggestions to Mahi Pono. Each member of the Core Working Group would be expected to reach out to their own networks to extend the discussion beyond the Core Working Group. While there would likely be strong differences in perspectives and opinions, the Core Working Group would need to find ways to establish core principles, common ground and manageable solutions.

The fundamental value that will help bring people to the same table is trust. The proposed Water Lease has elicited skepticism and distrust over many decades, and these feelings prevent willingness for participating in mediation and collaboration. While developing trust among the various groups will be challenging, the first step is transparency. Being open about intent, plans, and activities can begin to establish credibility and open the door to dialogue.

Specifically for the Ke'anae – Wailuānui community to move past historical impacts, there needs to be established a point of departure. Mitigation needs to go beyond the physical restoration of streams. It needs to address the social context

and include apology and reconciliation. This needs to be done within a cultural foundation that binds the community together, and key players, including Mahi Pono, public agencies and elected officials. The manner and forum for this process should be defined by the cultural leaders integral with the process

The socio-economic impacts of the Proposed Action are addressed at length in Section 4.7 of the Draft EIS, and in further detail in Appendices G through I (Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report). Draft EIS Section 4.7 has subsections addressing impacts to populations and impacts (Section 4.7.1), impacts to social characteristics (Section 4.7.2), impacts to the economy and other fiscal considerations (4.7.3), and impacts to the agricultural economy. (4.7.4). The potential socio-economic impacts of the alternatives to the Proposed Action considered by the Draft EIS are analyzed in Section 3.4.11 (Social Characteristics), 3.4.12 (Economic and Fiscal Resources), and 3.4.13 (Agricultural and Related Economic Resources). The Draft EIS thoroughly addressed cumulative socio-economic impacts in Section 4.17. That discussion has been further supplemented by updates in the Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report as shown on pages 4-331 to 4-336 of the Final EIS.

Comment 50: *There isn't enough water for the Kuleana farmers who were once ensured water rights by Prince Jonah Kūhiō Kalaniana'ole. Hawai'i's history needs to be better documented and considered.*

Response 50: Regarding your comment about the water rights of kuleana farms, the Hawai'i Supreme Court has determined that those rights consist of the rights to the use of water "appurtenant" to and utilized by certain parcels of land at the time of their original conversion into fee simple land, when title was confirmed by the Land Commission Award and title conveyed by the issuance of a Royal Patent. *Reppun v. Board of Water Supply*, 65 Hawai'i 531, 551; 656 P. 2d 57, 71 (1982).

The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that "existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted." See CWRM D&O FOF 54. Moreover, the prior water licenses issued to EMI in the past continued to recognize the rights of other property owners "for domestic purposes and the irrigation of kuleanas entitled to the same." See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby "The State reserves the right...to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally

protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water. . . .” It is expected that the lessee under the Water Lease would be subject to similar requirements and would therefore not impair the "water rights" of "Kuleana farmers."

With regard to the East Maui streams in the License Area covered by the CWRM D&O, the uses of water by those who registered diversions claiming “appurtenant”, or “kuleana” rights were analyzed in detail separately with regard to each stream. The Proposed Action assessed under this EIS contemplates a Water Lease that would be in full compliance with the limitations set forth under the CWRM D&O.

Regarding your comment that Hawai‘i history needs to be better documented and considered, Section 1.3 of the EIS includes a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui. The Archaeological Literature Review and Field Inspection (EIS Appendix E), (which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe‘e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui), provides information about the precontact to modern times in East Maui.

Comment 51: John Longmire, East Maui resident:

Native Hawaiian practices and reliance on the streams will be affected if the water lease is granted; however, studies and concerns regarding these potential impacts are not adequately documented in the Draft EIS.

Response 51: You have not provide any basis for your comment that potential impacts to native Hawaiian practices and reliance on streams have not been adequately documented in the Draft EIS. We believe the Draft EIS adequately documented such impacts, as well as other relevant environmental impacts. As it relates to traditional and cultural practices within the East Maui area, the CIA and Section 4.6 of the EIS acknowledges that the Proposed Action may impact Native Hawaiian cultural resources and practices and provides for several recommendations to mitigate those impacts. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, potential impacts presented in Section 4.6 of the Draft EIS include the following:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to ‘ōpae, ‘o‘opu, pūpūlo‘i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail);

Neritinu graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui.

However, based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, as shown on pages 4-158 to 4-159 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action as shown on pages 4-239 to 4-252 of the Final EIS.

CSH offers specific recommendations to mitigate impact to Native Hawaiian practices and reliance on streams, summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of optical encoders with float tape and data loggers within the EMI Aqueduct System; 2) notify and ensure appropriate training of any persons required to enter the License Area regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Comment 52: *Family's property borders an EMI easement, and because of this, we have encountered barriers to development of the property. Impacts to smaller family properties, and identifying which properties, should be acknowledged so that people are aware if they may be or are already implicated.*

Response 52: Specific discussions of impacts on individual property owners is beyond the scope of the EIS. Please see Response #1 above regarding the scope of the EIS. However, we note that the Proposed Action, including operation of the EMI Aqueduct System, would be subject to compliance with all applicable and enforceable land use plans and policies, which are discussed in Chapter 5 of the Draft EIS. The Draft EIS also contains numerous graphics showing the property locations for the proposed Water Lease and also identifies the proposed License Area by tax map key.

Comment 53: *Councilmember Michael J. Molina:*

The total amount of water to be diverted from non-restored streams should be identified. The percentage of water to be diverted from non-restored streams should also be disclosed.

Response 53: Please note that as discussed in Response #34 above, it is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams,

which caused gauges to wash away. As noted in the CWRM D&O FOF EMI takes measurements at the boundary of each section of the License Area and at its gauging stations at Maliko Gulch. However, for the purpose of measuring the aggregate flow from entire License Area, the measurements taken at the Honopou boundary were used.

However, the total amount of water that could be diverted from the License Area after taking into account all of the flow restoration requirements under the CWRM D&O is provided in the EIS, and that estimated available median flow is 87.95 mgd. This information is provided in several sections of the EIS including, for example, Section 2.1.2.

Comment 54: *The number of streams and the names of the streams where water is to be diverted should be defined.*

Response 54: The information you requested was provided in the Draft EIS in Section 1.3.4.1 and summarized in Table 1-3. This Section and table, which has been renewed to Petitioned and Non-Petitioned Streams – 2018 IIFS D&O Flow Restoration Table, have been revised in the Final EIS for further clarification based on comments received on the Draft EIS as shown on pages 1-13 to 1-24 of the Final EIS.

Comment 55: *The amount of water to be diverted from partially restored streams should be disclosed.*

Response 55: The total amount of water that could be diverted from the License Area after taking into account all of the flow restoration requirements under the CWRM D&O is provided in the EIS, and that estimated available median flow is 87.95 mgd. Obviously that figure does not include any flow from the streams that were ordered for full flow restoration. It is comprised of flow from the non-petitioned streams and the streams that were ordered to have partial flow restoration and, in two instances, petitioned-streams for which CWRM did not establish any new IIFS.

Comment 56: *The Proposed Action of the Draft EIS states: “The amount of water allowed to be diverted by the Water Lease will be significantly less than the amount diverted for sugar cultivation.”*

- *There should be a comparison drawn between the amount of water proposed to be diverted compared to the water diverted for sugar.*

Response 56: The Draft EIS included a comparison between the amount of water proposed to be diverted under the Proposed Action compared to the amount of water that was diverted for sugar. Specifically, Section 2.1.2 of the Draft EIS states:

Up until 1986, when the first return of water was made to the East Maui streams, the long-term average delivery by the EMI Aqueduct System was 165 mgd (CWRM D&O, FOF 519) before any use of the water by the MDWS or HC&S. In 2001, the CWRM began the process toward its D&O for several East Maui streams that further changed the amount of water available for delivery to Upcountry Maui and to the Central Maui agricultural fields. Based on these changes to the system, a more recent history of flow deliveries from the EMI Aqueduct System was computed from 1987 to 2006 (20 year time period). When analyzing the delivery data at Honopou Stream and Maliko Gulch, the median (Q50) flow at these areas for this time period was 135.58 mgd at Honopou Stream and 146.64 mgd at Maliko Gulch (Akinaka, 2019).

Compliance with the June 2018 CWRM D&O requires modifications to many of the stream diversion works that are part of the EMI Aqueduct System. . . . the amount of water that may be diverted should the Water Lease be issued is substantially less than the amount that was diverted during normal sugar production. For example, in 2006 it is estimated that the EMI Aqueduct System delivered approximately 156.69 mgd at Maliko Gulch, whereas under the CWRM D&O, it is estimated that the delivery at Maliko Gulch will be approximately 92.32 mgd (Akinaka, 2019).

The median flow required by the CWRM D&O provides an estimated available median flow at Honopou Stream of 87.95 mgd, where the EMI Aqueduct System leaves the License Area. Beyond the License Area, the diverted streams only provide supplemental ditch flow when License Area diversions are low. The amount that can be added is relatively low because when rainfall is high in East Maui, the ditches are fuller and there is little needed to supplement the flow. And, when rainfall is low in East Maui, the streams west of Honopou Stream have less flow in them as they are in an area that receives less rainfall than areas further east. During drier (low flow) periods, it is estimated that 4.37 mgd is available to supplement the EMI Aqueduct System between Honopou Stream and Maliko Gulch. With this added flow, the estimated median flow available beyond Maliko Gulch for use in Upcountry Maui and the Central Maui fields is estimated to be 92.32 mgd (Akinaka, 2019).

Comment 57: *Mahi Pono should be a party to this proposed Draft EIS and water lease since they will be directly benefitting from the diversion of these waters.*

Response 57: It is not clear what you mean by Mahi Pono being a "party" to this EIS or the Water Lease. This EIS is being prepared by A&B pursuant to orders issued by BLNR as described in Response #3, directing A&B to prepare the EIS. However, as is evident by the text of the EIS, information from Mahi Pono, particularly related to Mahi Pono's farm plan, has been solicited and is fully considered in the EIS. However, it is also important to recognize that the Central Maui agricultural fields are privately owned and farming is a permitted activity on those lands, and therefore farming on those lands is not a trigger for the preparation of an EIS. As for being a "party" to the Water Lease, the EIS analyzes proposed uses of the water, but is not necessarily tied to a specific applicant (although the EIS explains how A&B, on May 14, 2001, requested that the State offer at public auction a long-term water lease under HRS § 171-58). Presumably, any party who intends to use the water in a manner consistent with the EIS analysis could bid on the lease at public auction.

Comment 58: *The Draft EIS states: "The Water Lease is to be awarded by public auction."*

- *The process for public auction and awarding of the lease should be defined.*

Response 58: HRS § 171-58(c) provides in relevant part that "disposition of water rights may be made by lease at public auction as provided in [HRS Chapter 171]." That section of the law also provides that "any disposition by lease shall be subject to disapproval by the legislature by two-thirds vote of either the senate or the house of representatives or by majority vote of both in any regular or special session next following the date of disposition."

HRS § 171-16(a) describes the public auction process as follows:

(a) Auctions. Public notice of any proposed disposition by auction shall be given at least once statewide and once in the county where the land being disposed of is located. Notice of the auction shall contain the following:

- (1) Time and place of the auction;
- (2) General description of the land, including the address and tax map key;
- (3) Specific use for which the disposition is intended; and
- (4) Upset price or rental to be charged. The maps showing the metes and bounds description and the classification of the land shall be kept in the office of the board of land and natural

resources and of its land agent in the county in which the land is situated, and shall be open for inspection at all reasonable hours.

Further specifics on the public auction process have not been made publicly available at this time. We expect that the DLNR/BLNR will provide more details on the process once the EIS is finalized and the Water Lease process can proceed.

Comment 59: *The Draft EIS states: “The content and parameters of a watershed management plan related to the proposed Water Lease are unresolved at this time but will be resolved before BLNR can issue the Water Lease.”*

- *The “content and the parameters of the watershed management plan” that has yet to be “resolved” should be outlined and defined.*
- *The specific timing for resolving the parameters of the watershed management plan should be noted as well. Resolution before BLNR is too vague and too close to awarding of lease.*

Response 59: Please note that on October 11, 2019, the BLNR approved the minimum content requirements for a watershed management plan which are discussed in Response #23 above, and provided in Section 2.1. of the Final EIS as shown on pages 2-2 to 2-4. With respect to the timing, as presented in Section 8 of the EIS, the specific contents and parameters of the watershed management plan in connection with the proposed Water Lease will be resolved before the BLNR can issue the Water Lease.

Comment 60: *The Draft EIS states: “The Water Lease is also subject to the rights of the DHHL to reserve water sufficient to support current and future homestead needs.”*

- *The amount set aside for the DHHL reserve that should be approximated in a specific water demand cannot be provided at this time.*

Response 60: Specific information regarding the DHHL's future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS, and updated in the Final EIS, as discussed in Response #13 and # 22 above, and shown on pages 2-4 to 2-7. The assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui) as shown on pages 2-4 to 2-7.

Comment 61: *The use of reclaimed and recycled wastewater was dismissed because of construction of transmission pipelines and potential impacts to native Hawaiian birds. This matter should be explored further using other transmission possibilities, such as tankers.*

Response 61: As discussed in Response #31 above, the Final EIS has been revised to incorporate a discussion of anticipated plans to retrofit the County's Kahului WWRF plant to provide R-1 treatment capabilities in the future (as a project targeted for implementation as early as 2026-2028) but this upgrade currently has not been funded. It is noted that upgrading this facility to R-1 treatment standards is contingent upon the availability of County funding. This discussion is shown on pages 3-9 to 3-11 of the Final EIS. In summary, the yield of the subject WWRF would be nominal (approximately 5.5 mgd) and it would also require the installation of a transmission / transportation system to convey these recycled waters from the Kahului WWRF to the Central Maui agricultural fields, a distance of some 10+ miles as there is no current transmission system that is capable of conveying recycled waters to the Central Maui agricultural fields. In addition, construction near Kanahā Pond, which is designated as a State wildlife sanctuary and any development along that corridor that surrounds the pond would raise the risks of new environmental impacts in an acknowledged sensitive area, and be subject to additional regulatory processes and controls such as compliance with Section 7 with the USFWS, Chapter 6E, DOH approval process for construction and treatment, and recycled water use permits.

Even if this modest amount of water could feasibly be transported to Central Maui, it should be noted that a challenge associated with the production of recycled waters includes the wide variety of chemicals and compounds as well as microorganisms, organic chemicals, inorganic chemicals, disinfectants, disinfectant byproducts that need to be considered when treating reused water. Each of these products has the potential to be harmful to both humans and the environment. The extent of environmental impacts from these byproducts is dependent on the concentration as well as the type of specific compound/chemical in use. If not treated properly and used in the Central Maui agricultural fields, the chemicals and compounds used for the R-1 water could reduce crop yields for consumption and the underlying soils in Central Maui.

Comment 62: *Councilmember Tamara Paltin:*

The lease was issued so long ago, and with no treaty of annexation, was it ever valid in the first place, and should we even be considering renewing it knowing what we know now?

Response 62: Providing a legal analysis of contracts and agreements enabling an applicant to pursue a proposed action is beyond the scope of an EIS. Please refer to Response #1 above regarding the scope of the EIS. However, please note that the pending request is for a new, long-term (30 year), water lease to be issued at public auction no Water Lease has been issued, and no

Water Lease will be issued until after an EIS is accepted. Your comment about "renewing" is unclear as no renewals are proposed.

Comment 63: *To ask for a 30-year lease of a public trust without any reference to timeframes, deliverables, or performance requirements does not seem appropriate.*

Response 63: Please note that the phasing and timing of the Proposed Action is included in Section 2.1.5 of the EIS. Specifically, Section 2.1.5 of the Draft EIS states:

After the Final EIS (FEIS) is published and accepted by the BLNR, the State of Hawai'i will conduct appraisals of the water from the License Area, produce lease agreements and a Watershed Management Plan (refer to Section 2.1). Once this is complete the Water Lease will be put to public auction. Once the Water Lease is issued by the BLNR, under the Proposed Action, Mahi Pono can implement its proposed farm plan.

An estimated 10 years will be required for Mahi Pono and lessees to remove volunteer sugarcane and weeds from the approximate 30,000 acres, amend soils, install field improvements, build warehouses and other structures, and plant crops. The predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years (Plasch, 2019).

In order for Mahi Pono and other farmers to justify the very substantial investment in a 30,000-acre farm, a long-term water lease will be required. A short-term lease would derail development of the Mahi Pono farm plan because of the risk of not being able to farm for a long enough period to recover their planned investment (Plasch, 2019).

However, please further note that the terms and conditions of the Water Lease are at the discretion of the BLNR. Should the BLNR make performance indicators a part of the Water Lease, the lessee will comply with those terms and conditions.

Regarding water being a public trust, we acknowledge that the Proposed Action (the issuance of a 30-year Water Lease by BLNR), requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai'i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. A specific

discussion regarding the Public Trust Doctrine has been added to the Final EIS as Section 1.5 as shown on pages 1-25 to 1-27.

Comment 64: *Why hasn't the applicant engaged with the County? There have been several invitations to public meetings, letters, and requests for information from the applicant that have been ignored.*

Response 64: The EIS process has included substantial engagement. Chapter 9 of the EIS contains all consultation efforts during this EIS process. Specifically, all the County of Maui agencies were consulted with during the EIS Preparation Notice (EISPN) and the Draft EIS stages. It is further noted that there were also several opportunities for members of the public to participate in public scoping meetings conducted as part of the EIS effort. Moreover, numerous of the agencies provided comments to both documents as shown in Appendix M of the EIS, which includes all comments and responses related to the EISPN, and Appendix N of the Final EIS which includes all comments and responses related to the Draft EIS.

Regarding meetings with the Maui County Council, representatives of A&B, after the close of its sugar operations and prior to the sale of its agricultural fields to Mahi Pono, appeared before the Council to discuss its diversified agricultural plans for its former sugar lands. Representatives of Mahi Pono have individually met with several members of the Maui County Council, but Mahi Pono has not been formally invited to provide testimony at a formal meeting of the County Council or any of its committees.

Mahi Pono has also had various meetings with community groups such as Go Maui, Maui Tomorrow, Mā'alaea Community Association, Pukalani Community Association, and the Alliance of Maui Community Associations regarding the Mahi Pono farm plan and use of water from East Maui streams, and conducted farm tours with members of the community. Mahi Pono is also working directly with MDWS as well as the County Corporation Counsel and Mayor's offices, to help coordinate continued deliveries of surface water to the County's Kamole-Weir WTP and the KAP.

Comment 65: *An alternative that has not been explored is the potential to utilize R-1 water from the Wailuku-Kahului Wastewater Reclamation Facility to satisfy irrigation needs now or in the future.*

Response 65: The use of recycled water from the Kahului WWRF was discussed in the Draft EIS Section 3.1.1.2. As explained in Response #31 above, that section of the EIS has been updated to reflect the County's plans to upgrade the Kahului WWRF to an R-1 treatment facility which can be used for food crops. However, it is anticipated that this upgrade would not occur

until 2026-2028. Moreover, this WWRF would produce only about 5.5 mgd. In other words, this potential supplemental resource would supply a limited amount of water in a manner that generally would not enhance the environmental quality, or avoid, reduce, or minimize some or all of the adverse environmental effects, costs, or risks that are associated with the Proposed Action. Please see a further discussion on this topic in Response #61 above and on pages 3-9 to 3-11 of the Final EIS.

Comment 66: *Other Discussion:*

Please provide stream-gauge measurements of stream flows upstream and downstream of each diversion for each stream contained within the area of the Draft EIS.

Response 66: Please see Response # above. It is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gauges to wash away. As noted in the CWRM D&O FOF 50, EMI takes measurements at the boundary of each section of the License Area and at its gauging stations at Maliko Gulch. However, for the purpose of measuring the aggregate flow from entire License Area, the measurements taken at the Honopou boundary were used.

Comment 67: *The DEIS refers to "Base Conditions" as those that occurred during full diversion during sugar cane cultivation.*

Response 67: Your comment is unclear as there is no reference in the Draft EIS to "Base Conditions" being the diversions that took place during the cultivation of sugarcane. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP

expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI’s West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko‘olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table in Section 3.5 as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 68: *Annually ~26% of the Upcountry water supply is being provided by the water contained in this diversion (Kamole and the East Maui Lease areas).*

Response 68: We are unclear on the source of your 26% figure. However, please note that all of the surface water supplied to MDWS’s Upcountry Maui Water System, which is 80-90% of the total water used in the Upcountry Maui Water System (see EIS Section 2.1.3.1), is tied to EMI’s ability to divert water from the License Area. MDWS’ right to access this source on a long-term

basis is contingent upon the issuance of the Water Lease. As discussed in Section 3.3 of the Draft EIS:

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. As a consequence, domestic and agricultural water needs in Upcountry Maui would need to be met by alternative water sources that would need to be developed by the MDWS. At this point in time, it is unknown whether sufficient groundwater resources exist in Upcountry Maui to meet these water demands. It is anticipated that the development of alternative water-source infrastructure would be prohibitively expensive, and depending upon the specific sources, or combination of sources, could result in significant direct adverse impacts to the environment.

However, please note that the discussion in the Draft EIS regarding the Upper and Lower Kula Systems has been supplemented with the additional figure as shown on page 2-15 [FEIS FIGURE 2-4] which has been added to Section 2.1.3.1 of the Final EIS to accurately show which system is serving which community in Upcountry Maui.

Moreover, the water delivered to the MDWS through Wailoa Ditch is an important back-up source for the Lower Kula and Upper Kula Systems during dry periods as the Wailoa Ditch is the more reliable of the three Upcountry surface water sources. Water is pumped uphill from the Kamole-Weir WTP to the Upper and Lower Kula systems during dry periods. Therefore, these systems also depend on the EMI Aqueduct System in crucial, drought times. Please note that Section 2.1.3.1 of the Final EIS has been supplemented to include this information as shown on pages 2-17 to 2-20.

Comment 69: *There are development tunnels that are counted as groundwater, not surface water.*

Response 69: It is unknown what specific development tunnels you are referring to, but it is our understanding that the CWRM looks at tunnel water on a case-by-case basis with respect to categorizing it as ground water or surface water. Generally, it is considered as ground water but the situation gets more complicated once the water flows into streams and mixes with surface water. Factored into the CWRM categorization decision is how the tunnel water is conveyed and when it daylights from the tunnel.

Comment 70: *Climate-appropriate crops are not put forth as an alternative.*

Response 70: It is unclear what is meant by climate-appropriate crops, however, please note that all the crops in the Mahi Pono farm plan are well suited for the climate in Central Maui.

Moreover, as discussed in Response #8 above, the Mahi Pono farm plan is a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e. orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, soil conditions, seasonality and the need to be sensitive to the existing local farming community.

Comment 71: *What is the exact area that is going to be served by the water in this diversion (including parcels and CPRs)?*

Response 71: It is unclear what is meant by “this diversion.” However, Chapter 2 of the EIS presents the areas to be serviced by or in connection with the diverted surface water.

Comment 72: *Is the diverted water going to be supplied to A&B-owned properties and CPRs in the Central Valley?*

Response 72: As discussed in Section 2.1 of the Final EIS, the Water Lease will enable the EMI Aqueduct System to continue to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion. The Proposed Action will also ensure the continued delivery of water for the Nāhiku community which, through the MDWS, draws water sourced directly from EMI’s West Makapipi Tunnel 2 (Well No. 4806-07), a development tunnel located on EMI land directly adjacent to the Koolau Ditch. It will also allow the continued provision of water to approximately 30,000 acres of agricultural lands (formerly in sugarcane) in Central Maui. Limited water (no more than 1.1 mgd) is presently being made available on an interim basis to pre-existing additional agricultural uses, as well as community, commercial, and industrial uses outside of Mahi Pono's Central Maui agricultural fields. None of the water diverted under the Water Lease would be used for any of the remaining A&B properties that were not sold to Mahi Pono, unless properties receive water through the MDWS, like any other MDWS customer.

Comment 73: *The DEIS makes reference to a “watershed plan.” Will this plan be drafted by the applicant, or does the applicant plan to utilize the existing watershed plan that is used by the East Maui Watershed Partnership?*

Response 73: Please note as discussed in Response #23 above, the lessee is subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. Furthermore, as discussed in Response #24 above, under the Proposed Action, it is anticipated that EMI and/or Mahi Pono will continue to pursue watershed management activities. This has been added to Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4. This could be a

continuation of the EMWP Management Plan, or developing a new watershed management plan, or a combination of both. Please also refer to Response #74 below.

Comment 74: *If the applicant plans to utilize the watershed plan currently used by the East Maui Watershed Partnership, how will downstream issues below the jurisdiction of the EMWP be adequately addressed?*

Response 74: With respect to the proposed Water Lease, the law (HRS § 171-58) requires that the Water Lease lessee agree to work with the DLNR to develop and implement a watershed management plan. That watershed management plan would need to meet the content requirements approved by the BLNR as described in Response #23 above and pages 2-2 to 2-4 of the Final EIS, and see also EIS Appendix O-1. The BLNR-approved content requirements for a watershed management plan note that DLNR "will work with each individual lessee to determine the specific management actions, based on the site-specific needs, that will result in the prevention and degradation of surface water and ground water quantity and quality within the water lease area. Those actions, described within the plan, will be informed by existing watershed management plans (should they exist)." Under the Proposed Action, it is anticipated that EMI and/or Mahi Pono will continue to pursue watershed management activities, through a watershed management plan prepared in compliance with HRS § 171-58. Thus, the EMWP watershed plan will not be the applicable plan under the proposed Water Lease

Comment 75: Shay Chan Hodges, Board of Water Supply:

Please see following written testimony, dated October 4, 2019. [Enclosing an email dated October 4, 2019 from Shay Chan Hodges to EACP Committee re Temporary Investigative Group - Research.pdf]

Response 75: Please note that we have received the Board of Water Supply's Temporary Investigate Group Research Notes dated October 4, 2019, through a Draft EIS comment letter submitted directly by Shay Chan Hodges. Our response to that letter is contained within Appendix N of the Final EIS.

Moreover, as discussed in Response #28 above, the TIG Report was made public on October 16, 2019, after the publication of the Draft EIS, and a copy of the TIG Report has been provided as Appendix Q of the EIS. A discussion of the TIG report has been added to Section 3.1.2 of the Final EIS, as shown on pages 3-19 to 3-20.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for

10238-04
Letter to Councilmember Kelly T. King

**ORDER RE ALEXANDER & BALDWIN, INC.'S AND EAST MAUI
IRRIGATION COMPANY, LIMITED'S SUBMISSION OF ENVIRONMENTAL
IMPACT STATEMENT SCOPE OF WORK FILED JUNE 9, 2016**

On June 9, 2016, Alexander & Baldwin, Inc. (A&B) and East Maui Irrigation Company, Limited (EMI) filed a Submission of Environmental Impact Statement Scope of Work (Scope of Work) in response to the Order for A&B to Commence the Environmental Review Process and Deferring Decision on Petitioners' Motion to Establish Scope of Reconvened Contested Case Proceedings filed on April 14, 2016 (Board's Order). Petitioner, Nā Moku Aupuni O Ko'olau Hui, filed a Response to A&B and EMI's Scope of Work on June 17, 2016.

The Board of Land and Natural Resources (Board) notes that the Scope of Work sets forth the information requested in the Board's Order. A&B and EMI should proceed with the preparation of an environmental impact statement (EIS) in as expeditious manner as possible. A&B and EMI should copy the Board on any notices that are sent out in connection with the EIS.

SO ORDERED this 8th day of July, 2016.

SUZANNE D. CASE¹
Presiding Officer
Board of Land and Natural Resources

¹ The Board members have delegated authority to Suzanne Case to sign this Order on behalf of the Board.

--------------------	--

I. INTRODUCTION

I. INTRODUCTION

A. BACKGROUND

In May 2001, Alexander & Baldwin, Inc. and East Maui Irrigation Company, Ltd. (EMI) (also collectively referred to as A&B) filed an Application for the Sale of Lease at Public Auction (“A&B Lease Application”) with the Board of Land and Natural Resources (BLNR) seeking a long-term 30-year lease for the “*right, privilege, and authority to enter and go upon*” the Nāhiku, Ke‘anae, Honomanū, and Huelo license areas “*for the purpose of developing, diverting, transporting, and using government-owned waters*”. Compliance with the requirements of Chapter 343, Hawaii Revised Statutes (HRS) is necessary prior to the BLNR’s consideration of the long-term lease request. By order dated April 14, 2016, the BLNR directed A&B, to provide to the Board, a scope of work for the preparation and processing of an environmental review document pursuant to Chapter 343, HRS. See **Appendix “A”**. In preparing the scope of work, A&B has assumed that an Environmental Impact Statement (EIS) process instead of an Environmental Assessment process would be the appropriate means of addressing the requirements of Chapter 343, HRS, for the proposed lease request. The trigger for compliance with Chapter 343, HRS environmental review is the use of state lands. It is assumed that the BLNR will be the Accepting Authority for the EIS.

It is noted that the BLNR’s order required specific content requirements to be incorporated in the scope of work, as follows:

1. The scope of work should distinguish those portions of the EIS that can be undertaken prior to the Commission on Water Resource Management’s (CWRM) decision on the petition to amend the Interim Instream Flow Standards (IIFS) from those that require a decision from the CWRM prior to completion.
2. The scope of work should demonstrate compliance with requirements contained in Hawai‘i Administrative Rules, Section 11-200-17.
3. The scope of work should include a tentative schedule for commencement and completion of various portions of the scope of work.

With respect to the EIS schedule noted in Item No. 3, above, the order states that to the degree that A&B’s decision to transition away from sugar cane cultivation affects the ability of, or timing for A&B to complete portions of the environmental review document, that should be noted in the scope of work.

This report sets forth the scope of work for the preparation and processing of an EIS, as required by the BLNR.

B. HISTORY OF WATER LEASES

The A&B Lease Application seeks to continue the operation by A&B subsidiary, EMI, of the East Maui aqueduct system which is an integrated system of diversions, ditches, intakes, and tunnels that collects water from streams located on the rainy windward slopes of East Maui and transports it to A&B's sugar cane fields in Central Maui, as well as to the Maui County Department of Water Supply for the domestic water needs of Upcountry Maui and the irrigation needs of small farms throughout Upcountry as well as in the Kula Ag Park. The watersheds from which it collects water total approximately 50,000 acres, of which EMI owns approximately 17,000 acres. Approximately 33,000 acres in the Huelo, Honomanū, Ke'anae, and Nāhiku watersheds are owned by the State of Hawai'i and have historically been leased to EMI for the purposes of developing, diverting, transporting and using the government-owned waters.

The aqueduct system was constructed in phases beginning in 1876 in accordance with agreements between EMI's predecessor entities and the Kingdom of Hawai'i and later the Territory of Hawai'i. Major milestone completion dates of the current system include the original 17-mile ditch in 1878, Koolau Ditch in 1904, the Haiku Ditch in 1914, the Kauhikoa Ditch in 1915, and the Wailoa Ditch in 1923. Since 1938, the relationship between the government of Hawai'i and EMI with regard to the coordinated operation of the Ditch System on government and EMI owned lands has been based on an agreement (the "1938 Agreement") dated March 18, 1938 between the Territory of Hawai'i and EMI. The 1938 Agreement provided a framework for a transition from a patchwork of previously issued water leases with differing lease and rental terms, to the subsequent issuance by the Territory, following public auction, of long-term water lease for each of the four (4) watersheds that comprise the current license areas.

The four (4) license areas and their respective most recent long-term lease terms are listed in **Table 1**. After the expiration of the terms of the long-term lease, revocable permits were issued. The revocable permits are issued by the BLNR and administered by the Department of Land and Natural Resources' (DLNR) Land Division.

Table 1. License Areas and Final Lease Before Conversion to Revocable Permits

License Area	General Lease Number	Term
Nāhiku	GL 3505	1955-1976
Ke‘anae	GL 3349	1950-1971
Honomanū	GL 3695	1962-1986
Huelo	GL 3578	1960-1981

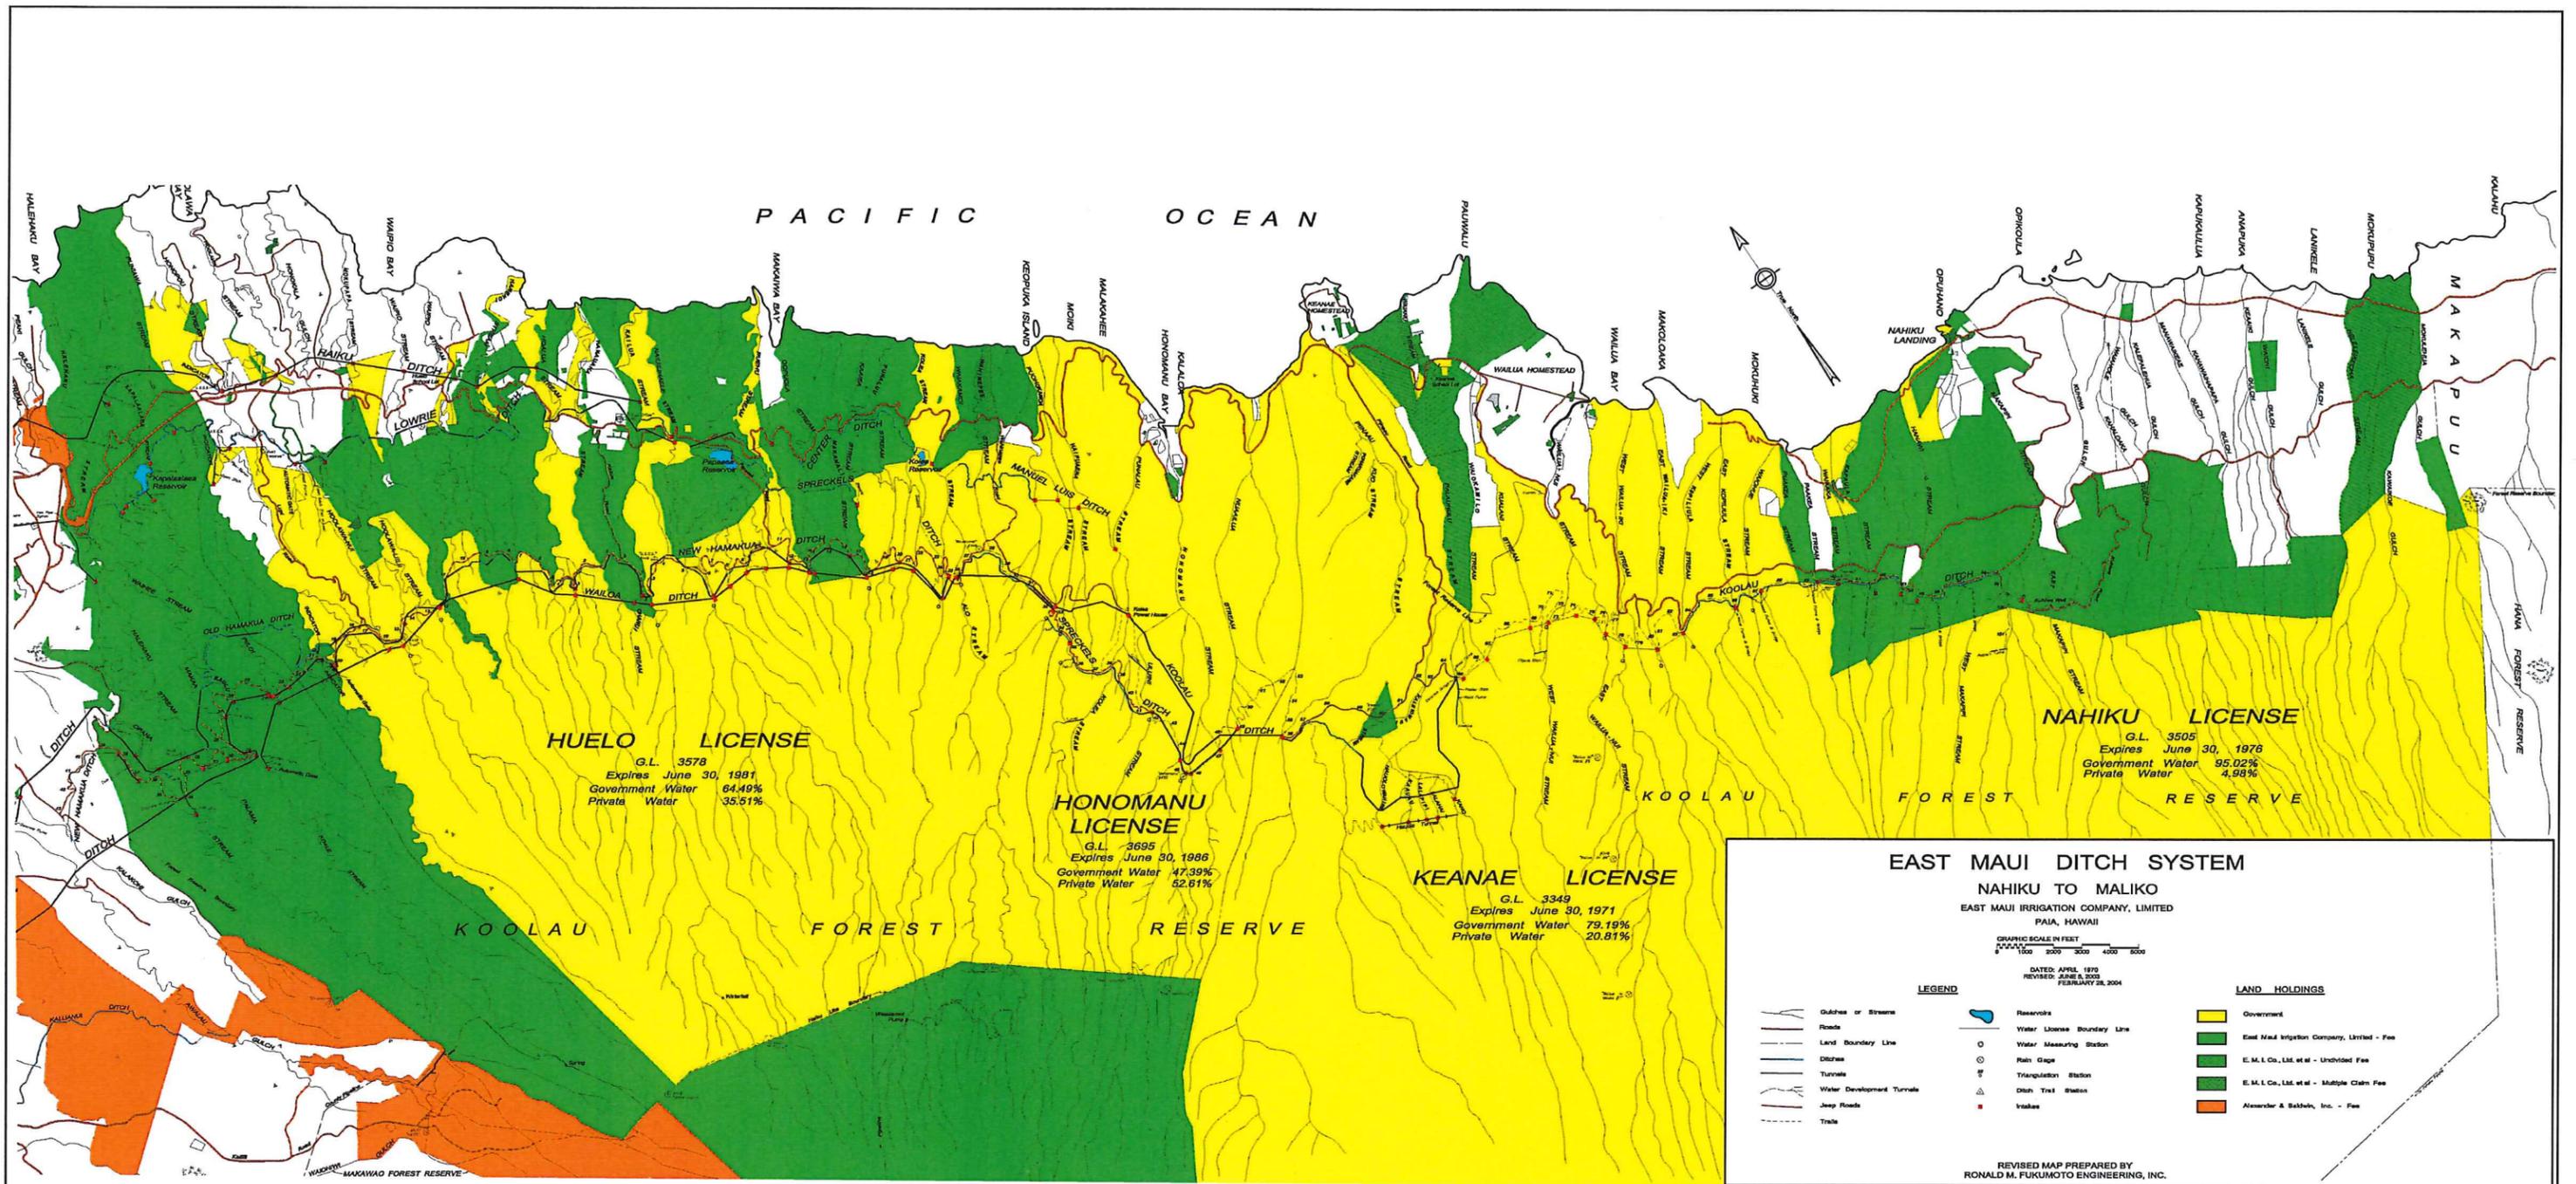

The location of the four (4) license areas are illustrated in **Figure 1** and described in **Table 2** below.

Table 2. License Areas

License Area	Tax Map Key	Area	Revocable Permit No.
Nāhiku	(2)1-2-04:05, 07	10,111.220 acres, more or less	S-7266
Ke‘anae	(2)1-1-02:02 (por.)	10,768.000 acres, more or less	S-7265
Honomanū	(2)1-1-001:44	3,381.000 acres, more or less	S-7263
Huelo	(2)1-1-001:05 (2)2-9-014: 01, 05, 11, 12, 17	8,752.690 acres, more or less	S-7264

As noted previously, the A&B Lease Application was filed with the BLNR in May 2001, seeking a long-term, 30-year lease rather than continuing with year-to-year revocable permits. Shortly thereafter, Na Moku Aupuni O Koolau Hui, Inc. (“Na Moku”) and Maui Tomorrow requested a contested case hearing, with Native Hawaiian Legal Corporation (NHLC) filing on behalf of petitioners Na Moku, Elizabeth Lapenia, Beatrice Kekahuna, and Marjorie Wallett. (In May 2007, Elizabeth Lapenia withdrew from the case and is no longer represented in it.) Concurrently, the Petitioners filed with the Commission on Water Resources Management (CWRM) a Petition to Amend the Interim Instream Flow Standard (IIFS) for 27 Streams in East Maui.

CWRM has not issued a final decision on the IIFS for the 27 streams, which is the subject of a contested case proceeding. The BLNR has not reconvened the contested case hearing for the A&B Lease Application pending the outcome of the IIFS proceedings.

C. STREAMS WITHIN LICENSE AREAS

There are 40 streams within the four (4) license areas. Of these 40 streams, A&B currently diverts water from 36 of these streams, but is in the process of permanently abandoning all of its diversions on and restoring water to five (5) of these 36 streams. In light of this restoration action, A&B requests to continue to divert water from 31 streams. See **Table 3**. The EIS shall assess the impacts of the “*right, privilege, and authority to enter and go upon*” the license areas “*for the purpose of developing, diverting, transporting, and using government-owned waters*” for the 31 streams.

Table 3. License Area Streams

License Area	No.	Stream Name	Subject to Petition to Amend IIFS?	Notes on Diversion
Nahiku License Revocable Permit No. S-7266	1	Makapipi	Yes	
	2	Hanawi	Yes	
	3	Kapaula	Yes	
Keanae License Revocable Permit No. S-7265	4	Waiaaka	Yes	
	5	Paakea	Yes	
	6	Puakea	No

	11	West Wailua-iki	Yes	
	12	East and West Wailuanui	Yes	Planned for full and permanent restoration
	13	Waikani*	Yes	Not diverted
	14	Kualani	Yes	Not diverted (stream is tributary of Waiokamilo)
	15	Waiokamilo	Yes	Fully restored in 2007
	16	Palauhulu	Yes	Planned for full and permanent restoration
	17	Waianu/Ohia	Yes	Not diverted
Honomanū License - Revocable Permit No. S-7263	18	Piinaau	Yes	Planned for full and permanent restoration
	19	Nuaailua	Yes	
	20	Honomanū	Yes	
	21	Kolea/Punalau	Yes	
Huelo License	22	Haipuaena	Yes	
	23	Puohokamoa	Yes	

License Area	No.	Stream Name	Subject to Petition to Amend IIFS?	Notes on Diversion
Revocable Permit No. S-7264	24	Wahinepee	Yes	
	25	Alo	Yes	
	26	Waikamoi	Yes	
	27	Kolea	No	
	28	Punaluu	No	
	29	Kaaiea	No	
	30	Oopuola	No	
	31	Puehu	No	
	32	Nailiilihaele	No	
	33	Kailua/Ohanui	No	
	34	Hanauana	No	
	35	Hoalua	No	
	36	Puolua/Hanehoi	Yes	Planned for full and permanent restoration
	37	Waipio	No	
	38	Mokupapa	No	
	39	Hoolawa-Liili/Hoolawa-Nui	No	
40	Honopou	Yes	Planned for full and permanent restoration	
* Waikani is listed on this table because a Petition to amend the IIFS for Waikani has been filed. Waikani, however, is a waterfall on the Wailuanui Stream.				

D. FORMAT FOR DOCUMENTING THE EIS SCOPE OF WORK

The EIS scope of work described in this report reflects the process-oriented nature of Chapter 343, HRS environmental review documents. Therefore, while the scope of work presented herein seeks to be as comprehensive as possible in terms of defining actions to be managed and implemented by the EIS preparer, input received from agencies, organizations, and the public during various phases of document preparation and review may be recognized and incorporated into the EIS by the EIS preparer and Accepting Authority.

The EIS scope of work presented in this report addresses topic areas consistent with the BLNR's order and is organized by section headings, as summarized in **Table 4**.

Table 4. Summary of Report Organization

II. SCOPE OF WORK FOR THE ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN) AND ATTENDANT CONSULATION/SCOPING PROCESS

A. ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE DEFINING THE PROPOSED ACTION

The preparation of the Draft and Final EIS documents is guided by the provisions of Hawaii Administrative Rules (HAR), Title 11, Department of Health, Chapter 200, Environmental Impact Statement Rules. The initial document preparation phase of the EIS process is the preparation of the EIS Preparation Notice (EISPN). The EISPN addresses the content requirements of an Environmental Assessment and serves as a mechanism for soliciting early input from agencies, citizen groups and individuals. In this instance, comments received on the EISPN would serve to identify key issues which would be addressed in the Draft EIS and Final EIS.

The EISPN will identify the proposed action to be assessed during the EIS process. In this case, the proposed action is a long-term 30-year lease for the *“right, privilege, and authority to enter and go upon”* the license areas *“for the purpose of developing, diverting, transporting, and using government-owned waters”* from the 31 streams in the Nāhiku, Ke‘anae, Honomanū, and Huelo license areas. The lease will not allow more water to be diverted than allowed by the IIFS decisions, currently pending before the CWRM, and as may be further modified in the future.

As noted previously, the petition to amend the IIFS for 27 streams is pending with the CWRM. Pursuant to a court ruling made in response to the appeal of a 2003 BLNR decision in the contested case hearing for the A&B Lease Application, the BLNR may wait for the CWRM to act on the IIFS petitions and rely on CWRM’s determination as to the minimum instream flows necessary to protect traditional and customary practices of native Hawaiians, rather than conducting its own independent investigation of these issues as part of the lease process. Any disposition of water by the BLNR in connection with the lease application would be subject to the amended IIFS established by CWRM. Accordingly, the environmental review process under Chapter 343, HRS cannot be properly completed until the CWRM issues a final decision on the petitions to amend the IIFS.

The timing of a final decision from the CWRM on the petitions to amend the IIFS is unknown. A preliminary time schedule for the EIS process as it relates to CWRM's decision on the petitions to amend the IIFS is discussed in Chapter V. As noted in Chapter V, there are some portions of the EIS process that may be undertaken prior to the CWRM decision on the amended IIFS while other tasks will require a decision from CWRM prior to EIS completion.

In the event the EISPN is published prior to the CWRM decision on the amended IIFS, the proposed action described in the EISPN shall state that the amount of water to be diverted will be dependent on the pending petitions to amend the IIFS and that the Draft EIS and supporting technical studies will assess the impacts of the water lease, taking into account the water availability set forth by the CWRM decision on amending the IIFS for the 27 streams. The EISPN should identify the parameters, such as the CWRM decision, that will define the proposed action that will be assessed in the Draft EIS.

B. IDENTIFICATION OF ISSUES TO BE ADDRESSED IN THE ENVIRONMENTAL IMPACT STATEMENT

Issues identification may not be limited to the EISPN review process, but may also include a public scoping process which may consist of meetings with interested and affected stakeholders. Issues identification may also be defined through review of testimony and filings with the CWRM. Other means of soliciting input for purposes of identifying issues to be addressed in the EIS document include review of testimony and documents associated with related water use matters affecting East Maui Streams. Irrespective of the method of identifying issues and concerns, the EIS preparer shall utilize best efforts to thoroughly identify issues which should be addressed in the EIS document.

It is noted that issues identification is a work element which is not limited to a specific phase of the EIS process (i.e., issues identification extends beyond the EISPN phase of work). For example, as technical studies are prepared and their respective findings are disclosed in the Draft EIS, comments on the studies may lead to new questions and comments which should be addressed in the Final EIS.

With respect to this EIS Scope of Work, an initial list of issue topics which are deemed appropriate for consideration in the EIS are summarized in **Table 5**. The issue categories and topics listed in **Table 5** follow, in part, the analytical framework for defining instream flow standards. It is expected that this list will be expanded once the EISPN and Draft EIS processes are initiated.

Table 5. Preliminary List of Issues to be Addressed in the EIS

Issue Category	Topics to be Addressed in EIS
Existing Conditions	<ul style="list-style-type: none"> • Existing and Surrounding Land Use • Topography and Soil Characteristics • Climate • Hazardous Materials/Substances
Hydrogeology	<ul style="list-style-type: none"> • Groundwater Interaction • Surface-Water Flows
Fish/Wildlife Habitat	<ul style="list-style-type: none"> • Native Vertebrates • Invertebrates • Invasive Species • Abundance • Diversity • Distribution • Species Sustainability
Ecosystem Maintenance	<ul style="list-style-type: none"> • Estuaries • Wetlands • Riparian areas • Nearshore Waters
Water Quality	<ul style="list-style-type: none"> • Water Quality Standards • Total Maximum Daily Load
Natural Hazards	<ul style="list-style-type: none"> • Flooding • Tsunami Exposure
Historic Resources	<ul style="list-style-type: none"> • Archaeology • Cultural Resources
Hawaiian Rights	<ul style="list-style-type: none"> • Traditional and Customary Rights and Practices • Taro Cultivation • Appurtenant Rights
Non-Instream or End Uses of Diverted Water	<ul style="list-style-type: none"> • Water Delivery Systems • Domestic/Municipal Use • Agricultural Uses • Agricultural Productivity • Present vs. Future Uses • Economic Impacts
Aesthetics	<ul style="list-style-type: none"> • Scenic Views
Recreation	<ul style="list-style-type: none"> • Swimming • Nature Study • Fishing • Hiking
Public Services	<ul style="list-style-type: none"> • Police • Fire • Medical Services
Economy	<ul style="list-style-type: none"> • Employment and Personal Income • Fiscal Impacts
Infrastructure	<ul style="list-style-type: none"> • Roadways • Wastewater Systems (Private and Municipal) • Water Systems (Private and Municipal)

Issue Category	Topics to be Addressed in EIS
	<ul style="list-style-type: none"> • Drainage System • Diversion Infrastructure • Other Utilities (Electrical, Communication)

C. PREPARATION OF THE EISPN DOCUMENT

The EIS preparer shall develop the EISPN in accordance with HAR, Title 11, Chapter 200, Sections 11-200-10 and 11-200-15. In this regard, the EISPN shall meet the requirements for content compliance, as summarized in **Table 6**.

Table 6. Summary of Content Requirements of the EISPN

HAR, Title II, Section 200 Reference	Content Requirement
11-200-10 (1)	Identification of applicant or proposing agency
11-200-10 (2)	Identification of approving agency, if applicable
11-200-10 (3)	Identification of agencies, citizen groups, and individuals consulted in making the assessment
11-200-10 (4)	General description of the action’s technical, economic, social, and environmental characteristics
11-200-10 (5)	Summary description of the affected environment, including suitable and adequate regional, location and site maps such as Flood Insurance Rate Maps, Floodway Boundary Maps, or United States Geological Survey topographic maps
11-200-10 (6)	Identification and summary of impacts and alternatives considered
11-200-10 (7)	Proposed mitigation measures
11-200-10 (8)	Agency determination or, for draft environmental assessments only, an anticipated determination
11-200-10 (9)	Findings and reasons supporting the agency determination or anticipated determination
11-200-10 (10)	Agencies to be consulted in the preparation of the EIS, if an EIS is to be prepared
11-200-10 (11)	List of all permits and approvals (State, federal, county) required

Inasmuch as the EISPN serves as notice that an EIS will be prepared and will be used as a scoping document, the content requirements set forth in **Table 6** will not be fully addressed. The EISPN document shall indicate, preliminarily, studies to be completed and issues to be analyzed in further detail in the Draft EIS.

D. CONSULTED PARTIES

The EIS preparer shall identify agencies, stakeholders, and community groups that will be consulted during the preparation of the EIS. The Office of Environmental Quality Control provides guidance on agencies and organizations that should receive copies of the Draft EIS and Final EIS. It is noted that A&B will be consulting with the Department

of Hawaiian Home Lands (DHHL) early in the process with respect to water reservations pursuant to Section 171-58(g), HRS, which states:

The department of land and natural resources shall notify the department of Hawaiian home lands of its intent to execute any new lease, or to renew any existing lease of water rights. After consultation with affected beneficiaries, these departments shall jointly develop a reservation of water rights sufficient to support current and future homestead needs. Any lease of water rights or renewal shall be subject to the rights of the department of Hawaiian home lands as provided by section 221 of the Hawaiian Homes Commission Act.

**III. SCOPE OF WORK FOR
THE PREPARATION OF THE
DRAFT ENVIRONMENTAL
IMPACT STATEMENT**

III. SCOPE OF WORK FOR THE PREPARATION OF THE DRAFT ENVIRONMENTAL IMPACT STATEMENT

A. DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS) CONTENT REQUIREMENTS

The EIS preparer shall prepare the Draft EIS in accordance with requirements set forth in Hawaii Administrative Rules (HAR), Title 11, Chapter 200, Section 11-200-16 and Section 11-200-17. Importantly, the Draft EIS “*shall fully declare the environmental implications of the proposed action and shall discuss all relevant and feasible consequences of the action.*”

Content requirements of the Draft EIS document are summarized in **Table 7**.

Table 7. Summary of Content Requirements of the Draft EIS

HAR, Title 11, Section 200 Reference	Content Requirement Summary
11-200-17(b)	Draft EIS Summary Sheet
11-200-17(c)	Table of Contents
11-200-17(d)	Statement of Purpose and Need
11-200-17(e)	Project Description
11-200-17(f)	Alternatives to the Proposed Action
11-200-17(g)	Description of the Environmental Setting
11-200-17(h)	Relationship of the Proposed Action to Land Use Plans, Policies and Controls
11-200-17(i)	Discussion of Probable Impacts
11-200-17(j)	Relationship between Local Short-Term Uses of the Environment and Maintenance/Enhancement of Long-Term Productivity
11-200-17(k)	Description of Irreversible and Irrecoverable Commitments of Resources
11-200-17(l)	Discussion of Probable Adverse Environmental Effects
11-200-17(m)	Discussion of Mitigation Measures to Address Adverse Impacts
11-200-17(n)	Summary of Unresolved Issues
11-200-17(o)	Listing of Governmental Agencies, Organizations and Individuals Consulted in Preparing the Draft EIS
11-200-17(p)	Comments Received and Responses Made During the Consultation Process

With respect to the Draft EIS's section on "Alternatives to the Proposed Action" (Section 11-200-17(f)), the EIS preparer shall consider the outcome of the CWRM's decision on the IIFS. While the decision of the CWRM on the IIFS will dictate the framework for conducting the analysis of alternatives in the EIS, the EIS preparer shall nonetheless, examine, at a minimum, the "No Diversion Alternative", among others.

With respect to the Draft EIS's section on "Relationship of the Proposed Action to Land Use Plans, Policies, and Controls" (Section 11-200-17(h)), the EIS preparer shall, at a minimum, consider the following:

- Hawaii State Plan
- Hawaii State Functional Plans
- Hawaii State Land Use Designations
- Maui Countywide Policy Plan
- Maui Island Plan
- Applicable Maui Community Plans
- Maui Water Use and Development Plan
- County of Maui Zoning
- Hawaii Coastal Zone Management Program

B. ELEMENTS OF THE DRAFT EIS REQUIRING CWRM DECISION ON INTERIM INSTREAM FLOW STANDARDS

In preparing the Draft EIS, the EIS preparer shall consider those environmental, socio-economic, public services and infrastructure parameters for which the CWRM's decision to amend the IIFS is needed. For those elements requiring a CWRM decision, the completion of the Draft EIS will be deferred until such decision is rendered. **Table 8** summarizes, preliminarily, parameters to be analyzed in the Draft EIS, and identifies those elements for which a CWRM decision on the IIFS is required.

Table 8. Preliminary List of Draft EIS Issues and Dependency on CWRM Decision on IIFS

Issue Category	Topics to be Addressed in EIS	CWRM Decision Required to Complete EIS Analysis?
Existing Conditions	Existing and Surrounding Land Use	No
	Topography and Soil Characteristics	No
	Climate	No
	Hazardous Materials/Substances	No
Hydrogeology	Groundwater Interaction	Yes
	Surface-Water Flows	Yes
Fish/Wildlife Habitat	Native Vertebrates	Yes
	Invertebrates	Yes
	Invasive Species	Yes
	Abundance	Yes
	Diversity	Yes
	Distribution	Yes
	Species Sustainability	Yes
Ecosystem Maintenance	Estuaries	Yes
	Wetlands	Yes
	Riparian areas	Yes
	Nearshore Waters	Yes
Water Quality	Water Quality Standards	Yes
	Total Maximum Daily Load	Yes
Natural Hazards	Flooding	Yes
	Tsunami Exposure	No
Historic Resources	Archaeology	No
	Cultural Resources	Yes
Hawaiian Rights	Traditional and Customary Rights and Practices	Yes
	Taro Cultivation	Yes
	Appurtenant Rights	Yes
Non-Instream or End Uses of Diverted Water	Water Delivery Systems	Yes
	Domestic/Municipal Use	Yes
	Agricultural Uses	Yes
	Agricultural Productivity	Yes
	Present vs. Future Uses	Yes
	Economic Impacts	Yes
Aesthetics	Scenic Views	Yes
Recreation	Swimming	Yes
	Nature Study	Yes
	Fishing	Yes
	Hiking	No

Issue Category	Topics to be Addressed in EIS	CWRM Decision Required to Complete EIS Analysis?
Public Services	Police	No
	Fire	No
	Medical Services	No
Economy	Employment and Personal Income	Yes
	Fiscal Impacts	Yes
Infrastructure	Roadways	No
	Wastewater Systems (Private and Municipal)	No
	Water Systems (Private and Municipal)	Yes
	Drainage System	No
	Diversion Infrastructure	Yes
	Other Utilities (Electrical, Communication)	No

In addition to the assessment parameters listed in **Table 8**, the EIS preparer shall undertake an analysis of cumulative and secondary impacts. Cumulative impact is defined as:

The impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

A secondary impact is defined as:

Effects which are caused by the action and are later in time or farther removed in distance, but are still reasonable foreseeable. Indirect effects may include growth inducing effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems. Including ecosystems.

In the context of the water lease request, secondary impacts of the noninstream uses of the diverted water should also be assessed. For example, future County domestic and agricultural water demands needed to implement anticipated growth pursuant to the Maui Island Plan may be viewed as an impact “later in time” or “further removed in distance”, but still reasonably foreseeable.

C. TECHNICAL STUDIES TO BE INCORPORATED IN THE EIS

Specific topics to be addressed in the EIS may require specialized studies to ensure that current conditions, impact analysis and proposed mitigation measures are appropriately considered by qualified specialists in their respective fields of study. Such specialists, for example, may include biologists, hydrologists, archaeologists, engineers, cultural specialists, and economists. The foregoing list of specialists are not exhaustive. For this reason, the EIS preparer shall assess the issues identified, as described previously, to determine whether specific technical studies are needed to address current conditions, analysis of impacts and potential mitigation measures.

With respect to the EIS for the lease application submitted by A&B, relevant studies which have been previously completed, are summarized in **Table 9**.

Table 9. Technical Studies Previously Completed Which Hold Relevance to the EIS Scope of Work

A. U.S. Geological Survey Studies	
1.	Stephen B. Gingerich, <i>Ground-Water Occurrence and Contribution to Streamflow, Northeast Maui, Hawaii</i> , Water-Resources Investigations Report 99-4090 (1999)

8.	Letter to Lenore Ohye (Acting Deputy Director of CWRM) from Stephen S. Anthony (Director of Pacific Islands Water Science Center) re Discharge Measurements, Makapipi Stream, Maui, Hawai'i, September 13-17, 2010, Nov. 5, 2010
B. Division of Aquatic Resources Studies	
1.	Glenn R. Higashi, et al., <i>Stream Survey Reports</i> prepared for CWRM, DAR and Bishop Museum, June 2008. Stream Survey Reports were prepared for: Honopou, Hanehoi, Waikamoi, Puohokamoa, Haipuaena, Punalau, Honomanu, Nuaailua, Pihaau, Ohia, Waiokamilo, Wailuanui, West Wailuaiki, East Wailuaiki, Kopiliula, Waiohue, Paakea, Kapaula, Hanawi, and Makapipi streams.
2.	Letter from Robert Nishimoto (DAR) to Ken Kawahara (CWRM) dated Apr. 1, 2010
3.	Memo from Robert Nishimoto (DAR) to Ken Kawahara (CWRM) dated May 17, 2010
4.	Letter from Dan A. Polhemus (DAR) to CWRM dated Dec. 15, 2009
5.	James E. Parham, et al., <i>The Use of Hawaiian Stream Habitat Evaluation Procedure to Provide Biological Resource Assessment in Support of Instream Flow Standards for East Maui Streams</i> , Bishop Museum and DAR, Nov. 20, 2009

6.	Glenn R. Higashi, et al. <i>Monitoring Changes in Habitat, Biota, and Connectivity Resulting From Water Returns in the East Maui Streams of East Wailua Iki, and Waiohue</i> , DAR and Bishop Museum, Jan. 6, 2015
C. Commission on Water Resources Management Studies	
1.	CWRM, <i>Instream Flow Standard Assessment Report</i> , September 2008 and December 2009. Instream Flow Standard Assessment Reports prepared for: Honopou, Hanehoi, Piinaau, Waiokamilo, Waialuanui, Waikamoi, Puohokamoa, Haipuaena, Punalau, Honomanu, Nuaailua, Ohia, West Wailuaiki, East Wailuaiki, Kopiliua, Waiohue, Paakea, Waiaaka, Kapaula, Hanawi, and Makapipi streams
D. SWCA Environmental Consultants Studies	
1.	John I. Ford, Steven W. Carothers, Robert A. Kinzie III, <i>Status of Native Hawaiian Macrofauna in East Maui Streams and Biological Considerations For the Amendment of Interim Instream Flow Standards in Selected Streams (IIFS)</i> , SWCA White Paper, June 2009
E. Cultural Studies	
1.	County of Maui Planning Department, <i>Kalo Kanu O Ka'āina: A Cultural Landscape Study of Ke'anae and Wailuanui, Island of Maui</i> , July 1995
2.	Kepā Maly and Onaona Maly, <i>Wai O Ke Ola: He Wahi Mo'olelo No Maui Hikina</i> , 2002

The EIS preparer shall review the technical studies listed in **Table 9**, as well as other studies which may hold relevance to the EIS process. The EIS preparer shall determine whether the studies are current and whether they appropriately address the issues identified. Additionally, the EIS preparer shall determine whether other technical studies should be undertaken to ensure that proper analysis of issues are completed.

Preliminarily, **Table 10** provides a listing of additional technical studies which may be deemed warranted for the EIS.

Table 10. Additional Technical Studies to Support the EIS

Study	Consultant/Expert	CWRM Decision Required to Complete Technical Study? ^a
Biological Resources Survey	Biologist	Yes
Water Quality Study	Environmental Consultant	Yes
Surface and Groundwater Hydrology Assessment	Hydrologist	Yes
Agricultural Impact Assessment	Agricultural Economist	Yes
Archaeological Inventory Survey or Assessment	Archaeologist	No
Cultural Impact Assessment	Cultural Resources Expert	Yes
Diversion Infrastructure Assessment	Civil and/or Structural Engineer	Yes
Economic Impact Analysis	Economist	Yes
^a Where appropriate, preliminary work may be initiated for the foregoing studies, but completion of the studies would require CWRM's IIFS decision.		

Again, the full range of technical studies required for the EIS will be determined upon completion of the EISPN. The scope of analysis for each of the preliminarily identified studies listed in **Table 10** will need to be developed to address issues and concerns documented through the EISPN and related scoping efforts. For example, to the extent that the cultural reports previously prepared may have not addressed specific issues raised by comments to the EISPN, additional cultural impact analysis would be warranted. If the EIS preparer and cultural specialist determine that a newly prepared Cultural Impact Assessment is needed based on issues raised, then such new report would be prepared and incorporated in the Draft EIS.

**IV. SCOPE OF WORK FOR
THE PREPARATION OF THE
FINAL ENVIRONMENTAL
IMPACT STATEMENT**

IV. SCOPE OF WORK FOR THE PREPARATION OF THE FINAL ENVIRONMENTAL IMPACT STATEMENT

The Final EIS shall be prepared in accordance with Hawaii Administrative Rules (HAR), Title 11, Chapter 200, Section 11-200-18. In summary, the EIS preparer will incorporate in the Final EIS, the following:

- The Draft EIS will be revised to incorporate substantive comments received during the consultation and review process.
- Reproduction of all letters received containing substantive questions, comments or recommendations.
- A list of persons, organizations, and public agencies commenting on the Draft EIS.
- The responses of the applicant or proposing agency to each substantive question, comment, or recommendation received in the review and consultation process.

Additionally, the EIS preparer shall prepare the Final EIS in a format which allows the reader to easily distinguish changes made to the text of the Draft EIS.

**V. PRELIMINARY TIME
SCHEDULE FOR THE
ENVIRONMENTAL IMPACT
STATEMENT PROCESS**

V. PRELIMINARY TIME SCHEDULE FOR THE ENVIRONMENTAL IMPACT STATEMENT PROCESS

A. OVERALL TIMEFRAME FOR THE PREPARATION AND PROCESSING OF THE ENVIRONMENTAL IMPACT STATEMENT

The overall timeframe for the preparation and processing of the EIS will, in part, depend on when the CWRM issues its decision with respect to the Petitions to Amend the IIFS. In this regard, two (2) timeline scenarios for the EIS preparation and processing have been developed. The scenarios presented herein are not intended to obligate the EIS preparer to complete the process within the timeframes noted. They are however, intended to provide project stakeholders a general understanding of tasks and milestones which govern the overall process timeline.

Two (2) timelines scenarios presented are as follows:

- **Scenario 1:** Timeline Assuming the CWRM Completes IIFS Decision-Making before the EIS Process is Initiated
- **Scenario 2:** Timeline Assuming the CWRM Completes IIFS Decision-Making after the EIS Process is Initiated

The formulation of the two (2) timeline scenarios assumes that there would be no appeal filed on the CWRM’s decision. If an appeal is filed on the IIFS decision, the timeline scenarios would be based on the final IIFS decision once the appeal process has been completed.

1. Scenario 1 Timeline: Assumes CWRM Completes IIFS Decision-Making Before EIS Process is Initiated

The Scenario 1 Timeline is presented in **Figure 2**. The “Task” column in **Figure 2** reflects the major action items and milestones in the EIS preparation process. The “Months from Start” row at the top of the timeline indicates the estimated number of months associated with each of the tasks. The number of months assigned to each task is a best estimate only, but is considered reasonable in the context of the Chapter 343, HRS process. It is noted that the timeline presented is

Task	Dependent on CWRM Decision	Months from Start																					
		1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22

CWRM DECISION ON IIFS - PRIOR TO INITIATION OF EIS PROCESS

Source: Munekiyo Hiraga

Figure 2 Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas
 Scenario 1: CWRM Decision On IIFS Occurs Before the EIS Process Has Been Initiated

intended to be illustrative of the general process and would be further defined through the EIS process. For example, the specific technical studies and time required to prepare each would be defined by the EIS preparer and qualified technical consultant.

As noted above, Scenario 1 assumes that the CWRM completes its IIFS decision-making before the EIS process is started. Therefore, all of the technical studies which would be undertaken in support of the EIS can be initiated at the outset of the EIS preparation process. Under this scenario, the total duration to commence and complete the EIS is approximately 22 months.

2. **Scenario 2 Timeline: Assumes CWRM Completes IIFS Decision-Making After the EIS Process is Initiated**

The Scenario 2 Timeline is presented in **Figure 3**. The timeline's format is similar to Scenario 1, with the exception that the schedule is bifurcated as follows:

- Actions/milestones of the EIS which can be completed prior to the CWRM's decision-making on the IIFS
- Actions/milestones of the EIS which would be completed after the CWRM's decision-making on the IIFS.

The red vertical bar in the schedule reflects the undetermined time wherein the CWRM's decision on the IIFS is pending. Once the CWRM's action on the IIFS is completed, the EIS process can resume. Under this scenario, about eight (8) months of EIS work can be initiated before work would stop, pending the CWRM's decision. Once the CWRM completes its decision-making on the IIFS, an additional 19 months of work is estimated. If the CWRM decision occurs during the initial eight (8) months of EIS processing, the technical studies dependent on the CWRM decision can be initiated sooner.

As noted previously, the timeline is intended to be illustrative of the overall process and details with respect to the time required to prepare the technical studies and which studies (or portions thereof) would be initiated prior to the CWRM decision would be made by the EIS preparer and technical consultants.

It is noted that depending on the timeframe in which the CWRM IIFS decision is issued, there may be circumstances where some of the EIS work and technical studies undertaken prior to the IIFS decision may need to be reexamined or updated (i.e., if the IIFS decision takes longer than anticipated/assumed which impacts the applicability of the findings of the studies).

The variance in time between Scenario 1 and Scenario 2 is attributed to the unknown timeframe in which the IIFS decision will be made and the assumption that there will be EIS technical studies which cannot be initiated or completed until after the CWRM's IIFS decision process is completed.

3. **Timeline Qualifications**

The timelines presented for Scenario 1 and Scenario 2 represent a best estimate based on general parameters for EIS processing. The illustrative timelines assume that the EIS preparer and the DLNR will coordinate and resolve issues that may arise during the preparation and processing of the EIS in a timely manner. However, it is noted that there are several factors that can influence the timeline. Such factors may include:

- Significant comments from agencies, stakeholders, or members of the public during the review of the EISPN or Draft EIS that require additional coordination or the need for additional technical studies
- Findings from technical studies that lead to new questions or comments which should be addressed in the Final EIS
- The decision of HC&S to transition away from sugar cane cultivation may affect the overall timeline for the EIS. The repurposing of lands currently used for sugar cane production to alternative agricultural uses should be considered as part of the EIS's analysis of "non-instream or end uses of diverted water" section. Accordingly, the overall EIS timeline may be affected pending A&B's determination of alternative agricultural end use plans.

4. **Pre-EIS Time Requirements**

While **Figure 2** and **Figure 3** provide general guidance with regard to timeline parameters for the EIS, additional time which should be considered in the overall process is the time required for the procurement of the EIS consultant and qualified subconsultants required to prepare the various technical studies. The

procurement process and timeline has not yet been determined. However, a reasonable estimate of time to complete this pre-EIS phase of the process is 3 to 4 months.

APPENDIX

APPENDIX A.

Order for A&B to Commence the Environmental Review Process and Deferring Decision on Petitioners' Motion to Establish Scope of Reconvened Contested Case Proceeding

On June 15, 2015, the parties submitted a status report to the Board regarding the initiation of discussions between the parties. Nā Moku re-confirmed the withdrawal of its objection to A&B preparing the environmental review documents in connection with its application for a lease. The parties also agreed on a framework for initiating work on the environmental review process. The parties were still in discussion regarding the disposition of the 2015 lawsuit. Nā Moku was to request the BLNR to defer action on Petitioner's Motion while the parties continue discussions on beginning the environmental review process prior to the Commission on Water Resource Management's (CWRM) final decision on the petitions to amend interim instream flow standards (IIFS) in east Maui. No further filings were received from the parties.

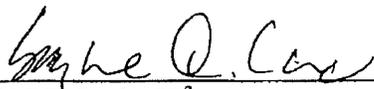

Petitioner's Motion argued that the contested case should be reconvened for the Board to require the timely preparation of an environmental assessment to disclose the impacts of the diversion of water from the four license areas (Honomanu, Keanae, Huelo and Nahiku) pursuant to revocable permits S-7263 (Honomanu), S-7264 (Huelo), S-7265 (Keanae) and S-7266 (Nahiku). Petitioner's Motion also urged to Board to reconvene the contested case in order for the Board to address its obligations pursuant to Hawaii Revised Statutes chapter 171.

During oral argument it became apparent that the key issue was the commencement of the environmental review process. Based on the records in this case and the argument presented to the Board, the Board orders A&B to commence the environmental review process in support of A&B's application for a lease of water from the license areas of Honomanu, Keanae, Huelo and Nahiku. The Board will defer decision making on Petitioner's Motion at this time.

Within sixty (60) days of this order A&B must provide to the Board a scope of work for the preparation of an environmental assessment or an environmental impact statement. The scope of work should distinguish those portions that can be undertaken prior to CWRM's final

decision on the petitions to amend IIFS in east Maui from those that require a decision from the CWRM prior to completion.² The scope of work should address, at a minimum, the content requirements contained in Hawaii Administrative Rules § 11-200-10 for an environmental assessments or § 11-200-17 for an environmental impact statement. Accompanying the scope of work should be a tentative schedule for commencement and completion of the various portions of the scope of work.

SO ORDERED this 14th day of April, 2016.

SUZANNE D. CASE³
Presiding Officer
Board of Land and Natural Resources

² The Board notes that on January 5, 2016 A&B announced that it would be transitioning out of farming sugar and would instead pursue a diversified agricultural model for its HC&S plantation on Maui. To the degree that the decision to transition away from sugar cane cultivation affects the ability of or timing for A&B to complete portions of the environmental review documents that should be noted in the scope of work.

³ The Board members have delegated authority to Suzanne Case to sign this Order on behalf of the Board.

**SUBJECT: Draft Environmental Impact Statement for the Proposed Lease
for the Nahiku, Ke‘anae, Honomanū, and Huelo License Areas**

Aloha e Mr. Matsukawa,

Mahalo for this opportunity to provide comments on the Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke‘anae, Honomanū, and Huelo License Areas

While I hold the seat as the Council Member for the Molokai residency area, all Maui County Council Members are at-large representatives and have kuleana to the entire County. This is a kuleana I take very seriously.

E ola i ka wai, water is life, therefore, the planning of how water is used and who controls its use can never be understated. In Hawai‘i, water is also a public trust, and the priorities are clearly outlined in the water code.

After listening to the concerns of my constituents and in reviewing what I’ve been able to of the 2,700 pages in the short 45-day comment period, the first thing I must point out is the inadequacy of time the community has been given to review this document. My request is that you will publicly announce a longer period of time for comments to be submitted. I believe 60 more days would be better, extending your internal deadline to January 7, 2020. It is clear that 45 days is all the law requires of you, but if true collaboration with the community is your intent, then extending the deadline should be something you would be more than happy to do.

I request that the Final EIS provide the information I have concerns and questions about.

- 1) The FEIS should discuss the option of not diverting any streams and what impact that would have on East Maui ecosystems and communities.

- 2) The FEIS should provide an in-depth review of and discuss the benefits of shorter term lease options of less than 30 years, due to uncertainties of future rainfall and future water supplies.
- 3) The FEIS should include a more accurate evaluation and description of water delivery to Nahiku and consider eliminating the entire Nahiku license area from the DEIS calculations and considerations.
- 4) Nahiku would still get water even without the 30 year lease because their water comes from a development tunnel that feeds groundwater directly to Nahiku. This delivery system only serves residents in Nahiku. Lease or no lease, Nahiku would still receive water.
- 5) The FEIS should include comments from State and County departments concerned with fisheries that would be impacted by this lease.
- 6) The FEIS should include an evaluation of your plan to fund and manage eradication and/or containment of alien/invasive species.
- 7) While the DEIS assumes the state will prepare a Management Plan, why is the plan to be created/drafted after the FEIS is accepted? This seems backwards, rather, the FEIS should inform the Management Plan.
- 8) The FEIS should include an evaluation of the legal ramifications of the proposed use of “the total amount of water available after compliance with the IIFS requirements of the CWRM D&O” (p.iii: Executive Summary, DEIS) until DHHL “needs it.” Whether DHHL “needs” it or not, is not for Mahi Pono to decide, nor comment on. EMI/Mahi Pono should keep in mind that DHHL water requirements supersede EMI/Mahi Pono’s requirements, if the FEIS contains this same assumption without proper input and discussion with DHHL.

I look forward to hearing that you will gladly extend the deadline to give your new community a opportunity to have a realistic amount of time necessary to review this 2,700-page document.

Mahalo,

Keani Rawlins-Fernandez

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Keani Rawlins-Fernandez:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *After listening to the concerns of my constituents and in reviewing what I’ve been able to of the 2,700 pages in the short 45-day comment period, the first thing I must point out is the inadequacy of time the community has been given to review this document. My request is that you will publicly announce a longer period of time for comments to be submitted. I believe 60 more days would be better, extending your internal deadline to January 7, 2020. It is clear that 45 days is all the law requires of you, but if true collaboration with the community is your intent, then extending the deadline should be something you would be more than happy to do.*

Response 1: We acknowledge your comments above. However, please note that there is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comments were received during the statutory comment period.

Comment 2: *The FEIS should discuss the option of not diverting any streams and what impact that would have on East Maui ecosystems and communities.*

Response 2: We respectfully disagree with your comment. The EIS analyzed a “No Action” alternative which is assessed in Section 3.3 of the EIS that assumes no Water Lease would be issued. However, under the No Action alternative, the EMI Aqueduct System could continue to divert approximately 30% of the water available from the Collection Area, plus approximately 4.37 mgd from the privately owned lands between Honopou Stream and Māliko Gulch. That is because the rights under the 1938 Agreement are independent of the Proposed Action under consideration in this EIS.

As it relates to impacts on the East Maui ecosystems, please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS addresses native stream habitat impacts. As discussed in Section 3.4.3, the HSHEP model estimated that approximately 79.8% of total HU would be available under the No Action alternative, or put another way, the No Action alternative decreases the amount of available habitat units by approximately 20.2%. As it relates to terrestrial flora and fauna, EMI would continue operation and maintenance of the EMI Aqueduct System, then the activities would have impacts comparable to the Proposed Action as discussed in Section 3.4.8 of the EIS.

As it relates to impacts to the East Maui communities, Section 3.4.11 has been expanded to further discuss concerns associated with the No Action alternative as shown on pages 3.35 to 3.36 of the Final EIS.

Comment 3: *The FEIS should provide an in-depth review of and discuss the benefits of shorter term lease options of less than 30 years, due to uncertainties of future rainfall and future water supplies.*

Response 3: Please note that the EIS did provide an in-depth review of shorter lease terms. Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that *"a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability."* The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central

Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Comment 4: *The FEIS should include a more accurate evaluation and description of water delivery to Nahiku and consider eliminating the entire Nahiku license area from the DEIS calculations and considerations.*

Response 4: In response to your comment regarding the Nāhiku water delivery, please see page 2-23 of the Final EIS, which is a depiction of Figure 2-6 that has been added to the Final EIS. Please note that following publication of the Draft EIS, the applicant received additional information from the MDWS regarding the source of the water that services the Nāhiku community. A copy of the MDWS letter is included in Appendix P to the Final EIS. Please note, the description of the Nāhiku water service from Section 2.1.3.3 of the Draft EIS, has been revised to take into account clarifications from the MDWS, as shown on pages 2-21 to 2-22.

According to MDWS, EMI's West Makapipi Tunnel 2, Well No. 4806-07, which is also known as the "Nāhiku Tunnel", is the sole source of water for the MDWS Nāhiku Water Service Area. It is our understanding that EMI developed and owns the Nahiku Tunnel that is the source of the

water. Per a 1973 Memorandum of Understanding with EMI and HC&S as amended, MDWS can draw only up to 20,000 gallons of water per twenty-four hour day to serve the Nāhiku community from properties owed by EMI and those under license from the State. EMI continues to deliver water to the Nāhiku community pursuant to a 2018 agreement which embodied the 1973 agreement as amended, which is premised upon EMI's continued receipt of permits or a lease from the State BLNR. Even though the agreement provides the MDWS a right to up to 20,000 gpd per twenty-four hour day, EMI has accommodated the needs of the Nāhiku community, which have ranged between approximately 8,345 (2018) to 40,925 (2007) gpd on a daily basis, although supply of amounts over 20,000 gpd on any given day is not required under the agreement.

With regards to your comment the entire Nāhiku portion of the License Area should be eliminated, please note that there are streams and small tributaries within the Nāhiku portion of the License Area that the EMI Aqueduct System could still divert under the Proposed Action. Hence it would not be feasible to eliminate the Nāhiku portion from the License Area. However, as a new condition included in the 2020 and 2021 water revocable permits required the removal of the Hanawā NAR from the revocable permit area and calls for A&B to continue discussions with DOFAW to identify additional forest reserve lands to be removed from the License Area. The Hanawā NAR consists of approximately 7,500 acres and is further discussed in Section 1.3.1 of the Final EIS as shown on page 1-2. It should be noted that no portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the revocable permit area will result in additional public access because the NAR rules restrict public access. However, this may not be true for other areas that DOFAW may want the BLNR to withdraw from the License Area going forward.

Comment 5: *Nahiku would still get water even without the 30 year lease because their water comes from a development tunnel that feeds groundwater directly to Nahiku. This delivery system only serves residents in Nahiku. Lease or no lease, Nahiku would still receive water.*

Response 5: As noted in Response #4 above, the "Nāhiku Tunnel", is the sole source of water for the MDWS Nāhiku Water Service Area. It is our understanding that EMI developed and owns the Nahiku Tunnel that is the source of the water. Per a 1973 Memorandum of Understanding with EMI and HC&S as amended, MDWS can draw only up to 20,000 gallons of water per twenty-four hour day to serve the Nāhiku community from properties owed by EMI and those under license from the State. EMI continues to deliver water to the Nāhiku community pursuant to a 2018 agreement which embodied the 1973 agreement as amended, which is premised upon EMI's continued receipt of permits or a lease from the State BLNR. Even though the agreement provides the MDWS a right to up to 20,000 gpd per twenty-four hour day, EMI has accommodated the needs of the Nāhiku community, which have ranged between

approximately 8,345 (2018) to 40,925 (2007) gpd on a daily basis, although supply of amounts over 20,000 gpd on any given day is not required under the agreement. Hence, as stated in Section 3.3 of the Final EIS:

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate for Upcountry Maui and Nāhiku.

Comment 6: *The FEIS should include comments from State and County departments concerned with fisheries that would be impacted by this lease.*

Response 6: Please note that the Final EIS includes all comments received during the statutory 45-day comment period, including those received from State and County departments and are reproduced in Appendix N.

As it relates to impacts on nearshore fisheries, the collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within

estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have esturine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration

Comment 7: *The FEIS should include an evaluation of your plan to fund and manage eradication and/or containment of alien/invasive species.*

Response 7: As discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 8: *While the DEIS assumes the state will prepare a Management Plan, why is the plan to be created/drafted after the FEIS is accepted? This seems backwards, rather, the FEIS should inform the Management Plan.*

Response 8: As noted in Response #7 above, the requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan.

Comment 9: *The FEIS should include an evaluation of the legal ramifications of the proposed use of “the total amount of water available after compliance with the IIFS requirements of the CWRM D&O” (p.iii: Executive Summary, DEIS) until DHHL “needs it.” Whether DHHL “needs” it or not, is not for Mahi Pono to decide, nor comment on. EMI/Mahi Pono should keep in mind that DHHL water requirements supersede EMI/Mahi Pono’s requirements, if the FEIS contains this same assumption without proper input and discussion with DHHL.*

Response 9: With regards to you comment relating to the legal ramifications of diverting water after compliance with the IIFS requirements prior to DHHL use, please note that that the State

has yet to issue a water lease under HRS § 171-58, and, therefore, the implementation of a DHHL reservation under subsection (g) has yet to be realized. We understand that the DHHL water reservation process involves several steps before a water reservation is formally requested. One step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following acceptance by the Hawaiian Homes Commission (HHC) of the Beneficiary Consultation Report, and an authorization to the Chairperson of the HCC to formally request a water reservation, the Chairperson submits a request for a water reservation to the Commission on Water Resource Management (CWRM). CWRM approval is required to establish a DHHL water reservation for purposes of a water lease.

Section 2.1.1 of the Draft EIS explains that the DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B / EMI, Mahi Pono, the DLNR's Land Division, and DHHL staff and consultants. Section 2.1.1 has been updated in the Final EIS as shown on pages 2-4 to 2-7 to acknowledge that the results of the Beneficiary Consultation were subsequently presented to the HHC on May 30, 2019, as agenda item G-2. The HHC then passed a motion to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for a water lease from DLNR, and to reauthorize the Chairperson to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation amount in the request approved by the HHC is for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Kēōkea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This reservation amount is consistent with that projected in the Draft EIS. The revisions updating Section 2.1.1 in the Final EIS, as discussed above, are shown on pages 2-4 to 2-7 to this letter. As of the time that this response letter was drafted, it is our understanding the water reservation request has not been made to CWRM.

We concur that the statements in the Draft EIS claiming that the lessee under the proposed Water Lease would be able to use the water reserved by DHHL under HRS § 171-58(g) until such time that DHHL has an actual need for that water should not have been made. Such temporary uses of the DHHL reservation water are not addressed under HRS § 171-58. We further concur that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessor and the DHHL would be necessary to allow any temporary use of water reserved for DHHL as noted in a letter received from DHHL regarding the Draft EIS.

With regard to considering the impacts of DHHL physically claiming its reservation, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the

sliding scale quantified effects based upon each 1 mgd reduction in water) and in that way addresses the possible reduction due to the DHHL reservation. The DHHL reservation was acknowledged in the Draft EIS ("Projections of the amount of government water available from the License Area at Honopou stream after taking into account the CWRM D&O, is approximately 87.95 mgd. This amount would be subject to further reduction in accordance with the DHHL reservation once called upon for use by the DHHL.").

Within the EIS, the analysis of this reduction in available water for the Water Lease lessee falls under the Reduced Water Volume alternative. Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has subsequently been updated in the Final EIS to include a comparative table in Section 3.5 as shown on pages 3-49 to 3-80.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

**RE: Request for a time extension for the Draft EIS for East Maui Water
Leases comments**

Dear Mr. Tsutsui, Mr. Benjamin, Mr. Hirokawa, Mr. Matsukawa, and Ms. Case;

The Maui County Council Agricultural, Environmental and Cultural Preservation (EACP) Committee reviewed the above-cited draft EIS on October 7th and will meet again October 15th to finalize their comments. At the October 8th meeting, the Committee voted to request an extension for comments for the County Council and for the public in general. The committee's comments will need to be prepared and then approved at the next full county council meeting. The document is 2,700 pages and

October 8, 2019
Page 2

the public will need time to fully review all of it. In light of the County Council process and schedule, and the large size of the document, we are requesting a 60 day time extension on the comment period.

The Board of Land and Natural Resources required A&B and EMI to proceed with the EIS preparation in 2016. The applicant has been working on the document for about three years since they issued their EIS Prep Notice. The result of their three years of effort is a 2700 page document that deserves to be read and analyzed by those affected. The purpose of the draft EIS review process is to provide the public and other agencies an opportunity to discover the extent to which a proposing agency or applicant has examined environmental concerns and available alternatives. Please give us the courtesy of an extension and we will provide useful feedback that should make the final EIS a better document.

Thank you for taking the time to respond to my request by October 14, 2019 so that the committee members will have your decision when they meet next. If you have any questions please contact my Executive Assistant Gina Flammer at 270-5510 or at gina.flammer@mauicounty.us.

Mahalo nui loa,

Shane Sinenci, Councilmember
East Maui District
(808) 270-7246

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Councilmember Sinenci:

Thank you for your letter dated October 8, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The Maui County Council Agricultural, Environmental and Cultural Preservation (EACP) Committee reviewed the above-cited draft EIS on October 7th and will meet again October 15th to finalize their comments. At the October 8th meeting, the Committee voted to request an extension for comments for the County Council and for the public in general. The committee’s comments will need to be prepared and then approved at the next full county council meeting. The document is 2,700 pages and the public will need time to fully review all of it. In light of the County Council process and schedule, and the large size of the document, we are requesting a 60 day time extension on the comment period.*

Response 1: We note that the Maui County Council Agricultural, Environmental, and Cultural Preservation (EACP) Committee reviewed the subject Draft EIS met on October 15th to finalize their comments. We also understand that at the October 8th meeting, the EACP Committee voted to request an extension for comments for the County Council and the public in general. With regards to your request for a 60-day time extension, please note that there is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period

for the Draft EIS was not extended. Please note that more than 400 comments were received during the statutory comment period.

Comment 2: *The Board of Land and Natural Resources required A&B and EMI to proceed with the EIS preparation in 2016. The applicant has been working on the document for about three years since they issued their EIS Prep Notice. The result of their three years of effort is a 2700 page document that deserves to be read and analyzed by those affected. The purpose of the draft EIS review process is to provide the public and other agencies an opportunity to discover the extent to which a proposing agency or applicant has examined environmental concerns and available alternatives. Please give us the courtesy of an extension and we will provide useful feedback that should make the final EIS a better document.*

Response 2: Please note that the actual text of the Draft EIS is approximately 560 pages, which includes numerous graphics, and there are a total of thirteen appendices, nine of which were completed by technical consultants. We also note that over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M). The Applicant made every reasonable effort to convey information through the Draft EIS in a manner that is accurate, thorough, and appropriately concise in order to provide the public with an opportunity to fairly analyze the potential impacts of the Proposed Action. With regards to your comment about an extension, as stated in Response #1 above, there is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended.

Comment 3: *Thank you for taking the time to respond to my request by October 14, 2019 so that the committee members will have your decision when they meet next. If you have any questions please contact my Executive Assistant Gina Flammer at 270-5510 or at gina.flammer@mauicounty.us.*

Response 3: We appreciate your interest and participation in this environmental review process.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

10238-04
Letter to Councilmember Shane Sinenci

Re: Proposed Lease (Water Lease) for Nahiku, Ke'anae, Honomanu, and
Huelo License Areas; Draft Environmental Impact Statement (DEIS)

Dear Mr. Matsukawa:

The Board of Water Supply has unanimously voted at its special meeting of November 4, 2019, to affirm Department of Water Supply's comments submitted to the State of Hawaii Board of Land and Natural Resources on November 4, 2019.

In advance, thank you for your attention to this matter.

Sincerely,

Zoltan Milaskey
Vice Chair

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Milaskey:

Thank you for comments dated November 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The Board of Water Supply has unanimously voted at its special meeting of November 4, 2019, to affirm Department of Water Supply’s comments submitted to the State of Hawaii Board of Land and Natural Resources on November 4, 2019.*

Response 1: We acknowledge that the County of Maui Board of Water Supply (BWS) at its special meeting of November 4, 2019 voted to affirm the County of Maui Department of Water Supply’s (MDWS) comments.

Comment 2: *The Board of Water Supply has voted at its special meeting of November 4, 2019, to provide the following comments on the draft environmental impact statement as follows:*

Section 4.7.3, Economic and Fiscal (page 4-146). Applicant is encouraged to include a budgetary line item for capital improvements of the EMI transmission system

Response 2: Please note as discussed in Section 2.1 of the Final EIS, for the EMI Aqueduct System, total operational costs for labor, fringe benefits, materials, professional services, taxes, maintenance, anticipated rental payments to the State for the Water Lease, and other expenses are projected to be approximately \$2.2 million per year. Note that the Draft EIS stated these costs would be approximately \$2.5 million but have been adjusted to account for recent changes.

Comment 3: *Section 4.7.2, Social Characteristics, East Maui, Impacts and Mitigation Measures (page 4-138). Impacts and Mitigations Measures. Include "A&B" alongside of Mahi Pono as a key stakeholder. A&B, as the applicant, should participate in community outreach and reconciliation as the historically responsible party.*

Response 3: The SIA, as well as Section 4.7.2 of the EIS, recommends that there be community outreach by the Applicant in connection with issuance of the Water Lease. However, terms of the Water Lease are at the discretion of the BLNR. Should the BLNR make this a requirement of the Water Lease, the Applicant will comply with all conditions of the Water Lease.

Comment 4: *Provide a detailed plan on mitigating water losses and improve system efficiency, to include repair and maintenance of the diversion system and ditches.*

Response 4: Your Comment #4 is unclear as you do not specifically refer to which system you are speaking about; the EMI Aqueduct System or the Central Maui Field Irrigation System.

Regarding the EMI Aqueduct System, it is highly efficient. On the whole, the EMI Aqueduct System does not lose water over the entire length of the system, up to its terminus at Kamole Weir. It is not until the EMI Aqueduct System transitions into the Central Maui Field Irrigation System used in the Central Maui agricultural fields that there starts to be losses due to seepage because its agricultural ditches and reservoirs are open and are not lined. Please note that this clarification has been made throughout the Final EIS as shown on pages 2-11, 2-27, 3-12, and 4-76. However, EMI staff does conduct routine maintenance and repair on the EMI Aqueduct System. As discussed in the Section 2.1.2 of the Final EIS as shown on page 2-7, under the Proposed Action, "maintenance and repair" involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment.

Regarding the Central Maui Field Irrigation System, Mahi Pono's plans for improving irrigation efficiency is stated throughout Chapter 5 of the Draft EIS. Mahi Pono expects to invest over \$20 million to increase the efficiency of its private Central Maui Field Irrigation System in Central

Maui (i.e., the infrastructure that distributes water from Kamole Weir to the agricultural fields and also within those fields).

As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. These new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Reducing water usage through effective irrigation ensures conservation of Hawai'i's natural resources. Please note that this information has been added to Section 2.1.4 of the Final EIS, as shown page 2-25, as well as other sections when discussed.

Comment 5: *Provide A&B, EMI, and Mahi Pono's plan to monitor the IIFS that CWRM has set*

Response 5: The IIFS required under the Commission on Water Resources Management (CWRM) Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O) is a separate process from the Water Lease process, as discussed in Section 1.3.3 of the Draft EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Please note, however, that as required by the CWRM D&O, EMI submitted a report to the CWRM one year following the date of the issuance of the D&O that outlined and discussed:

1. Modifications to diversions to meet the amended IIFS.
2. Water deliveries at Honopou Stream and Māliko Gulch, and any changes EMI ascribes to the amended IIFS.
3. Changes in stream diversions and ditch settings as Mahi Pono's irrigation requirements increase.

In addition, the requirements of the current East Maui revocable water permits specify that quarterly reports to the BLNR are required. These reports are mandated to include a statement of compliance with the IIFS. Since the CWRM D&O was issued, EMI has been working closely with the CWRM staff on the implementation of the ordered IIFS. The IIFS are being met for all

License Area streams. It is expected, and the EIS takes into account, that compliance with the IIFS requirements under the CWRM D&O will also be required under the Proposed Action.

Comment 6: *Provide their watershed management protection plan.*

Response 6: As discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the Final EIS as shown on pages 2-2 to 2-4.

Comment 7: *Section 5.8, Permits and Approval (page 5-175). Consider adopting an Accountability Committee, made up of volunteers, including stakeholders of East Maui, related government officials, and the operator/lessee, to ensure the terms of the water lease are being met on a regular basis*

Response 7: We acknowledge your comments. Please note, as mentioned in Response #3 above, the terms of the Water Lease are at the discretion of the BLNR. Should the BLNR make this a requirement of the Water Lease, the Applicant will comply with all conditions of the Water Lease.

Comment 8: *Lease should clearly state that the Lessee shall divert water only for its agricultural use and for the County and DHHL's use for domestic, agriculture, and municipal purposes.*

Response 8: Please note that this is consistent with the Proposed Action and the uses described in Chapter 2 of the EIS.

Comment 9: *Pursuant to HRS Section 171-58(e), the Applicant shall provide a surety bond to ensure that the condition regarding developing and implementing a watershed management protection plan is met*

Response 9: As noted in Response #7 above, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan.

Comment 10: *The Board of Water Supply would support a shorter lease than 30 years, such as the following: 15-year lease with a 10-year compliance report that if not met, lease will not qualify for renewal (compliance report would be monitored and enforced by a government body).*

Response 10: We acknowledge that the BWS supports a shorter lease term. Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes

water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Comment 11: *In regards to Section 3.1.2, we support further consideration for recycled water use from Kahului WWRf at every level of review on this lease.*

Response 11: The availability of the use of reclaimed water from the Wailuku-Kahului Wastewater Reuse Facility (WWRf) is discussed in Draft EIS Section 3.1.1.2 (Reclaimed Water), which provides an analysis of the feasibility of the use of reclaimed water from the Wailuku-Kahului WWRf to irrigate the Central Maui fields. As discussed, the recycled water alternative using existing R-2 water from the Kahului WWRf could be considered an alternative as supplemental source. However, R-2 water has limited useability on crops. County of Maui Department of Environmental Management (DEM) does not intend to send this R-2 water to the Central Maui agricultural fields. Further consideration of this alternative has been included in Chapter 3 of the FEIS, which has also been supplemented with a discussion about the potential new reuse/effluent disposal facility in Central Maui to be located south-west of the Kahului WWRf that is being considered by the County Department of Environmental Management. See pages 3-9 to 3-11 of the Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

**Re: Proposed Lease for the Nahiku, Ke`anae, Honomanu, and Huelo License Areas -
For the Draft Environmental Impact Statement (DEIS)**

Dear Mr. Hirokawa:

Thank you for the opportunity to comment on the consultation for the Draft Environmental Impact Statement (DEIS) for the Proposed Lease for the Nahiku, Ke`anae, Honomanu, and Huelo License Areas. The County of Maui Department of Water Supply (MDWS) has received the consultant's September 23, 2019 responses to our December 20, 2016 comments on the Preparation of an Environmental Impact Statement, and we offer the following comments on the consultant's responses and other pertinent issues to consider in the Final EIS (FEIS).

Section 2.1.4 Changing Economic and Climatic Conditions

The transitions of Mahi Pono lands to an alternative agricultural model, with variations in crop types, geographic distribution, timing, and associated future water demands and water availability are uncertain. The FEIS should address potential impacts and mitigations related to the Proposed Action in the event that: 1) alternative agricultural uses are inadequate to sustain the economic viability of the East Maui Irrigation (EMI)/Mahi Pono System over the transition period or longer term; and 2) diverted water is inadequate to balance what is available from the brackish wells, given the brackish well water use exists because, "the full needs of the 30,000 acres of Central Maui fields could not be met by stream waters diverted by the EMI/Mahi Pono Aqueduct System at all times of the year" (page 2-17).

Section 3.1.2 Alternatives Considered but Dismissed

In the event the EMI/Mahi Pono system is not economically viable, "at risk," or compromised due to the above cited issues or state of infrastructure, lack of capital to upgrade, etc.; the EIS should assess alternative solutions to mitigate the impacts upon end users, with the MDWS municipal/public use in particular as the highest priority. Subsection 3.1.2 Aqueduct Ownership could address an alternative operations model to ensure continued distribution to Kamole Weir and the Upcountry community as this is a primary objective of the Proposed Action and purpose of the Water Lease.

The groundwater development alternative is presented as 53 well sites and excessive transmission. The FEIS should consider a more feasible alternative such as a combination of available surface water in drought, supplemented by groundwater from Haiku and/or Honopou aquifers developed on A&B Inc. owned land, and using the existing transmission through Wailoa Ditch.

The recycled water alternative, using R-2 at Kahului WWRF, alternatively upgrade quality to R-1 water, should be further considered as a viable alternative and supplemental source to surface water from the proposed lease. The short term construction near Kanaha pond should be weighed against long term reliable recycled water source. Current available flow of 4 mgd will increase as Central Maui is developed.

Both alternatives along with upgrade of existing HC&S reservoirs can offset about 25 mgd, or 40% of needed surface water supply. It would be wise to develop contingency source as instream flow standards will eventually be established for all diverted streams, further reducing available water for off stream uses.

These alternatives are consistent with proposed strategies in the March 2019 Draft Water Use and Development Plan as follows:

Chapter 12 and 13, Strategies #47 and #50: "Diversify supply for agricultural use to increase reliability", and "Balance existing diversions with alternative sources for agriculture to mitigate low flow stream conditions"

Chapter 15 Strategies # 8 and #9: "Consider alternative sources of irrigation water including wastewater reuse, recycled stormwater runoff, and brackish well water in land use permitting to mitigate low flow stream conditions. Require alternative sources for irrigation when reasonably available in county discretionary land use permitting" and "Expand distribution from the Kahului Wastewater Treatment Facility and the application for planned energy crops. Potential available recycled water is 4.2 mgd".

Mr. Ian C. Hirokawa
State of Hawaii Board of Land and Natural Resources

3.2.1 Reduced Water Volume Alternative

The DEIS states that under the Reduced Water Volume alternative, the MDWS may receive no water from Wailoa Ditch or some amount up to 7.1 mgd. The FEIS should discuss the option to allow the MDWS allocation to remain at 7.1 mgd, while other allocations are potentially reduced as a proposed mitigation to ensure the adequate water supply is provided to meet the Upcountry community needs under the Reduced Water Volume alternative.

Section 4.2.2 System Efficiency

With regard to efficiency, capacity, and monitoring of systems, the DEIS addresses water losses and identifies mitigating actions to improve irrigation efficiency in the Central Maui field system. The FEIS should identify any mitigating actions to address system transmission losses which geographically occurs in the open ditch/aqueduct system in the License Area prior to Maliko Gulch/entering Mahi Pono's Central Maui field system. Field surveys by the U.S. Geological Survey (USGS) characterized seepage losses and gains in the EMI ditch system. The USGS study showed that losses are greater than gains at low flows, but at higher flows gains (from groundwater, especially in the tunnels) are greater than the losses. (CCH-MA-13-31 Minute Order 16, Hearing Officer's Proposed Findings of Fact, Conclusions of Law, & Decision and Order, FoF 377)

Section 3.4.4 and 4.2.2 Impact on Groundwater Recharge

The DEIS discussion on impact on groundwater recharge from diverted surface water under the proposed lease is limited to impact on groundwater from cessation of sugar cultivation and from stream restoration actions under the CWRM D&O. The FEIS should address the impact on groundwater recharge in the license area from the proposed lease for the purpose of developing, diverting, transporting and using government owned waters. For example, the impact on groundwater from exported stream flow in the license area could at least be compared to the benefits of imported stream flow to groundwater in Central Maui.

We hope you find this information useful.

Sincerely,

Jeffrey T Pearson, P.E.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Pearson:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Section 2.1.4 Changing Economic and Climatic Conditions

Comment 1: *The transitions of Mahi Pono lands to an alternative agricultural model, with variations in crop types, geographic distribution, timing, and associated future water demands and water availability are uncertain. The FEIS should address potential impacts and mitigations related to the Proposed Action in the event that: 1) alternative agricultural uses are inadequate to sustain the economic viability of the East Maui Irrigation (EMI)/Mahi Pono System over the transition period or longer term; and...*

Response 1: Your comment that the EIS should address potential impacts and mitigations to the Proposed Action in the event that the agricultural uses proposed in Central Maui are inadequate to sustain the economic viability of the EMI Aqueduct System and the Central Maui Irrigation System is highly speculative, and therefore was not a reasonable alternative that was assessed within the EIS. The scope of the EIS assesses the anticipated environmental impacts associated

with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS, including the proposed Mahi Pono farm plan. The environmental impacts of the potential Water Lease are included throughout Chapter 4 of the EIS. However, the economic and fiscal impacts of the Proposed Action were also assessed in the Economic and Fiscal Impact Study report attached to the EIS as Appendix H and summarized in Section 4.7.3 of the EIS. The impacts of the Proposed Action on the agricultural economy are described in Section 4.7.4 of the EIS and Appendix I, the Agricultural and Related Economic Impacts report.

Moreover, Section 2.1.4 describes the Mahi Pono farm plan as follows:

Mahi Pono’s farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation. All of these things must be considered when developing an evolving and feasible diversified agricultural plan for Central Maui.

As discussed in Section 3.2.1 of the EIS, Mahi Pono has expressed an intention to farm as much of the approximately 30,000 acres in Central Maui as is possible. Thus it is expected that the Mahi Pono farm activities will support the operation of the EMI Aqueduct System.

Comment 2: *The FEIS should address potential impacts and mitigations related to the Proposed Action in the event that: 2) diverted water is inadequate to balance what is available from the brackish wells, given the brackish well water use exists because, "the full needs of the 30,000 acres of Central Maui fields could not be met by stream waters diverted by the EMI /Mahi Pono Aqueduct System at all times of the year" (page 2-17).*

Response 2: With regards to your comment that the EIS should address potential impacts and mitigations to the Proposed Action in the event that diverted water is inadequate to balance what is available from the brackish wells, a shortage of diverted surface water is addressed in a number of places in the EIS, including those sections covering the Reduced Water Volume Alternative and the No Action Alternative. Please note that the Mahi Pono farm plan, provided in Table 2-1 of the Draft EIS, lists the acreage that Mahi Pono proposes to irrigate under the Proposed Action as shown below:

Proposed Use	Acres	Gallon Per Acre a Day	Surface MGD	Ground water MGD	Total MGD	Annual MGD	% of Total
<i>Community Farm</i>	800	3,392	1.87	0.83	2.70	987	3.28%
<i>Orchards (citrus, mac nuts, beverage crops)</i>	12,850	5,089	53.39	12.04	65.43	23,883	79.48%
<i>Tropical Fruits</i>	600	4,999	2.07	0.87	2.94	1,073	3.57%
<i>Row and Annual Crops</i>	1,200	3,392	3.14	0.95	4.09	1,491	4.96%
<i>Energy Crops</i>	500	3,392	1.18	0.53	1.70	622	2.07%
<i>Pasture, irrigated</i>	4,700	1,161	4.20	1.25	5.46	1,992	6.63%
<i>Pasture, unirrigated</i>	9,100	0	0	0	0.00	0	0.00%
<i>Green Energy</i>	250	0	0	0	0.00	0	0.00%
TOTAL	30,000	2,744	65.86	16.47	82.33	30,047.77	100.00%

Hence, under the Proposed Action approximately 9,100 acres would be unirrigated. Moreover, consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture in Central Maui.

Table 3-1 of the Draft EIS provides the Mahi Pono farm plan in the event that no Water Lease is issued (resulting in less diverted water) as shown below:

Proposed Use	Acres	GPAD	Surface MGD	Groundwater MGD	Total MGD	Annual MGD	% of Total
<i>Community Farm</i>	300	3,392	0.70	0.26	0.97	353	3.25%
<i>Orchards (citrus, mac nuts, beverage crops)</i>	4,180	5,089	17.36	3.39	20.75	7,574	69.77%

<i>Tropical Fruits</i>	200	4,999	0.69	0.26	0.95	349	3.21%
<i>Row and Annual Crops</i>	400	3,392	1.15	0.82	1.98	722	6.65%
<i>Energy Crops</i>	200	3,392	0.47	0.20	0.68	248	2.28%
<i>Pasture, irrigated</i>	3,800	1,161	3.40	1.01	4.41	1,610	14.83%
<i>Pasture, unirrigated</i>	20,670	0	0	0	0.00	0	0.00%
<i>Green Energy</i>	250	0	0	0	0.00	0	0.00%
<i>TOTAL</i>	30,000	991	23.79	5.95	29.74	10,855.16	100.00%

The impacts under the No Action alternative are discussed throughout Section 3.4 of the EIS. Under the No Action alternative, approximately 20,670 acres would be unirrigated. Food crop production and beneficial economic impacts would be significantly less than the Proposed Action as discussed in Section 3.4.13 of the Draft EIS.

Thus, it can be assumed that should the diverted water be inadequate to balance what is available from the brackish wells, there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, and an increase of about 188 acres of land in unirrigated pasture, for every 1 mgd lost.

Section 3.1.2 Alternatives Considered but Dismissed

Comment 3: *In the event the EMI/Mahi Pono system is not economically viable, "at risk," or compromised due to the above cited issues or state of infrastructure, lack of capital to upgrade, etc.; the EIS should assess alternative solutions to mitigate the impacts upon end users, with the MDWS municipal/public use in particular as the highest priority.*

Response 3: Regarding your comment that the EIS should assess alternative solutions to mitigate the impacts upon end users in the event that the EMI Aqueduct System and the Central Maui Irrigation System are not economically viable and compromised is highly speculative and therefore was not assessed as a reasonable alternative within the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of*

developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included throughout Chapter 4 of the EIS.

However, as noted throughout the Draft EIS, the provision of diverted East Maui stream water to the end user, MDWS, is contingent upon the issuance of the Water Lease by the terms of the water delivery agreement with EMI. As discussed in Section 3.3 of the Draft EIS:

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. As a consequence, domestic and agricultural water needs in Upcountry Maui would need to be met by alternative water sources that would need to be developed by the MDWS. At this point in time, it is unknown whether sufficient groundwater resources exist in Upcountry Maui to meet these water demands. It is anticipated that the development of alternative water-source infrastructure would be prohibitively expensive, and depending upon the specific sources, or combination of sources, could result in significant direct adverse impacts to the environment.

Section 3.4 of the EIS provides a comparative analysis of the impacts of the Reduced Water Volume Alternative and No Action Alternative, both of which would involve less or no water being delivered to MDWS. In addition, a summary table comparing the various alternatives, as well as the No Action alternative, has been added as Table 3-2 to Section 3.5 of the Final EIS as pages 3-49 to 3-80.

Comment 4: *Subsection 3.1.2 Aqueduct Ownership could address an alternative operations model to ensure continued distribution to Kamole Weir and the Upcountry community as this is a primary objective of the Proposed Action and purpose of the Water Lease.*

Response 4: Although supporting continued delivery of water to the MDWS to serve Upcountry Maui is an objective of the Proposed Action, it is not the primary objective. The primary objective of the Proposed Action is to obtain the Water Lease which will support agricultural use in the Central Maui agricultural fields as well as continued deliveries of surface water to MDWS. However, alternative ownership of the EMI Aqueduct System is acknowledged within the EIS. As discussed in EIS Section 3.1.2, the EMI Aqueduct System is privately owned and is not for sale. Therefore, the Aqueduct Ownership alternative is speculative. However, Section 3.1.2 has been updated in the Final EIS to take into account the report prepared by the County of Maui Board of Water Supply (BWS) Temporary Investigative Group (TIG) to explore options for ensuring public access to water, including the feasibility of purchasing and maintaining the EMI Aqueduct System (the TIG Report). See pages 3-19 to 3-20 of the Final EIS. The TIG Report

was made public on October 16, 2019, after the publication of the Draft EIS, and a copy of the TIG Report has been provided as Appendix Q of the EIS.

Acquisition of the EMI Aqueduct System by the County or any other public entity remains purely speculative at this time. The EMI Aqueduct System is not for sale or lease, and forced acquisition of the system is projected to be prohibitively expensive, resulting in substantial costs to the public. It is noted that the TIG Report's proposal for water rates for the Central Maui agricultural fields is nearly ten times that of what is being charged at the Kula Agricultural Park (KAP) and to Upcountry agricultural users. Such a dramatic increase in water rates would have associated economic, fiscal, and social impacts, Countywide. Moreover, should the County bid for the Water Lease, it would need to utilize the water in a fashion consistent with the analysis in this EIS (or complete the necessary environmental review for any use that is not considered in this EIS). Furthermore, much of the institutional knowledge needed to properly operate the EMI Aqueduct System would be lost under any change in ownership scenario. This could reduce the efficacy of the system, result in the incapability of new ownership to properly maintain it, and possibly lead to additional and unforeseen environmental impacts that would run contrary to the perceived enhancement of environmental quality that you infer.

Comment 5: *The groundwater development alternative is presented as 53 well sites and excessive transmission. The FEIS should consider a more feasible alternative such as a combination of available surface water in drought, supplemented by groundwater from Haiku and/or Honopou aquifers developed on A&B Inc. owned land, and using the existing transmission through Wailoa Ditch.*

Response 5: Please note that the alternatives analysis provided in Chapter 3 of the Final EIS has been supplemented in response to certain comments received in response to the Draft EIS. Specifically, Section 3.1.1.1 of the Final EIS has been revised to expand the discussion on East Maui groundwater resources that was included in the Draft EIS, to include lands owned by A&B and close enough to the ditch so that it can be used for transmission. We acknowledge your comments above regarding a more feasible alternative, though the revised analysis indicates that this alternative is infeasible.

Your comment about excessive transmission is unclear. However, please note that the “groundwater alternative” discussed in Section 3.1.1.1 of the EIS, is intended to reduce the amount of surface water required for irrigation to support diversified agriculture in Central Maui. If sufficient groundwater source could be developed and coupled with the amount of surface water available under the “No Action” alternative or the “Reduced Water Volume” alternative, such a scenario could, theoretically, meet the objectives of the Proposed Action. But the analysis does not support the feasibility of this approach.

The Central Maui aquifers have a limited amount of groundwater resources as discussed in Section 3.1.1.1 of the Final EIS:

The Central Maui agricultural fields are within the MDWS's Central Maui Aquifer Sector which includes four aquifer systems: Pā'ia, Kahului, Kamaole, and Makawao aquifers. Currently, ~~the Mahi Pono's~~ Central Maui agricultural fields have 10 ~~15~~ wells (see Figure 2-7 ~~2-5~~) in the Pā'ia, ~~and~~ Kahului, ~~and~~ Ha'ikū aquifers.¹ The average ~~amount of pumping rate from 1987 to 2006 was about 26,663 mg per year. This volume equates to a pumping average of 73 mgd. Brackish~~ brackish groundwater used on the Central Maui agricultural fields from 2008 to 2013 was approximately 42.5 ~~70~~ mgd. (Plasch, Updated 2020 ~~2019~~). This average daily pumping rate is well above the Sustainable Yield (SY) of 8 ~~32~~ mgd (7 mgd for the Pā'ia aquifer, ~~and~~ 1 mgd for the Kahului aquifer, ~~and~~ 24 mgd for the Ha'ikū aquifer (within the Ko'olau Aquifer Sector Area)), as determined by the CWRM (see detailed discussion in Section 4.2.2). This high pumping rate may have been achievable in the past due to the large amount of recharge that was occurring when sugar was being cultivated and irrigated by imported surface water from East Maui. During this same period, the total amount of surface water being applied to the Central Maui agricultural fields was approximately 106.61 mgd. irrigation from surface water in Central Maui was approximately 112 mgd, and an additional approximately 44 mgd of surface water was applied to the fields through system losses (evaporation and leakage) within the Central Maui field system. The recharge from the application of this volume of East Maui surface water on the Central Maui agricultural fields served to replenish these system losses were replenishing the Kahului and Pā'ia aquifers and is likely the reason that pumping groundwater at rates greater than the SY was achievable.

Hence, high pumping rates in the past were possible as significantly more surface water was being diverted by the EMI Aqueduct System from East Maui to Central Maui, and the underlying aquifers recharged accordingly from the irrigation of the fields as well as the seepage losses in the on-farm distribution system (Central Maui field irrigation system which includes unlined ditches and reservoirs). Seepage losses from the on-farm distribution system, including reservoirs, were calculated using the National Engineering Handbook published by the Soil Conservation Service of the U.S. Department of Agriculture, and estimated to be approximately 22.7% of the water delivered to the fields (i.e., water lost to seepage and evaporation, and

¹ Note that CWRM D&O, FOF 738 refers to 15 brackish water wells, which was the number of brackish wells that A&B utilized during it sugar cane operations. However, one of the 15 wells referred to, State Well No. 5128-002, does not serve the Central Maui agricultural fields and four of the other brackish wells are on lands not sold to Mahi Pono and thus are not available for Mahi Pono's use. See discussion at Section 2.1.4.

including other water uses, such as water used for reservoirs, fire protection, dust control, and hydroelectric uses). See Final EIS Section 2.1.4 at page 2-27; CWRM D&O, FOF 730-737. Under the Proposed Action, it is estimated that approximately 87.95 mgd will be available to divert from the License Area after compliance with the Commission on Water Resource Management (CWRM) Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O) and an additional 4.37 mgd from private lands between Honopou Stream and Maliko Gulch, for a total of 92.32 mgd as discussed in Section 2.1.2 of the Draft EIS. Specifically, Section 2.1.2 of the Draft EIS states:

With the issuance of the Water Lease under the Proposed Action, the EMI Aqueduct System would divert only the maximum allowable amount under the CWRM D&O from streams within the License Area, which is estimated to be approximately 87.95 mgd. The EMI Aqueduct System is estimated to divert an additional 4.37 mgd from the point that it leaves the License Area at Honopou Stream and collects water from streams on privately owned land to its last diversion at Maliko Gulch. Thus, an estimated total of approximately 92.32 mgd would be conveyed to supply the MDWS for users in Upcountry Maui, Nāhiku, and the agricultural fields in Central Maui.

As further discussed in Section 3.1.1.1 of the Draft EIS, significantly less water will be diverted to Central Maui under the Proposed Action than occurred in the past, under full sugar cultivation, which will lead to less recharge of the aquifers which will in turn decrease the amount of groundwater that can be pumped to have sustainable groundwater aquifers. Specifically, Section 3.1.1.1 of the Final EIS states:

Under the Proposed Action, less surface water will be used for irrigation in the Central Maui agricultural fields than was the case in the past, leading to less recharge of the underlying aquifers (85.22 92.32 mgd is the maximum amount of surface water estimated to be available under the Proposed Action at Māliko Gulch as compared to the recent (2008-2013) average during sugarcane operations of approximately 106.61 mgd). All of Mahi Pono's ~~the~~ existing wells are located within the Pā'ia, and Kahului, and Ha'ikū aquifers and, with little recharge from former sugar irrigation levels, maximum pumping exceeding the SY of 8 32 mgd would eventually increase salinity of the water drawn from the wells. At that point, pumping rates would need to be reduced to protect the aquifers. ~~Given that there are other wells in these aquifers, the safe maximum pumping rate is probably about half, or 4 mgd (Akinaka, 2019).~~

It should be noted that the groundwater in the Central Maui aquifers are brackish, meaning that they have higher salinity levels. The Mahi Pono farm plan is a diversified agricultural plan as discussed in Section 2.1.4 of the Draft EIS, which proposes orchards, tropical fruits, row and

annual crops, and energy crops. These types of crops are not as salt tolerant as sugarcane. Usage of the groundwater is even further restricted due to higher salinity in the groundwater and less salt tolerance of the crops to be planted when compared to sugar cane. Specifically, Section 2.1.4 of the Draft EIS states:

From 1986 to 2013, A&B pumped an average of 71 mgd from the brackish water wells; during the 2008-to-2013 period, these wells delivered about 70 mgd of brackish groundwater to the lower-elevation fields. This was a suitable source of water for sugarcane during droughts because sugarcane can tolerate periodic use of water with higher salinity levels.

When the sugarcane fields were in cultivation, well water was being applied typically during dry periods, when surface water was not available for sustained periods. Sugar cane was cultivated in a twenty-four month crop cycle, providing ample time for the crop to recover from a prolonged use of brackish water. The crops planned for Mahi Pono's diversified agricultural operation may have a shorter crop cycle and be much less tolerant than sugar cane of higher salinity levels. Thus, the planned crops will generally be more vulnerable to the negative impacts on crop growth associated with prolonged exposure to brackish water and lower crop yields.

However, to increase groundwater yields, additional wells could potentially be drilled in the Central and East Maui aquifers (i.e., in the Haiku and Honopou aquifers) as discussed in Section 3.1.1.1 of the Final EIS. Specifically, Section 3.1.1.1 of the Final EIS states:

To increase groundwater supplies for irrigation of the Central Maui agricultural fields yields, additional wells could be drilled in other aquifers in Central and East Maui. The groundwater in East Maui's Ko'olau Aquifer Sector could be an alternative water source to supplement or replace some of the East Maui stream surface water for use in Central Maui. The Ko'olau Aquifer Sector generally underlies the License Area and is made up of four aquifer regions, identified as the Ha'ikū, Honopou, Waikaimoi, and Ke'anae Aquifers. (See Figure 4-17). Specifically, it is anticipated that the potential development of new wells sited on Mahi Pono / EMI owned lands within the privately owned portions of the Collection Area as well as areas between Honopou Stream and Māliko Gulch that transect the Ko'olau Aquifer Sector could potentially be pursued and transported to the MDWS and the Central Maui agricultural fields via the existing EMI Aqueduct System. These wells could be dedicated to supply water to the EMI Aqueduct System or into existing storage reservoirs that serve the same uses served by the EMI Aqueduct System. Due to the uncertainty of obtaining requisite approvals to drill new wells on State land, this alternative assumes well development on Mahi Pono /EMI land.

For the purposes of this analysis, using the SY as the maximum amount of groundwater theoretically available for use, the development of potential well sites within the proximity to the EMI Aqueduct System were considered, together with the following environmental and feasibility factors:

1. Avoiding the siting of well development locations near streams in order to minimize potential impacts to streamflow;
2. Locating the well development sites near a collection point or opening to the EMI Aqueduct System. As a large portion of the overall EMI Aqueduct System is made up of tunnels, many areas are not accessible for the purposes of discharging pumped groundwaters into the EMI Aqueduct System;
3. Spacing potential well development sites at least 1,000 feet apart from each other to minimize drawdown effects on the aquifer; and
4. Developing the potential well sites on lands which are legally accessible by EMI staff, i.e., on EMI / Mahi Pono owned lands.

Land use restrictions based on the environmental criteria noted above, as well as the practicalities of using lands owned by EMI and/or Mahi Pono, were the major constraining factors when considering the number of new wells that could be developed.

It can also be noted that the wells were capped at 1 mgd pumping rates because of the numerous wells required in the area and the potential effects larger pumping rates could have on the aquifer. It was previously determined that the East Maui Ko'olau Aquifer Sector has a hydraulic head of around 5 to 6 feet which in turn can sustainably support wells with a max pumping capacity of 1 to 1.5 mgd. (See Mink & Yuen, Inc., Final Supplemental Environmental Impact Statement for the East Maui Water Development Plan, prepared for the Maui County Department of Water Supply, at 31 (2002), available at http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2002-11-08-MA-SFEIS-East-Maui-Water-Withdrawn.pdf.) Due to this prior determination, it is expected that the environmental impacts, such as drawdown effects, of a pumping rate greater than 1 mgd would be more severe in the East Maui environment.

It is also noted that anything larger than 1 mgd involves much higher development and operational costs, both of which make the well less cost effective. Therefore, the 1 mgd standard is used as the most cost effective well to drill. Well pumps that

exceed 1 mgd result in the water becoming exponentially more expensive to pump, which then minimizes the benefits of the well water. Additionally, water supply wells are typically installed at 1 mgd to make repairs easier. The uniformity between wells makes ordering and stocking parts easier and more efficient, allowing for parts to be ordered in bulk, thus reducing the cost of repairs and maintenance.

Using these criteria to locate potential new wells to source the EMI Aqueduct System, and taking into consideration the CWRM SY, discussed in more detail in Section 4.2.2, approximately 26 new well sites were identified for consideration (6 in the Ke'anae Aquifer, 7 in the Waikamoi Aquifer, 7 in Honopou Aquifer, and 6 in the Ha'ikū Aquifer) (See Figure 3-1). This would provide up to 26 mgd of replacement water, which is a fraction of what the Mahi Pono farm plan needs at full implementation.

Well development costs are estimated at \$10 million per well (\$260 million total). Although the DEIS outlines and evaluates an estimated cost of approximately \$6 million per 1 mgd well, recent relevant construction cost comparisons reflect that well development in East Maui, which involve typically remote, undeveloped areas, could be much more costly. This rough estimate well development cost of \$10 million per 1 mgd well assumes includes the following:

1. The potential well sites are mostly undeveloped and away from existing roadways. Providing access to these new sites will require extensive planning and permitting in addition to being very costly. (\$2 million)
2. Due to the remoteness of the sites, power supply is not readily available. Power will need to be brought in from the nearest power sources. It is also likely that the power supply in the area may need to be upgraded to provide adequate power for the new wells. Deep wells such as these require large pumps that require lots of power to operate them. (\$1 million)
3. Preparation and development of the well site including clearing, grading, paving and securing of the site. (\$500,000)
4. Other development requirements such as material transportation and overall construction difficulties in remote areas. (\$500,000)
5. Drilling and casing the well shaft. (\$2M)
6. Mechanical work to install the pump within the well shaft and the mechanical pump controls. (\$1 million)

7. Electrical work required to provide power and the electrical pump controls (\$1.5 million) Building structures to house the mechanical and electrical equipment and controls. (\$500,000)
8. Installing piping to transport pumped water from the well to the ditch (\$200,000)
9. Installing a receiving and diversion structure to transmit the pumped water into the ditch system. (\$200,000)
10. Testing for well capacity, the pump and its controls. (\$500,000)

These costs estimates are based on comparable wells developed in North Kona and Upcountry Maui (Akinaka, 2020). It should be noted however, that these costs estimates do not include the significant power generation costs incurred from having to continually pump the wells, or other operation and maintenance costs related to running a deep well system. These wells will be approximately 1400+ feet deep, requiring significant pumping costs. The Kuhiwa Well, located in Nāhiku, Maui, can be used for reference. It is at an elevation of 1,396 feet with a well depth of 1,411 feet.² That elevation and well depth is similar for all the proposed wells. (Akinaka, 2020).

It is also assumed that the amount of land needed for well development with access can be estimated to be around one acre. Although well sites are typically not very large, due to how remote most of the proposed well locations are, it can be assumed that lengthy access and utility developments might increase the amount of land needed. Additionally, the development of new wells and associated infrastructure would involve considerable land disturbance in areas that are relatively undisturbed now. This could increase environmental impacts, including potential impacts to undiscovered historic sites and cultural resources, and also require some slight topographic and soil changes.

Furthermore, impacts of well development will need to be assessed at each potential well site as the development of each site would carry a unique set of associated risks, impacts, and challenges. Accessibility and cost of power to supply and operate the wells reflect just a subset of such challenges. As emphasized previously, the extent and nature of these impacts will differ by location and setting. Notably, one impact that should be considered is the effect groundwater pumping will have on nearby surface water sources (streams). Often, groundwater pumping

² The probability of finding high level groundwater is unknown and is therefore not contemplated within this analysis. If high level groundwater was located, the well depths could be reduced.

in an area may have a direct relation to lower stream flows and less surface water sources being available due to ground and surface water interaction. The resulting impacts of groundwater pumping, i.e., a reduction in available surface water, could negate any benefits that may arise from the reduction in the amount of surface water used.

Due to the lack of groundwater usage in East Maui, the relationship between surface water and groundwater in the area is largely unknown. This lack of information increases the risk involved with developing groundwater as a supplemental or replacement resource for surface water from East Maui. It should also be noted that obtaining the required land use entitlements, well construction permits, and other construction permits for associated infrastructure, would take considerable time and could face opposition that may make well development and construction challenging. Nevertheless, depending on the terms and conditions of the Water Lease, it is conceivable that the lessee could incrementally pursue well development to supplement the East Maui surface water.

On a macro level, it is well established that a range of environmental impacts are generally associated with the development of wells within the East Maui region (Maui Pineapple Company, 1991). Based on past experience of developing new wells, these impacts range from the destruction of native plants and habitats to introduction of invasive species during the construction and operation of the wells. Also, changes in the topography from development could impact natural runoff directions. The extent of impacts of this nature could be considerable depending upon the location of the sites used. Impacts will vary by location due to remoteness of the area and how much development will be needed for both the pumping site as well as the utilities and access. There are numerous other site-specific impacts that would need to be considered that would require investigations at each potential site, such as: archaeological investigations, investigating the elevation of the water table (identifying if high level water bodies are present), construction impacts (noise, dust, overgrowth on site due to rainfall), and habitat and vegetation investigation (determining if rare/endangered species are present and how development will affect them). Moreover, the amount of land needed to undertake well development will vary from site to site due to requirements to distance well development from pollutants as well as from other wells to prevent drawdown effects.

Supplying well-sourced groundwater to the EMI Aqueduct System presents an additional challenge. Keeping water at the highest elevation ditch (the Wailoa Ditch) would be optimal to mitigate the additional energy costs incurred for the distribution of the water to the end users. One of the challenges that will be faced is the fact that Wailoa Ditch consists mostly of tunnels/covered ditch areas, which

makes getting the water into the EMI Aqueduct System challenging. This could require additional piping from the well(s) to the nearest open point on the EMI Aqueduct System as well as additional power requirements and costs. These cost and power needs are not included in the rough estimates provided above.

Development of new groundwater wells in the Ko'olau Aquifer Sector, after taking into account basic environmental considerations such as seeking to limit impacts to streams, minimizing drawdown effects on the aquifer, and accessibility to the EMI Aqueduct System, would, at best, provide only a limited amount of water. Moreover, the Ko'olau Aquifer Sector is relatively untouched in terms of well development. Groundwater impacts are expected to be more severe and noticeable as a result of drilling a well in an untouched aquifer as compared to drilling in an aquifer that is being pumped from existing wells, increasing environmental risks.

Due to the fact that potential well development would also involve the use of generally remote undisturbed lands in the State Land Use Conservation District, construction of wells and associated infrastructure would generate new and ongoing demands for electrical power. As such, even this limited well development analysis would not appear to enhance environmental quality when compared to the continued use of surface water through the existing, gravity-fed, EMI Aqueduct System, which requires no new construction or significant alterations to continue in operation.

Assuming that a single well is normally allowed to pump about 1 mgd within its area, 53 new well sites would need to be developed, each requiring site acquisition, drilling, testing and if adequate, brought into production. These wells would need to be spaced far enough to avoid salt water intrusion into the aquifer. Each well site would have an estimated development cost of \$6 million. (Akinaka, 2019). To plan, obtain permits for, and construct 53 wells would probably be in the order of \$318 million. Added to this cost would be transmission pipes, additional pumping and related energy consumption to reach higher elevations, and reservoirs. It is anticipated to be very unlikely that 53 new wells could be constructed within the Central and East Maui areas, as the environmental impacts would be considerable and permit approvals would be prohibitive. Therefore, the groundwater alternative continues to be ~~is~~ viewed as an unreasonable alternative with greater risks of adverse environmental effects than the Proposed Action, and was dismissed from further review.

Hence, the assessment included land in East Maui, including land owned by A&B.

Comment 6: *The recycled water alternative, using R-2 at Kahului WWRF, alternatively upgrade quality to R-1 water, should be further considered as a viable alternative and supplemental*

source to surface water from the proposed lease. The short term construction near Kanaha pond should be weighed against long term reliable recycled water source. Current available flow of 4 mgd will increase as Central Maui is developed. Both alternatives along with upgrade of existing HC&S reservoirs can offset about 25 mgd, or 40% of needed surface water supply. It would be wise to develop contingency source as instream flow standards will eventually be established for all diverted streams, further reducing available water for off stream uses.

Response 6: Regarding reclaimed water, the “reclaimed water” alternative discussed in Section 3.1.1.2 of the Draft EIS is intended to supplement surface water diversions as there is not enough reclaimed water to replace all of the needed East Maui surface water. However, please note that Mahi Pono’s water needs are current and will increase over time to support a growing farm, and existing, known reclaimed water sources in Central Maui are limited. Section 3.1.1.2 (Reclaimed Water), which provides an analysis of the feasibility of the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility (WWRF) to irrigate the Central Maui fields. As discussed, the recycled water alternative using existing R-2 water from the Kahului WWRF could be considered an alternative as supplemental source. However, R-2 water has limited useability on crops. County of Maui Department of Environmental Management (DEM) does not intend to send this R-2 water to the Central Maui agricultural fields.

Section 3.1.1.2 of the EIS also explores the viability of the use of R-1 treated water, which although is not as restrictive as using R-2 waters from an agricultural viability standpoint, still carries a negative stigma when used on unprocessed agricultural food crops. While the County DEM has expressed a desire to upgrade the Kahului WWRF plant to provide R-1 treatment capabilities in the future, the upgrade has not been funded as therefore remains speculative at this time. Furthermore, this hypothetical source could at best provide only 5.5 mgd of R-1 treated waters and would require the installation of a transmission / transportation system to convey the recycled water from the Kahului WWRF to the Central Maui agricultural fields.

Additionally, Section 3.1.1.2 of the EIS acknowledges concerns raised about the Wailuku-Kahului WWRF being located in a hazardous and exposed location, at the front of a tsunami flood zone and a 3.2 feet sea level rise exposure area, rendering it a vulnerable public facility. Further environmental concerns with upgrading this facility are present as it would require construction near Kanahā Pond, which is designated a s State wildlife sanctuary, and other concerns with potential impacts to groundwater, surface water, and coastal water pollution. Thus, this alternative would provide only a limited amount of water at the risk of potentially significant environmental impacts.

Further consideration of this alternative has been included in Chapter 3 of the Final EIS, which has also been supplemented with a discussion about the potential new reuse/effluent disposal

facility in Central Maui to be located south-west of the Kahului WWRF that is being considered by the County DEM. See Final EIS pages 3-9 to 3-11.

Hence, minimal reclaimed water can be relied upon for Mahi Pono's farm plan as the present flow is approximately 7.9 mgd. Moreover, the facility only produces R-2 water which can minimally be applied to the crops proposed in the Mahi Pono farm plan, so it can only serve a small percentage of Mahi Pono's needs. We recognize that there are plans in place to upgrade the Kahului WWRF to an R-1 treatment facility which reclaimed water can be used for food crops. However, it is anticipated that this upgrade would not occur until 2026-2028. As shown above, Section 3.1.1.2 of the Final EIS has been updated to further discuss the County's current plans regarding their reuse / disposal system.

Regarding your comment about the upgrading existing reservoirs, this is discussed in Section 3.1.1.3 of the Draft EIS. The total existing storage can provide approximately 16 days based on the estimated available surface water for diversion after compliance with the CWRM D&O. However, it should be noted that the existing reservoirs are filled when flows through the EMI Aqueduct System exceed the irrigation needs. Specifically, Section 3.1.1.3 of the Final EIS states:

The existing 41 reservoirs are fed by the EMI Aqueduct System surface water diversions so they can be filled when the amount of water delivered exceeds the amount used. The EMI Aqueduct System, however, is not designed to capture and convey high-volume freshet flows which overwhelm and bypass the diversions. ~~If such freshet flows (in excess of the IIFS standards under the CWRM D&O) could be captured, it could significantly increase storage capacity.~~ As discussed in Section 2.1.4, an estimated 85.22 mgd gross total of surface water (less Central Maui Field Irrigation System losses, a net estimated 65.88 mgd) will be needed to support Mahi Pono's farm plan at full implementation. Currently, the size and location of the existing reservoirs, as well as water availability do not lend themselves to providing significant back-up storage. Rather, the reservoirs are generally used for operational purposes, to move water to different fields.

However, please note that Section 3.1.1.3 of the Final EIS has been to expand on the discussion of improving existing storage facilities that was included in the Draft EIS.

Regarding your comment about all diverted streams eventually having an amended IIFS is too speculative to assess or discuss at this time, in this EIS. However, a "reduced water volume" alternative is discussed in Section 3.2.1 of the EIS and the impacts of this alternative are analyzed throughout Section 3.4 of the EIS.

Comment 7: *These alternatives are consistent with proposed strategies in the March 2019 Draft Water Use and Development Plan as follows:*

Chapter 12 and 13, Strategies #47 and #50: "Diversify supply for agricultural use. to increase reliability", and "Balance existing diversions with alternative sources for agriculture to mitigate low flow stream conditions"

Chapter 15 Strategies # 8 and #9: "Consider alternative sources of irrigation water including wastewater reuse, recycled stormwater runoff, and brackish well water in land use permitting to mitigate low flow stream conditions. Require alternative sources for irrigation when reasonably available in county discretionary land use permitting" and "Expand distribution from the Kahului Wastewater Treatment Facility and the application for planned energy crops. Potential available recycled water is 4.2 mgd".

Response 7: We acknowledge your comments and understand that your proposed alternative is consistent with the above strategies from the March 2019 Draft Water Use and Development Plan. As discussed above in Responses 3 through 6 above, several alternatives to the Proposed Action were considered in the EIS, including alternative sources of water such as groundwater wells, the use of reclaimed water, desalinization, and added reservoir storage. Please note that the alternatives analysis provided in Chapter 3 of the Final EIS has been supplemented to address certain comments received in response to the Draft EIS as shown on pages 3-2 to 3-19.

Comment 8: *3.2.1 Reduced Water Volume Alternative*

The DEIS states that under the Reduced Water Volume alternative, the MDWS may receive no water from Wailoa Ditch or some amount up to 7.1mgd. The FEIS should discuss the option to allow the MDWS allocation to remain at 7.1mgd, while other allocations are potentially reduced as a proposed mitigation to ensure the adequate water supply is provided to meet the Upcountry community needs under the Reduced Water Volume alternative.

Response 8: As noted in Response #3 above, the existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if less water is awarded than what is allowed under the Proposed Action, allocation to MDWS may need to be reduced as well. Specifically, as discussed in Section 3.2.1 of the Draft EIS:

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. Under the Reduced Water Volume alternative, depending on the amount of water authorized under the

Water Lease, the MDWS may receive no water from the Wailoa Ditch or some amount up to 7.1 mgd. The greater the reduction in the amount authorized under the Water Lease, proportionally less water will be available to the MDWS.

Your comment that the EIS should discuss an option that allow MDWS allocation to remain at 7.1 mgd, while other allocations are potentially reduced falls under “Reduced Water Volume” alternative. As noted above, under the Reduced Water Volume alternative, MDWS may receive some amount up to 7.1 mgd, depending on the amount of the reduction. If the MDWS allocation were to remain at 7.1 mgd and other allocations reduced, as discussed in Section 3.4.13 of the EIS:

For each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be a reduction of about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture, a reduction in direct sales on Maui of about \$1.7 million per year, a reduction in direct and indirect sales on Maui and O’ahu of about \$3.3 million per year, about 8.5 fewer direct jobs on Maui and about 12 fewer direct-and-indirect jobs on Maui and O’ahu, and a reduction in State revenues of about \$50,000 per year.

Thus, a reduction of the allocation of water to the Central Maui agricultural fields under such a scenario would result in significant adverse impacts to agricultural production in the Central Maui agricultural fields with related economic impacts.

Comment 9: Section 4.2.2 System Efficiency

With regard to efficiency, capacity, and monitoring of systems, the DEIS addresses water losses and identifies mitigating actions to improve irrigation efficiency in the Central Maui field system. The FEIS should identify any mitigating actions to address system transmission losses which geographically occurs in the open ditch/aqueduct system in the License Area prior to Maliko Gulch/entering Mahi Pone's Central Maui field system. Field surveys by the U.S. Geological Survey (USGS) characterized seepage losses and gains in the EMI ditch system. The USGS study showed that losses are greater than gains at low flows, but at higher flows gains (from groundwater, especially in the tunnels) are greater than the losses. (CCH-MA-13-31 Minute Order 16, Hearing Officer's Proposed Findings of Fact, Conclusions of Law, & Decision and Order, FoF 377)

Response 9: Please note that the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so

without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System. Hence, it is not necessary to identify any mitigative measures for the EMI Aqueduct System as a whole. Any improvements made to decrease losses during low flows would only lessen the gains made from infiltration during high flows.

Comment 10: Section 3.4.4 and 4.2.2 Impact on Groundwater Recharge

The DEIS discussion on impact on groundwater recharge from diverted surface water under the proposed lease is limited to impact on groundwater from cessation of sugar cultivation and from stream restoration actions under the CWRM D&O. The FEIS should address the impact on groundwater recharge in the license area from the proposed lease for the purpose of developing, diverting, transporting and using government owned waters. For example, the impact on groundwater from exported stream flow in the license area could at least be compared to the benefits of imported stream flow to groundwater in Central Maui.

Response 10: Please note that groundwater impacts from the Proposed Action are discussed for all the impacted regions: East Maui, Upcountry Maui, and Central Maui in Section 4.2.2 of the EIS. Specifically, as it relates to the License Area in East Maui, Section 4.2.2 of the Final EIS states:

The Proposed Action is limited to the issuance of the Water Lease for the subject License Area, which would enable the lessee to continue operation of the EMI Aqueduct System that has been in operation for over a century. The Proposed Action continues the use of the EMI Aqueduct System ~~system~~ for the transport of surface water, and allows the lessee or its permittees, to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System. In general, the Proposed Action will maintain existing conditions, in compliance with the CWRM D&O and any reservations in favor of the DHHL. No significant impacts on groundwater in the region are anticipated.

Groundwater levels are expected to be greater than historic levels due to increased recharge from stream restoration actions under the CWRM D&O. Moreover, according to a USGS publication (2019) on estimating the groundwater of Maui through 2035, the Ko'olau Aquifer System is expected to see an increase in groundwater from recharge rates due to changes in rainfall patterns from future climate change trends. Thus, even lesser impacts to East Maui groundwater are anticipated as a result of the Proposed Action.

Hence, impacts on East Maui groundwater resources from the Proposed Action are expected to be positive as there will be less surface water diverted than historically during sugarcane operations.

However, the impacts on Central Maui groundwater resources will be negative under the Proposed Action and alternatives when compared to when sugarcane was in operation due to less surface water from East Maui being diverted and used in the Central Maui agricultural fields, thereby resulting in less recharge rates of the Central Maui aquifers and decreased sustainable yield. See FEIS Section 4.2.2 at page 4-75 to 4-77. Changes in rainfall patterns may further decrease the amount available for pumpage.

Section 4.2.2 at pages 4-72 to 4-73 also discusses the impacts of the Proposed Action on groundwater in Upcountry Maui. The Proposed Action will maintain current conditions and no significant impacts are expected to groundwater resources in Upcountry Maui as surface water deliveries from the EMI Aqueduct System are expected to continue. This section also recognizes that dry weather or conditions from future climate change could exacerbate the duration of periods of low rainfall, in which case less water can be diverted from the License Area streams. In those periods, dependence on groundwater resources in Upcountry Maui may increase and/or water conservation measures may be necessary.

Moreover, please note that Section 4.2.2 of the Final EIS has been revised as on page 4-71 for East Maui and page 4-76 for Central Maui of the FEIS, to take into account a 2019 USGS publication on estimating the groundwater of Maui through 2035.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.³ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

³ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Suzanne Case, Chair
and Members of the Board of Land &
Natural Resources, State of Hawai`i
1151 Punchbowl St.
Honolulu, HI 96813

Aloha Chair Case and Members of the Board,

**SUBJECT: DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR A
PROPOSED 30-YEAR WATER LEASE FOR THE NĀHIKU,
KE`ANAE, HONOMANŪ AND HUELO, MAUI LICENSE AREAS**

Mahalo for this opportunity to provide input on the Draft Environmental Impact Statement ("DEIS") submitted by Alexander & Baldwin, Inc. ("A&B") and East Maui Irrigation Company, Ltd. ("EMI") for a proposed water lease for the Nāhiku, Ke`anae, Honomanū, and Huelo License Areas. Following are my broad and cursory comments to the DEIS.

Inadequate time frame for review and comment of 2,700-page document.

First thing, please grant an extension to the 45-day comment period.

This is such a voluminous and technical document to read through and process. One of the purposes of the Environmental Impact Statement process is to afford the public the opportunity to weigh in on impacts and mitigating factors of proposals utilizing public lands, money and/or resources. Allowing for more comment time considering the size and subject matter of the DEIS will afford for additional community engagement and well thought-out input.

Additionally, with work, community and family responsibilities, 45 days is simply insufficient to put together proper comments.

Suzanne Case, Chair
and BLNR Members

New details and truths surrounding the illegal occupation of Hawai`i.

The DEIS document does not include any new acknowledgement of facts and truths surrounding the illegal occupation of Hawai`i that have recently come to light.

For over a century Maui's water resources have been tied up in leases for the benefit of the sugar and pineapple industries on Maui. Control of our east Maui water resources was not held in trust, but rather, essentially privatized for economic gain. Big agriculture was the accepted foundational reason provided to the community for the original leases.

Today, we are equipped with truthful details and a better understanding of the rule of law as it applies to Hawai`i's political history – which must not be denied or go unmentioned in this important DEIS having to do with our publicly held water trust.

With the release of Dr. Keanu Sai's doctoral thesis work on the status of the Hawaiian Kingdom under international law, it is questionable if the Board of Land and Natural Resources ("BLNR") actually has the authority to be granting this lease as it is unclear how the United States and therefore the State of Hawai`i has legal authority here in Kō Hawai`i Pae `Āina.

The United States constitution clearly states that for one independent nation to become a part of another independent nation there must be a treaty of annexation. A joint resolution of congress has no effect outside the borders of the United States to annex Hawai`i, which achieved independent nation status on November 28, 1843.

What is the United States and thus the "State of Hawai`i" then doing? They are occupying a sovereign country and allowing things to occur that are not in Hawai`i's best interests such as allowing foreign entities to control our resources for their profit at the expense of the people of these lands.

Unknown effects of climate change & global warming to the resource.

Maui County and the State of Hawai`i are in its infant stages of understanding potential impacts of climate change and global warming to our ecosystems that serve as links to our water sources.

Suzanne Case, Chair
and BLNR Members
November 7, 2019
Page 3

No data exists to safely assure that the resource will not be impacted by “business as usual” behavior, considering the factors of climate change and global warming. This document does not appear to include mitigating formulas for managing our fresh water resource in this new era of drastic climate change.

Sufficient sustainable balance of resource for healthy stream life and native tenant uses.

If the BLNR is intent on moving forward with this lease process they need to ensure that there is enough water left in all streams to sustain a healthy balance of aquatic habitat for indigenous stream life, our nearshore fisheries, kalo farmers and native tenant rights.

This cannot be done if there is no real-time method of monitoring in-stream flows. Setting in-stream flow standards mean nothing if they are not followed, enforced and adequately consistently measured and this has been the problem for Maui County to date.

Riding the line (as proposed) between the amount of water CWRM’s D&O requires for full stream restoration for 10 streams plus partial flow restoration to 12 additional streams in the subject area and requesting to use what remains leaves no “wiggle room” for any unknown factors.

The impact of diverting water from Nāhiku is a severe impact to kalo farmers and should be stricken from the lease proposal.

A record of questionable past management.

Based on Commission on Water Resource Management (“CWRM”), A&B and EMI’s historical lack of management in East Maui and the ongoing water wars, I do not think a 30-year lease is appropriate. These entities need to be held accountable for meeting certain requirements in a timely manner and improving and maintaining the system that they want to continue to use. Based on past performance by all entities, any lease issued needs to be revisited every one or two years to ensure that the lessee is in fact using the water for their farming operations and that their agricultural plans are moving forward and they are using all of the water they are requesting and that they are taking steps to maintain the system so that water is not being wasted.

Hawaii Revised Statutes requires lessees of water rights and the Department of Land and Natural Resources (“DLNR”) to jointly develop and implement a watershed management plan. For all the years A&B and EMI have been taking

Suzanne Case, Chair
and BLNR Members
November 7, 2019
Page 4

water from East Maui, under the oversight of CWRM and DLNR, only now we are talking about developing and implementing a Watershed Management Plan?

For over at least a decade, (and maybe more) the County of Maui has pro-actively appropriated hundreds of thousands of dollars for watershed protection in the East Maui area, with no law mandating us to fund this effort. But still we are only able to manage the Miconia (rather than eradicate), we are all holding our breath over here hoping we don't experience the devastation from ROD that Hawaii island has experienced. Invasive species are a reality, and there doesn't seem to be enough attention and "wiggle room" to respond in the event of a catastrophic environmental change to our forest and watershed.

New available technologies with potential to extend the water cycle.

It is hard to predict what the landscape, water availability and demand will be 30 years from now, it is hard to predict the technologies that will be available so far in the future especially with all of the uncertainties we face with climate change and sea level rise. We do need to share the water so that first and foremost the water needs of the people of East Maui are taken care of and then our upcountry existing residents and then our agriculture operations, however there are things that we need to do to address our wastewater situation in the tsunami inundation zone with sea level rise presenting real threats.

A&B has dedicated lands to the county for wastewater and the technology is available to reclaim the water to standards which agriculture can use. The county needs to start building wastewater treatment facilities more inland that do not inject effluent into the ocean. That is a valuable resource, we need to phase out the use of the Kahului wastewater treatment facility and build treatment facilities in the area of Mahi Pono lands thus making use of reclaimed waters for agriculture and alleviating the taking of East Maui waters. This can be done prior to 30 years and thus the lease should not be for that long.

No established track record for resource recipient Mahi-Pono.

The public is still waiting and watching to see what will be done with the forty-one thousand acres that they knew to be HC&S. Granting any type of lengthy license is russian roulette. They have no social equity in our community, they have no agricultural equity, and whether or not A&B, EMI or Mahi Pono's name is on the license, its still a risk because the primary and missing element that may have justified the takings in the past is no longer present – and that's the plantation as we knew it.

Suzanne Case, Chair
and BLNR Members
November 7, 2019
Page 5

Maui County, BLNR, CWRM, and the State of Hawaii should take this transition period very slowly and with an abundance of caution. Start with short term leases, that are assessed annually. As Mahi Pono's credibility builds, so may the length of the leases, provided climate change effects cooperate in a favorable way.

Mahi Pono has no experience of managing a Hawaii public trust resource and no viable long-term farm plan that has been presented to the public prior to what is in this DEIS to validate the public allowing the control of their resource be tied up in a long-term license to private for-profit parties.

In closing, I again respectfully request that the review period be extended to allow for more in-depth analysis and comment by the stakeholders i.e. the public.

Sincerely,

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Councilmember Paltin:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200, Section 18. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: Inadequate time frame for review and comment of 2,700-page document.
First thing, please grant an extension to the 45-day comment period.

This is such a voluminous and technical document to read through and process. One of the purposes of the Environmental Impact Statement process is to afford the public the opportunity to weigh in on impacts and mitigating factors of proposals utilizing public lands, money and/or resources. Allowing for more comment time considering the size and subject matter of the DEIS will afford for additional community engagement and well thought-out input.

Additionally, with work, community and family responsibilities, 45 days is simply insufficient to put together proper comments.

Response 1: We acknowledge your comments requesting a time extension to the Draft EIS public comment period to allow for additional public comment. Please note that there is no statutory mechanism that provides for time extensions to the public comment period of 45 days, which is set forth under Hawai‘i Revised Statutes (HRS) § 343-5. Hence, the comment period

for the Draft EIS could not be extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 2: *New details and truths surrounding the illegal occupation of Hawai‘i.*

The DEIS document does not include any new acknowledgement of facts and truths surrounding the illegal occupation of Hawaii that have recently come to light.

Response 2: Please note that this is not within scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 3: *For over a century Maui’s water resources have been tied up in leases for the benefit of the sugar and pineapple industries on Maui. Control of our east Maui water resources was not held in trust, but rather, essentially privatized for economic gain. Big agriculture was the accepted foundational reason provided to the community for the original leases.*

Today, we are equipped with truthful details and a better understanding of the rule of law as it applies to Hawaii’s political history — which must not be denied or go unmentioned in this important DEIS having to do with our publicly held water trust.

Response 3: We acknowledge your comments. Please note that Hawaii's history has not gone unmentioned or denied in the EIS. Section 1.3 of the Draft EIS included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui. Historical context is also provided through the Archaeological Literature Review and Field Inspection (LRFI), (Appendix E), prepared by Cultural Surveys Hawaii (CSH) which includes an analysis of the natural and built environment of the License Area and a comprehensive review of traditional and historic background information of the region, including a review of previous archaeological studies and findings in the region, The LRFI has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe‘e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui. It also provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. The Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area, and also provides information on traditional and historical accounts of East Maui. The CIA has been supplemented with information related to additional outreach

conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) also provides an overview of the history of Maui Island that helped to shape the current social environment. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

With regards to your comment about the public trust, we acknowledge that should the Water Lease be issued, it will be subject to the Public Trust Doctrine as well as the State Water Code. Section 1.5, titled "The Public Trust Doctrine" has been added to the Final EIS to explicitly address the Public Trust Doctrine. See Final EIS pages 1-25 to 1-27. The dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine.

Comment 4: *With the release of Dr. Keanu Sais doctoral thesis work on the status of the Hawaiian Kingdom under international law, it is questionable if the Board of Land and Natural Resources ("BLNR") actually has the authority to be granting this lease as it is unclear how the United States and therefore the State of Hawaii has legal authority here in Kō Hawaii Pae Aina.*

The United States constitution clearly states that for one independent nation to become a part of another independent nation there must be a treaty of annexation. A joint resolution of congress has no effect outside the borders of the United States to annex Hawaii, which achieved independent nation status on November 28, 1843.

What is the United States and thus the State of Hawaii' then doing? They are occupying a sovereign country and allowing things to occur that are not in Hawaii's best interests such as allowing foreign entities to control our resources for their profit at the expense of the people of these lands.

Response 4: Please note that this EIS is being prepared under current laws and statutes. It is not within scope of the EIS to analyze the points mentioned in your Comment #4 above. As stated in Response #2 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using

government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 5: Unknown effects of climate change & global warming to the resource.

Maui County and the State of Hawaii are in its infant stages of understanding potential impacts of climate change and global warming to our ecosystems that serve as links to our water sources.

No data exists to safely assure that the resource will not be impacted by "business as usual" behavior, considering the factors of climate change and global warming. This document does not appear to include mitigating formulas for managing our fresh water resource in this new era of drastic climate change.

Response 5: Please note that the EIS includes the most recent information regarding climate change within its analysis. As discussed in Section 4.3.1 of the Draft EIS:

Regular trade winds are key in driving the Hawai'i's hydrological cycle, generating rainfall which helps maintain Maui's water supply. However, a recent study showed that Hawai'i's trade winds have decreased in frequency by approximately 30% over the past 37 years, from 291 days per year in 1973, to 210 days per year in 2009 (Garza et. al, 2012). The decrease in the trade winds could have serious implications for the Hawaiian Islands, including adversely impacting local agriculture, native ecosystems and endangered species, and the State's limited freshwater supply.

Overall, the State of Hawai'i is experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014)...

Climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. Such rainfall patterns increase the amount of stormwater runoff flowing through the region, including through the streams within the License Area that reach the shoreline. The expected

climatic changes in precipitation patterns and streamflow will influence the quantities and concentration of stormwater runoff entering the nearshore environments and coastal waters, resulting in increased sedimentation, impacting coral reefs. However, because of the continuous wave energy in shore areas in East Maui, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species. (SE & MRC, 2019).

Hence, the EIS recognizes that the State of Hawai‘i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). As such, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall. Section 4.3.1 of the Final EIS has been expanded to include information from the Archaeological Literature Review and Field Inspection (LRFI) report (Appendix E), the Cultural Impact Assessment (CIA) report (Appendix F), and the Terrestrial Flora and Fauna Technical Report (Appendix C) prepared for this EIS as shown on pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed. Specifically, Section 4.3.1 of the Final EIS states:

Climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. According to a USGS publication (2019) on estimating the groundwater of Maui through 2035, the Ko‘olau Aquifer System is expected to see an increase in groundwater from recharge rates due to changes in rainfall patterns from future climate change trends. Such rainfall patterns increase the amount of stormwater runoff flowing through the region, including through the streams within the License Area that reach the shoreline. The expected climatic changes in precipitation patterns and streamflow will influence the quantities and concentration of stormwater runoff entering the nearshore environments and coastal waters, resulting in increased sedimentation, impacting coral reefs. However, because of the continuous wave energy in shore areas in East Maui, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species. (SE & MRC, 2019).

Historic properites and archeological resources, as well as cultural resources and practices, located within chronic flooding areas can experience potential adverse effects due to climate change. For example, burial sites along the Hāmākuapoko

District coastline, located approximately 15.0 km (9.3 miles) from the License Area, are being impacted by high surf and high tide events leading to the inadvertent exposure and discovery of human skeletal remains (SHPD 2019a, 2019b, 2020).

As discussed by Tetra Tech and DLNR Office of Conservation and Coastal Lands (2017), the low-lying traditional landscape of the Ke‘anae Peninsula in East Maui is particularly vulnerable to sea level rise, which is discussed further in Section 4.3.2 below. Potential impacts could include inundation of near coastal lo‘i and historic structures or indirect impacts to water quality in pond fields with the introduction of increased salinity levels.

Impacts and Mitigation Measures

The Proposed Action is limited to the issuance of the Water Lease for the subject License Area, which would enable the lessee to continue operation of the EMI Aqueduct System that has been in operation for over a century. The Proposed Action continues the use of the EMI Aqueduct System system for the transport of surface water, and allows the lessee or its permittees, to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System. In general, the Proposed Action will maintain existing conditions, in compliance with the CWRM D&O and any reservations in favor of the DHHL. No significant impacts on climate in East Maui are anticipated as a result of the Proposed Action. Moreover, because the EMI Aqueduct System is a gravity fed system it is extremely energy efficient and does not rely on non-renewable sources of energy for its operation. A number of comments to the DEIS requested additional information related to climate change. As discussed above, according to a USGS publication (2019) on estimating the groundwater of Maui through 2035, the Ko‘olau Aquifer System is expected to see an increase in groundwater from recharge rates due to changes in rainfall patterns from future climate change trends. However, it is noted that climate change also may have the potential to decrease rainfall amounts within the License Area, therefore causing a decrease in stream flow, which could result in an increase in required maintenance and repair of the EMI Aqueduct System. Should happen, repair and maintenance activities would not exceed in scope the current (and long-standing) nature of EMI's maintenance and repair activities, as discussed in Section 2.1.2.

As a general matter, climate change impacts tend to favor invasive non-native botanical species at the expense of native forests. Droughts increase the incidence of fire, which in Hawai‘i, tends to favor warm-season grasses and other invasive species (Hughes et al. 1991; Loope and Giambelluca 1998). Flooding and hurricanes open the forest canopy, and that can

promote erosion and invasion of non-native pioneer species into the forest understory (Loope and Giambelluca 1998).

Climatic changes would have the most impact on species that require specialized habitats within microclimates, such as endemic damselflies and endemic honeycreepers that are restricted to habitats free of diseases transmitted by mosquitoes. Small environmental changes to microclimates may remove opportunities for foraging, reproduction, and other life history requirements that these species depend on. These changes may ultimately cause a decrease in populations, local extirpations, and in some cases extinction. In addition, an increase in temperature would also be expected to favor invasive alien species at the expense of native vegetation and move alien-dominated forest upward in elevation, ultimately driving out native species through competition (Loope and Giambelluca 1998).

Warming temperatures associated with climate change would allow the Culex mosquito to expand into unoccupied habitat and allow for the development of diseases such as avian malaria above elevations previously occupied (Freed et al. 2005; Samuel et al. 2012). Increasing temperatures would likely increase Hawaiian forest bird exposure to and increase transmission of avian malaria. Hawaiian forest birds that are susceptible to and cannot tolerate avian malaria would suffer population declines and may become extinct in the wild (Samuel et al. 2012).

Although the USGS publication (2019) has estimated increased rainfall in East Maui as a result of changes in rainfall patterns from future climate change changes, climate change could result in lower rainfall and thus lower levels of streamflow. Notwithstanding, compliance with the IIFS under the CWRM D&O will be required. Hence less flow would be available for the EMI Aqueduct System to divert, which in turn means less water for MDWS and less water to irrigate the Central Maui agricultural fields.

However, the The exact nature of how the climate will change and impacts from any changes is unknown. As research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies for climatic changes.

We disagree with your comment that the EIS does not include mitigation measures for managing freshwater resources. It is recognized that Hawai'i's fresh water originates from the forest, which capture and absorb hundreds of inches of rain each year, allowing for slow infiltration and replenishment of our aquifers and streams. Based upon this understanding, the legislature added sub-section (e) to HRS § 171-58, requiring the incorporation of a watershed management plan into all water lease agreements to help protect freshwater resources (surface and groundwater).

In addition to sustaining ground and surface water supplies, healthy forests reduce erosion by holding soil in place, improve water quality, and provide habitat for unique and endangered plants and animals. Focusing on watershed management plans that target mauka protection actions (fencing, removal of hooved animals from important watershed forests, invasive weed control, etc.) that benefit native forests is essential if water lessees are going to have a reliable long-term supply of fresh water.

Additionally, the CIA and EIS identify impacts to the regional environment, taro farming, and freshwater resources within the License Area based public documentation and consultation with the community as presented in Section 4.6 of the Draft EIS. Specifically, Section 4.6 of the Draft EIS states:

4. *Participant Kyle Nakanelua is concerned with the act of diverting water. He explicitly states that “when those places dry up that adversely impacts the way of life, the cultural practice if you will” and it “adversely impacts the people’s way of life that live there.”*
 - a. *To support this claim, Mr. Nakanelua states that ‘ōpae was once prevalent in the streams that flowed through their family property named Lakini. He relates that when he began to regularly clean the property his grandmother would still catch ‘ōpae. He adds that today there is no ‘ōpae but there are prawns. When CSH asked if ‘ōpae was being overpicked, he replied “no” because “we were the only one there.” He also does not think the introduction of prawns is to blame but believes “that the flow of water is impactual” and has seen the water decline since 1989.*
5. *A 2014 declaration provided by Dan Clark from Ke‘anae stated he needs cool, fast running water for optimal kalo production. Due to low stream flow results, there has been an increase in disease to his kalo, which decreases production.*
6. *Jonah Jacintho states in his 2014 declaration that due to a lack of stream flow, fish populations have decreased therefore he cannot fish as much. To increase the population of ocean fish, fresh water is integral for spawning and nutrients. He also added that more water in stream beds would also increase ‘o‘opu, prawn, and hīhīwai populations.*

Section 4.6 of the EIS summarizes the findings of the CIA as follows:

Based on information gathered from the cultural and historical background, and the community consultation, significant cultural resources were identified within the License Area, as well as outside of the License Area. It should be acknowledged that although some of the impacted cultural resources exist outside of the License Area, what takes place within the License Area directly affects these cultural practices and resources. At present, there is documentation and testimony indicating traditional and customary Native Hawaiian rights are currently being exercised within the License Area. Cultural resources, practices, and beliefs were identified as currently existing within the License Area. In addition, East Maui, which includes the License Area and beyond the License Area, maintains a rich subsistence and cultural history.

Additionally, the CIA and Section 4.6 of the Final EIS have been updated to more specifically include identified impacts and associated mitigation measures related to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action based on community consultation as shown on pages 4-171 to 4-254 of the Final EIS.

Comment 6: Sufficient sustainable balance of resource for healthy stream life and native tenant uses.

If the BLNR is intent on moving forward with this lease process they need to ensure that there is enough water left in all streams to sustain a healthy balance of aquatic habitat for indigenous stream life, our nearshore fisheries, kalo farmers and native tenant rights.

Response 6: We acknowledge your comments. As discussed in Section 1.3.4 of the Draft EIS, the requirements under the Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O) significantly reduces the amount of water that can be diverted for offstream uses relative to the capacity and use of the EMI Aqueduct System from when sugar was being cultivated. Ten streams were ordered to have no diversions at all (one of which, Waiokamilo, had stream flow fully restored in 2007) (referred to as “Fully Restored Streams” in Figure 1-3), five were required to return 64% of the median base flow (BFQ50) in the stream at all times (referred to as “Habitat Streams” in Figure 1-3), and seven were required to have 20% of BFQ50 in the stream at all times (referred to as “Connectivity Streams” in Figure 1-3). While the CWRM D&O did not set IIFS for 12 streams within the License Area that are diverted by the EMI Aqueduct System because those streams were not included in the petitions filed by NHLC on behalf of Nā Moku, the CWRM D&O did take those streams into account. CWRM D&O at ii.

However, the EIS does not rely solely on the findings and conclusions in the CWRM D&O. Appendix A and Section 4.2.1 of the Draft EIS presented the HSHEP model which was used to quantify the impacts of flow restoration on native stream animal habitat to determine an

appropriate balance between instream and off stream water uses. Due to an increase in streamflow under the Proposed Action when compared to historical diversion rates, native stream habitats are anticipated to have an increase in habitat units (HU). However, these HU will slightly decrease from current conditions as more water is gradually diverted as the Mahi Pono farm plan develops to full build-out as outlined in Section 4.2.1 of the EIS. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as follows:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed after compliance with the ~~under the~~ CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 36.1% ~~40%~~ from the Natural Flow Condition (no diversion) scenario condition, but is increased by approximately more than 13.8% ~~10%~~ over the Full Diversion scenario (comparable to historical sugar operations) condition. In other words, 63.9% ~~60%~~ of the total HU remains within the License Area under the Proposed Action. This ranges from 96.7% of the HU in the Full flow Restoration streams to 15% remaining HU in the No Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

As discussed in Section 2.1.4 of the EIS, as of the date of the DEIS, the EMI Aqueduct System was only diverting approximately 20 mgd; more recently diversions have been up to approximately 26 mgd. These conditions are comparable to the No Action scenario discussed within Section 3.4.3 of the EIS where approximately 79.8% of the total HU remains in the License Area. In other words, the Proposed Action would reduce total HU as compared to existing conditions by approximately 15.9%. However, this reduction would occur over time as not all of the available surface water under the Proposed Action would be

needed, and thus diverted immediately. Rather, the amount of water diverted at any given time will be only what is needed to meet the needs of the MDWS and of Mahi Pono's agricultural operations in Central Maui. Moreover, the CWRM D&O requires EMI to report on changes in stream diversions and ditch settings as irrigation requirements increase. EMI also maintains a system of optical encoders with float tape and data loggers within the EMI Aqueduct System. The information obtained is reported to CWRM on a monthly basis.

In summary, ~~The~~ the HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural ~~Flow~~ (undiverted) ~~Condition~~ conditions. However, in making decisions about instream flows, the CWRM must weigh the importance of the present or potential instream values with the importance of the present or potential uses of water for noninstream purposes, including the economic impact of restricting such uses. It is also its duty to establish IIFS that protect instream values to the extent practicable and to protect the public interest. The public interest includes not only protecting instream values but also preserving agricultural lands and assuring adequate water supplies for Maui.

As it relates to nearshore fisheries, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams

(Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83 of the Final EIS.

As it relates to kalo farmers, please note that the CWRM D&O addressed the needs for kalo farming for the vast majority of streams that are diverted and proposed for diversion under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS, including within the Huelo area. It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation.

However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-

valley characteristics of major taro growing areas, with many streams flowing through gulches as noted in Appendix I and Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Regarding rights to native tenants, the Hawai‘i Supreme Court has determined that those rights consist of the rights to the use of water “appurtenant” to and utilized by certain parcels of land at the time of their original conversion into fee simple land, when title was confirmed by the Land Commission Award and title conveyed by the issuance of a Royal Patent. *Reppun v. Board of Water Supply*, 65 Hawai‘i 531, 551; 656 P. 2d 57, 71 (1982).

The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” See CWRM D&O Finding of Fact (FOF) 54. Moreover, the prior water licenses issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “The State reserves the right...to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights...as well as other statutorily or judicially recognized interests relating to the right to withdraw water. . . .” It is expected that the lessee under the Water Lease would be subject to similar requirements and would therefore not impair the "water rights" of "Kuleana farmers."

With regard to the East Maui streams in the License Area covered by the CWRM D&O, the uses of water by those who registered diversions claiming “appurtenant”, or “kuleana” rights were analyzed in detail separately with regard to each stream. The Proposed Action assessed under this EIS contemplates a Water Lease that would be in full compliance with the limitations set forth under the CWRM D&O.

Comment 7: *This cannot be done if there is no real-time method of monitoring in-stream flows. Setting in-stream flow standards mean nothing if they are not followed, enforced and adequately consistently measured and this has been the problem for Maui County to date.*

Response 7: Please note that the IIFS required under the CWRM D&O is a separate process from the Water Lease process, as discussed in Section 1.3.3 of the Draft EIS. Under this process, the CWRM ensures/monitors that instream flow standards are being met.

As required by the CWRM D&O, EMI submitted a report to the CWRM one year following the date of the issuance of the D&O that outlined and discussed:

1. Modifications to diversions to meet the amended IIFS.
2. Water deliveries at Honopou Stream and Māliko Gulch, and any changes EMI ascribes to the amended IIFS.
3. Changes in stream diversions and ditch settings as Mahi Pono’s irrigation requirements increase.

In addition, the requirements of the current East Maui revocable water permits specify that quarterly reports to the BLNR are required. These reports are mandated to include a statement of compliance with the 2018 IIFS. Since the CWRM D&O was issued, EMI has been working closely with the CWRM staff on the implementation of the ordered IIFS. The IIFS are being met for all License Area streams. It is expected, and the EIS takes into account, that compliance with the IIFS requirements under the CWRM D&O will also be required under the Proposed Action.

Comment 8: *Riding the line (as proposed) between the amount of water CWRM’s D&O requires for full stream restoration for 10 streams plus partial flow restoration to 12 additional streams in the subject area and requesting to use what remains leaves no “wiggle room” for any unknown factors.*

Response 8: Please note that your comment is unclear. However, the environmental impacts of the potential Water Lease are included throughout Chapter 4 of the EIS. The terms of the Water Lease are at the discretion of the BLNR including how much water can be diverted under the proposed Water Lease. Moreover, unknown factors are taken into consideration under HRS § 171-58(d), which provides in relevant part:

Subject to the applicable provisions of section 171-37(3), the board, at any time during the term of the lease of water rights, may withdraw from waters leased from the State and from sources privately owned by the lessee so much water as it may deem necessary to (1) preserve human life and (2) preserve animal life, in that order of priority; and that from waters leased from the State the board, at any time during the term of the lease of water rights, may also withdraw so much water as it may deem necessary to preserve crops; provided that payment for the waters shall be made in the same manner as provided in this section.

Comment 9: *The impact of diverting water from Nāhiku is a severe impact to kalo farmers and should be stricken from the lease proposal.*

Response 9: The three streams within the Nāhiku region that have been diverted by the EMI Aqueduct System were all ordered for restoration under the CWRM D&O. Makapipi stream was ordered for full restoration and Hanawi and Kapaula streams were ordered for connectivity restoration. As previously mentioned, any water lease will have to be in compliance with the CWRM D&O.

Comment 10: A record of questionable past management.

Based on Commission on Water Resource Management ("CWRM"), A&B and EMI's historical lack of management in East Maui and the ongoing water wars, I do not think a 30-year lease is appropriate. These entities need to be held accountable for meeting certain requirements in a timely manner and improving and maintaining the system that they want to continue to use. Based on past performance by all entities, any lease issued needs to be revisited every one or two years to ensure that the lessee is in fact using the water for their farming operations and that their agricultural plans are moving forward and they are using all of the water they are requesting and that they are taking steps to maintain the system so that water is not being wasted.

Response 10: We acknowledge your comments relating to questionable management. Regarding your comment about a 30-year lease not being appropriate, Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability." The Alternative Lease Duration alternative is described in Section 3.2.2.1 of the EIS and fully analyzed across the spectrum of environmental criteria in Section 3.4 of the EIS. In addition, a summary table comparing the various alternatives, as well as the No Action alternative, has been added as Table 3-2 to Section 3.5 of the Final EIS as pages 3-49 to 3-80." The Agricultural and Related Economic Impacts report provided as

Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Related to the Alternative Lease Duration alternative, the following revisions have been made to Section 3.2.2.1 of the Final EIS at page 3-21

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability. Additionally, the infrastructure and land management necessary to support a diversified agriculture farm plan is different from what was necessary for sugar cane, and thus requires significant infrastructure improvements and land

preparation. Given the considerable time and expense it takes to develop a diversified farm plan such as the one Mahi Pono is proposing, a shorter term water lease would likely result in a reduced range of crops, and the reduced cultivation of designated Important Agricultural Lands (IAL) in Central Maui. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

Regarding your comment that the Water Lease issued should be revisited every one to two years, please note that the terms of the Water Lease are at the discretion of the BLNR. Should the BLNR make this a requirement of the Water Lease, and should the Applicant find the terms of the Water Lease acceptable, the Applicant will comply with all conditions of the Water Lease. Moreover, as noted in Response #7 above, the requirements of the current East Maui revocable water permits specify that quarterly reports to the BLNR are required. These reports are mandated to include a statement of compliance with the IIFS. Moreover, in response to your concern about using the water for farming operations, it is expected that the Water Lease, if issued, will be issued conditioned upon identified and approved uses of the water, and the lessee would have to comply with those requirements in order to retain its rights under the Water Lease. Your comment about the maintenance of the system is unclear. Regarding the EMI Aqueduct System, it is highly efficient. On the whole, the EMI Aqueduct System does not lose water over the entire length of the system, up to its terminus at Kamole Weir as confirmed by a 2012 United States Geological Survey (USGS) study, entitled "Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawai'i", that was prepared in cooperation with the CWRM and cited in the 2018 CWRM D&O. It is not until the EMI Aqueduct System transitions into the Central Maui Field Irrigation System used in the Central Maui agricultural fields that there starts to be losses due to seepage because its agricultural ditches and reservoirs are open and are not lined. Please note that this clarification has been made throughout the Final EIS at pages 2-11, 2-27, 3-12, and 4-76

EMI staff does conduct routine maintenance and repair on the EMI Aqueduct System to ensure its efficiency as shown at page 2-7 of the Final EIS, under the Proposed Action, "maintenance and repair" involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment.

Regarding the Central Maui Field Irrigation System, Mahi Pono's plans for improving irrigation efficiency is stated throughout Chapter 5 of the Draft EIS. Mahi Pono expects to invest over \$20 million to increase the efficiency of its private Central Maui Field Irrigation System in Central Maui, as described in more detail in Response # 10 above, and in Section 2.1.4 at page 2-25 of the Final EIS.

Comment 11: *Hawaii Revised Statutes requires lessees of water rights and the Department of Land and Natural Resources (“DLNR”) to jointly develop and implement a watershed management plan. For all the years A&B and EMI have been taking water from East Maui, under the oversight of CWRM and DLNR, only now we are talking about developing and implementing a Watershed Management Plan?*

Response 11: As discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. Since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS at pages 2-2 to 2-4 has been updated to reflect this new information about the contents of an acceptable watershed management plan. The minimum content requirements under the category of "Goals" are described in detail in Section 2.1.4 as shown on pages 2-2 to 2-4.

In response to your suggestion that there has been a delay in addressing watershed management, please note that as discussed in Section 2.1 of the Draft EIS, A&B was a founding member of the East Maui Watershed Partnership (EMWP), which was the first watershed partnership in the State of Hawai‘i and which served as a model for other watershed partnerships throughout the State. In reviewing existing watershed management plans in general, however, DLNR has recently determined that some of the existing watershed plans are not always directly correlated to the water lease area and some plans are old and outdated. In certain places, new threats to watershed health are not addressed in existing watershed plans. Additionally, DLNR determined that estimated budgets in such existing plans may not reflect the current cost of management if the plan is over 5 years old. As such, DLNR will work with proposed water lessees to determine if any existing plan meets the minimum content requirements and sufficiently addresses the protection of watershed forests and freshwater resources in the License Area. If it does not, DLNR will work with the lessee to determine the specific actions needed and jointly develop a new plan or update the existing plan as noted above. It should be noted that the existence of a watershed management plan does not absolve a water lessees’ duty to help with the implementation of management actions. A lessee must provide DLNR proof that it is already contributing to the protection of the watershed, and membership in a Watershed Partnership may not fulfill the requirement of implementation.

Comment 12: *For over at least a decade, (and maybe more) the County of Maui has pro-actively appropriated hundreds of thousands of dollars for watershed protection in the East*

Maui area, with no law mandating us to fund this effort. But still we are only able to manage the Miconia (rather than eradicate), we are all holding our breath over here hoping we don't experience the devastation from ROD that Hawaii island has experienced. Invasive species are a reality, and there doesn't seem to be enough attention and "wiggle room" to respond in the event of a catastrophic environmental change to our forest and watershed.

Response 12: We acknowledge your comment that the County of Maui has actively appropriated money for watershed protection in East Maui. Regarding your comments about invasive species, it is noted in Appendix C that that low-elevation portions of the License Area are already highly impacted by invasive plants. However, it is noted in Appendix C that high-elevation portions of the License Area are predominately dominated by native species and is very likely to contain habitat for several endangered or threatened species. Impacts related to flora and fauna as a result of the Proposed Action are discussed in Section 4.4 of the EIS. Please note that Section 4.4.1 and Section 4.4.2 have been revised in the Final EIS based on comments received on the Draft EIS to further outline the existing conditions of the License Area and more accurately reflect targeted mitigation measures based on feedback provided by the DLNR and USFWS, including those related to rapid 'ōhi'a death, as shown on page 4-122 to 4-123

Comment 13: *New available technologies with potential to extend the water cycle.*

It is hard to predict what the landscape, water availability and demand will be 30 years from now, it is hard to predict the technologies that will be available so far in the future especially with all of the uncertainties we face with climate change and sea level rise. We do need to share the water so that first and foremost the water needs of the people of East Maui are taken care of and then our upcountry existing residents and then our agriculture operations, however there are things that we need to do to address our wastewater situation in the tsunami inundation zone with sea level rise presenting real threats.

Response 13: We acknowledge your comments. As noted in Response #5 above, the EIS includes the most recent information regarding climate change within its analysis. However, the exact nature of how the climate will change and impacts from any changes is unknown. As research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies for climatic changes.

Relating to your comments about sharing water and ensuring the water needs of East Maui and Upcountry residents are met, please note that this is consistent with the goals and objectives of the Proposed Action. See EIS Section 1.2, which provides:

In general, the objectives of the issuance of the Proposed Action (Water Lease) are:

- *Preserve and maintain the EMI Aqueduct System, including its access roads*
- *Continue to meet domestic and agricultural water demands in Upcountry Maui*
- *Continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses)*
- *Continue to serve community water demands in Nāhiku*

Regarding your comment about “*our wastewater situation in the tsunami inundation zone with sea level rise presenting real threats,*” please note that this is not within the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS. However, Section 3.1.1.2 (Reclaimed Water) within Chapter 3 of the EIS acknowledges concerns raised about the Wailuku-Kahului Wastewater Reclamation Facility (WWRF) being located in a hazardous and exposed location, at the front of a tsunami flood zone and a 3.2 feet sea level rise exposure area, rendering it a vulnerable public facility.

Comment 14: *A&B has dedicated lands to the county for wastewater and the technology is available to reclaim the water to standards which agriculture can use. The county needs to start building wastewater treatment facilities more inland that do not inject effluent into the ocean. That is a valuable resource, we need to phase out the use of the Kahului wastewater treatment facility and build treatment facilities in the area of Mahi Pono lands thus making use of reclaimed waters for agriculture and alleviating the taking of East Maui waters. This can be done prior to 30 years and thus the lease should not be for that long.*

Response 14: We acknowledge your comments. However, please note that the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Planning for new County WWTPs is beyond the scope of this EIS for a water lease. However, in response to your comment about Mahi Pono potentially making use of reclaimed water for

agricultural purposes, this scenario was considered within Chapter 3 of the EIS. Specifically, as it relates to recycled water for agricultural use, the availability of the use of reclaimed water from the Wailuku-Kahului Wastewater Reuse Facility (WWRF) is discussed in Draft EIS Section 3.1.1.2 (Reclaimed Water), which provides an analysis of the feasibility of the use of reclaimed water from the Wailuku-Kahului WWRF to irrigate the Central Maui fields. As discussed, the recycled water alternative using existing R-2 water from the Kahului WWRF could be considered an alternative as supplemental source. However, R-2 water has limited useability on crops. County of Maui Department of Environmental Management (DEM) does not intend to send this R-2 water to the Central Maui agricultural fields. Further consideration of this alternative has been included in Chapter 3 of the Final EIS, which has also been supplemented with a discussion about the potential new reuse/effluent disposal facility in Central Maui to be located south-west of the Kahului WWRF that is being considered by the County Department of Environmental Management. See Final EIS pages 3-9 to 3-11.

Comment 15: No established track record for resource recipient Mahi-Pono.

The public is still waiting and watching to see what will be done with the forty one thousand acres that they knew to be HC&S. Granting any type of lengthy license is russian roulette. They have no social equity in our community, they have no agricultural equity, and whether or not A&B, EMI or Mahi Pono's name is on the license, its still a risk because the primary and missing element that may have justified the takings in the past is no longer present — and that's the plantation as we knew it.

Response 15: With regards to your comment about what will be done with 41,000 acres, please note that this is incorrect. For the purposes of the EIS, the term Central Maui, for the purposes of projecting full implementation of the Proposed Action and related diversified agricultural plan, refers to the approximately 30,000 acres of agricultural land that had been cultivated with sugarcane for over a century utilizing water from the EMI Aqueduct System. Geographically, what is referred to as Central Maui encompasses approximately 36,000 acres, but approximately 6,000 acres is comprised of uncultivated areas, including roads, gulches, and patches of uncultivated land. See Chapter 4 at page 4-1 and the Executive Summary at pages iii to iv.

You are correct that the old style of plantation farming and monocrop farming is no longer present. Instead, consistent with the State mandate for Important Agricultural Lands, and the desire to increase food self-sufficiency, Mahi Pono is pursuing diversified agriculture. The Mahi Pono farm plan is identified in the EIS as a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community. This is explained in Section 2.1.4 of the EIS as follows:

Mahi Pono's farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation. All of these things must be considered when developing an evolving and feasible diversified agricultural plan for Central Maui.

Another factor in developing the farm plan is to be sensitive to the existing local farming community. Mahi Pono does not want to displace local farmers by planting competing crops or artificially accelerating the ramp-up of operations, both of which could have the potential to drive local farmers out of the market. Mahi Pono's goals for its diversified farm plan will be guided by its core principles of using reasonable and environmentally responsible "best management practices", planting non-GMO crops, and growing food for local consumption.

Mahi Pono's farm plan and its impacts are based on a production timeline of full operations by 2030. It is explained in Section 2.1.5 of the EIS that it will take approximately 10 years for Mahi Pono and its lessees to remove volunteer sugarcane and weeds, amend soils, install field improvements, build warehouses and other structures accessory to its agriculture use, and plant crops. The predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. At full operations, the Mahi Pono farm plan is anticipated to consist of the following as presented in Section 2.1.4 of the Draft EIS:

The Mahi Pono farm plan assumes the following:

- *The total surface water available for use after system losses (approximately 22%) is estimated to be approximately 65.88 mgd.*
- *Surface water can be supplemented by a brackish groundwater amount equal to 20 percent of surface water. Taking into account the CWRM D&O, it is estimated that there could be up to 16.47 mgd of brackish groundwater used in the Central Maui agricultural fields. (Plasch, 2019)*
- *Under the CWRM D&O, the total water available for use on the Central Maui agricultural fields after system losses is approximately 82.35 mgd*
- *That total amount of water will be delivered to approximately 30,000 acres. Of those 30,000 acres:*
 - *Approximately 15,950 acres would be used for farming, including 12,850 acres for orchard crops and 3,100 acres for other crops.*

- *Approximately 13,800 acres would be used for pasture, of which about 4,700 acres would be irrigated.*
- *Approximately 250 acres would be used for green energy, such as a solar farm.*

Because there is insufficient surface water to support the entire farm plan, brackish groundwater will also be used. . .

This farm plan would consist of the following:

- *Approximately 20,650 acres of irrigated farm land, including 12,850 of orchard crops, 600 acres of tropical fruit, 1,200 acres of row and annual crops, in addition to a community garden and limited non-GMO energy crops.*
- *Approximately 13,800 acres of cattle pasture, comprised of 4,700 acres of irrigated pasture, and 9,100 acres of unirrigated pasture. This should fit the proposed model of grass-finishing on irrigated pasture. The unirrigated acreage is less than 10,000 acres, which helps ensure that that the entire area devoted to unirrigated pasture will remain productive.*

However, please note that the water use figures in Table 2-1 of the Draft EIS (Table 2-2 of the Final EIS) that is within Section 2.1.4 of the Final EIS at page 2-29 has been refined based on data collected to date. Section 2.1.4 of the Final EIS has also been updated with current and near-term expected water use for year 2021 as shown on pages 2-30 and 2-32.

It important to note that as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet the needs of the approved water uses, including the MDWS and of Mahi Pono's agricultural operations in Central Maui.

Regarding your comment about Mahi Pono having no social and agricultural equity is unclear. However, Mahi Pono is an agricultural company and the main source of its revenue is and will be from agriculture and its agricultural activities as discussed in detail in Section 4.7.4 of the EIS. Specifically, Section 4.7.4 of the Draft EIS states:

At full development, the Mahi Pono farm plan would result in a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops. Annual sales are expected to reach about \$155.9 million. The pastures would support a cattle herd of about 7,300 cow-and-calf animal units

(au), produce over 4,300 calves per year, and generate revenues of about \$4.8 million per year. Thus, total farm sales would be about \$160.7 million per year, of which an estimated \$104.4 million (65%) would be Hawai'i sales and \$56.2 million export sales (35%).

Based on recently built or approved solar farms, the solar farm would generate about 82,100 MW of electricity per year, with revenues of about \$8.2 million per year paid by MECO to the solar-farm operator. Combined farm and energy revenues would reach about \$168.9 million per year in direct sales (exceeding the 2006 revenues from sugar production of \$101 million, and the \$116 million average for the 2008-to-2013 period). Purchases of goods and services by farmers and the families of employees would generate indirect sales and, in turn, these suppliers would generate more indirect sales by their purchase of goods and services. The indirect sales are estimated at about \$160.7 million per year. Total direct-plus-indirect sales would be about \$329.5 million, of which about \$273.8 million would be on Maui and about \$56.2 million on O`ahu.

About \$24.9 million of consumption expenditures would be subject to the excise tax on final sales, and about \$248.2 million subject to the excise tax on intermediate sales. Rental income from leasing land to other farmers and to an energy company would be about \$1 million per year. Profits from farm operations, energy operations, and indirect sales would be about \$33 million.

Mahi Pono has individually met with several members of the Maui County Council. Mahi Pono has also had various meetings with community groups such as Go Maui, Maui Tomorrow, Mā'alaea Community Association, Pukalani Community Association, and the Alliance of Maui Community Associations regarding the Mahi Pono farm plan and use of water from East Maui streams, and conducted farm tours with members of the community.

Mahi Pono is also working with the County of Maui Department of Water Supply (MDWS), as well as the County Corporation Counsel and Mayor's offices, to help coordinate continued deliveries of surface water to the County's Kamole-Weir Water Treatment Plant (WTP) and the Kula Agricultural Park (KAP).

Comment 16: *Maui County, BLNR, CWRM, and the State of Hawaii should take this transition period very slowly and with an abundance of caution. Start with short term leases, that are assessed annually. As Mahi Pono's credibility builds, so may the length of the leases, provided climate change effects cooperate in a favorable way.*

Response 16: We acknowledge your comments. Currently, the water use is being authorized through revocable permits that the BLNR must re-authorize every year. The express purpose of the EIS, as ordered by the BLNR, is to assess the environmental impacts of a proposed long-term water lease. The details of this are provided in Section 1.4 of the EIS. As discussed in Response #10 above, under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered. Given the considerable time and expense it takes to develop a diversified farm plan such as the one Mahi Pono is proposing, a shorter term water lease would likely result in a reduced range of crops, and the reduced cultivation of Important Agricultural Lands (IAL) in Central Maui. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation.

Comment 17: *Mahi Pono has no experience of managing a Hawaii public trust resource and no viable long-term farm plan that has been presented to the public prior to what is in this DEIS to validate the public allowing the control of their resource be tied up in a long-term license to private for-profit parties.*

Response 17: Please note that Mahi Pono has been using public trust resources since they purchased A&B's former sugarcane land in Central Maui in December 2018 and has been expanding their agricultural operations since that time. Please note that Section 2.1.4 of the Final EIS has been revised to reflect Mahi Pono's current and near-term expected water use as shown on pages 2-30 and 2-32.

It is important to note that as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet the needs of the approved water uses, including the MDWS and of Mahi Pono's agricultural operations in Central Maui.

Moreover, as noted in Response #3 above, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. As previously mentioned, a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action as shown on pages 1-25 to 1-27.

Letter to Councilmember Tamara Paltin
Page 26 of 26
September 3, 2021

Comment 18: *In closing, I again respectfully request that the review period be extended to allow for more in-depth analysis and comment by the stakeholders i.e. the public.*

Response 18: We acknowledge your comments. As discussed in Response #1 above, the period for public comment associated with the Draft EIS is defined by statute, as set forth under HRS § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Technical Assistance for the Draft Environmental Impact Statement for a Proposed Water Lease for the Nahiku, Keanae, Honomanu and Huelo License Areas, Maui

The U.S. Fish and Wildlife Service (Service) is providing this letter in response to a request for comment on the two-volume Draft Environmental Impact Statement (DEIS) for a Proposed Lease (Water Lease) for the Nahiku, Keanae, Honomanu and Huelo license areas of Maui, Hawaii, pursuant to Hawaii Revised Statutes Chapter 343 (HRS 343). This letter has been prepared under the authority of and in accordance with provisions of the Endangered Species Act (ESA) of 1973 [16 U.S.C. 1531 *et seq.*; 87 Stat. 884], National Environmental Policy Act of 1969 [42 U.S.C. 4321 *et seq.*; 83 Stat. 852], as amended, and other authorities mandating the Service's review of projects and provision of technical assistance to conserve trust resources.

Proposed Action

The Proposed Action involves diversion of flows from a set of perennial streams on the north flank of the Haleakala volcano on the eastern section of Maui island, Hawaii (referred to subsequently as "East Maui") to agricultural fields in central Maui. These stream flows originate from four separate license areas running from east to west along the mountain as follows: Nahiku, with an area of approximately 10,111 acres; Keanae, with an area of approximately 10,768 acres; Honomanu, with an area of approximately 3,381 acres; and Huelo, with an area of approximately 8,753 acres. In aggregate, these license areas comprise approximately 33,013 acres, or 51.6 square miles, much of which is covered in native rain forest vegetation and inhabited by hundreds of native species, many of them endemic to the island of Maui, and some listed as threatened or endangered under the ESA.

The diverted stream flows will be captured by the existing East Maui Irrigation Aqueduct System (referred to as the "EMI system"), which consists of 388 separate intake structures, 24 miles of

ditches, 50 miles of tunnels, 12 inverted siphons, and numerous other small intakes, pipes and flumes. This system, which has operated in various forms since 1878, is now jointly owned by the East Maui Irrigation Company, Limited (EMI), a wholly owned subsidiary of Alexander & Baldwin, Inc. (A&B), and Mahi Pono LLC (Mahi Pono), a farming venture between Pomona Farming, LLC, a California-based agricultural group, and the Public Sector Pension Investment Board (PSP Investments), a Canadian pension management firm. For the past 93 years, the EMI system has represented a highly integrated water catchment system that, until recently, diverted the majority of stream runoff from the north side of Haleakala to the agricultural lands of central Maui. At this time, the EMI system represents the largest privately owned water company in the United States, and during the days of plantation operation its Wailoa Canal had a higher median flow than any natural river in the state of Hawaii.

The EMI system is currently authorized to divert up to 80 million gallons of water per day (mgd) based on a one-year revocable permit approved by the State of Hawaii's Board of Land and Natural Resources (BLNR). The Proposed Action seeks the issuance of a single long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. These users include: (1) the County of Maui for its domestic water supply needs in both Upcountry Maui and at Nahiku near the east end of the EMI system; (2) the Department of Hawaiian Home Lands for a future water reservation sufficient to support current and future homestead needs as per the provisions of Section 221 of the Hawaiian Homes Commission Act; and (3) Mahi Pono, which seeks to pursue diversified agriculture on former Hawaiian Commercial & Sugar Company (HC&S) sugarcane plantation lands it has recent purchased from A&B. As reiterated at multiple points throughout the DEIS, the underlying purpose of the Proposed Action is to preserve and maintain the EMI water diversion system, including its access roads, and to continue to supply water for domestic and agricultural uses on Maui. In addition, the proposed action will involve access to State of Hawaii lands in order to maintain and repair existing roads and trails used as part of the EMI system.

While the DEIS was in preparation, the State of Hawaii's Commission on Water Resource Management issued a Decision and Order (D&O) on June 20, 2018, establishing Interim Instream Flow Standards for 27 East Maui streams that had been subject to IIFS Petitions since May 2001. The Proposed Action seeks to divert the maximum allowable amount of water specified for off-stream uses under the D&O from the four state license areas. This equates to approximately 88 mgd at Honopou Stream (the most westerly catchment on State land), and 92 mgd at Maliko Gulch (where the system transitions from diversion to agricultural field irrigation), with the additional water gained between the two reference points coming from private lands owned by affiliates of EMI. The diverted waters will be used to irrigate 26,600 acres of agricultural lands in central Maui owned by Mahi Pono and formerly devoted to sugarcane plantation use through its subsidiary Hawaiian Commercial & Sugar (HC&S), as well as to maintain current service to the Maui County Department of Water Supply (which also

supplies the Kula Agricultural Park). The proposed action will be privately financed, and does not propose or require the use of any public funds to cover the estimated \$2.5 million per year in EMI system operating and maintenance costs.

The Service notes that the amount of water diversion in the Proposed Action represents approximately 59 percent of the 157 mgd being delivered by the system past Maliko Gulch in 2006 when the HC&S sugarcane plantation was still in operation, equating to a 41% reduction over these recent rates of diversion. The amount of water diverted under the Proposed Action also represents only 20 percent of the full potential diversion capacity of the entire EMI system when it was formerly intact, and prior to inactivation of at least 70 points of diversion in compliance with the CWRM D&O. The Service commends all parties involved in having taken substantive steps to re-balance instream versus offstream uses in this sector.

As a condition of this lease application, Alexander & Baldwin (A&B) was instructed by the BLNR on July 8, 2016 to prepare an EIS pursuant to HRS Chapter 343. The Service's comments are in response to the DEIS, which was submitted to the State of Hawaii's Office of Environmental Quality Control (OEQC) on September 9, 2019, with request that a notice be published by OEQC requesting public comment.

Potential Impacts of the Proposed Action to ESA-listed Species

The long history of stream diversions by the EMI system on East Maui has created a wide array of impacts to trust resources, including both the native stream biota, other species which inhabit the adjacent upland forests, and nearshore marine ecosystems that rely on streams for nutrient inputs. Several native stream-associated insect species occurring on East Maui water lease areas are now listed under the Endangered Species Act, specifically the damselflies *Megalagrion pacificum*, *Megalagrion nesiotetes*, and *Megalagrion xanthomelas*, all three listed as endangered under the ESA. *Megalagrion pacificum* breeds in stream pools and side channels, with adults patrolling the margins of the stream corridor, and therefore suffers direct impacts from loss of habitat linked to diminished stream flows. The breeding habitats of *Megalagrion nesiotetes* are not known, but the adults also utilize the stream corridor, and are not present in areas where diversions have created dry streambeds in the place of a formerly flowing channel. *Megalagrion xanthomelas* breeds in pools along stream terminal reaches, and although the species is not currently documented from windward East Maui, has the potential to occur there. Higher rates of diversion will therefore lead to higher rates of direct impact to all of these listed species.

In addition, the ditch system also provides a lateral conduit across drainage divides for aquatic invasive species (AIS), such as topminnows, which can use the aquaduct to colonize upper stream reaches that they would otherwise not be able to access. Such species have been shown to significantly impact populations of ESA-listed native *Megalagrion* damselflies, and thus inhibit their recovery. The Service suggests that the FEIS devote discussion to how such migratory pathways for AIS could be interrupted. This could be as simple as putting small vertical drops in the ditch profile at appropriate and practical intervals, such most AIS cannot pass such obstacles

when moving up-current. Once such species are prevented from continuously recolonizing such reaches, the existing populations may eventually be flushed out over time by strong flood events. Eliminating this dispersal pathway would thus aid in improving the biological integrity of restored habitat, and promote the recovery of ESA-listed damselfly species. The Service's Hawaii Fish Habitat Partnership program is available to provide technical expertise on such potential modifications to the EMI system.

In addition to the listed damselflies, based on information provided in the DEIS and pertinent information in our files, including data compiled by the Hawaii Biodiversity and Mapping Project, there are 10 listed birds, 2 listed reptiles, 1 listed mammal, 7 listed insects, and 43 listed plants that may occur or have final designated Critical Habitat within or near the vicinity of the license areas proposed for diversion. These listed species are as follows:

<u>Birds</u>	<u>Status</u>
Band-rumped storm-petrel (<i>Oceanodroma castro</i>)	Endangered
Akohekohe (<i>Palmeria dolei</i>)	Endangered, Critical habitat present
Hawaiian coot (<i>Fulica alai</i>)	Endangered
Hawaiian duck (<i>Anas wyvilliana</i>)	Endangered
Hawaiian goose or nene (<i>Branta sandvicensis</i>)	Endangered
Hawaiian petrel (<i>Pterodroma sandwichensis</i>)	Endangered
Hawaiian stilt (<i>Himantopus mexicanus knudseni</i>)	Endangered
Iiwi (<i>Drepanis coccinea</i>)	Threatened
Kiwikiu (<i>Pseudonestor xanthophrys</i>)	Endangered, Critical habitat present
Newell's shearwater (<i>Puffinus newelli</i>)	Threatened
<u>Reptiles</u>	<u>Status</u>
Green sea turtle (<i>Chelonia mydas</i>)	Endangered
Hawksbill sea turtle (<i>Eretmochelys imbricata</i>)	Endangered
<u>Mammals</u>	<u>Status</u>
Hawaiian hoary bat (<i>Lasiurus cinereus semotus</i>)	Endangered
<u>Insects</u>	<u>Status</u>
Blackburn's sphinx moth (<i>Manduca blackburni</i>)	Endangered
Flying earwig Hawaiian damselfly (<i>Megalagrion nesiotes</i>)	Endangered
Orangeblack Hawaiian damselfly (<i>Megalagrion xanthomelas</i>)	Endangered
Pacific Hawaiian damselfly (<i>Megalagrion pacificum</i>)	Endangered
Yellow-faced bee (<i>Hylaeus anthracinus</i>)	Endangered
Yellow-faced bee (<i>Hylaeus assimulans</i>)	Endangered
Yellow-faced bee (<i>Hylaeus longiceps</i>)	Endangered

<u>Plants</u>	<u>Status</u>	<u>Critical Habitat Unit</u>
<i>Adenophorus periens</i>	Endangered	Montane Wet 2
<i>Asplenium peruvianum</i> var. <i>insulare</i>	Endangered	Montane Wet 2, Montane Mesic 1
<i>Bidens campylotheca</i> ssp. <i>pentamera</i>	Endangered	Montane Wet 2, Montane Mesic 1
<i>Bidens campylotheca</i> ssp. <i>waihoiensis</i>	Endangered	Lowland Wet 1, Montane Wet 2
<i>Calamagrostis expansa</i>	<u>Endangered</u>	None
<i>Clermontia oblongifolia</i> ssp. <i>mauiensis</i>	<u>Endangered</u>	Lowland Wet 1, Montane Wet 2
<i>Clermontia peleana</i>	<u>Endangered</u>	Lowland Wet 1
<i>Clermontia samuelii</i>	Endangered	Lowland Wet 1, Montane Wet 2
<i>Cyanea asplenifolia</i>	Endangered	Lowland Wet 1
<i>Cyanea copelandii</i> ssp. <i>haleakalaensis</i>	Endangered	Lowland Wet 1, Montane Wet 2
<i>Cyanea duvalliorum</i>	Endangered	Lowland Wet 1, Montane Wet 1, Montane Wet 2
<i>Cyanea hamatiflora</i> ssp. <i>hamatiflora</i>	Endangered	Lowland Wet 1, Montane Wet 2
<i>Cyanea horrida</i>	Endangered	Montane Wet 2, Montane Wet 2
<i>Cyanea kunthiana</i>	Endangered	Lowland Wet 1, Montane Wet 2
<i>Cyanea maritae</i>	Endangered	Lowland Wet 1, Montane Wet 1
<i>Cyanea mceldowneyi</i>	Endangered	Lowland Wet 1, Montane Wet 1, Montane Wet 2

<i>Melicope ovalis</i>	Endangered	Lowland Wet 1
<i>Microlepia strigosa</i> var. <i>mauiensis</i>	Endangered	None
<i>Mucuna sloanei</i> var. <i>persericea</i>		
<i>Ochrosia haleakalae</i>	Endangered	Lowland Wet 1

	Endangered	None
<i>Peperomia subpetiolata</i>	Endangered	Montane Wet 2
<i>Peucedanum sandwicense</i>	Threatened	Coastal 1
<i>Peperomia subpetiolata</i>	Endangered	Montane Wet 2
<i>Phyllostegia bracteata</i>	Endangered	Montane Wet 2, Montane Mesic 1 Lowland Wet 1, Montane Wet 2
<i>Phyllostegia haliakalae</i>	Endangered	Montane Wet 2, Montane Mesic 1
<i>Phyllostegia mannii</i>	Endangered	Montane Wet 1 Montane Wet 2
<i>Phyllostegia pilosa</i>	Endangered	None
<i>Platanthera holochila</i>	Endangered	
<i>Schiedea diffusa</i> ssp. <i>diffusa</i>	Endangered	
<i>Schiedea jacobii</i>	Endangered	Montane Wet 2
<i>Wikstroemia villosa</i>	Endangered	Lowland Wet 1, Montane Wet 2, Montane Mesic 1

Impacts to Listed Species in the Lease Areas

The Service therefore has a clear interest in addressing the amount of future water diversion proposed for East Maui, the license areas in which it will occur, and the impacts to native ecosystems and species that may result from the continued operation and maintenance of the EMI system. The native forest habitat becomes progressively more extensive and of higher ecological integrity as one moves eastward from the Huelo and Honomanu license areas and into the Keanae and Nahiku areas. The native species richness in the stream communities follows a similar west-to-east progression. Therefore, diversions from the Nahiku and Keanae license areas are likely to be of higher impact to ESA-listed species, and native Hawaiian plant and animal species in general, than are diversions from the Huelo and Honomanu areas.

Among the major threats to the survival in the wild of the three listed forest bird species (akohekohe, iwi, and kiwikiu) is mortality caused by avian malaria, which is vectored by the introduced mosquito *Culex quinquefasciatus*. This mosquito species breeds in stagnant pools free from fish in dewatered stream beds, and is by contrast uncommon along stream channels with continuous flow and healthy fish populations. By converting continuously flowing streams into nearly dry beds with scattered small pools, the EMI system's diversions have created corridors of habitat by which *Culex* mosquitoes can penetrate uphill more deeply into the native forest, and more readily reach susceptible native forest bird populations. This represents a significant, although indirect, impact of the proposed diversions to this set of listed species.

Impacts to Listed Species in Agricultural Areas

The DEIS encompasses the redevelopment of the fields in the central plain of Maui into diversified agriculture by Mahi Pono. The fallow fields and roadsides in this area contain known occurrences of the endangered Blackberry's sphinx moth and one of its key host plants, the non-native tree tobacco (*Nicotiana glauca*), is widespread in this habitat. The DEIS should include

avoidance and minimization measures to ensure no adverse impacts to this widespread species will occur as a result of the field redevelopment of long term operations of agriculture use.

Blackburn's Sphinx Moth:

We offer the following survey recommendations to assess whether the Blackburn's sphinx moth is present within an action area:

- A biologist familiar with the species should survey areas of proposed activities for Blackburn's sphinx moth and its larval host plants prior to work initiation.
- Surveys should be conducted during the wettest portion of the year (usually November-April or several weeks after a significant rain) and within 4-6 weeks prior to construction.
- Surveys should include searches for eggs, larvae, and signs of larval feeding (chewed stems, frass, or leaf damage).

If moths or the native aiea or tree tobacco over 3 feet tall are found during the survey, please contact the Service for additional guidance to avoid take.

If no Blackburn's sphinx moth, aiea, or tree tobacco are found during surveys, it is imperative that measures be taken to avoid attraction of Blackburn's sphinx moth to the project location and prohibit tree tobacco from entering the site. Tree tobacco can grow greater than 3 feet tall in approximately 6 weeks. If it grows over 3 feet, the plants may become a host plant for Blackburn's sphinx moth. We therefore recommend that you:

- Remove any tree tobacco less than 3 feet tall.
- Monitor the site every 4-6 weeks for new tree tobacco growth before, during and after the proposed ground-disturbing activity.
- Monitoring for tree tobacco can be completed by any staff, such as groundskeeper or regular maintenance crew, provided with picture placards of tree tobacco at different life stages.

Please note: Based on the size and the location of the agricultural operations proposed, we expect that Blackburn's sphinx moth occur throughout the area.

Hawaiian seabirds:

The DEIS also states that some new infrastructure will be associated with the redevelopment of these fields. Avoidance and minimization for seabirds should be incorporated into any development, particularly related to lighting, to avoid take of these listed taxa.

- Fully shield all outdoor lights so the bulb can only be seen from below bulb height and only use when necessary.
- Install automatic motion sensor switches and controls on all outdoor lights or turn off lights when human activity is not occurring in the lighted area.
- Avoid nighttime construction during the seabird fledging period, September 15 through December 15.

Hawaiian hoary bat:

The redevelopment of the agricultural fields into orchards may create breeding habitat for the endangered Hawaiian hoary bat, which is known to be attracted to orchards, mac-nut farms, and

similar tree-based agriculture for foraging and roosting. The Hawaiian hoary bat roosts in both exotic and native woody vegetation across all islands and will leave young unattended in trees and shrubs when they forage. If trees or shrubs 15 feet (ft) or taller are cleared during the pupping season, there is a risk that young bats could inadvertently be harmed or killed since they are too young to fly or may not move away. Additionally, Hawaiian hoary bats forage for insects from as low as three feet to higher than 500 ft above the ground and can become entangled in barbed wire used for fencing.

To avoid and minimize impacts to the endangered Hawaiian hoary bat we recommend incorporating the following applicable measures into your project description:

- Do not disturb, remove, or trim woody plants greater than 15 ft tall during the bat birthing and pup rearing season (June 1 through September 15).
- Do not use barbed wire for fencing.

All other listed species:

For other listed species, including plants and invertebrates, that may be within the project area, the Service advises reviewing our standard avoidance and minimization measures at:

<https://www.fws.gov/pacificislands/promo.cfm?id=177175840>

We recommend you incorporate the relevant measures into the DEIS and all project implementation plans.

Compliance with the ESA

If the project cannot fully avoid the take of all threatened and endangered species, the project will need to seek an Incidental Take Permit under section 10(a)(1)(B) of the ESA. As part of the permit application, the project should develop a Habitat Conservation Plan that outlines the direct and indirect effects of the project to listed species, measures to avoid and minimize impacts, and compensatory mitigation to offset impacts that cannot be avoided. Please contact the Service for additional information on the permitting process. Please be aware that the Hawaii Division of Forestry and Wildlife (DOFAW) also administers a similar process pursuant to the State's endangered species law (HRS-195D). We recommend you meet with DOFAW to discuss compliance with the State endangered species law.

Service Comments Related to NEPA and Other Trust Resources

Below, the Service provides specific comments on particular sections of the DEIS:

Description of Interim Instream Flow Standard Decision and Order (Section 1.3.4)

The Service notes that the discussion on page 1-12 does not completely align with the information presented in Table 1.3. With regards to kalo growing streams, within which all diversion is to cease, Ohia/Waianu and Kulani/Hamau are both listed even though they have never been diverted. It might be clearer if the FEIS clarifies that out-of-basin diversions are not allowed in the future for these streams. In the discussion of streams with high biological value, it is not clearly indicated that Waiohue and West Wailua Iki streams were ordered to full restoration for biological value, and the latter also as a comparison to the partially restored East

Wailua Iki. Instead, this paragraph implies that all the streams it lists, including the two just mentioned, were restored to 64% of BFQ₅₀. In addition, this paragraph lists Piinaau and Wailuanui streams as having been partially restored for biological value, whereas they were ordered fully restored for kalo cultivation, and are mentioned as such in the preceding paragraph under kalo streams. All these inconsistencies should be corrected in the FEIS. It should also be ensured that this information is consistent between Section 1.3 and Section 4.2, where much of it is repeated.

In the discussion of streams that have barriers to biological or ecological improvement, Waiaka is listed as a stream that has been ordered restored to 20% of BFQ₅₀ in the CWRM D&O, but in Table 1.3 it is listed as having had no restoration ordered. This inconsistency should also be rectified in the FEIS.

Finally, although it is mentioned on page 1-13 that diversions of streams from the higher elevation eastern portion of the windward Haleakala watershed contribute to the operational capacity of the EMI system, it was noted by Service personnel in May 2019 that no water was being diverted east of Koolau Gap, and yet the system still seemed to be functional from Puohokamoa westward. Therefore, it does not appear that diversions from the more easterly streams are essential to the functioning of the ditch system. This should be clarified in the FEIS.

Central Maui Field System (Section 2.14)

On page 2-18 the DEIS indicates that of the total 92 mgd proposed for diversion, 26 mgd, or 28 percent, is lost to seepage and other factors between Maliko Gulch and the eventual points of delivery in the Central Maui field system. In addition, Table 2.1 indicates that over 79 percent of the water diverted is proposed to be used to irrigate orchard crops that constitute only 43 percent of the total acres irrigated. Much of this orchard production, which includes macadamia nuts and beverage crops, would appear to be targeted at markets other than Maui, where local demand for such products is limited. The Service recommends that the FEIS make a clearer distinction between which crops on the Mahi Pono lands are diversified agriculture intended to supply local demand on Maui, and which are cash crops intended for export, given that it appears the majority of the water proposed for diversion is intended to support the latter.

Alternatives Rejected (Section 3.1)

In addition to the preferred alternative, a 30-year lease allowing diversion of 87.95 mgd from the currently defined state lease areas, represented by the Proposed Action, the DEIS also considers but rejects 4 alternatives involving alternate water sources, and one alternative involving a change of system ownership.

In relation to alternative water sources, the DEIS in section 3.1 rejects the use of well water from central Maui, because this is contingent on recharge, and a certain amount of this water is brackish to varying extents. However, the Service notes that the DEIS also indicates that 28 percent of the water delivered by the EMI ditch system to central Maui is lost to seepage, and

that this large rate of loss is beneficial in that it recharges local aquifers. The Service contends that it therefore seems logical to try and recover some of the seepage via wells, and reiterates its previous position in support of using alternative water sources to the best extent possible in order to reduce reliance on surface water diversions, as stated in its letter of February 20, 2016, providing comments on the Notice of Intent for preparation of the current DEIS. In particular, the FEIS should explain the hydrological dynamics that might preclude the use of wells to seek recovery of such a large amount of seepage loss, which could offset the need for a certain amount of surface water diversion.

Alternatives Considered (Section 3.2)

In section 3.2, four additional alternatives are considered in addition to the preferred alternative:

- 1) *Reduced water volume* - As per section 3.2.1, the applicant wishes to divert the maximum 87.95 mgd of water allowed under the CWRM D&O in order to irrigate the maximum amount of acreage in central Maui. It is noted that even if this amount of water is allowed, it is only estimated to be sufficient to irrigate 23,000 acres of the 30,000 potentially available in this area for agriculture, and that the diversion allotment might be subsequently reduced by reservations for DHHL. As such, the applicant asserts that any long-term lease that permitted a lesser amount of water diversion would be inconsistent with their long-term objectives. In order to make up the shortfall in irrigation water, the applicant proposes to use well water, despite arguing against this approach in Section 3.1.
- 2) *Water lease with different terms* - In section 3.2.2.1, the applicant also asserts that any water lease of a duration shorter than 30 years could inhibit their ability to obtain financing for agricultural operations in central Maui, which would again be inconsistent with their objectives. The Service proposes that a 30-year lease with slightly different increments of diversion could in fact be viable (see new proposed Alternative 5 below).
- 3) *Modified lease area* - In section 3.2.2.2, the applicant notes that the BLNR has discretion to limit the geographic parameters of the lease to an area smaller than that currently proposed, and that this would not necessarily be inconsistent with the objectives of the Proposed Action. Given the higher quality of biological resources at the eastern end of the EMI system, the Service continues to support a Modified Lease Area alternative that concentrates surface water diversions in the more western Huelo and Honomanu license areas, with the more eastern Keanae and Nahiku license areas being utilized secondarily (see new proposed Alternative 5 below).
- 4) *No action* – Under this alternative, the applicant would continue to divert up to 80 mgd of water from the 4 state lease areas under a continuing series of one-year revocable permits. The Service considers this alternative inadvisable given that recent court decisions have judged this practice of using an indefinite series of short-term permits as substitutes for long-

term leases to be illegal. Additionally, this alternative does not adequately address potential project impacts to trust resources and endangered species.

Additional Alternative to be Considered

Given the considerations outlined above, the Service suggests that an additional hybrid alternative be evaluated in the FEIS, consisting of a 30-year lease with a gradually increasing diversion allotment, contingent upon demonstrated need, with the later increments of this diversion being obtained from points of diversion progressively further east along the EMI aqueduct system.

Specifically, the Service proposes that the FEIS evaluate an additional alternative consisting of a 30-year lease with an initial ceiling of 48 mgd taken from catchments in the Huelo and Honomanu license areas west of the Koolau Gap, with future options, upon proof of need and subject to approval by the BLNR, for two additional diversion increments of 20 mgd each, to be drawn from catchments successively further east in the Keanae and Nahiku license areas. This would provide a potential withdrawal of up to 88 mgd of diversion from the state license areas, as currently allowed under the CWRM D&O, but at the same time retain water in streams for public trust purposes until such time as the needs for offstream uses in Central Maui were demonstrated to the BLNR.

The above proposal is consistent with previous comments by the Service in its letter of February 20, 2016. On page 2-19 of the current DEIS, it is estimated that it will require 10 years to fully implement the Mahi Pono farm plan on 30,000 acres of former sugarcane lands. Since this conversion will not be instantaneous, it is clear that the amount of water diverted from the State lease areas will gradually ramp up over time, presuming no unanticipated delays or changes to the business model intervene. In its previous letter, the Service suggested using a phased approach to the water lease, with incrementally larger amounts of diversion being allowed as the demand for such was demonstrated, noting that it would also be consistent with the Hawaii State Water Code. The Service notes that this approach was not evaluated in the current DEIS, and so reiterates this suggestion for the FEIS.

The Service further notes that the DEIS estimates annual maintenance costs on the EMI aqueduct system will run on the order of \$2.5 million per year. A recent visit by Service staff to various portions of the EMI system in May 2019, in company with staff from the Hawaii Department of Land and Natural Resources, led to the observation that many sections of the system are already being blocked by treefalls and land slips, and that there was apparently no diversion of water in the system anywhere east of Puohokamoa Stream. This indicates that a significant portion of the system east of Koolau Gap is idle, that a large amount of maintenance on the ditch system has already been deferred, and that a major investment may be necessary to bring it back to its former level of operation. Given a 10-year deployment of the associated farm plan, this also indicates that a large initial dollar investment will need to be made up-front for many years just to keep the system operational, in anticipation of future returns as the diversified agricultural

operation is built out. Such a scenario comes with major uncertainties in regard to supply, demand, and macroeconomic cycles, thus the it is the Service's position that a lease for a modest amount of initial water delivery, coupled with future options for incrementally stepped up deliveries based on outcomes and need, is a more logical approach, and that such an alternative should be analyzed in the FEIS. This approach would also have the benefit of maximizing interim instream flows and associated ecological functions in the near term.

Comparative evaluation of reasonable alternatives (Section 3.4)

In regard to section 3.4, where the potential impacts of the various alternatives are compared, the Service has the following comments:

1) *Coastal Waters (Section 3.4.5)*

In this section on page 3-9, it is stated that neither the proposed action or any of the various alternatives would impact the coastal waters of East Maui, because the ocean environment is not affected by the intensity of stream flow, being so much larger. The Service considers analysis to be overly simplistic, because it overlooks the role that stream inflows play in regard to the delivery of land-based nutrient inputs to nearshore waters, and the associated positive effects on fisheries recruitment, particularly in oligotrophic tropical seas such as those surrounding the Hawaiian Islands. This topic needs to be addressed in the FEIS, and the superficial treatment of coastal water interactions with stream inflows needs to be examined in much greater detail.

b) *Flora, Fauna and Invertebrates (Section 3.4.8)*

The DEIS contends that modifying the lease area could result in greater public access, which would result in trampling and other impacts to the existing flora. In addition, significant concerns are raised about the possible introduction of invasive weeds. The Service notes, however, that the majority of the vegetation surrounding the EMI ditch system and its access roads is overwhelmingly dominated by invasive non-native plant species, the trampling or disturbance of which would present minimal concern, and that any weeds that might be transported into the license area by members of the public are already present and proliferating. As such, the potential biological impacts related additional public access to this area do not appear to be a reasonable basis for rejection of the Modified Lease Area alternative.

4.2.1 *Surface Waters (4-54)*

Given that the HEP model was originally developed by the Service, we consider the version tailored to Hawaiian stream ecosystems, HSHEP, to be a valid tool for estimating gains or losses of stream habitat and function related to varying diversion scenarios as used in the DEIS. As noted in section 4.2.1, this model's results indicate that the proposed action will

have a negative impact by reducing stream flow from that prevailing under natural, un-diverted conditions. The Service acknowledges that it is the mandate of Hawaii CWRM to balance the loss of such instream uses with the needs of offstream users. However, the Service also notes that under HRS 174C, agricultural diversions are not considered a public trust use. As stated by the Hawaii State Supreme Court in its Waiahole Ditch decision of August 22, 2000: “Although its purpose has evolved over time, the public trust has never been understood to safeguard rights of exclusive use for private commercial gain.”

The current CWRM D&O has resulted in the restoration of significant amounts of flowing stream habitat in East Maui, and the Service finds this commendable. However, as noted on page 4-58 of the DEIS, lateral entrainment and out-of-basin export by the ditch system of migratory diadromous biota, such as fishes and prawns, remains a significant issue. The Service recommends that the FEIS discuss in greater detail what steps might be taken to minimize such entrainment at the points of diversion, so as to allow the fullest possible utilization of the restored habitat by native organisms, and thereby reduce the biological impacts of the proposed action.

Biosecurity Provisions

While much of the ditch system and access roads are in areas where non-native species and ecosystems predominate, native forest is found in many locations of the system and the access roads and ditch are adjacent to native-dominated habitats upslope. As such, biosecurity is important to minimize movement of particularly noxious pests and threats into these areas. Two of the more recent concerns that should be addressed include Rapid Ohia Death and little fire ants (*Wasmannia auropunctata*). Little fire ants have been found in many areas of Maui, including Huelo, Haiku, and Nahiku on the north side of the island (<https://mauiinvasive.org/little-fire-ant/>). Similarly, Rapid Ohia Death caused by two species of fungal pathogens was first found on Maui in 2019 in a single tree on East Maui. It is important to prevent the spread of both of these invasive species into more intact native forests through adequate biosecurity. The following are recommendations for appropriate response to these and other invasive species that could be used to develop an appropriate biosecurity plan.

1. All work vehicles, machinery, and equipment should be cleaned, inspected by its user, and found free of mud, dirt, debris and invasive species prior to entry into the natural areas or native habitat.

a. Vehicles, machinery, and equipment must be thoroughly pressure washed in a designated cleaning area and visibly free of mud, dirt, plant debris, insects, frogs (including frog eggs) and other vertebrate species such as rats, mice and non-vegetative debris. A hot water wash is preferred. Areas of particular concern include bumpers, grills, hood compartments, areas under the battery, wheel wells, undercarriage, cabs, and truck beds (truck beds with accumulated material (intentionally placed or fallen from trees) are prime sites for hitchhikers).

b. The interior and exterior of vehicles, machinery, and equipment must be free of rubbish and food. The interiors of vehicles and the cabs of machinery must be vacuumed clean. Floor mats shall be sanitized with a solution of >70% isopropyl alcohol or a freshly mixed 10% bleach solution.

c. Any machinery, vehicles, equipment, or other supplies found to be infested with ants (or other invasive species) must not enter natural areas or native habitat. Treatment is the responsibility of the equipment or vehicle owner and operator.

2. Little Fire Ants – All work vehicles, machinery, and equipment should be inspected for invasive ants prior to entering the natural areas or native habitat.

a. A visual inspection for little fire ants should be conducted prior to entry into natural areas or native habitat.

b. Hygiene is paramount but even the cleanest vehicle can pick up a little fire ant. Place MaxForce Complete Brand Granular Insect Bait (1.0% Hydramethylnon; <http://littlefireants.com/Maxforce%20Complete.pdf>) into refillable tamper resistant bait stations. An example of a commercially available refillable tamper resistant bait station is the [Ant Café Pro](https://www.antcafe.com/) (<https://www.antcafe.com/>). Place a bait station (or stations) in vehicle. Note larger vehicles, such as trucks, may require multiple stations. Monitor bait stations frequently (every week at a minimum) and replace bait as needed. If the station does not have a sticker to identify the contents, apply a sticker listing contents to the station.

c. Any machinery, vehicles, equipment, or other supplies found to be infested with ants (or other invasive species) must not enter natural areas or native habitat until it is sanitized and re-tested following a resting period. Infested vehicles must be sanitized following recommendations by the Hawaii Ant Lab (<http://www.littlefireants.com/>) or other ant control expert and in accordance with all State and Federal laws. Treatment is the responsibility of the equipment or vehicle owner.

d. Gravel, building materials, or other equipment such as portable buildings should be baited using MaxForce Complete Brand Granular Insect Bait (1.0% Hydramethylnon; <http://littlefireants.com/Maxforce%20Complete.pdf>) or AmdroPro (0.73% Hydramethylnon; <http://littlefireants.com/Amdro%20Pro.pdf>) following label guidance.

e. Storage areas that hold field tools, especially tents, tarps, and clothing should be baited using MaxForce Complete Brand Granular Insect Bait (1.0% Hydramethylnon; <http://littlefireants.com/Maxforce%20Complete.pdf>) or AmdroPro (0.73% Hydramethylnon; <http://littlefireants.com/Amdro%20Pro.pdf>) following label guidance.

3. Base yards and staging areas inside and outside areas must be kept free of invasive species.

- a. Base yards and staging areas should be inspected at least weekly for invasive species and any found invasive removed immediately. Pay particular attention to where vehicles are parked overnight, keeping areas within 10-meters of vehicles free of debris. Parking on pavement and not under trees, while not always practical is best.
- b. Project vehicles or equipment stored outside of a base yard or staging area, such as a private residence, should be kept in a pest free area.

4. All cutting tools must be sanitized to prevent the Rapid 'Ōhi'a Death (ROD) fungus.

- a. Avoid wounding 'ōhi'a trees and roots with mowers, chainsaws, weed eaters, and other tools. Cut only the minimum amount of trees and branches as approved for the project.
- b. All cutting tools, including machetes, chainsaws, and loppers must be sanitized to remove visible dirt and other contaminants prior to entry into natural areas or areas with native habitat, and when moving to a new project area within the native habitat area. Tools may be sanitized using a solution of >70% isopropyl alcohol or a freshly mixed 10% bleach solution. One minute after sanitizing, you may apply an oil based lubricant to chainsaw chains or other metallic parts to prevent corrosion.
- c. Only dedicated tools and chainsaws should be used to sample known or suspected ROD infected trees.
- d. Vehicles, machinery, and equipment must be cleaned as described in (1) above.

5. Imported firewood, logs, and 'ōhi'a parts:

- a. 'Ōhi'a firewood, 'ōhi'a logs, and 'ōhi'a parts should not be transported.

6. For individuals working in the field:

- a. **Before going into the field**, visually inspect and clean your clothes, boots, pack, radio harness, tools and other personal gear and equipment, for seeds, soil, plant parts, insects, and other debris. A small brush is handy for cleaning boots, equipment and gear. Soles of shoes should be sanitized using a solution of >70% isopropyl alcohol or a freshly mixed 10% bleach solution.
- b. **Immediately before leaving the field**, visually inspect and clean your clothes, boots, pack, radio harness, tools, and other personnel gear and equipment, for seeds, soil, plant parts, insects, and other debris. Soles of shoes should be sanitized using a solution of >70% isopropyl alcohol or a freshly mixed 10% bleach solution.

c. **Little fire ants nest in trees.** If you are under a tree and that tree is bumped or somehow stressed, the threat response of the ants is to fall from the leaves and sting the person under the tree. If you are subject to an ant-attack, do not panic. The ants are extremely small but their stings are painful so make sure you remove all ants from your body and clothing. The stings cause inch long welts that are itchy and painful, and can last for weeks. Treat stings as you would other insect stings. In some persons stings can produce life threatening reactions. Stocking antihistamine in the first aid kit is a reasonable precaution.

The Service appreciates the opportunity to comment on this DEIS. If you have any questions regarding this letter, please contact Fish and Wildlife Biologist Dan Polhemus by telephone at (808) 792-9415 or by electronic mail at Dan_Polhemus@fws.gov, or Fish and Wildlife Biologist John Vetter by telephone at (808) 792-9400 or by electronic mail at John_Vetter@fws.gov.

Sincerely,

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas
01EPIF00-2017-TA-0059

Dear Ms. Bogardus:

Thank you for comments dated November 6, 2019 (01EPIF00-2017-TA-0059) regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The U.S. Fish and Wildlife Service (Service) is providing this letter in response to a request for comment on the two-volume Draft Environmental Impact Statement (DEIS) for a Proposed Lease (Water Lease) for the Nahiku, Keanae, Honomanu and Huelo license areas of Maui, Hawaii, pursuant to Hawaii Revised Statutes Chapter 343 (HRS 343). This letter has been prepared under the authority of and in accordance with provisions of the Endangered Species Act (ESA) of 1973 [16 U.S.C. 1531 et seq.; 87 Stat. 884], National Environmental Policy Act of 1969 [42 U.S.C. 4321 et seq.; 83 Stat. 852], as amended, and other authorities mandating the Service's review of projects and provision of technical assistance to conserve trust resources.*

Response 1: We acknowledge your comments and understand that the comment letter provided by the U.S. Fish and Wildlife Service (USFWS) has been prepared under the authority and in accordance with provisions of the Endangered Species Act (ESA), National Environmental Policy Act of 1969, and other applicable authorities. Further, we understand your response is also to provide technical assistance to conserve trust resources.

Comment 2: Proposed Action

The Proposed Action involves diversion of flows from a set of perennial streams on the north flank of the Haleakala volcano on the eastern section of Maui island, Hawaii (referred to subsequently as "East Maui") to agricultural fields in central Maui. These stream flows originate from four separate license areas running from east to west along the mountain as follows: Nahiku, with an area of approximately 10,111 acres; Keanae, with an area of approximately 10,768 acres; Honomanu, with an area of approximately 3,381 acres; and Huelo, with an area of approximately 8,753 acres. In aggregate, these license areas comprise approximately 33,013 acres, or 51.6 square miles, much of which is covered in native rain forest vegetation and inhabited by hundreds of native species, many of them endemic to the island of Maui, and some listed as threatened or endangered under the ESA.

Response 2: We concur that the Proposed Action involves the continued diversion of East Maui streams that are located on State lands (License Area), thus the need for a Water Lease from the State, as discussed in Section 2.1 to support the uses described in the EIS. However, please note that Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that are in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on page 1-2 and page 3-22. Thus, it is anticipated that the Board of Land and Natural Resources (BLNR) may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area and is part of the Nāhiku portion of the License Area.

We do not dispute your characterization of the License Area as, “*much of which is covered in native rain forest vegetation and inhabited by hundreds of native species, many of them endemic to the island of Maui, and some listed as threatened or endangered under the ESA.*” Appendix C to the EIS, the Terrestrial Flora and Fauna Technical Report prepared by SWCA Environmental Consultants (SWCA), as well as Sections 4.4.1 and 4.4.2 of the EIS discuss vegetation types and species found within the License Area.

Comment 3: *The diverted stream flows will be captured by the existing East Maui Irrigation Aqueduct System (referred to as the "EMI system"), which consists of 388 separate intake structures, 24 miles of ditches, 50 miles of tunnels, 12 inverted siphons, and numerous other small intakes, pipes and flumes. This system, which has operated in various forms since 1878, is now jointly owned by the East Maui Irrigation Company, Limited (EMI), a wholly owned subsidiary of Alexander & Baldwin, Inc. (A&B), and Mahi Pono LLC (Mahi Pono), a farming venture between Pomona Farming, LLC, a California-based agricultural group, and the Public Sector Pension Investment Board (PSP Investments), a Canadian pension management firm.*

Response 3: The stream diversion system is referred to as the EMI Aqueduct System throughout the Draft EIS. Your description is generally consistent with the following applicable language from Section 1.3.1 of the Draft EIS, but the number of inverted siphons identified in the Draft EIS is 13, not 12:

The EMI Aqueduct System was constructed in phases, beginning in the 1870s and extending to its completion, as it currently stands, in 1923. It consists of approximately 388 separate intakes, 24 miles of ditches, and 50 miles of tunnels, as well as numerous small dams, intakes, pipes, 13 inverted siphons and flumes.

The EMI Aqueduct System has been operating since 1878. Your description of the ownership of the EMI Aqueduct System is not correct. The EMI Aqueduct System is owned by East Maui Irrigation Company, LLC whose members are Alexander & Baldwin, LLC, Series T and MP EMI, LLC.

Comment 4: *For the past 93 years, the EMI system has represented a highly integrated water catchment system that, until recently, diverted the majority of stream runoff from the north side of Haleakala to the agricultural lands of central Maui. At this time, the EMI system represents the largest privately owned water company in the United States, and during the days of plantation operation its Wailoa Canal had a higher flow than any natural river in the state of Hawaii.*

Response 4: Your Comment #4 above is unclear as we are unsure by what is meant by “stream runoff.” The EMI Aqueduct System diverts water directly from streams, not from runoff. However, please note as discussed in Section 4.2.1 of the Draft EIS, the EMI Aqueduct System was designed to capture 100% of normal low flows, which is roughly analogous to the stream’s baseflow. Moreover, stream baseflow should also be considered in the context of freshet flows that occur following heavy rainfall events. The streams of East Maui are notably very flashy, at times producing extremely high freshet flows compared to their base flow as a result of rainfall events. Thus, the total amount of stream flow is much higher than the baseflows. Specifically, Section 4.2.1 of the Draft EIS states:

The diversions in the EMI Aqueduct System were built to capture 100% of normal low flows plus some small amount of storm runoff. Hawaiian streams are “flashy”, meaning discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

Regarding your comment about the EMI Aqueduct System representing the largest privately owned water company in the United States, we are uncertain this is true. As reported in the Cultural Impact Assessment (CIA) provided as EIS Appendix F, the Wailoa Ditch, was started in 1918 and completed in 1923, and at that time it had a greater median flow than any natural river in Hawai‘i. As discussed in the Draft EIS, construction of the EMI Aqueduct System started in the 1870s.

Comment 5: *The EMI system is currently authorized to divert up to 80 million gallons of water per day (mgd) based on a one-year revocable permit approved by the State of Hawaii’s Board of Land and Natural Resources (BLNR).*

Response 5: Note that the current RPs issued by the BLNR for the year 2021 allow for a lesser quantity to be diverted - only up to 45 mgd. The 2018 revocable permits allowed for up to 80 mgd to be diverted.

Comment 6: *The Proposed Action seeks the issuance of a single long-term (30- year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. These users include: (1) the County of Maui for its domestic water supply needs in both Upcountry Maui and at Nahiku near the east end of the EMI system; (2) the Department of Hawaiian Home Lands for a future water reservation sufficient to support current and future homestead needs as per the provisions of Section 221 of the Hawaiian Homes Commission Act; and (3) Mahi Pono, which seeks to pursue diversified agriculture on former Hawaiian Commercial & Sugar Company (HC&S) sugarcane plantation lands it has recent purchased from A&B. As reiterated at multiple points throughout the DEIS, the underlying purpose of the Proposed Action is to preserve and maintain the EMI water diversion system, including its access roads, and to continue to supply water for domestic and agricultural uses on Maui. In addition, the proposed action will involve access to State of Hawaii lands in order to maintain and repair existing roads and trails used as part of the EMI system.*

Response 6: Your characterization of the Proposed Action is generally consistent with what is described in the Draft EIS, with the modification that only a portion of the Nāhiku community is presently served by the County of Maui Department of Water Supply (MDWS). Moreover, Section 2.1.3.3 of the Final EIS, regarding the delivery of domestic water to the portion of Nāhiku community that is served by the MDWS, has been revised to clarify how water is received by the MDWS from the EMI Aqueduct System, as shown at pages 2-21 to 2-22.

With regard to water for the Department of Hawaiian Home Lands (DHHL), should any water lease be issued, it is understood that such a lease will be subject to a reservation in favor of the DHHL, as required by statute (HRS § 171-58(g)). As discussed in Draft EIS Section 2.1.1, "*The Water Lease is also subject to the DHHL rights to reserve water sufficient to support current and future homestead needs as provided by Section 221 of the Hawaiian Homes Commission Act.*" Notably, therefore, the requirement of State water leases is to reserve water for DHHL's needs, but not to physically deliver it. Specific information regarding the DHHL's future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd as shown at pages 2-4 to 2-7. As explained on pages 2-4 to 2-7 the DHHL water reservation process involves several steps before a reservation amount is formally identified. The first step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following adoption of the Beneficiary Consultation Report and an authorization to the Chairman to seek a reservation of water, the Commission on Water Resource Management (CWRM) could act on a reservation request related to a proposed lease.

As explained in Section 2.1.1 of the Draft EIS, DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B/EMI, Mahi Pono, the Department of Land and Natural Resources' (DLNR) Land Division, and DHHL staff and consultants. The results of the Beneficiary Consultation were presented to the HHC on May 30, 2019, as agenda item G-2. The motion passed by the HHC to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation request was approved by the HHC related to the EMI Aqueduct System for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

Note that Section 2.1.1 of the Draft EIS stated, with respect to the DHHL reservation, that "*Until that reservation is physically claimed, however, it will be available for use by the lessee.*" That statement has been clarified in the Final EIS as shown on page 2-4, as it is uncertain whether the DHHL reservation amount would be available to the lessee until such time as it is needed by DHHL. Such temporary uses of the DHHL reservation water are not addressed under HRS § 171-58. We further acknowledge that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessor and the DHHL would be necessary to allow any temporary use of water reserved for DHHL.

Comment 7: *While the DEIS was in preparation, the State of Hawaii 's Commission on Water Resource Management issued a Decision and Order (D&O) on June 20, 2018, establishing Interim Instream Flow Standards for 27 East Maui streams that had been subject to IIFS Petitions since May 2001. The Proposed Action seeks to divert the maximum allowable amount of water specified for off-stream uses under the D&O from the four state license areas. This equates to approximately 88 mgd at Honopou Stream (the most westerly catchment on State land), and 92 mgd at Maliko Gulch (where the system transitions from diversion to agricultural field irrigation), with the additional water gained between the two reference points coming from private lands owned by affiliates of EMI. The diverted waters will be used to irrigate 26,600 acres of agricultural lands in central Maui owned by Mahi Pono and formerly devoted to sugarcane plantation use through its subsidiary Hawaiian Commercial & Sugar (HC&S), as well as to maintain current service to the Maui County Department of Water Supply (which also supplies the Kula Agricultural Park).*

Response 7: Indeed, the State of Hawai'i CWRM) issued its Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01 on June 20, 2018 (CWRM D&O), prior to the publication of the Draft EIS on September 23, 2019. The premise for this sequence was for the Draft EIS to use the CWRM D&O as a basis for determining the amount of water available for the Proposed Action and consequent analyses. As a correction to your comment, however, as discussed in Section 1.3.4 of the Draft EIS, the CWRM found that there were 24 streams, not 27, subject to the contested case. Specifically, Footnote 7 of Chapter 1 of the Draft EIS states:

The CWRM found that there were 24, not 27, streams that were the subject of the contested case. The difference being that (i) Waikani is not a stream but a waterfall of Wailuānui Stream; (ii) Alo is a tributary of Waikamoi Stream; (iii) Pua'aka'a is a tributary of Kopili'ula Stream; and (iv) Pi'ina'au and Palauhulu are separate streams that join together before reaching the ocean (CWRM D&O, FOF 56).

Your statement that the diverted water will be used to irrigate 26,600 acres is incorrect. As discussed in Section 2.1.4 of the Draft EIS, the Central Maui agricultural fields consist of approximately 30,000 acres of which approximately 20,650 acres will be irrigated farm land (emphasis added).

However, please note that Table 2-1 in the Draft EIS (which provides the components of the farm plan and proposed water usage) has been slightly revised in the Final EIS (as Table 2-2) to address rounding errors as shown on page 2-29.

We also offer a correction to your comment that the diverted waters are going to “*agricultural lands in central Maui owned by Mahi Pono and formerly devoted to sugarcane plantation use through its subsidiary Hawaiian Commercial & Sugar (HC&S).*” Please note that HC&S was a subsidiary of A&B as discussed in Section 1.3.2 of the Draft EIS, not Mahi Pono.

Comment 8: *The proposed action will be privately financed, and does not propose or require the use of any public funds to cover the estimated \$2.5 million per year in EMI system operating and maintenance costs.*

Response 8: Your statement that the Proposed Action will not require the use of any public funds is correct. Regarding the operating and maintenance costs of the EMI Aqueduct System, Please note that the discussion in Section 2.1 of the Final EIS regarding the total operational costs for labor, fringe benefits, materials, professional services, taxes, maintenance, anticipated rental payments to the State for the Water Lease, and other expenses has been updated as shown on page 2-1 of the Final EIS based on the latest revocable permits costs for 2021. These costs are estimated to be approximately \$2.2 million per year.

Comment 9: *The Service notes that the amount of water diversion in the Proposed Action represents approximately 59 percent of the 157 mgd being delivered by the system past Maliko Gulch in 2006 when the HC&S sugarcane plantation was still in operation, equating to a 41% reduction over these recent rates of diversion. The amount of water diverted under the Proposed Action also represents only 20 percent of the full potential diversion capacity of the entire EMI system when it was formerly intact, and prior to inactivation of at least 70 points of diversion in compliance with the CWRM D&O. The Service commends all parties involved in having taken substantive steps to re-balance instream versus offstream uses in this sector.*

Response 9: For the Draft EIS, Akinaka & Associates prepared the calculations of water available for the Proposed Action after compliance with the CWRM D&O (92.32 mgd at Maliko Gulch). Based on this amount, the percentage calculations provided in your Comment #9 are accurate. As a further consideration, up until 1986, when the first voluntary return of water was made to the East Maui streams, the long-term average delivery by the EMI Aqueduct System was 165 mgd (CWRM D&O, Finding of Fact (FOF) 519) at Māliko Gulch. In 2006 it is estimated that the EMI Aqueduct System delivered approximately 156.69 mgd at Māliko Gulch. This reduction is due in part to some amount of stream restoration having been implemented. Under the Proposed Action, after compliance with the CWRM D&O, it is estimated that the delivery at Māliko Gulch will be approximately 92.32 mgd. The Service's commendation for the steps taken to re-balance instream and offstream uses is acknowledged.

Comment 10: *As a condition of this lease application, Alexander & Baldwin (A&B) was instructed by the BLNR on July 8, 2016 to prepare an EIS pursuant to HRS Chapter 343. The Service's comments are in response to the DEIS, which was submitted to the State of Hawaii's Office of Environmental Quality Control (OEQC) on September 9, 2019, with request that a notice be published by OEQC requesting public comment.*

Response 10: We acknowledge your comments and understand that these comments are in response to the Draft EIS published by the State of Hawai'i Office of Environmental Quality Control in the September 23, 2019 publication of *The Environmental Notice*.

Comment 11: Potential Impacts of the Proposed Action to ESA-listed Species

The long history of stream diversions by the EMI system on East Maui has created a wide array of impacts to trust resources, including both the native stream biota, other species which inhabit the adjacent upland forests, and nearshore marine ecosystems that rely on streams for nutrient inputs.

Response 11: Please note that streams in East Maui have been diverted for over a century and it is not scientifically possible to fully document impacts that first took place more than a century ago as pre-diversion data does not exist. Certainly, for the more than 100 years since the EMI Aqueduct System was constructed and has been in operation, much of the State of Hawai‘i has witnessed a broad array of impacts to trust resources as a result of human activity in the islands. In East Maui, the EMI Aqueduct System has contributed to such impacts along with the expansion of public transportation corridors, urban and agricultural development, intended and unintentional introduction of non-native plants and animals, and public and private access and associated activities in undeveloped areas. Given this broad and complex history of human activity and their environmental impacts in East Maui, your comment broadly attributing a wide array of impacts to trust resources to the long history of stream diversion by the EMI Aqueduct System is an exaggeration. The biological studies prepared for the Draft EIS document the existing environmental conditions in East Maui, and offer some insight as to which impacts may be attributable to the EMI Aqueduct System.

The clearest impact attributable to the EMI Aqueduct System is on the stream biota, which is discussed in Section 4.2.1 of the Draft EIS, summarizing findings of the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) report in Appendix A to the EIS. The HSHEP model was designed to quantify how various man-made changes affect native Hawaiian amphidromous stream animals and is based on statewide observations of these animals' distribution and habitat. While there are no studies describing East Maui stream biota conditions prior to the construction of the EMI Aqueduct System, the HSHEP's "Baseline Condition – Natural Flow" model provides a means of estimating the naturally available habitat for stream species under natural conditions, i.e., no water diversions and no impacts on passage or entrainment of animals.

The impacts of the EMI Aqueduct System on species that inhabit the adjacent upland forest is less clear. Sections 4.4.1 and 4.4.2 of the Draft EIS, respectively, summarize a terrestrial flora and fauna biological survey that was prepared by SWCA in 2019, and included as Appendix C to the EIS. The flora survey documented the substantial establishment of non-native species, as well as the rarity and non-observance of native species, including protected species, in the License Area. Likewise, the fauna survey documented established populations of non-native mammals, birds and invertebrates, as well as the rarity or non-observance of native species, including protected species, in the License Area. Also documented was the retreat of various remaining native flora and fauna to upper elevation habitats. It is speculative, however, to single out the construction and operation of the EMI Aqueduct System as creating these impacts.

A stream and ocean water chemistry assessment was conducted for the Draft EIS by Sea Engineering, Inc. (SE) and Marine Research Consultants, Inc. (MRC) in 2018, Appendix B to the EIS. The study, which is summarized in Section 4.2.3 of the Draft EIS, concluded that the effects of stream water on marine waters is minor in these habitats, due to the physical processes associated with a relatively small input of stream water to the vastly larger ocean environment. Although the study did not include a major storm event, freshet stream flows during such conditions would add orders-of-magnitude greater amounts of stream input to nearshore waters. However, the amount of water that can be diverted during such events would be miniscule in proportion. Therefore, neither during the prevailing weather conditions nor storm events would diversion of stream input affect nearshore ocean water chemistry on a significant scale. The prevailing condition of extreme mixing by physical forces is the most important factor in diminishing the zone of influence of stream water in the marine setting. As a result of the continual, intense, wave energy, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species.

However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

For historical context, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C to the EIS) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the HSHEP Model (Appendix A to the EIS) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As

it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F to the EIS) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G to the EIS) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

Comment 12: *Several native stream-associated insect species occurring on East Maui water lease areas are now listed under the Endangered Species Act, specifically the damselflies *Megalagrion pacificum*, *Megalagrion nesiotes*, and *Megalagrion xanthomelas*, all three listed as endangered under the ESA. *Megalagrion pacificum* breeds in stream pools and side channels, with adults patrolling the margins of the stream corridor, and therefore suffers direct impacts from loss of habitat linked to diminished stream flows. The breeding habitats of *Megalagrion nesiotes* are not known, but the adults also utilize the stream corridor, and are not present in areas where diversions have created dry streambeds in the place of a formerly flowing channel. *Megalagrion xanthomelas* breeds in pools along stream terminal reaches, and although the species is not currently documented from windward East Maui, has the potential to occur there. Higher rates of diversion will therefore lead to higher rates of direct impact to all of these listed species.*

Response 12: Table 4-5 in Section 4.4.2 of the Draft EIS state that the three species mentioned above in Comment #12 are known to occur within the License Area. Moreover, please note that impacts related to *Megalagrion pacificum*, *Megalagrion nesiotes*, and *Megalagrion xanthomelas* were modeled the HSHEP model that more appropriately addressed habitat suitability associated with the species. The HSHEP model is provided in the EIS as Appendix A. The HSHEP model quantifies the distribution and extent of habitat and its response to the various flow restoration scenarios, summarized in Section 4.2.1 and Section 4.4.2 of the Draft EIS as it relates to the three species mentioned in Comment #12. Specifically, Section 4.2.1 of the Draft EIS states:

*Habitat suitability indices were developed for the typical group of native freshwater fish and macroinvertebrates found in Hawaiian streams, namely: 'O'opu nākea (*Awaous stamenius*); 'O'opu alamo'o (*Lentipes concolor*); 'O'opu naniha (*Stenogobius hawaiiensis*); 'O'opu nōpili (*Sicyopterus stimpsoni*); 'O'opu akupa (*Eliotris sandwicensis*); 'Ōpae kala'ole (*Atyoida bisulcata*); 'Ōpae 'oeha 'a (*Macrobrachium grandimanus*); and Hihīwai (*Neritina granosa*).*

*In addition to the species listed above, three native damselflies (*Megalagrion xanthomelas*, *Megalagrion pacificum*, and *Megalagrion nesiotes*) and an introduced mosquito (*Culex quinquefasciatus*) habitats were also modeled to see how the water diversions may impact their population sizes. (Trutta, p. 26, 2019) In general, restoration of stream flow should improve damselfly habitat and decrease mosquito habitat where these species use instream habitats. Restoration of baseflow, however, will likely also improve habitat conditions for a number of introduced predator and competitor species of the native damselflies and thus may not, in itself, increase damselfly populations.*

As discussed in Section 2.1 of the EIS and Response #9 above, the Proposed Action is requesting to divert no more than the maximum amount of water allowed under the CWRM D&O, being approximately 92.32 mgd at Māliko Gulch (far less than was diverted in the past). The CWRM D&O requires full restoration of 10 streams within the License Area, and partial restoration for biological reasons to several other streams within the License Area. See CWRM D&O at 268. Hence, as concluded in Section 4.4.2 of the EIS, the Proposed Action is not anticipated to adversely impact these three special-status species. Conversely, it is anticipated that the Proposed Action will overall increase the habitat for these three special-status species compared to historical diversions during sugarcane operations.

Comment 13: *In addition, the ditch system also provides a lateral conduit across drainage divides for aquatic invasive species (AIS), such as topminnows, which can use the aqueduct to colonize upper stream reaches that they would otherwise not be able to access. Such species have been shown to significantly impact populations of ESA-listed native *Megalagrion* damselflies, and thus inhibit their recovery. The Service suggests that the FEIS devote discussion to how such migratory pathways for AIS could be interrupted. This could be as simple as putting small vertical drops in the ditch profile at appropriate and practical intervals, such most AIS cannot pass such obstacles when moving up-current. Once such species are prevented from continuously recolonizing such reaches, the existing populations may eventually be flushed out over time by strong flood events. Eliminating this dispersal pathway would thus aid in improving the biological integrity of restored habitat, and promote the recovery of ESA-listed damselfly species. The Service's Hawaii Fish Habitat Partnership program is available to provide technical expertise on such potential modifications to the EMI system.*

Response 13: We acknowledge your comments above that the EMI Aqueduct System can act as a lateral conduit for aquatic invasive species (AIS), such as topminnows, which can use the system to colonize stream segments in East Maui that they would otherwise be unable to colonize. However, please note that we believe that many upper reaches of streams would not be colonized by AIS such as topminnows as there are numerous weirs, or vertical drops within the EMI Aqueduct System that would prevent upstream travel. In instances where there are segments of the EMI Aqueduct System that would allow AIS to travel into the upper reaches of the streams, these will need to be addressed on a case-by-case basis to prevent or mitigate impacts

from AIS, while ensuring that native instream species and habitats are not negatively impacted. Generally speaking, AIS migratory pathways can be mitigated, as suggested in Comment #13, adding small vertical drops in the ditch profile, or similar types of modifications to the ditches to impede movement of AIS such as adding physical barriers or control structures such as a dam. We acknowledge that the USFWS Hawai'i Fish Habitat Partnership program is available and provides technical expertise on such potential modifications to the EMI Aqueduct System.

Comment 14: *In addition to the listed damselflies, based on information provided in the DEIS and pertinent information in our files, including data compiled by the Hawaii Biodiversity and Mapping Project, there are 10 listed birds, 2 listed reptiles, 1 listed mammal, 7 listed insects, and 43 listed plants that may occur or have final designated Critical Habitat within or near the vicinity of the license areas proposed for diversion. These listed species are as follows:*

***See USFWS comment letter dated November 6, 2019 at pages in Appendix N to the EIS for list.**

Response 14: We acknowledge your comments and understand that data compiled by the Hawai'i Biodiversity and Mapping Project shows that there are 10 listed birds, 2 listed reptiles, 1 listed mammal, 7 listed insects, and 43 listed plants that may occur or have final designated critical habitat within or near the vicinity of the License Area. The list that you provided on pages 4-6 of your comment letter is generally consistent with what was provided in Section 4.4 and Appendix C of the EIS as it relates to the species within the License Area. The species identified in your letter that were not included in Section 4.4 of the Draft EIS were added to the Final EIS as shown on pages 4-115 to 4-117 as it relates to flora, and pages 4-127 to 4-128 as it relates to fauna.

Comment 15: Impacts to Listed Species in the Lease Areas

*The Service therefore has a clear interest in addressing the amount of future water diversion proposed for East Maui, the license areas in which it will occur, and the impacts to native ecosystems and species that may result from the continued operation and maintenance of the EMI system. The native forest habitat becomes progressively more extensive and of higher ecological integrity as one moves eastward from the Huelo and Honomanu license areas and into the Keanae and Nahiku areas. The native species richness in the stream communities follows a similar west-to-east progression. Therefore, diversions from the Nahiku and Keanae license areas are likely to be of higher impact to ESA-listed species, and native Hawaiian plant and animal species in general than are diversions from the Huelo and Honomanu areas. Among the major threats to the survival in the wild of the three listed forest bird species (akohekohe, iiwi, and kiwikiu) is mortality caused by avian malaria, which is vectored by the introduced mosquito *Culex quinquefasciatus*. This mosquito species breeds in stagnant pools free from fish in dewatered stream beds, and is by contrast uncommon along stream channels with continuous flow and healthy fish populations. By converting continuously flowing streams into nearly dry beds with scattered small pools, the EMI system's diversions have created corridors of habitat by which *Culex* mosquitoes can penetrate uphill more deeply into the native forest, and more*

readily reach susceptible native forest bird populations. This represents a significant, although indirect, impact of the proposed diversions to this set of listed species.

Response 15: We acknowledge your comments. As discussed in Section 4.4.1 of the Final EIS, the native forest habitat becomes progressively more extensive and of higher ecological integrity as one moves eastward from the Huelo and Honomanū portions of the License Area and into Ke‘anae and Nāhiku portions of the License Area.

While we acknowledge your interest in the impacts of the Proposed Action on native forest habitat within and beyond the License Area, we are confident that the Draft EIS has adequately established the scope of impacts associated with the Proposed Action in compliance with HRS Chapter 343 and HAR Title 11, Chapter 200. With the revisions that have been incorporated in the Final EIS based on comments received on the Draft EIS, the Final EIS complies with the content requirements for assessing impacts of the Proposed Action. This includes addressing the impact that the Proposed Action will have on native forests, which is not anticipated to extend beyond the License Area.

Regarding your comment that diversions from the Nāhiku and Ke‘anae portions of the License Area are more likely to impact ESA-listed species and native plant and animal species than diversions from the Huelo and Honomanū portions of the License Area, please note that the CWRM D&O restored flow to the majority of the streams within the Nāhiku and Ke‘anae portions of the License Area. Table 1-3 and Figure 1-3 of the Draft EIS show the restoration status of each stream within the License Area. Specifically, the majority of the streams in the Ke‘anae portion of the License Area were restored for “Full Restoration” and “Biological / Limited Streams.” Within the Nāhiku portion of the License Area, Makapipi stream was ordered for full restoration and Hanawī and Kapaula streams were ordered to be restored as “Connectivity Streams.” Hence, the impact from the Proposed Action in these areas will be minimal as the amount of water that can be diverted is restricted. Please note that Table 1-3 and Figure 1-3 in the Final EIS have been revised as shown on pages 1-19 to 1-23 to accurately reflect the changes made in Section 1.3.4 regarding the stream references.

Your suggestion that the mosquito *Culex quinquefasciatus* is somehow limited in its breeding habitat to stagnant pools free from fish in dewatered stream beds is unfounded. The surrounding forests are a huge rainfall catchment area with innumerable opportunities for standing water to occur long enough for mosquitos to breed. Therefore, any suggestion that dewatered stream beds could serve as identifiable corridors for mosquitos into native upland forests is also unfounded. Nevertheless, the instream amount of potential mosquito habitat was quantified using the HSHEP model presented in Appendix A and summarized in Section 4.2.1 of the EIS. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat. Thus, an increase in mosquito habitat was predicted to occur at diverted flows. In all cases, no increase in stream discharge diversion has been proposed. This is a result of the diversions already conveying baseflow from the diverted streams. Therefore, the Proposed Action will not increase

mosquito habitat even in locations where the flow restoration has not been proposed. Based on the modeled relationship between increased streamflow and decreased mosquito habitat, in all cases where flow restoration has been proposed there is expected to be a decrease in mosquito breeding habitat as discussed in Section 4.2.1 and Section 4.4.2 of the Draft EIS. While the HSHEP analysis was focused only on mosquito breeding habitat, given the impact of avian malaria on native stream birds, the Proposed Action will do nothing to increase mosquito breeding habitat and therefore should not negatively impact listed native birds.

Your speculation that dewatered streams could serve as a corridor for mosquitos transmitting avian malaria to reach upland forest habitats may be based on a misunderstanding of why protected bird species remain in those areas. There is evidence of a thermal barrier to mosquitos at higher elevations where the temperature declines. Currently, Hawaiian honeycreepers (including ‘akohekohe, ‘i‘iwi, and kiwikiu that you mention) are already impacted by avian malaria below this thermal barrier, which occurs above 4,921 feet above sea level in the winter months and above 6,234 feet above sea level in the summer months, to the degree that they are rarely found at lower elevations (USFWS 2006, Warner 1968). In other words, this disease and the presence of disease-carrying mosquitos, has already nearly extirpated low-elevation populations of these birds. If there is a thermal barrier to mosquitos, other protected bird populations at higher elevations would also have less potential for contracting avian malaria.

This information has been clarified in Section 4.4.2 of the Final EIS as shown on pages 4-126 to 4-127, and pages 4-130 to 4-131 as it relates to impacts from mosquitos of fauna.

Comment 16: Impacts to Listed Species in Agricultural Areas

*The DEIS encompasses the redevelopment of the fields in the central plain of Maui into diversified agriculture by Mahi Pono. The fallow fields and roadsides in this area contain known occurrences of the endangered Blackburn's sphinx moth and one of its key host plants, the non-native tree tobacco (*Nicotiana glauca*), is widespread in this habitat. The DEIS should include avoidance and minimization measures to ensure no adverse impacts to this widespread species will occur as a result of the field redevelopment of long term operations of agriculture use.*

Blackburn's Sphinx Moth:

We offer the following survey recommendations to assess whether the Blackburn's sphinx moth is present within an action area:

- A biologist familiar with the species should survey areas of proposed activities for Blackburn's sphinx moth and its larval host plants prior to work initiation.*
- Surveys should be conducted during the wettest portion of the year (usually November-April or several weeks after a significant rain) and within 4-6 weeks prior to construction.*
- Surveys should include searches for eggs, larvae, and signs of larval feeding (chewed stems, frass, or leaf damage).*

Response 16: As discussed in Section 4.4.2 (Central Maui) and Appendix C of the Draft EIS, the Blackburn's Sphinx Moth is identified as "May Occur in Central Maui" according to the USFWS, and the tree tobacco being observed within the Central Maui agricultural fields. Therefore, mitigation measures regarding the Blackburn's Sphinx Moth are recommended. Specifically, Section 4.4.2 of the Draft EIS states that:

A survey for potential larval host plants for Blackburn's sphinx moth (particularly tree tobacco) should be conducted by biologists before construction/vegetation clearing. Results of the survey should be provided to the USFWS. If host plants are found, surveys for Blackburn's sphinx moth should be performed according to the most recent USFWS guidance, and preferably during the wet season (January to April), roughly 4 to 8 weeks following a significant rainfall event. Results of the survey should be provided to the USFWS. Any necessary follow-up actions should be coordinated with the USFWS.

Comment 17: *If moths or the native aiea or tree tobacco over 3 feet tall are found during the survey, please contact the Service for additional guidance to avoid take.*

Response 17: At any time that the Blackburn's sphinx moths or the native aiea or tree tobacco over three feet tall are found during the suggested surveys, Mahi Pono will contact the USFWS for additional guidance as mentioned in Section 4.4.2 of the Draft EIS.

Comment 18: *If no Blackburn's sphinx moth, aiea, or tree tobacco are found during surveys, it is imperative that measures be taken to avoid attraction of Blackburn's sphinx moth to the project location and prohibit tree tobacco from entering the site. Tree tobacco can grow greater than 3 feet tall in approximately 6 weeks. If it grows over 3 feet, the plants may become a host plant for Blackburn's sphinx moth. We therefore recommend that you:*

- *Remove any tree tobacco less than 3 feet tall.*
- *Monitor the site every 4-6 weeks for new tree tobacco growth before, during and after the proposed ground-disturbing activity.*
- *Monitoring for tree tobacco can be completed by any staff, such as groundskeeper or regular maintenance crew, provided with picture placards of tree tobacco at different life stages.*

Please note: Based on the size and the location of the agricultural operations proposed, we expect that Blackburn's sphinx moth occur throughout the area.

Response 18: We acknowledge your comments above in Comment #18. Please note that Section 4.4.2 of the Draft EIS discusses the recommended mitigation measures mentioned in Comment #17 above.

Comment 19: *Hawaiian seabirds:*

The DEIS also states that some new infrastructure will be associated with the redevelopment of these fields. Avoidance and minimization for seabirds should be incorporated into any development, particularly related to lighting, to avoid take of these listed taxa.

- *Fully shield all outdoor lights so the bulb can only be seen from below bulb height and only use when necessary.*
- *Install automatic motion sensor switches and controls on all outdoor lights or turn off lights when human activity is not occurring in the lighted area.*
- *Avoid nighttime construction during the seabird fledging period, September 15 through December 15.*

Response 19: Please note that Section 4.4.2 of the Draft EIS with respect to Central Maui did discuss mitigation measures to minimize potential impacts to seabirds. Specifically, Section 4.4.2 of the Draft EIS states:

To minimize potential impacts to seabirds, the following measures should be followed:

- *Construction activity should be restricted to daylight hours as much as practicable during the seabird peak fallout period (September 15 to December 15) to avoid the use of nighttime lighting that could attract seabirds.*
- *All outdoor lights should be shielded to prevent upward radiation. This has been shown to reduce the potential for seabird attraction. A selection of acceptable, seabird-friendly lights can be found online at the Kauai Seabird Habitat Conservation Program website: <http://www.kauai-seabirdhcp.info/lighting-homes-businesses/>*
- *Outside lights not needed for security and safety should be turned off from dusk through dawn during the fledgling fallout period (September 15 to December 15).*

Please note that the above discussion has been expanded to include the mitigation measures included in Comment #19. See page 4-135 of the Final EIS.

Comment 20: *Hawaiian hoary bat:*

The redevelopment of the agricultural fields into orchards may create breeding habitat for the endangered Hawaiian hoary bat, which is known to be attracted to orchards, mac-nut farms, and similar tree-based agriculture for foraging and roosting. The Hawaiian hoary bat roosts in both exotic and native woody vegetation across all islands and will leave young unattended in trees and shrubs when they forage. If trees or shrubs 15 feet (ft) or taller are cleared during the pupping season, there is a risk that young bats could

inadvertently be harmed or killed since they are too young to fly or may not move away. Additionally, Hawaiian hoary bats forage for insects from as low as three feet to higher than 500 ft above the ground and can become entangled in barbed wire used for fencing.

To avoid and minimize impacts to the endangered Hawaiian hoary bat we recommend incorporating the following applicable measures into your project description:

- *Do not disturb, remove, or trim woody plants greater than 15 ft tall during the bat birthing and pup rearing season (June 1 through September 15).*
- *Do not use barbed wire for fencing.*

Response 20: The mitigation measures you suggest are consistent with the measures recommended in the EIS. As noted in Section 4.4.2 of the EIS regarding Central Maui, and in Section 7.2 of Appendix C to the EIS, mitigation to address the potential of impacts to Hawaiian hoary bat include:

If felling of standing trees occurs during the bat breeding season, direct impacts could occur to juvenile bats that are too small to fly but too large to be carried by a parent. To minimize this impact, no trees taller than 15 feet (4.6 m) should be trimmed or removed between June 1 and September 15.

The use of barbless top-strand wire is recommended for all fence construction to avoid entanglement of Hawaiian hoary bat.

It has also been noted in Section 4.4.2 of the EIS that Mahi Pono has used barbed wire strand as a deterrent to deer, which, if unchecked, could destroy crops. However, Mahi Pono has indicated that it will work with the State Division of Forestry and Wildlife (DOFAW) and the Department of Agriculture to determine whether the existing fences are a danger to the Hawaiian hoary bat and if so, whether an effective alternative can be implemented to deter deer from entering on to the farm land.

Moreover, please note that the analysis presented in Section 6.1.3.1 of Appendix C and summarized in Section 4.4.2 of the Final EIS has been expanded to discuss that orchard crops increase the breeding habitat of the Hawaiian hoary bat, as shown on page 4-134 to page 4-135

Comment 21: *All other listed species:*

For other listed species, including plants and invertebrates, that may be within the project area, the Service advises reviewing our standard avoidance and minimization measures at: <https://www.fws.gov/pacificislands/promo.cfrn?id=177175840>

We recommend you incorporate the relevant measures into the DEIS and all project implementation plans.

Response 21: Please note that we have reviewed the provided link above in Comment #21 and the mitigation measures discussed in Section 4.4.1 and Section 4.4.2 of the Draft EIS are generally consistent with what is provided in the link.

Comment 22: *Compliance with the ESA*

If the project cannot fully avoid the take of all threatened and endangered species, the project will need to seek an Incidental Take Permit under section 10(a)(1)(B) of the ESA. As part of the permit application, the project should develop a Habitat Conservation Plan that outlines the direct and indirect effects of the project to listed species, measures to avoid and minimize impacts, and compensatory mitigation to offset impacts that cannot be avoided. Please contact the Service for additional information on the permitting process.

Response 22: Please note that the Proposed Action constitutes the issuance of a long-term Water Lease as discussed in Response #2 above. Its issuance would allow for the continued operation of the EMI Aqueduct System to deliver water for uses described in the EIS. As a continuation of existing activities in East Maui and Upcountry Maui and a continuation of agricultural activity in Central Maui, no take of any listed species is anticipated from the Proposed Action. Hence, the Proposed Action will not require a Habitat Conservation Plan and Incidental Take Permit. However, we acknowledge that if the Mahi Pono farm plan cannot fully avoid the take of all threatened and endangered species, Mahi Pono will comply with all laws, rules and regulations as necessary, and consult with the USFWS as it further implements its farm plan.

Comment 23: *Please be aware that the Hawaii Division of Forestry and Wildlife (DOFAW) also administers a similar process pursuant to the State's endangered species law (HRS-195D). We recommend you meet with DOFAW to discuss compliance with the State endangered species law.*

Response 23: We acknowledge your Comment #23 and understand that the State of Hawai'i DLNR DOFAW administers a permitting process pursuant to the State's endangered species law (HRS Chapter 195D), as discussed in the SWCA report at Section 2.3 Mahi Pono will consult with the DOFAW as it further implements its farm plan.

Comment 24: Service Comments Related to NEPA and Other Trust Resources

Below, the Service provides specific comments on particular sections of the DEIS: Description of Interim Instream Flow Standard Decision and Order (Section 1.3.4) The Service notes that the discussion on page 1-12 does not completely align with the information presented in Table 1.3. With regards to kalo growing streams, within which all diversion is to cease, Ohia/Waianu and Kulani/Hamau are both listed even though they have never been diverted. It might be clearer if the FEIS clarifies that out-of-basin diversions are not allowed in the future for these streams.

Response 24: Table 1-3 of the EIS specifically addresses the Streams in the License Area as Presented in the CWRM D&O. ‘Ōhi‘a / Waianu and Kualani / Hāmau streams were specified by the Petitioners in the Petitions for Interim Instream Flow Standards (IIFS) filed with CWRM in 2001. On June 20, 2018, CWRM issued its CWRM D&O regarding the Petitioned streams. As explained in Section 4.17.2.2 of the Final EIS, ‘Ōhi‘a / Waianu and Kualani / Hāmau Streams have never been diverted by the EMI Aqueduct System as the streams lie below the EMI Aqueduct System, as noted in CWRM D&O FOF 57 and Draft EIS Table 1-3. Under the CWRM D&O, CWRM ordered that ‘Ōhi‘a / Waianu and Kualani / Hāmau streams (as well as Honopou, Huelo (Puolua), Hanehoi, Pi‘ina‘au, Palauhulu, Waikamilo, Wailuanui, and Makapipi, would have all diversions ceased to allow for all water to flow to the taro growing areas or for community and non-municipal domestic use, as discussed in Section 1.3.4 of the Draft EIS.

Comment 25: *In the discussion of streams with high biological value, it is not clearly indicated that Waiohue and West Wailua Iki streams were ordered to full restoration for biological value, and the latter also as a comparison to the partially restored East Wailua Iki. Instead, this paragraph implies that all the streams it lists, including the two just mentioned, were restored to 64% of BFQ₅₀.*

Response 25: Table 1-3 in the Draft EIS lists the CWRM D&O restoration status for Waiohue Stream as “Full”, indicating that this stream was ordered for full restoration. The Draft EIS also cites the CWRM D&O Conclusions of Law (COL) 131, which explained that certain of the Petitioned streams, including Waiohue, have “*the potential to benefit greatly from the restoration of flow to a minimum H₉₀ level based on the biological diversity and habitat that already exists under diverted conditions. These streams should be restored to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and customary Native Hawaiian rights.*” The Final EIS will include a clarifying statement to the aforementioned discussion that will state “Waiohue stream was ordered to be fully restored pursuant to the CWRM D&O.”

As for West Wailuāiki Stream, Section 1.3.4 of the Draft EIS on page 1-12 states that:

...the CWRM determined that West Wailuāiki presents a unique research opportunity to collect valuable information regarding the impact of full restoration of a stream versus habitat restoration (H₉₀). East and West Wailuāiki lie in close proximity to each other with similar biological values and similar habitat biota. The CWRM intends for these two streams to be studied in the future in combination with one another to see the impact, if any, of full restoration versus habitat restoration (CWRM D&O, COL 135).

The Final EIS includes the clarifying statement to the aforementioned discussion that states, “*West Wailuāiki Stream was ordered to be fully restored pursuant to the CWRM D&O*” as shown on page 1-14.

Language from Page v of the Executive Summary of the CWRM D&O has also added to Section 1.3.4 of the Final EIS as shown on pages 1-14 to 1-16.

Comment 26: *In addition, this paragraph lists Piinaau and Wailuanui streams as having been partially restored for biological value, whereas they were ordered fully restored for kalo cultivation, and are mentioned as such in the preceding paragraph under kalo streams. All these inconsistencies should be corrected in the FEIS. It should also be ensured that this information is consistent between Section 1.3 and Section 4.2, where much of it is repeated.*

Response 26: Both Pi‘ina‘au and Wailuānui streams were ordered for full streamflow restoration under the CWRM D&O. This was noted in Table 1-3 of the Draft EIS. In the CWRM D&O, streams were analyzed and noted for more than one type of value. Pi‘ina‘au and Wailuānui are examples of this. In Section F.1 of the CWRM D&O COL, entitled “Water for streams with high biological value”, COL 132(a) and (b) provide as follows:

132. The streams that would most benefit from having IIFS set at H₉₀ or above are:

a. Pi‘ina‘au –potential to sustain a large and diverse population of native stream species if flow is restored to the stream;

b. Wailuanui – flow restoration would likely increase habitat availability for the rich diversity of native species represented in the stream while also creating connectivity and suitable depths for native species in the currently dry or shallow sections dewatered by the diversions.

At the same time, in Section F.2 of the CWRM D&O COL, entitled “Conveyance of water to kalo growing areas or for community use”, COL 138 and 139 provide:

138. The following streams will have all diversions ceased to allow for all water to flow to the taro growing areas or for community and non-municipal domestic use: Honopou, Huelo (Puolua), Hanehoi, Pi‘ina‘au, Palauhulu, Waikamilo, Wailuanui, Ohia, Waianu, Kualani, and Makapipi. (emphasis added)

139. All diversions for these streams shall be modified so that no out of watershed transfers will occur from these streams.

As such, it is not inconsistent to view Pi‘ina‘au or Wailuānui as biological streams as well as streams for kalo growing and community use. Reference to COL 138 was made in the Draft EIS

in Section 1.3.4. Reference to COL 132(a) and (b) has been added to Section 1.3.4 of the Final EIS as shown on page 1-14.

Comment 27: *In the discussion of streams that have barriers to biological or ecological improvement, Waiaaka is listed as a stream that has been ordered restored to 20% of BFQ₅₀ in the CWRM D&O, but in Table 1.3 it is listed as having had no restoration ordered. This inconsistency should also be rectified in the FEIS.*

Response 27: Table 1-3 of the Draft EIS correctly notes, and is consistent with the CWRM D&O chart at p. 268, that the ordered restoration status for Waiaaka stream is “none” at the IIFS location above Hāna Highway. As presented in the CWRM D&O COL, Section F.3., Waiaaka Stream is identified as one of those streams that have barriers to biological or ecological improvements. As cited in the Draft EIS, CWRM D&O COL 146 states, “g. Waiaaka – there is a single diversion of the stream at the Koolau Ditch. There is very little habitat above the ditch with most of the hydrologic unit below the ditch. The stream provides 100 percent of the expected natural habitat availability even under diverted conditions.” The statement in Section 1.3.4 of the Final EIS regarding Waiaaka Stream of the Final EIS has been revised to clarify this as shown on page 1-13.

Comment 28: *Finally, although it is mentioned on page 1-13 that diversions of streams from the higher elevation eastern portion of the windward Haleakala watershed contribute to the operational capacity of the EMI system, it was noted by Service personnel in May 2019 that no water was being diverted east of Koolau Gap, and yet the system still seemed to be functional from Puohokamoa westward. Therefore, it does not appear that diversions from the more easterly streams are essential to the functioning of the ditch system. This should be clarified in the FEIS.*

Response 28: At the time the USFWS personnel attended a field visit, water needs on the Mahi Pono farm were low, as Mahi Pono is in its initial stages of establishing its full diversified agricultural plan within the Central Maui agricultural fields. As Mahi Pono continues to build its farm, year by year, its water needs will increase and diversion of waters from streams east of Puohokamoa will increase, as allowed by the IIFS set by the CWRM D&O. Thus, it is incorrect to conclude that diversions from streams east of Puahokamoa are not essential, or that those portions of the EMI Aqueduct System are not essential. Your field visit was made at a point in time and not reflective of the long-term needs of a farm plan that would re-establish sustainable agriculture across the Central Maui agricultural fields.

Comment 29: *Central Maui Field System (Section 2.14)*

On page 2-18 the DEIS indicates that of the total 92 mgd proposed for diversion, 26 mgd, or 28 percent, is lost to seepage and other factors between Maliko Gulch and the eventual points of delivery in the Central Maui field system. In addition, Table 2.1 indicates that over 79 percent of the water diverted is proposed to be used to irrigate orchard crops that constitute only 43

percent of the total acres irrigated. Much of this orchard production, which includes macadamia nuts and beverage crops, would appear to be targeted at markets other than Maui, where local demand for such products is limited. The Service recommends that the FEIS make a clearer distinction between which crops on the Mahi Pono lands are diversified agriculture intended to supply local demand on Maui, and which are cash crops intended for export, given that it appears the majority of the water proposed for diversion is intended to support the latter.

Response 29: Regarding your comment about the distinction between which crops on Mahi Pono lands are intended to supply the local demand and which are cash crops intended for export, it is anticipated at full development of their farm plan, local sales by Mahi Pono and its farm tenants are expected comprise 65% of total sales, with exports at 35%. Local sales are preferred over exports because it saves on overseas shipping costs. Both local sales and exports are beneficial to Hawai'i: local sales that displace imports reduce the financial drain on the State as a whole, while exports generate income for the State. Please note that Section 4.7.4 of the Final EIS, which was included in the Draft EIS as well, states that local sales by Mahi Pono and its farm tenants are expected comprise 65% of total sales, with exports at 35% on page 4-303.

You are correct that Table 2-1 estimates that orchards could use 79.48% of the total water under the Mahi Pono farm plan. As noted in Table 2-1, approximately 42% of the Central Maui agricultural fields (approximately 12,850 acres of the total 30,000 acres) are planned for orchard crops. Although, as recognized in the EIS, the Mahi Pono farm plan is necessarily an evolving plan that must be responsive to market conditions as well the existing local farming community.

It is unclear where your reference to the 26 mgd or 28 percent seepage figures come from as no such figures are referenced on page 2-18 of the Draft EIS or other places in the Draft EIS. As explained in Section 2.1.4 of the Draft EIS, seepage loss, which is recharged back into the groundwater, takes place beyond the last stream diversion at Māliko Gulch. There is no seepage loss in the EMI Aqueduct System up to Māliko Gulch. Moreover, the seepage loss that does occur is about 22.7% from the Central Maui Field Irrigation System. In other words, the losses are not within the EMI Aqueduct System. The losses occur within the Central Maui Field Irrigation System. The Final EIS clarifies the issue of seepage to recharge the Central Maui aquifer system, as shown on pages 4-74 to 4-77.

Comment 30: *Alternatives Rejected (Section 3.1)*

In addition to the preferred alternative, a 30-year lease allowing diversion of 87.95 mgd from the currently defined state lease areas, represented by the Proposed Action, the DEIS also considers but rejects 4 alternatives involving alternate water sources, and one alternative involving a change of system ownership.

In relation to alternative water sources, the DEIS in section 3.1 rejects the use of well water from central Maui, because this is contingent on recharge, and a certain amount of this water is brackish to varying extents. However, the Service notes that the DEIS also indicates that 28

percent of the water delivered by the EMI ditch system to central Maui is lost to seepage, and that this large rate of loss is beneficial in that it recharges local aquifers. The Service contends that it therefore seems logical to try and recover some of the seepage via wells, and reiterates its previous position in support of using alternative water sources to the best extent possible in order to reduce reliance on surface water diversions, as stated in its letter of February 20, 2016, providing comments on the Notice of Intent for preparation of the current DEIS. In particular, the FEIS should explain the hydrological dynamics that might preclude the use of wells to seek recovery of such a large amount of seepage loss, which could offset the need for a certain amount of surface water diversion.

Response 30: Please see Response #29 above regarding the system losses being estimated at 22.7%, not 28% and where the seepage actually occurs, in the Central Maui Field Irrigation System, not the EMI Aqueduct System. Regarding your comment about using seepage via wells, it seems that there is a misunderstanding in the use of water resources for the Mahi Pono farm plan. Please note as discussed in Section 2.1.4 of the Draft EIS that well water will be used to supplement the surface water diversions and irrigate the Central Maui agricultural fields. Specifically, as stated in Section 2.1.4 of the Draft EIS:

Surface water can be supplemented by a brackish groundwater amount equal to 20 percent of surface water. Taking into account the CWRM D&O, it is estimated that there could be up to 16.47 mgd of brackish groundwater used in the Central Maui agricultural fields. (Appendix I Plasch, 2019)

With regards to the alternative discussion in Section 3.1.1.1 (Groundwater Alternative) of the Draft EIS, this is discussed as an alternative that could reduce the dependence of the surface water needed by supplementing surface water, but could not replace all surface water. Please note that the Draft EIS referred to 15 brackish groundwater wells as being available to Mahi Pono in Section 2.1.4 and Section 3.1.1.1 which discussed the Groundwater Alternative. This information was derived from the CWRM D&O FOF 738, as that was the number of brackish groundwater wells utilized during sugarcane operations by A&B. However, Mahi Pono only has access to 10 brackish wells that can serve the Central Maui agricultural fields. Please note that Section 2.1.4, Figure 2-7, and Section 3.1.1.1 of the Final EIS have been revised as shown on pages 2-24, 2-25, and pages 3-3 to 3-4.

Moreover, the Sustainable Yield (SY) of the Central Maui aquifers are relatively low compared to other aquifers on the island. However, historically, HC&S pumped the Central Maui aquifers much higher than the SY due to the amount of seepage in the Central Maui agricultural fields that occurred from system losses in the Central Maui Field Irrigation System during sugarcane operations. It should be noted that the amount of surface water diverted to Central Maui during 1987 to 2006 was approximately 146.64 mgd, which is significantly more than the amount estimated to be diverted under the Proposed Action (92.32 mgd) as discussed in Section 2.1.1 of the Draft EIS. It should be noted that sugarcane is a more salt tolerant crop compared to the crops proposed under the Mahi Pono farm plan. It is anticipated that finding viable agricultural

crops will require a range of trial-and-error efforts to identify an ideal crop mix that coordinates to the quality and amount of water available. Further, as noted in Section 5 of Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts) in the Draft EIS:

The irrigation system in Central Maui was not designed to vary the mix of surface water and brackish groundwater to accommodate crop needs of different fields. As a result, the surface-to-groundwater mix will be the same across all of the lower fields that can be irrigate[d] with groundwater.

Specifically, as described in Section 2.1.4 of the Draft EIS:

These brackish wells extract groundwater from the subsurface aquifers lying beneath the agricultural lands, and which are cyclically dependent on recharge derived from the irrigation of the overlying lands by water from the EMI Aqueduct System. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water. Groundwater, however, can be delivered to 7,000 acres at higher elevations via a shared pipeline that served as a penstock line for a hydroelectric unit (CWRM D&O, FOF 739). This pump station was designed and built to be an emergency water source for the high-elevation fields in the event of extreme drought.

Thus, due to the amount of surface water being diverted under the Proposed Action, which is less than historically, and the crops proposed under the Mahi Pono farm plan, less brackish water can be used to supplement the surface water to irrigate the Central Maui agricultural fields.

Further discussed in Section 3.1.1.1 of the Draft EIS and supplemented with further analysis in the Final EIS as shown on pages 3-3 to 3-9, additional wells could be drilled to supplement the surface water however, there are often significant environmental impacts associated with well-drilling. Thus, the groundwater alternative was considered to be unreasonable and was dismissed from further review.

Regarding your comment about the hydrological dynamics, please note that as discussed in Section 4.2.2 of the Draft EIS:

Because so little is known about the relationship between system losses and irrigation return water and how much could be reused as groundwater, a definite statement about impacts on groundwater cannot be made. However, the use of East Maui surface water to irrigate the Central Maui fields has long supplemented the underlying aquifers, and a similar relationship will continue under the Proposed Action, essentially constituting a beneficial impact to the Central Maui aquifers, albeit at a smaller scale than when sugarcane was being cultivated.

Comment 31: Alternatives Considered (Section 3.2)

In section 3.2, four additional alternatives are considered in addition to the preferred alternative:

1) Reduced water volume - As per section 3.2.1, the applicant wishes to divert the maximum 87.95 mgd of water allowed under the CWRM D&O in order to irrigate the maximum amount of acreage in central Maui. It is noted that even if this amount of water is allowed, it is only estimated to be sufficient to irrigate 23,000 acres of the 30,000 potentially available in this area for agriculture, and that the diversion allotment might be subsequently reduced by reservations for DHHL. As such, the applicant asserts that any long-term lease that permitted a lesser amount of water diversion would be inconsistent with their long-term objectives. In order to make up the shortfall in irrigation water, the applicant proposes to use well water, despite arguing against this approach in Section 3.1.

Response 31: You have a fundamental misunderstanding of what is described in Section 3.2.1 of the Draft EIS relative to the use of brackish water for irrigation. Water from brackish wells has long been a supplemental source of irrigation water for the Central Maui agricultural fields, notwithstanding the concurrent reliance upon the surface water from East Maui. See Draft EIS Section 2.1.4, explaining that the brackish water wells in Central Maui can supplement surface water to approximately 17,200 acres of the Central Maui agricultural fields. This arrangement is contemplated to continue under the Proposed Action, however, as noted in Response #30, because the amount of surface water from East Maui will be significantly less under the Proposed Action than it was in the past, and because the diversified agricultural farming plan proposed by Mahi Pono will not consist entirely of crops that are as salt tolerant as sugarcane, Mahi Pono will have less brackish irrigation water to rely upon than did HC&S during its sugarcane farming on the same land.

Regarding your comment about the amount of water available under the Proposed Action being sufficient to irrigate only 23,000 of the approximately 30,000 acres, please note that the State of Hawai'i Land Use Commission designated approximately 22,000 acres of the 30,000 acres of Central Maui agricultural fields owned by Mahi Pono as Important Agricultural Lands (IAL). The designation of IAL is determined based upon a number of factors, but such lands: (1) Are capable of producing sustained high agricultural yields when treated and managed according to accepted farming methods and technology; (2) Contribute to the State's economic base and produce agricultural commodities for export or local consumption; or (3) Are needed to promote the expansion of agricultural activities and income for the future, even if currently not in production. See HRS § 205-42.

As stated by the CWRM D&O, the CWRM estimated that the amount of water potentially available after implementation of the CWRM D&O might be enough for about 90% of the irrigation needs for the approximately 22,000 IAL lands in Central Maui. Specifically, Section 3.2.1 of the Draft EIS states:

The BLNR cannot authorize a lease that allows the use of more water than can be diverted under the CWRM D&O. However, the BLNR could elect to issue a water lease that authorizes the use of a lesser amount of water. Projections of the amount of government water available from the License Area at Honopou stream after taking into account the CWRM D&O, is approximately 87.95 mgd. This amount would be subject to further reduction in accordance with the DHHL reservation once called upon for use by the DHHL. The CWRM estimated that the amount of water potentially available after implementation of the CWRM D&O might be enough for about 90% of the irrigation needs for the approximately 23,000 IAL lands in Central Maui (although it is not clear if the CWRM D&O took into account the future DHHL reservation). However, there are approximately 30,000 agricultural acres in Central Maui (largely, but not exclusively, IAL lands), and Mahi Pono has expressed an intention to farm as much of that land as possible.

Hence, there are 30,000 acres total, all of which are not exclusively IAL lands and Mahi Pono intends to farm all 30,000 acres as discussed in Section 2.1.4 of the Draft EIS. Specifically, Table 2-2 discusses the acreage breakdown, of which approximately 9,100 acres is anticipated to be “Unirrigated Pasture” land. However, please note that the above has been corrected to state that there are approximately 22,000 acres designated as IAL lands, not 23,000 acres as was stated in the Draft EIS, as shown on page 3-21.

Comment 32: 2) *Water lease with different terms - In section 3.2.2.1, the applicant also asserts that any water lease of a duration shorter than 30 years could inhibit their ability to obtain financing for agricultural operations in central Maui, which would again be inconsistent with their objectives. The Service proposes that a 30-year lease with slightly different increments of diversion could in fact be viable (see new proposed Alternative 5 below).*

Response 32: Please note that the terms and conditions of the Water Lease are at the discretion of the BLNR. Should BLNR approve a Water Lease with a term as you suggest that is accepted by the lessee, the lessee will comply with all terms and conditions of the Water Lease. However, please note as discussed in Section 2.1.5 of the Draft EIS, it will take more than ten years for the Mahi Pono farm plan to reach full buildout. Hence, it is assumed that not all of the available water will be immediately diverted but rather will be diverted as needed in accordance with Mahi Pono’s incrementally growing farm activity.

Moreover, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private Central Maui Field Irrigation System in Central Maui (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. These new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all

water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Reducing water usage through effective irrigation ensures conservation of Hawai'i's natural resources. Please note that this information has been added to Section 2.1.4 of the Final EIS, as shown on page 2-25, as well as other sections when discussed.

Regarding the USFWS proposed alternative 5, the Draft EIS included an analysis of two alternatives that encompass what the USFWS is proposing: the Reduced Water Volume alternative and the Water Lease with Alternative Lease Duration alternative, discussed in Sections 3.2.1 and 3.2.2.1 of the EIS, respectively.

Comment 33: *3) Modified lease area - In section 3.2.2.2, the applicant notes that the BLNR has discretion to limit the geographic parameters of the lease to an area smaller than that currently proposed, and that this would not necessarily be inconsistent with the objectives of the Proposed Action. Given the higher quality of biological resources at the eastern end of the EMI system, the Service continues to support a Modified Lease Area alternative that concentrates surface water diversions in the more western Huelo and Honomanu license areas, with the more eastern Keanae and Nahiku license areas being utilized secondarily (see new proposed Alternative 5 below).*

Response 33: If your reference to a smaller lease area implies reduced access to streams, we disagree that this “would not necessarily be inconsistent with the objectives of the Proposed Action.” The EMI Aqueduct System traverses many different micro-climates within the East Maui watershed. In general, mean annual rainfall in the watersheds of East Maui increase with land elevation and, at the same elevation, decreases moving westward. The EMI Aqueduct System is at its highest elevation at its eastern end and decreases in elevation going westward. Therefore, the overall potential for available water in streams at the diversions is highest in the east and declines with elevation and direction moving westward.

Rainfall amounts also depend on weather conditions, as often times rainfall may be occurring in one sector of the EMI Aqueduct System and not in another. Farming needs a consistent source of irrigation water once a crop is planted and throughout its useful life. It would indeed be limiting on Mahi Pono's ability to farm and to increase its farmed acreage if its source of water was limited by geography to only a portion of the streams. EMI needs the flexibility to operate the EMI Aqueduct System most effectively to provide the water needed for uses described in the EIS.

Please note as discussed in Response #15 above that the CWRM D&O restored flow to the majority of the streams within the Nāhiku and Ke'anae portions of the License Area. Thus, the higher quality biological resources have been provided added protection, even under the Proposed Action.

The Modified Lease Area alternative that is discussed in the Draft EIS and further expanded on in the Final EIS refers to a smaller land area that would allow for more public access into the License Area while maintaining sufficient area within the License Area to ensure continued access for the operation and maintenance of the EMI Aqueduct System and to ensure safety of the system since it is a source of public drinking water, as well as safety of the EMI employees. Access to the streams will remain the same, in compliance with the CWRM IIFS decision. Under the “Modified Lease Area” alternative assessed in Section 3.2.2.2 the Draft EIS, it is assumed that access to and uses within the State-owned land that is outside of a smaller License Area would be managed by the State (presumably, DOFAW). DOFAW has not indicated how it intends to regulate those lands. Should there be greater public access to the License Area than currently exists, pursuant to the analysis in Section 3.2.2.2 of the EIS and Appendix C, it is anticipated that there may be an increased introduction or spreading of invasive species within these areas. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24, pages 3-32 to 3-34, and 3-44 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the impacts from experiencing an increase in public access in the License Area.

Section 1.3.1 and 3.2.2.2 of the Final EIS have also been updated to acknowledge that under the water RPs issued for 2020 and approved for 2021, the Hanawā NAR was removed from the License Area as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the potential to result in increased impacts to flora and fauna resources, but that will ultimately depend on if and when increased access takes place.

Comment 34: *4) No action - Under this alternative, the applicant would continue to divert up to 80 mgd of water from the 4 state lease areas under a continuing series of one-year revocable permits. The Service considers this alternative inadvisable given that recent court decisions have judged this practice of using an indefinite series of short-term permits as substitutes for long-term leases to be illegal. Additionally, this alternative does not adequately address potential project impacts to trust resources and endangered species.*

Response 34: Your description of the No Action alternative is not consistent with what was presented in the Draft EIS. The Draft EIS No Action alternative assumes that no Water Lease (or other permit authorizing the use of East Maui stream water from the State's land) would be authorized. Under that scenario it is estimated that the applicant could continue to divert only approximately 26.39 mgd from the License Area. Specifically, Section 3.3 of the Draft EIS states:

Under a 1938 agreement between the Territory of Hawai‘i and A&B, A&B was given a perpetual right and easement to convey water through those portions of the EMI Aqueduct System located within State lands, and to divert the water so conveyed through the EMI Aqueduct System, and A&B granted the Territory a similar perpetual right and easement. This agreement is in place irrespective of the issuance of any Water Lease. The No Action alternative would result in no Water Lease being issued from the State. However, under the 1938 agreement and a related calculation involving isohyet analysis of rainfall patterns, it is understood that approximately 30% of the water in the License Area streams is derived from the privately owned lands.

Therefore, the EMI Aqueduct System could continue to divert approximately 30% of the water available from the Collection Area, plus the 4.37 mgd from that portion of the Collection Area that is derived from privately owned lands outside of the License Area between Honopou stream and Māliko Gulch. Under the No Action alternative, it is assumed that an estimated total of 26.39 mgd is available to be diverted from that portion of the Collection Area east of Honopou stream, and approximately 4.37 mgd of surface water would be available from privately owned lands (i.e. not within the License Area) between Honopou stream and Māliko Gulch. Thus, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System under the No Action alternative would be approximately 30.76 mgd (Akinaka, 2019).

Please note that Section 3.3 of the Final EIS has been updated to include additional information on the 1938 Agreement, as shown on pages 3-24 to 3-25

Regarding your comment that Section 3.3 of the Draft EIS does not adequately address potential project impacts to trust resources and endangered species, note that the comparative analysis of the reasonable alternatives, including the No Action alternative, is set forth in Section 3.4 of the Draft EIS and Final EIS, which describes the impacts of the alternatives.

Comment 35: Additional Alternative to be Considered

Given the considerations outlined above, the Service suggests that an additional hybrid alternative be evaluated in the FEIS, consisting of a 30-year lease with a gradually increasing diversion allotment, contingent upon demonstrated need, with the later increments of this diversion being obtained from points of diversion progressively further east along the EMI aqueduct system.

Specifically, the Service proposes that the FEIS evaluate an additional alternative consisting of a 30-year lease with an initial ceiling of 48 mgd taken from catchments in the Huelo and Honomanu license areas west of the Koolau Gap, with future options, upon proof of need and subject to approval by the BLNR, for two additional diversion increments of 20 mgd each, to be drawn from catchments successively further east in the Keanae and Nahiku license areas. This would provide a potential withdrawal of up to 88 mgd of diversion from the state license areas,

as currently allowed under the CWRM D&O, but at the same time retain water in streams for public trust purposes until such time as the needs for offstream uses in Central Maui were demonstrated to the BLNR.

The above proposal is consistent with previous comments by the Service in its letter of February 20, 2016. On page 2-19 of the current DEIS, it is estimated that it will require 10 years to fully implement the Mahi Pono farm plan on 30,000 acres of former sugarcane lands. Since this conversion will not be instantaneous, it is clear that the amount of water diverted from the State lease areas will gradually ramp up over time, presuming no unanticipated delays or changes to the business model intervene. In its previous letter, the Service suggested using a phased approach to the water lease, with incrementally larger amounts of diversion being allowed as the demand for such was demonstrated, noting that it would also be consistent with the Hawaii State Water Code. The Service notes that this approach was not evaluated in the current DEIS, and so reiterates this suggestion for the FEIS.

Response 35: We acknowledge your comments and we appreciate the thought you put into them. However, please note that your alternative does not take into account the challenges and requirements of establishing a large scale diversified agricultural operation, the requirements of being relied upon as a public/community water source, nor the logistics of operating a system such as the EMI Aqueduct System to meet these needs. The hybrid proposal will therefore not meet the objectives of the Proposed Action.

As discussed in Response #33 above, the terms and conditions of the Water Lease are at the discretion of the BLNR. Should BLNR impose terms such as you suggest, it will be up to the proposed lessee as to whether they can comply with all terms and conditions of the Water Lease. If the terms are infeasible for the Proposed Action, a lease will not be entered into for the purpose of returning Central Maui to agriculture. However, please note as discussed in Section 2.1.5 of the Draft EIS, it will take more than ten years for the Mahi Pono farm plan to reach full buildout. Hence, not all of the available water will be immediately diverted but rather will be diverted as needed as determined by Mahi Pono's level of farming activity. Thus, in effect, the Proposed Action results in gradually increasing diversion of stream waters, as you propose—but limited by which streams water can be diverted from at any given time, other than to comply with the IIFS requirements under the CWRM D&O, which acts to protect streams of highest importance in the License Area while supporting the actual cultivation of the constitutionally mandated IAL's in Central Maui.

Furthermore, as discussed in Response #33 above, the Draft EIS included an analysis of two alternatives that encompass what the USFWS is proposing: the Reduced Water Volume alternative and the Water Lease with Alternative Lease Duration alternative, discussed in Sections 3.2.1 and 3.2.2.1 of the EIS, respectively. The Final EIS includes a "sliding scale" analysis of the impacts of the proposed Water Lease being issued but permitting water diversions in an amount less than what is allowed under the CWRM D&O in Section 3.2.1 of the Draft EIS. The sliding scale quantifies effects based upon each 1 mgd reduction in water, and

therefore provides the analytical framework for assessing the impacts of a Water Lease less than the Proposed Action. For each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture.

Comment 36: *The Service further notes that the DEIS estimates annual maintenance costs on the EMI aqueduct system will run on the order of \$2.5 million per year. A recent visit by Service staff to various portions of the EMI system in May 2019, in company with staff from the Hawaii Department of Land and Natural Resources, led to the observation that many sections of the system are already being blocked by treefalls and land slips, and that there was apparently no diversion of water in the system anywhere east of Puohokamoa Stream. This indicates that a significant portion of the system east of Koolau Gap is idle, that a large amount of maintenance on the ditch system has already been deferred, and that a major investment may be necessary to bring it back to its former level of operation.*

Response 36: Regarding your comment about the annual maintenance costs on the EMI Aqueduct System, please refer to Response #8 above.

Regarding your comments about a visit in May 2019 where USFWS observed that various sections of the EMI Aqueduct System were blocked by treefalls and land slips, EMI continually conducts maintenance and repair activities which involve keeping the waterways clear of trees, weeds, rocks, dirt and anything that will potentially impede the flow of water. This includes not only in ditches, but in tunnels and flumes as well. Some activities are performed by hand and other activities require small tractors and or specialized equipment. While EMI continually maintains the EMI Aqueduct System, the more utilized portions of the system are maintained more frequently than other portions. EMI evaluates areas of the EMI Aqueduct System regularly to identify where maintenance / repair activities are necessary and adds them to a list of maintenance projects. Please note that your May 2019 visit provided only a snapshot of the activity associated with the EMI Aqueduct System. The areas visited during the May 2019 visit with DOFAW focused on only a portion of the EMI Aqueduct System, primarily on locations where diversion activity had been suspended in part due to compliance with the CWRM D&O or temporarily suspended, due to low levels of water need on the Mahi Pono farm at that time. As noted in the Draft EIS, EMI will only divert the amount of water needed to deliver water to the County of Maui MDWS and for Mahi Pono farm plan needs at any given time. However, as Mahi Pono continues to expand its farming activities in Central Maui, as planned, the need for East Maui water will increase and diversions from streams east of Puohokamoa will ultimately resume, as allowed by the CWRM IIFS decision. The longer-term maintenance plan for the EMI Aqueduct System takes this phased incremental increase in the use of diversions into consideration, in its effort to ensure the entire EMI Aqueduct System remains efficiently functional. Moreover, in response to the Draft EIS comments regarding the condition of the EMI Aqueduct System, EMI staff have been conducting sweeps to locate / remove unnecessary ditch

debris from the License Area. Section 2.1.2 of the Final EIS has been revised to include this discussion as shown on page 2-7.

Comment 37: *Given a 10-year deployment of the associated farm plan, this also indicates that a large initial dollar investment will need to be made up-front for many years just to keep the system operational, in anticipation of future returns as the diversified agricultural operation is built out. Such a scenario comes with major uncertainties in regard to supply, demand, and macroeconomic cycles, thus the it is the Service's position that a lease for a modest amount of initial water delivery, coupled with future options for incrementally stepped up deliveries based on outcomes and need, is a more logical approach, and that such an alternative should be analyzed in the FEIS. This approach would also have the benefit of maximizing interim instream flows and associated ecological functions in the near term.*

Response 37: As noted in prior responses, your assumptions about the condition of the EMI Aqueduct System are misconstrued. The EMI Aqueduct System is in good working condition and EMI conducts regular maintenance on the system to keep it operating well. Therefore, a large initial dollar investment is not required up-front to keep the EMI Aqueduct System in good working order. Please note that the maintenance and repair costs associated with the EMI Aqueduct System are relatively constant as discussed in Section 4.7.3 of the Draft EIS. Specifically, Section 4.7.3 of the Draft EIS states:

Due to the nature of the EMI Aqueduct System, the operational costs are largely fixed, with minimal variable costs. Future operational costs for the EMI Aqueduct System are anticipated to be similar to the average cost experienced during the recent sugar operations period (2008-2013), with the only variation being the amount of the Water Lease payments owed to the State.

Regarding the Central Maui Field Irrigation System within the agricultural fields, as discussed in Response #33 above, Mahi Pono expects to invest over \$20 million to increase the efficiency of that private system. This investment is to improve water use efficiencies. However, it is not anticipated that large initial dollar investments are required up-front to keep the Central Maui Field Irrigation System operational as you suggest in Comment #37 above.

Furthermore, as discussed in Responses #33 and 35 above, the alternative that USFWS suggests is within the range of alternatives considered in the EIS.

Comment 38: Comparative evaluation of reasonable alternatives (Section 3.4)

In regard to section 3.4, where the potential impacts of the various alternatives are compared, the Service has the following comments:

1) Coastal Waters (Section 3.4.5)

In this section on page 3-9, it is stated that neither the proposed action or any of the various alternatives would impact the coastal waters of East Maui, because the ocean environment is

not affected by the intensity of stream flow, being so much larger. The Service considers analysis to be overly simplistic, because it overlooks the role that stream inflows play in regard to the delivery of land-based nutrient inputs to nearshore waters, and the associated positive effects on fisheries recruitment, particularly in oligotrophic tropical seas such as those surrounding the Hawaiian Islands. This topic needs to be addressed in the FEIS, and the superficial treatment of coastal water interactions with stream inflows needs to be examined in much greater detail.

Response 38: Regarding your comment about the Proposed Action and associated alternatives not having an impact on coastal water in East Maui, this is addressed by the Draft EIS in Section 4.2.3, which summarizes the stream and ocean water chemistry assessment conducted by Sea Engineering, Inc. (SE) and Marine Research Consultants, Inc. (MRC) in Appendix B. The collected data presented in Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. The entire purpose of the marine studies that were performed as part of this EIS was to quantify the degree of mixing of nutrients from stream waters within coastal waters. It is likely this work is the most comprehensive evaluation of such mixing ever performed on accessible East Maui Streams and cannot be considered “overly simplistic.” It is also established that by definition “oligotrophic tropical seas” contain very low nutrient concentrations, owing to lack of inputs from land. The oligotrophic zone is generally considered the open ocean. As such, such areas of the open ocean are physically separated from coastal ocean areas, which are influenced by input from land. Equating the effects of inputs of stream borne materials to the oligotrophic ocean is by definition, not a realistic consideration.

We recognize that land-based nutrient inputs to nearshore waters generally have a positive impact on fisheries. The greatest event-related nutrient input from streams in East Maui occurs during periodic but brief freshet flows that occur during wet-weather conditions. Those freshet flows, however, are orders of magnitude greater than the amount of water that can be diverted when they occur. Hence, nutrient delivery during these events would not be affected by the diversions. The collected data presented in Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, because the nutrient concentrations in the ocean do not change substantially due to stream diversions as proposed under the Water Lease, the Proposed Action is not anticipated to have negative impacts on fisheries.

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species (‘O‘opu naniha (*Stenogobius hawaiiensis*), ‘O‘opu akupa (*Eleotris sandvicensis*))

and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opulua, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83 of the Final EIS.

Comment 39: *b) Flora, Fauna and Invertebrates (Section 3.4.8)*

The DEIS contends that modifying the lease area could result in greater public access, which would result in trampling and other impacts to the existing flora. In addition, significant concerns are raised about the possible introduction of invasive weeds. The Service notes, however, that the majority of the vegetation surrounding the EMI ditch system and its access

roads is overwhelmingly dominated by invasive non-native plant species, the trampling or disturbance of which would present minimal concern, and that any weeds that might be transported into the license area by members of the public are already present and proliferating. As such, the potential biological impacts related additional public access to this area do not appear to be a reasonable basis for rejection of the Modified Lease Area alternative.

Response 39: To clarify, and as discussed in Section 3.2.2.2 of the Draft EIS, the BLNR has the discretion to set the geographic parameters of the License Area to one that is smaller than what is currently presented as the Proposed Action. However, the geographic extent of the License Area would need to ensure the operation and maintenance of the EMI Aqueduct System with appropriate buffers to ensure public safety, the safety of EMI employees, as well as the security of the EMI Aqueduct System which is a source of public drinking water. As such, the areas you identify as being dominated by invasive species (areas around the EMI Aqueduct System and its accessways) would not be those, for the most part, that would be opened up to the general public. Those areas would continue to be utilized by EMI staff for maintenance and operation of the EMI Aqueduct System.

Under the “Modified Lease Area” alternative assessed in Section 3.2.2.2 of the Draft EIS, it is assumed that access to and uses within the State-owned land that may no longer be part of a more limited Water Lease area would be managed by the State (presumably, DOFAW). DOFAW has not indicated how it intends to regulate those lands. As discussed in Section 3.4.8 of the Draft EIS, should there be greater public access to the License Area than currently exists, it is anticipated that there may be an increased introduction or spreading of invasive species to these areas. Please note that the discussion in Section 3.4.8 of the Final EIS has been expanded to discuss impacts from greater public access in more detail as shown on page 3-32.

Comment 40: *4.2.1 Surface Waters (4-54)*

Given that the HEP model was originally developed by the Service, we consider the version tailored to Hawaiian stream ecosystems, HSHEP, to be a valid tool for estimating gains or losses of stream habitat and function related to varying diversion scenarios as used in the DEIS. As noted in section 4.2.1, this model's results indicate that the proposed action will have a negative impact by reducing stream flow from that prevailing under natural, undiverted conditions. The Service acknowledges that it is the mandate of Hawaii CWRM to balance the loss of such instream uses with the needs of offstream users. However, the Service also notes that under HRS 174C, agricultural diversions are not considered a public trust use. As stated by the Hawaii State Supreme Court in its Waiahole Ditch decision of August 22, 2000: "Although its purpose has evolved over time, the public trust has never been understood to safeguard rights of exclusive use for private commercial gain."

The current CWRM D&O has resulted in the restoration of significant amounts of flowing stream habitat in East Maui, and the Service finds this commendable. However, as noted on page 4-58 of the DEIS, lateral entrainment and out-of-basin export by the ditch system of

migratory diadromous biota, such as fishes and prawns, remains a significant issue. The Service recommends that the FEIS discuss in greater detail what steps might be taken to minimize such entrainment at the points of diversion, so as to allow the fullest possible utilization of the restored habitat by native organisms, and thereby reduce the biological impacts of the proposed action.

Response 40: We appreciate your acknowledgement of the HSHEP model. We question, however, your characterization of HRS Chapter 174C, the State Water Code, as it relates to agricultural use of water. Please note that the State Water Code does not list public trust uses of water, nor is it stated anywhere in the code that the agricultural use of water is not a public trust use. In fact, HRS § 174C-2(c) declares the use of water for agriculture as being in the public interest, per below:

HRS § 174C-2 Declaration of Policy.

*(c) The state water code shall be liberally interpreted to obtain maximum beneficial use of waters of the State for purposes such as domestic uses, aquaculture uses, **irrigation and other agricultural uses**, power development, and commercial and industrial uses. However, adequate provision shall be made for the protection of traditional and customary Hawaiian rights, the protection and procreation of fish and wildlife, the maintenance of proper ecological balance and scenic beauty, and the preservation and enhancement of waters of the State for municipal uses, public recreation, public water supply, **agriculture and navigation. Such objectives are declared to be in the public interest.** (emphasis added)*

Contrary to your comment, the State Water Code clearly includes agricultural use of water as in the public interest and part of the balance with instream uses.

As for your reference to the Waiahole Ditch decision, please note that the Hawai‘i Supreme Court in said decision also stated the following:

We have indicated a preference for accommodating both instream and offstream uses where feasible. . . . In times of greater scarcity, however, the state will confront difficult choices that may not lend themselves to formulaic solutions. Given the diverse and not necessarily complementary range of water uses, even among public trust uses alone, we consider it neither feasible nor prudent to designate absolute priorities between broad categories of uses under the water resources trust. Contrary to the Commission’s conclusion that the trust establishes resource protection as “a categorical imperative and the precondition to all subsequent considerations,” we hold that the Commission inevitably must weigh competing public and private water uses on a case-by-case basis, according to any appropriate standards provided by law.

In re Water Use Permit Applications ("Waiahole I"), 94 Hawai'i 97, 142, 9 P.3d 409, 454 (2000).

The state also bears and “affirmative duty to take the public trust into account in the planning and allocation of water resources, and to protect public trust uses whenever feasible.” Preliminarily, we note that this duty may not readily translate into substantive results. The public has a definite interest in the development and use of water resources for various reasonable and beneficial public and private offstream purposes, including agriculture[.] Therefore, apart from the question of historical practice, reason and necessity dictate that the public trust may have to accommodate offstream diversions inconsistent with the mandate of protection, to the unavoidable impairment of public instream uses and values. . . . [B]y conditioning use and development on resource “conservation,” article XI, section 1 does not preclude offstream use, but merely requires that all uses, offstream or instream, public or private, promote the best economic and social interests of the people of this state. In the words of another court, “[t]he result . . . is a controlled development of resources rather than no development.”

Waiahole I, 94 Hawai'i at 141, 9 P.3d at 453.

Thus, under article XI, section 1 of the Hawai'i Constitution, the Proposed Action is an appropriate use of public waters which would allow the state to both protect water resources while allowing a use of water that is in the best economic and social interests of the people of the state, whether it is a public or private use of the water resource. Please note that Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine and public trust resources as shown on pages 1-25 to 1-27.

We agree that the IIFS requirements under the CWRM D&O have resulted in the restoration of significant amounts of flowing stream habitat. As noted in the HSHEP report, "Overall, the analysis resulting from the combination of field surveys and habitat modeling supports the flow restoration under the CWRM D&O 2018 IIFS in improving habitat conditions for native amphidromous stream animals." The HSHEP model focuses on changes in instream habitat, entrainment or barriers to passage for these migratory native stream species with respect to modifications of the stream environment. In the case of the East Maui streams covered by the Draft EIS, the primary impact (i.e., cause of entrainment) is streamflow diversion. Any changes to stream habitat arising from diversion structures are minuscule in comparison to the loss of habitat that arises from dewatered streams. Thus, the primary mitigation measure is flow restoration (the greater percentages of total streamflow diverted generally resulted in lower amounts of instream habitat for native stream species). The HSHEP modeling intent was to quantify the flow restoration effect on the native stream species. Thus, the results of the HSHEP model document mitigation measures to restore native stream life to various restoration targets. Appendix A to the EIS also recognizes other potential mitigation factors, such as engineering

changes to increase fish passage and decrease larval entrainment, diversion locations, and the number of diversions.

Regarding your question about what steps can be taken to minimize entrainment at the points of diversion, as discussed in Appendix A to the EIS, and summarized in EIS Section 4.2.1, updated as shown on pages 4-63 to 4-67 of the Final EIS, given the 250+ diversions within the EMI Aqueduct System, incremental changes to each aspect of diversion amount on habitat, entrainment, and passage for each diversion individually and all diversion combinations would result in too many model results for rational use (the number of possible combinations with just one change at each diversion is far over a billion different results, $2^{250}-1 = \text{combinations}$). Therefore, the HSHEP model discusses general guiding concepts associated with flow modification and changes to diversion design to minimize barriers to passage and larval entrainment:

With respect to diversion location:

- When comparing the location of a diversion, diverting comparable amounts of water at higher elevation diversions was less damaging to instream habitat for native stream species than diverting that water at lower elevation diversions.

With respect to a single diversion in comparison to multiple diversions:

- A single diversion at the upstream most diversion location capturing X amount of stream flow will result in more instream habitat than multiple stream diversions throughout the stream diverting the same amount of stream flow in total (sum of multiple diversions = X). The lower amount of total habitat under the partial water diversion at multiple diversions was the result of compounding impact on entrainment/passage barriers at each diversion.

With respect to modifications of the diversion for improved passage and decreased entrainment:

- Improvements in diversion passage resulted in more suitable habitat at most flow levels.
- At lower flow restoration amounts, modifications to improve passage resulted in greater gains in suitable habitat than at higher flow restoration level.

As discussed in Section 4.2 and Appendix A of the EIS, it was not possible to model every scenario and determine the “optimal” solution within the complex East Maui Irrigation system and thus the above are guiding concepts which may allow more specific actions to be determined as broader flow modification quantities are determined.

Comment 41: Biosecurity Provisions

While much of the ditch system and access roads are in areas where non-native species and ecosystems predominate, native forest is found in many locations of the system and the access roads and ditch are adjacent to native-dominated habitats upslope. As such, biosecurity is

*important to minimize movement of particularly noxious pests and threats into these areas. Two of the more recent concerns that should be addressed include Rapid Ohia Death and little fire ants (*Wasmannia auropunctata*). Little fire ants have been found in many areas of Maui, including Huelo, Haiku, and Nahiku on the north side of the island (<https://mauiinvasive.org/little-fire-ant/>). Similarly, Rapid Ohia Death caused by two species of fungal pathogens was first found on Maui in 2019 in a single tree on East Maui. It is important to prevent the spread of both of these invasive species into more intact native forests through adequate biosecurity. The following are recommendations for appropriate response to these and other invasive species that could be used to develop an appropriate biosecurity plan.*

- ***All work vehicles, machinery, and equipment should be cleaned, inspected by its user, and found free of mud, dirt, debris and invasive species prior to entry into the natural areas or native habitat.***
 - a. *Vehicles, machinery, and equipment must be thoroughly pressure washed in a designated cleaning area and visibly free of mud, dirt, plant debris, insects, frogs (including frog eggs) and other vertebrate species such as rats, mice and non-vegetative debris. A hot water wash is preferred. Areas of particular concern include bumpers, grills, hood compartments, areas under the battery, wheel wells, undercarriage, cabs, and truck beds (truck beds with accumulated material (intentionally placed or fallen from trees) are prime sites for hitchhikers).*
 - b. *The interior and exterior of vehicles, machinery, and equipment must be free of rubbish and food. The interiors of vehicles and the cabs of machinery must be vacuumed clean. Floor mats shall be sanitized with a solution of >70% isopropyl alcohol or a freshly mixed 10% bleach solution.*
 - c. *Any machinery, vehicles, equipment, or other supplies found to be infested with ants (or other invasive species) must not enter natural areas or native habitat. Treatment is the responsibility of the equipment or vehicle owner and operator.*

Response 41: We acknowledge your comments above and they have been taken into consideration. Please note that the above recommendations in Comment #41 are generally discussed in Section 4.4.1 of the Draft EIS. Specifically, Section 4.4.1 of the Draft EIS recommended the following mitigation measure:

- *To avoid the introduction or transport of new invasive plant species into more pristine portions of the License Area during EMI Aqueduct System maintenance activities, all equipment and vehicles arriving from outside the License Area should be washed and inspected prior to any maintenance activities on cliff sides, near waterfalls, and in other native species-dominated areas in the License Area. Such washing and inspecting should be done at a designated location.*

However, please note that Section 4.4.1 of the Final EIS has been revised to include more targeted discussions regarding mitigation measures to prevent the transport of invasive species into the License Area as recommended by the USFWS as shown on pages 4-121 to 4-124.

Comment 42: 2. Little Fire Ants -All work vehicles, machinery, and equipment should be inspected for invasive ants prior to entering the natural areas or native habitat.

A visual inspection for little fire ants should be conducted prior to entry into natural areas or native habitat.

- *Hygiene is paramount but even the cleanest vehicle can pick up a little fire ant. Place MaxForce Complete Brand Granular Insect Bait (1.0% Hydramethylnon; <http://littlefireants.com/Maxforcc.com/Maxforcc%20Complctc.pd20Complctc.pd00>) into refillable tamper resistant bait stations. An example of a commercially available refillable tamper resistant bait station is the Ant Cafe Pro (<https://www.antcafc.com/>). Place a bait station (or stations) in vehicle. Note larger vehicles, such as trucks, may require multiple stations. Monitor bait stations frequently (every week at a minimum) and replace bait as needed. If the station does not have a sticker to identify the contents, apply a sticker listing contents to the station.*
- *Any machinery, vehicles, equipment, or other supplies found to be infested with ants (or other invasive species) must not enter natural areas or native habitat until it is sanitized and re-tested following a resting period. Infested vehicles must be sanitized following recommendations by the Hawaii Ant Lab (<http://www.littlefireants.com/>) or other ant control expert and in accordance with all State and Federal laws. Treatment is the responsibility of the equipment or vehicle owner.*
- *Gravel, building materials, or other equipment such as portable buildings should be baited using MaxForce Complete Brand Granular Insect Bait (1.0% Hydramethylnon; <http://littlefireants.com/Maxforcc%20Complctc.pd00>) or AmdroProAmdroPro ((0.73%0.73% HydramethylnonHydramethylnon ; ; <http://littlefireants.com/Amdro%20Pro.pdt>) following label guidance.*
- *Storage areas that hold field tools, especially tents, tarps, and clothing should be baited using MaxForce Complete Brand Granular Insect Bait (1.0% Hydramethylnon; <http://littlefireants.com/Maxforcc%20Complctc.pd20Complctc.pd00>) To avoid the introduction or transport of new invasive plant species into more pristine portions of the License Area during EMI Aqueduct System maintenance activities, all equipment and vehicles arriving from outside the License Area should be washed and inspected prior to any maintenance activities on cliff sides, near waterfalls, and in other native species-dominated areas in the License Area. Such washing and inspecting should be done at a designated location.*
- *AmdroProAmdroPro ((0.73%0.73% HydramethylnonHydramethylnon ; ; <http://littlefireants.com/Amdro%20Pro.pdt>) following label guidance.*

Response 42: We acknowledge your comments above and they have been taken into consideration. Note that the Draft EIS did not discuss any targeted mitigation or avoidance measures as it relates to little fire ants but was generally discussed to deal with all invasive species. However, it is recognized the little fire ants are an issue in East Maui as recognized by

the Hawai'i Invasive Species Council. Please note that Section 4.4.2 of the Final EIS has been revised as shown on page 4-129 to include a target mitigation measure regarding little fire ants as recommended by the USFWS.

Comment 43: *3. Base yards and staging areas inside and outside areas must be kept free of invasive species.*

- *Base yards and staging areas should be inspected at least weekly for invasive species and any found invasive removed immediately. Pay particular attention to where vehicles are parked overnight, keeping areas within 10-meters of vehicles free of debris. Parking on pavement and not under trees, while not always practical is best.*
- *Project vehicles or equipment stored outside of a base yard or staging area, such as a private residence, should be kept in a pest free area.*

Response 43: Please note that the above recommendation in Comment #43 is generally discussed in Section 4.4.1 of the Draft EIS as noted in Response #41 above. However, please note that Section 4.4.1 of the Final EIS has been revised to include more targeted discussions on mitigation measures for invasive species as recommended by the USFWS as shown on pages 4-121 to 4-124.

Comment 44: *All cutting tools must be sanitized to prevent the Rapid 'Ohi'a Death (ROD) fungus.*

- *Avoid wounding 'ohi'a trees and roots with mowers, chainsaws, weed eaters, and other tools. Cut only the minimum amount of trees and branches as approved for the project.*
- *All cutting tools, including machetes, chainsaws, and loppers must be sanitized to remove visible dirt and other contaminants prior to entry into natural areas or areas with native habitat, and when moving to a new project area within the native habitat area. Tools may be sanitized using a solution of >70% isopropyl alcohol or a freshly mixed 10% bleach solution. One minute after sanitizing, you may apply an oil based lubricant to chainsaw chains or other metallic parts to prevent corrosion.*
- *Only dedicated tools and chainsaws should be used to sample known or suspected ROD infected trees.*
- *Vehicles, machinery, and equipment must be cleaned as described in (1) above.*

Response 44: We acknowledge your comments above and they have been taken into consideration. Note that the Draft EIS did not discuss any targeted mitigation or avoidance measures as it relates to cutting tools and Rapid 'Ōhi'a Death (ROD) fungus. Please note that Section 4.4.1 of the Final EIS has been revised to include the above recommendation as shown on 4-122 to 4-123.

Comment 45: *Imported firewood, logs, and 'ohi'a parts:*

- *'Ohi'a firewood, 'ohi'a logs, and 'ohi'a parts should not be transported.*

Response 45: We acknowledge your comments above and they have been taken into consideration. Note that the Draft EIS did not discuss any targeted mitigation or avoidance measures as it relates to ‘Ōhi‘a firewood, logs, and parts. Please note that Section 4.4.1 of the Final EIS has been revised to include the above recommendation as shown on page 4-123.

Comment 46: *For individuals working in the field:*

- *Before going into the field, visually inspect and clean your clothes, boots, pack, radio harness, tools and other personal gear and equipment, for seeds, soil, plant parts, insects, and other debris. A small brush is handy for cleaning boots, equipment and gear. Soles of shoes should be sanitized using a solution of >70% isopropyl alcohol or a freshly mixed 10% bleach solution.*
- *Immediately before leaving the field, visually inspect and clean your clothes, boots, pack, radio harness, tools, and other personnel gear and equipment, for seeds, soil, plant parts, insects, and other debris. Soles of shoes should be sanitized using a solution of >70% isopropyl alcohol or a freshly mixed 10% bleach solution.*
- *Little fire ants nest in trees. If you are under a tree and that tree is bumped or somehow stressed, the threat response of the ants is to fall from the leaves and sting the person under the tree. If you are subject to an ant-attack, do not panic. The ants are extremely small but their stings are painful so make sure you remove all ants from your body and clothing. The stings cause inch long welts that are itchy and painful, and can last for weeks. Treat stings as you would other insect stings. In some persons stings can produce life threatening reactions. Stocking antihistamine in the first aid kit is a reasonable precaution.*

Response 46: We acknowledge your comments above and they have been taken into consideration. Please note that the above recommendations in Comment #46 are generally discussed in Section 4.4.1 of the Draft EIS. Specifically, Section 4.4.1 of the Draft EIS states:

However, to the extent that maintenance activities are undertaken within the License Area in pristine areas, such as on cliffsides, nears waterfalls, or in other native species dominated areas, the following avoidance and minimization measures are recommended:

- *A qualified biological monitor should be on site to ensure that no listed or candidate species are impacted.*
- *The monitor should have familiarity with the plants of the area, including special-status species, familiarity with natural communities of the area, including special-status natural communities, experience conducting floristic field surveys, and experience with analyzing impacts of development on native plant species and natural communities*

10238-04

Letter to Ms. Michelle Bogardus

Page 43 of 43

September 3, 2021

- *To avoid the introduction or transport of new invasive plant species into more pristine portions of the License Area during EMI Aqueduct System maintenance activities, all equipment and vehicles arriving from outside the License Area should be washed and inspected prior to any maintenance activities on cliff sides, near waterfalls, and in other native species-dominated areas in the License Area. Such washing and inspecting should be done at a designated location.*

However, please note that Section 4.4.1 of the Final EIS has been revised to include more targeted discussions as recommended by the USFWS as shown on page 4-129. As it relates to little fire ants, please see Response #42 above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

via email: waterleaseeis@wilsonokamoto.com

Dear Mr. Matsukawa:

SUBJECT: Draft Environmental Impact Statement for the Proposed Water Lease located at Nahiku, Keanae, Honomanu, and Huelo License Areas, Island of Maui; TMK Nos.: (2) 1-2-004:005 and 007 por., (2) 1-1-002:002, (2) 1-1-001:044 and 050; and (2) 2-9-014:001, 005, 011, 012, and 017 on behalf of Alexander & Baldwin Inc. (A&B) / **East Maui Irrigation Company, Limited (EMI)**

Thank you for the opportunity to review and comment on the subject matter. The Land Division of the Department of Land and Natural Resources (DLNR) distributed or made available a copy of your request pertaining to the subject matter to DLNR's Divisions for their review and comments.

At this time, enclosed are comments from the (a) Engineering Division and (b) Office of Conservation and Coastal Lands on the subject matter. Should you have any questions, please feel free to contact Darlene Nakamura at 587-0417 or email: darlene.k.nakamura@hawaii.gov. Thank you.

Sincerely,

A handwritten signature in blue ink, appearing to read "Russell Y. Tsuji".

COMMENTS

The rules and regulations of the National Flood Insurance Program (NFIP), Title 44 of the Code of Federal Regulations (44CFR), are in effect when development falls within a Special Flood Hazard Area (high risk areas). State projects are required to comply with 44CFR regulations as stipulated in Section 60.12. Be advised that 44CFR reflects the minimum standards as set forth by the NFIP. Local community flood ordinances may stipulate higher standards that can be more restrictive and would take precedence over the minimum NFIP standards.

The owner of the project property and/or their representative is responsible to research the Flood Hazard Zone designation for the project. Flood Hazard Zones are designated on FEMA's Flood Insurance Rate Maps (FIRM), which can be viewed on our Flood Hazard Assessment Tool (FHAT) (<http://gis.hawaiiinfip.org/FHAT>).

If there are questions regarding the local flood ordinances, please contact the applicable County NFIP coordinating agency below:

- o Oahu: City and County of Honolulu, Department of Planning and Permitting (808) 768-8098.
- o Hawaii Island: County of Hawaii, Department of Public Works (808) 961-8327.
- o Maui/Molokai/Lanai County of Maui, Department of Planning (808) 270-7253.
- o Kauai: County of Kauai, Department of Public Works (808) 241-4896.

MEMORANDUM

TO: Russ Tsuji, Administrator
Land Division

FROM: Sam Lemmo, Administrator
Office of Conservation and Coastal Lands

NOV - 4 2019

SUBJECT: Comments on the Draft Environmental Impact Statement (EIS) for a Water Lease Located at Nāhiku, Ke'anae, Honomanū, and Huelo, Maui, TMKs: (2) 1-2-004: 005 & 007; 1-1-002:002; 1-1-001:044 & 050; 2-9-014: 001, 005, 011, 012 & 017

The Office of Conservation and Coastal Lands (OCCL) has reviewed the draft EIS regarding land uses in the Conservation District and note the entire licensed area is within the Conservation District Protective, Limited and Resource subzones. According to the draft document, a 30-year lease will enable the lessee to enter upon lands owned by the State to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System and allow for the continued operation of the Aqueduct System to deliver water. No new construction is required to issue the lease.

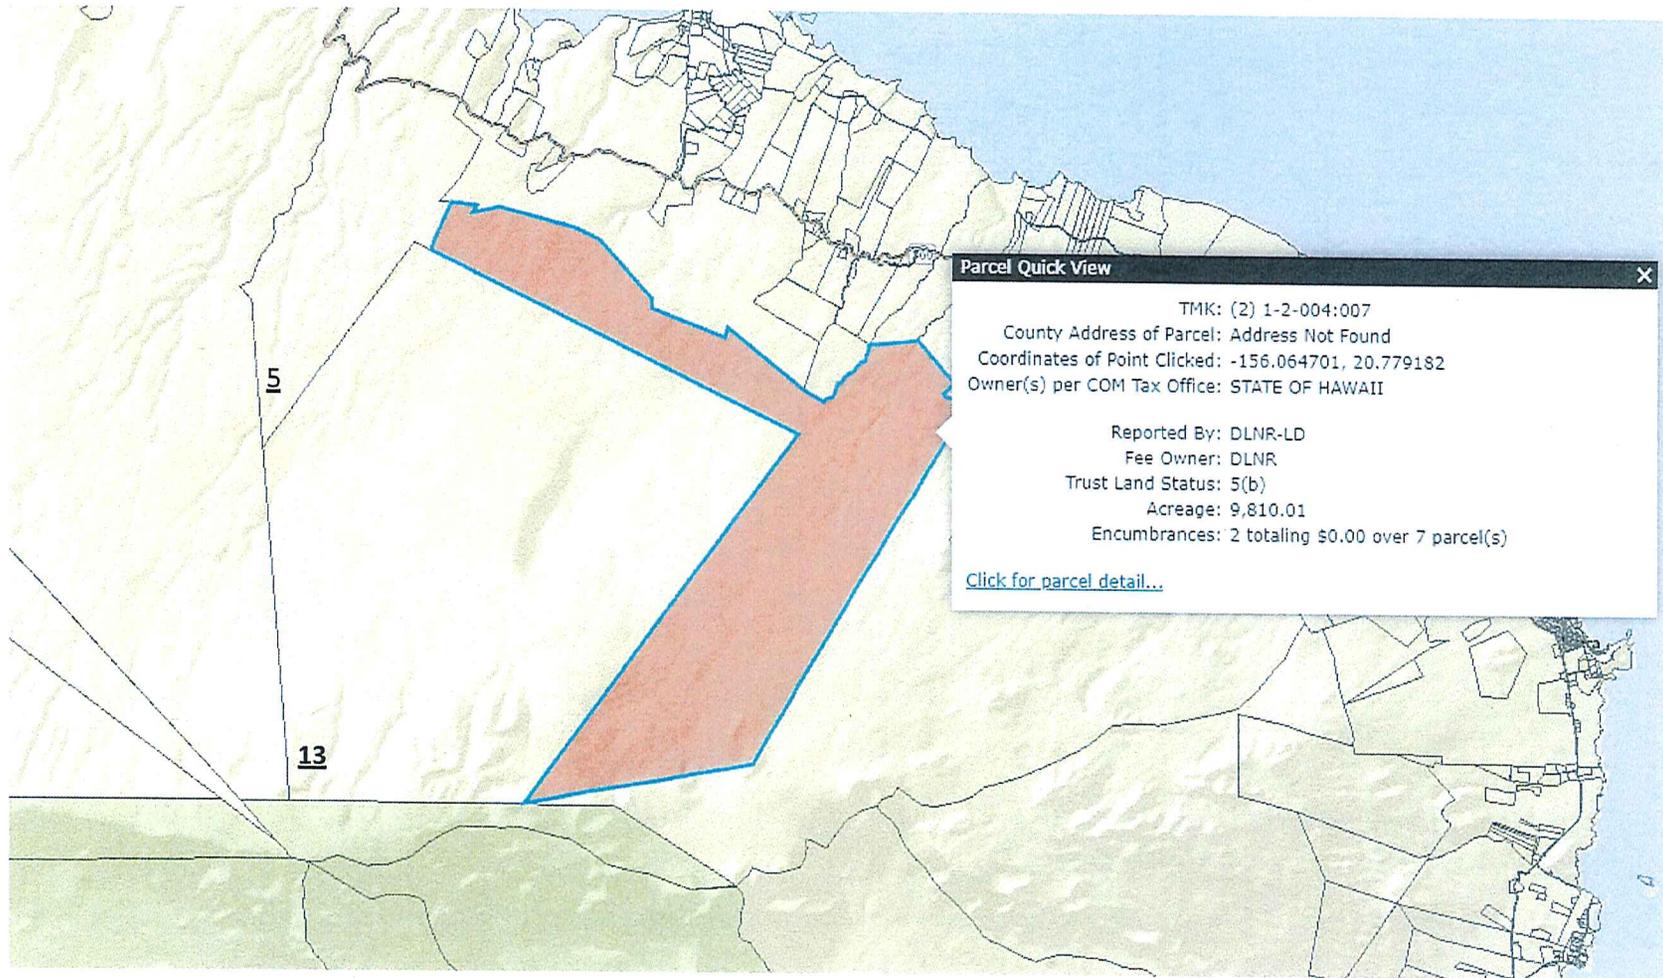

The OCCL recognizes the Aqueduct System as a nonconforming land use or a land use that was created prior to the advent of the Conservation District. While pursuant to the Hawai'i Administrative Rules (HAR) §13-5-7, the continuance, or repair and maintenance of nonconforming land uses shall not be prohibited; the repair of structures shall be subject to development standards set forth in HAR, Chapter 13-5. Further, modifications to the Aqueduct System to comply with instream flow standards; monitoring devices; related improvements to existing roads and trails; proposed new roads, dam reservoirs, and fencing; and native tree removal mitigation shall also be subject to HAR, Chapter 13-5.

According to the draft EIS, there is a concern about the physical condition of the Aqueduct System. While proposed mitigative action is identified for activities, there is no description of the expected "maintenance and repair" to the roads and trails and aqueduct that may be necessary for continued operation. The EIS should discuss the routine/preventative maintenance that is in place and given the age of the system are there any expected major future maintenance actions?

The OCCL notes on September 28, 1990, the Board of Land and Natural Resources (Board) approved Conservation District Use Permit (CDUP) MA-2376 for the installation of a water transmission line, the installation of 30 fifty-foot tall poles for overhead powerlines and a 1-year temporary land use to test Kuhiwa well. Our records indicate this land use upon Tax Map Key (2) 1-2-004:003. Pdf page 1033 appears to indicate that the Kuhiwa well is on parcel 007, when the Kuhiwa well is on parcel 003.

The illustrations and maps of the licensed area do not reflect the Natural Area Reserve on parcel 013. We have included an attachment of the area from the State Public Land Trust Information System that illustrates the new boundaries of TMKs: (2) 1-2-004:005, 007 & new NAR parcel 013. On January 27, 1984, the Board approved CDUP MA-1591 for Subdivision and Establishment of the Hanawi Natural Area Reserve that included portions of tax map keys: (2) 1-2-004:005 & 007. The staff recommendation to the Board stated the makai boundary was adjusted to the 2000-ft. elevation to exclude the existing Pogues tunnel and an area perceived as having potential for future water development. Given that areas of existing and potential future water development have been excluded from the Hanawi NAR, will the licensed area be amended, or will it include a portion of the NAR parcel 013?

Should there be any questions regarding this memorandum, contact Tiger Mills of our Office at (808) 587-0382.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas

Dear Ms. Chang:

Thank you for comments dated November 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The rules and regulations of the National Flood Insurance Program (NFIP), Title 44 of the Code of Federal Regulations (44CFR), are in effect when development falls within Special Flood Hazard Area (high risk areas). State projects are required to comply with 44CFR regulations as stipulated in Section 60.12. Be advised that 44CFR reflects the minimum standards as set forth by the NFIP. Local community flood ordinances may stipulate higher standards that can be more restrictive and would take precedence over the minimum NFIP standards.*

Response 1: We acknowledge your comments. However, please note that there is no development associated with the Proposed Action. The Proposed Action is the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose

of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugarcane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS, including those related to flood hazards. For East, Upcountry, and Central Maui, there are no significant impacts on flooding anticipated.

Comment 2: *The owner of the project property and/or their representative is responsible to research the Flood Hazard Zone designation for the project. Flood Hazard Zones are designated on FEMA's Flood Insurance Rate Maps (FIRM), which can be viewed on our Flood Hazard Assessment Tool (FHAT) (<http://gis.hawaiiifip.org/FHAT>).*

Response 2: Please note that Section 4.3.3 of the Draft EIS did research the Flood Hazard Zone designation for East, Upcountry, and Central Maui which are further depicted by Figures 4-29 to 4-31 for each respective region. As noted in Response #1, there are no significant impacts on flooding anticipated.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Honolulu, HI 96809

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas

Dear Mr. Lemmo:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The Office of Conservation and Coastal Lands (OCCL) has reviewed the draft EIS regarding land uses in the Conservation District and note the entire licensed area is within the Conservation District Protective, Limited and Resource subzones. According to the draft document, a 30-year lease will enable the lessee to enter upon lands owned by the State to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System and allow for the continued operation of the Aqueduct System to deliver water. No new construction is required to issue the lease.*

Response 1: You are correct. Please note that a discussion regarding the Conservation District subzones and its objectives has been added to Section 5.1.3 of the Final EIS, as shown on pages 5-36 to 5-39.

Comment 2: *The OCCL recognizes the Aqueduct System as a nonconforming land use or a land use that was created prior to the advent of the Conservation District. While pursuant to the Hawai'i Administrative Rules (HAR) §13-5-7, the continuance, or repair and maintenance of nonconforming land uses shall not be prohibited; the repair of structures shall be subject to development standards set forth in HAR, Chapter 13-5. Further, modifications to the Aqueduct System to comply with instream flow standards; monitoring devices; related improvements to existing roads and trails; proposed new roads, dam reservoirs, and fencing; and native tree removal mitigation shall also be subject to HAR, Chapter 13-5.*

Response 2: We acknowledge your comments that the EMI Aqueduct System is a nonconforming land-use that was developed prior to the advent of the State Land Use Conservation District. We note that pursuant to HAR §13-5-7, the continuance, or repair and maintenance of nonconforming land uses shall not be prohibited. Please note that as discussed in Section 2.1.2 of the Final EIS, under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment. The Applicant will ensure that repair and maintenance activities are subject to the development standards set for in HAR, Chapter 13-5. We also note that modifications to the EMI Aqueduct System to comply with the IIFS; monitoring devices; related improvements to existing roads and trails; proposed new roads, dam reservoirs, and fencing; and native tree removal mitigation are also subject to HAR, Chapter 13-5.

Comment 3: *According to the draft EIS, there is a concern about the physical condition of the Aqueduct System. While proposed mitigative action is identified for activities, there is no description of the expected "maintenance and repair" to the roads and trails and aqueduct that may be necessary for continued operation. The EIS should discuss the routine/preventative maintenance that is in place and given the age of the system are there any expected major future maintenance actions?*

Response 3: Your comment about the physical condition of the EMI Aqueduct System is unclear. Please note that the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System. We also note that Appendix D of the EIS provides a Historical Structure

Assessment East Maui Aqueduct System prepared by Mason Architects to provide an assessment of the historical significance of the EMI Aqueduct System.

Regarding maintenance and repair activities, as noted in Response #2 above, as discussed in Section 2.1.2 of the Final EIS, under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment.

Please note that at this time, there are not any expected major maintenance actions regarding the EMI Aqueduct System. However, regarding the Central Maui Field Irrigation System, where system losses are present, it should be noted Mahi Pono expects to invest over \$20 million to increase the efficiency of its Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to Section 2.1.4 of the Final EIS as shown in page 2-25.

Comment 4: *The OCCL notes on September 28, 1990, the Board of Land and Natural Resources (Board) approved Conservation District Use Permit (CDUP) MA-2376 for the installation of a water transmission line, the installation of 30 fifty-foot tall poles for overhead powerlines and a 1-year temporary land use to test Kuhiwa well. Our records indicate this land use upon Tax Map Key (2) 1-2-004:003. Pdf page 1033 appears to indicate that the Kuhiwa well is on parcel 007, when the Kuhiwa well is on parcel 003.*

Response 4: Please note that the Proposed Action is a request for a water lease to divert water from government-owned lands within the approximately 33,000-acre License Area. The location of the License Area is on State-owned lands identified by the Tax Map Key numbers listed in Table 1-1 and Figure 1-2 of the EIS. Please note that TMK (2) 1-2-004:003 is not a part of the Water Lease and is not relevant to the Proposed Action and is not related to the EMI Aqueduct System. Hence, it is outside the scope of this EIS.

Comment 5: *The illustrations and maps of the licensed area do not reflect the Natural Area Reserve on parcel 013. We have included an attachment of the area from the State Public Land Trust Information System that illustrates the new boundaries of TMKs: (2) 1-2-004:005, 007 & new NAR parcel 013. On January 27, 1984, the Board approved CDUP MA-1591 for*

10238-04
Letter to Mr. Samuel Lemmo
Page 4 of 4
September 3, 2021

Subdivision and Establishment of the Hanawi Natural Area Reserve that included portions of tax map keys: (2) 1- 2-004:005 & 007. The staff recommendation to the Board stated the makai boundary was adjusted to the 2000-ft. elevation to exclude the existing Pogues tunnel and an area perceived as having potential for future water development. Given that areas of existing and potential future water development have been exclude from the Hanawi NAR, will the licensed area be amended or will it include a portion of the NAR parcel 013?

Response 5: We acknowledge your comments. Section 1.3.1 and 3.2.2.2 of the Final EIS has been updated to acknowledge that under the water revocable permits (RPs) issued for 2020 and approved for 2021, the Hanawī Natural Area Reserve (NAR) was removed the License Area under the revocable permits as shown on page 1-2 and page 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

SUBJECT: Comments on the Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas

The Division of Forestry and Wildlife (DOFAW) acknowledges receipt of your letter dated September 23, 2019, recognizing DOFAW’s comments and concerns during the early consultation process regarding the DEIS and proposed water lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. While some of DOFAW’s comments (letter dated December 19, 2016) were included in Appendix J of the DEIS, others were not, including a letter dated January 24, 2017. Below we provide additional comments.

- 1) Please see our comments of January 24, 2017, provided here as Attachment 1.
- 2) Public access.

The DEIS proposed action to include lease of the entire Ko‘olau Forest Reserve (FR) and Hanawi Natural Area Reserve (NAR) is not appropriate. The area to be leased should include only the water diversion and delivery structures that are required to be accessed and maintained by A&B/EMI for water use purposes.

DOFAW advised A&B/EMI in its letters dated December 19, 2016 and January 24, 2017, and in a meeting with representatives of A&B/EMI in September 2019, that it does not intend to lease the entire Ko‘olau FR and Hanawi NAR to A&B/EMI for this proposed action. The Board of Land and Natural Resources (BLNR), at its October 11, 2019 meeting, affirmed that the license area would not include Hanawi NAR and would not comprise the entire Ko‘olau FR, and conditioned its approval of the annual Revocable Permit (RP) that is currently issued to A&B/EMI subject to A&B/EMI continuing discussions with DOFAW to identify additional Ko‘olau FR lands that will be removed from the license area.

The DEIS does not provide an adequate assessment of impacts to public access to the natural resources of the proposed lease area resulting from the proposed action. Pursuant to §11-200.1-13 (b)(2), an action shall be determined to have a significant effect on the environment if it may curtail the range of beneficial uses of the environment. The proposed action to lease

lands within the Ko'olau FR, which comprises nearly 50% of the public trust lands held in the forest reserve system on Maui, will significantly curtail beneficial uses of the forest reserves, including hiking, outdoor experience, recreation, hunting, gathering, and traditional and customary practice.

3) Disposition of structures, equipment, and items no longer in use.

The DEIS does not adequately assess the environmental impacts that may result from the abandonment of structures, equipment, and items no longer in use. The DEIS should assess those impacts and provide a schedule and plan for their removal.

DOFAW and partners, including the Division of Aquatic Resources (DAR), recently conducted inspections of stream diversion sites that A&B/EMI intended to discontinue use of for water diversion purposes. DOFAW noted at those sites structures, equipment, and items that upon abandonment would serve no functional purpose, that would have negative impacts on the environment, including creating breeding sites for mosquitoes that serve as vectors for diseases that impact humans and endangered birds, altering the natural condition of stream flows, and causing erosion that impacts coral reef and near shore marine habitats.

A report of our findings was submitted as comments to the Commission on Water Resource Management (CWRM), dated June 28, 2019, regarding A&B/EMI's application for a stream diversion works permit for abandonment of certain stream diversions. We refer you to those comments, included here as Attachment 2, for a description of some of the environmental impacts that are expected to result from the proposed action. Please note that we did not survey every diversion site with structures, equipment, and items no longer in use, and we provide those comments as examples to illustrate the issues of concern.

Sincerely,

David G. Smith
DOFAW Administrator

**SUBJECT: ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE FOR
PROPOSED LEASE FOR THE NĀHIKU, KE'ANAE, HONOMANŪ, AND
HUELO LICENSE AREAS**

Thank you for the opportunity to comment on the Environmental Impact Statement Preparation Notice (EISPN) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas to Alexander and Baldwin, Inc. and East Maui Irrigation Company, Limited (A&B). We are in receipt of the copy dated January 2017, and marked as Draft for Internal Review. We have previously provided comments on an earlier version of this Preparation Notice in a memo dated December 19, 2016 and note that our comments are not acknowledged or reflected in the current draft.

The proposed lease of state lands for the purpose of delivering water from those lands to users includes the state lands managed/designated to the Division of Forestry and Wildlife comprising the Ko'olau Forest Reserve, established by governor's proclamations of 1905 and 1907, and the Hanawī Natural Area Reserve (NAR), established by Executive Order 3351 (1986) (hereinafter, the Reserves). Those Reserves are managed by the Division for purposes consistent with their establishment under state law, including protection of watersheds, natural resources, native ecosystems, and public access. Further, the Reserves are public trust lands subject to constitutional and statutory provisions for public use, including hunting, gathering, recreational, subsistence and cultural use.

The Division is concerned that the proposed lease of the Reserves includes public lands well in excess of what is necessary to ensure the effective delivery of the water, and that the requested lease would unnecessarily encumber the Reserves, potentially impacting the purposes and public use of those areas. Pursuant to those concerns, we provide the following comments on the EISPN:

- 1) The proposed lease of the Hanawī NAR is not consistent with the statutory purpose of that Reserve and should be removed from consideration for lease. Further, the Division notes that any activities within the Hanawī NAR would require a Natural Area Reserve System special use permit that is presented to the Natural Area Reserves System Commission for recommendations to the Board of Land and Natural Resources.

- 2) The proposed land use agreement should be limited to the water infrastructure and other areas required for maintenance and conveyance of water, such as through an easement or other appropriate instrument that does not include the lease of the entirety of the Reserves; this alternative action should be considered as part of the EIS analysis.
- 3) The proposed land use agreement should not include restrictions on public access to the reserves.
- 4) The EISPN should include consideration of the following anticipated impacts of the proposed action on:
 - a) Native ecosystems, resource management, and recovery efforts for rare and endangered species.
 - b) Erosion and other impacts by soil as it relates to road maintenance activities.
 - c) Cultural and subsistence uses of the forest such as forest product collection.
 - d) Public access to the reserves.
 - e) Impacts of climate change to watershed and water diversion system of East Maui.
- 5) Hawai'i Revised Statutes (HRS) and Hawai'i Administrative Rules (HAR) for the Forest Reserve (Chapter 183, HRS and Chapter 13-104, HAR) and Natural Area Reserve Systems (Chapter 195, HRS and Chapter 13-209, HAR), should be included and considered in Chapter 4, "Compatibility with Land Use Plans and Policies, Required for Permits and Approvals."

The Division appreciates the long standing and productive relationship we have had with A&B and the adjacent landowners of East Maui for the responsible stewardship of watershed lands and natural resources of this region. This partnership has facilitated effective management and ensured that the natural resources of the East Maui watersheds are protected for the benefit of future generations. We look forward to productive discussions with A&B regarding this request and determining the appropriate land disposition for proposed water conveyance. Please contact Scott Fretz, Maui Branch Manager, at (808) 984-8100 or by email at Scott.Fretz@hawaii.gov if you have any questions or would like to follow-up on our comments.

SUBJECT: Comments on Alexander and Baldwin, Inc. applications for stream diversion works permits for abandonment.

Thank you for the opportunity to comment on the applications for stream diversion works permits for abandonment submitted to the Commission on Water Resource Management (Commission) by Alexander and Baldwin, Inc. (A&B). It is our understanding that the applicant intends to abandon 70 stream diversions and is in the process of securing the appropriate permits to do so. We understand further that the diversions are being grouped into different categories for administrative purposes and that separate applications are being submitted for each category.

The Division appreciates A&B's long-standing commitment to the conservation of East Maui's vital watersheds. We have worked closely with A&B and the other partners of the EMWP to implement effective conservation measures at a landscape scale with unprecedented success. We provide our comments here in the spirit of that partnership to further our shared commitment to the effective conservation of the watersheds of east Maui.

In a memo dated December 18, 2018, the Division provided comments on one of those applications, filed as SDWP 4915.6 (<https://dlnr.hawaii.gov/cwrm/surfacewater/review/>). In that memo, we expressed concerns that the applicant intends to leave in place a number of stream alterations that may substantially alter the natural condition of the streams, concrete fixtures, channels, walls, catchments, and tunnels that potentially alter stream flows and surfaces, exacerbate erosion, encourage establishment of invasive species, degrade plant and wildlife habitats, and affect wildlife dispersal and movements. Our comments were general, citing the biological and regulatory reasons for our concerns, and noting that the applicant did not explain its rationale for leaving certain stream alterations in place. We

requested that the applicant provide additional information to inform its proposal to leave those alterations in place.

In a follow-up discussion on March 28, 2019 with you and your staff regarding a subsequent application, filed as SDWP 4950.6, Division staff reiterated our concerns and offered to provide more specific comments and recommendations regarding the proposed abandonments. Pursuant to that, we conducted field assessments at selected diversions for which abandonment is planned. Our findings and recommendations from those assessments are provided in Attachments A and B.

Finally, we appreciate A&B's expressed desire to restore stream flow in a timely manner. While we acknowledge that implementation of some of the measures we recommend here may require additional time, we suggest that the primary tasks to restore stream flow can be implemented initially, ensuring that water is returned to the streams in a timely manner, with the additional recommended work to proceed on a reasonable schedule.

Attachment A

General comments

The Division of Forestry and Wildlife is responsible for the management of forest and wildlife resources within the Ko'olau Forest Reserve that may be affected by the actions proposed in the subject application. The applicant currently holds authorizations to employ certain structural improvements within the forest reserve to effect the diversion of water for collection and use. At such time that those structures will no longer be used for that, or any other, approved purpose, the Division requests that they be removed, to the extent practicable. We believe this request is consistent with the Commission's Conclusions of Law, dated June 20, 2018, in which it is noted that instream uses shall be guided by the general principles set forth in §13-169-20, Hawaii Administrative Rules, which include that, where practicable, streams should be maintained with water sufficient to preserve fish, wildlife, scenic, aesthetic, recreational, and other uses, and stream systems should be retained substantially in their natural condition.

In our field assessments conducted in May of this year, we noted several general issues of concern related to the proposed abandonment of diversion structures in the forest reserve. Those include:

1. Walls, structures, or channels that alter the natural course of the stream, such that water becomes trapped and stagnant in areas where flow is restricted. Stagnant waters become breeding sites for mosquitoes, which are vectors for introduced diseases that are a major threat to native forest birds.
2. Use of pipes or other structures that are known to obstruct passage of native fish.
3. Alteration of streams that result in high levels of erosion, affecting water quality.
4. Abandonment of accessory structures, including pipes, pump houses, intakes, mechanisms, or other items no longer in use, which may become derelict if not maintained.

Attachment B

Specific comments

1) Honopou Stream

a) Honopou is a perennial stream approximately 10 miles in length, originating in the Koolau Forest Reserve. The stream is reported by DAR to have native macro faunal diversity > 5 species, including native fish, crustaceans, and insects.

b) Diversions

i) Wailoa ditch intake (W-22)

(1) Comments

(a) Diversion located in Koolau FR

(b) Grate captures water diverting it to the Wailoa ditch. Application proposes to seal grate to allow stream to flow. Accessory pipes were found in the diversion area.

(2) Recommendations

(a) Remove any pipes and accessories not in use.

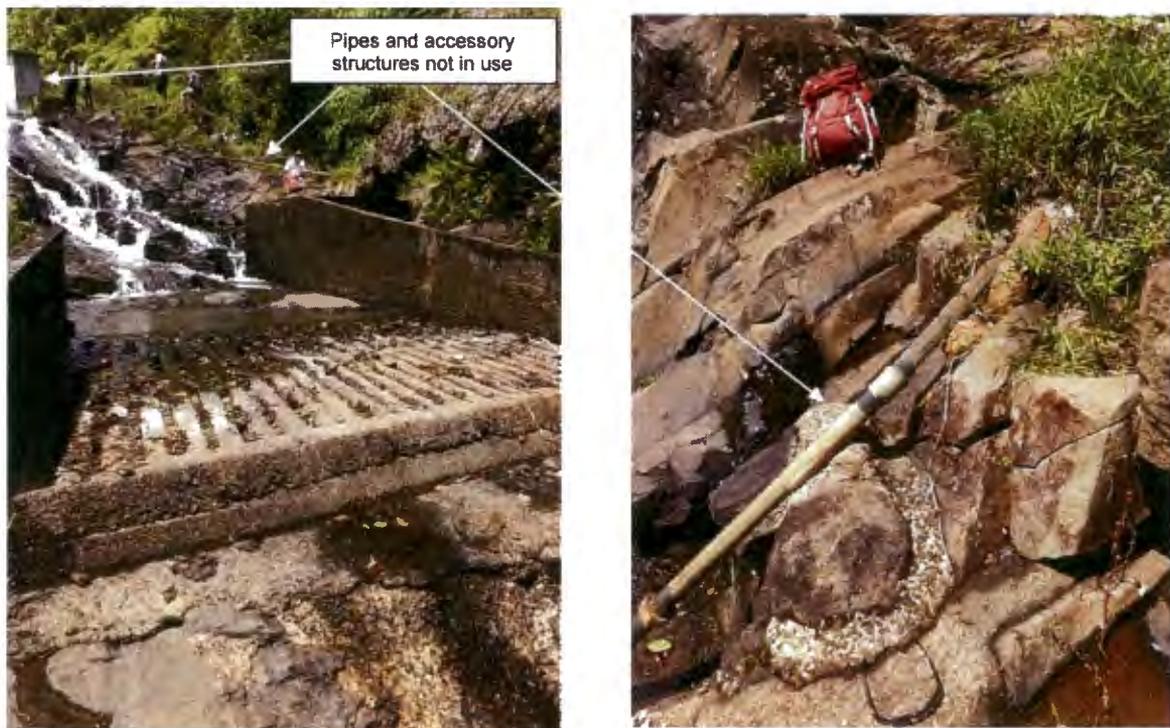

Figure 1. Wailoa ditch intake (W-22). Collection grate (left) and accessory pipes (right).

ii) New Hamakua ditch intake (NH-22)

(1) Comments

- (a) Diversion located in Koolau FR
- (b) Grate on the west side of stream captures water for diversion. Application proposes to seal grate by filling with concrete.

(2) Recommendations

- (a) After the grate is sealed, the steel plate should be removed and sufficient concrete should be used to ensure that stream flow is continuous over the grate area and water cannot become trapped and stagnant, creating breeding sites for mosquitoes.
- (b) Remove any accessory structures not in use, such as the pump house shown in the figure below.

Figure 2. Grate to be sealed (left). Accessory pump house above grate (right).

iii) Lupi long intake at Wailoa ditch (W-22a)

(1) Comments

- (a) Diversion located in Koolau FR
- (b) Grate is sealed. This tributary leads to Honopou stream.
- (c) The tributary appears to take a modified path through cut and disturbed soil that may be prone to extensive erosion. It is not clear why this is the case and whether this is an unnatural condition that has resulted from ground disturbance.

(2) Recommendation

- (a) Further investigation is recommended to assess whether there is an erosion problem that can be addressed.

iv) Wailole intake at New Hamakua ditch (NH-23)

(1) Comments

- (a) This diversion is on EMI lands.
- (b) The tributary feeds Honopou stream, which runs through the Koolau Forest reserve.
- (c) The road crossing this tributary to Honopou stream appears to be prone to high levels of erosion.

(2) Recommendation

- (a) Please assess erosion and impacts to water quality resulting from this location and consider installation of a concrete swale or other measures to control erosion.

Figure 3. Road crossing tributary would appear to be prone to high levels of erosion.

v) Honopou at Haiku ditch (H-8)

(1) Comments

(a) This diversion is on EMI lands.

(b) The diversion structures appear to include a steel plate that overhangs the stream. This plate may interfere with fish passage.

(2) Recommendation

(a) In addition to measures identified in the application, please remove the steel plate that overhangs the stream. This plate may obstruct fish passage.

2) Hanehoi stream

a) Hanehoi Stream is a perennial stream approximately 5.4 miles in length, originating in the Koolau FR. Hanehoi Stream supports native algae, crustaceans, and insects, including *Megalagrion pacificum*, listed as endangered under state and federal law.

b) Diversions

i) Hanehoi at Wailoa ditch (W-18)

(1) Comments

(a) Diversion located in Koolau FR

(b) Walls on both sides of the stream prevent the stream water from taking its natural course. The walls create sections where water stands and cause pooling of water, which becomes stagnant and creates breeding sites for mosquitoes.

(c) Water is also standing and foul in the sluice basin or catchment entry structure where the gate is located.

(2) Recommendations

(a) In addition to the measures identified in the application to seal the grate, remove the walls to restore the natural stream flow and eliminate mosquito breeding sites.

(b) Prevent stagnant water and mosquito breeding sites sealing the sluice basin or other measures to avoid water standing in the structure.

Figure 4. Stagnant water standing in depressions created by the walls and the gate structure.

ii) Hanehoi Huelo intake at New Hamakua ditch (NH-17)

(1) Comments

(a) The wall across the stream bed creates a dam that obstructs the natural course of the stream.

(2) Recommendations

(a) In addition to the measures identified in the application to seal the grate, please remove the wall across the stream bed to restore the natural stream flow.

Figure 5. Wall across stream bed creates a dam that that alters flow and creates standing water.

iii) West Hanehoi (Puolua) intake at New Hamakua ditch (NH-17a)

(1) Comments

(a) Located in Koolau FR

(b) This tributary enters the New Hamakua ditch where the access road runs along and makai of the ditch. The application proposes to install a stream bypass to enable the tributary to cross over the ditch.

(c) The stream must also cross the road and the application does not describe how that will be constructed.

(2) Recommendations

(a) The methods employed to enable the stream to cross the road should ensure that erosion of the road is avoided. This may be done by installing a concrete swale or by installation of a culvert of appropriate diameter under the road.

Figure 6. Location where tributary will cross the access road.

iv) Hanehoi (Puoloa) Roseapple intake at Lowrie ditch (L-7a).

(3) Comments

- (a) The application proposes to construct an overpass that will allow the stream to cross the ditch. Since the access road runs parallel to the ditch at this location, the stream will also need to cross the road.

(4) Recommendations

- (a) A concrete swale should be constructed across the road at this location to avoid erosion of the road, which appears to be currently comprised of soil only.
- (b) A culvert should not be used at this site since this stream is a fish corridor and fish are not expected to cross through culverts.

Figure 7. Location where stream will cross access road.

3) East Wailuanui Stream

a) Wailuanui Stream is a perennial stream that originates in the Koolau FR and spans a length of approximately 9.6 miles. Wailuanui Stream supports a high diversity of native species, including crustaceans, fish, snails, and insects.

b) Diversions

i) East Wailuanui at Koolau ditch (K-18)

(1) Comments

(a) This diversion consists of walls on both sides of the stream that divert the stream into the ditch on the west side of the stream. The east wall crosses nearly the entire stream bed to divert the water to the west.

(b) The walls trap standing water on both sides of the stream, as well as in the intake, which we found to be very stagnant, creating breeding sites for mosquitoes. The application proposes to permanently remove the sluice gate to restore stream flow and to fill the intake with concrete.

(2) Recommendations

(a) Remove the walls on the east and west side of the stream in their entirety. Those walls will no longer be used for diversion purposes and their presence creates large areas of stagnate water that creates breeding sites for mosquitoes.

(b) Ensure that sufficient fill material is used for the intake to ensure that water does not become stagnant in the intake.

(c) Remove the pillar and structures at the intake since they will no longer be used for water diversion purposes.

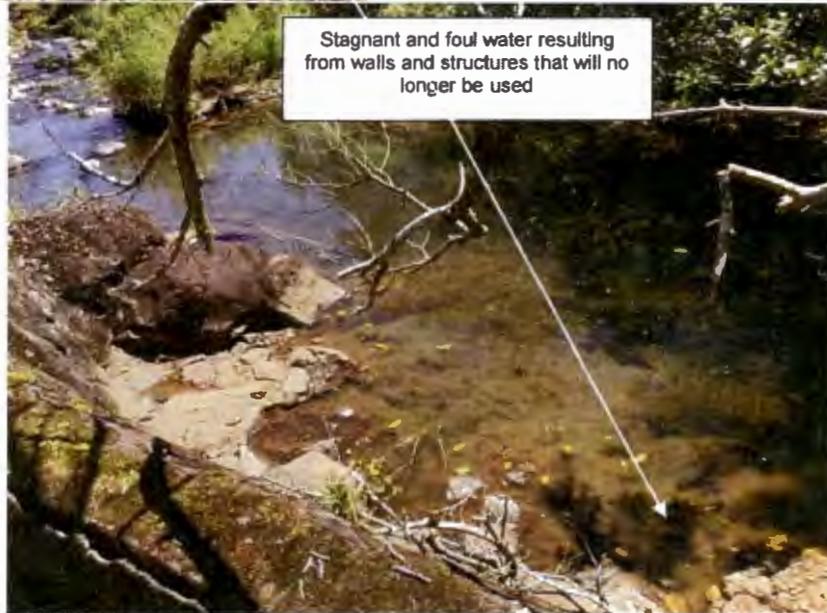

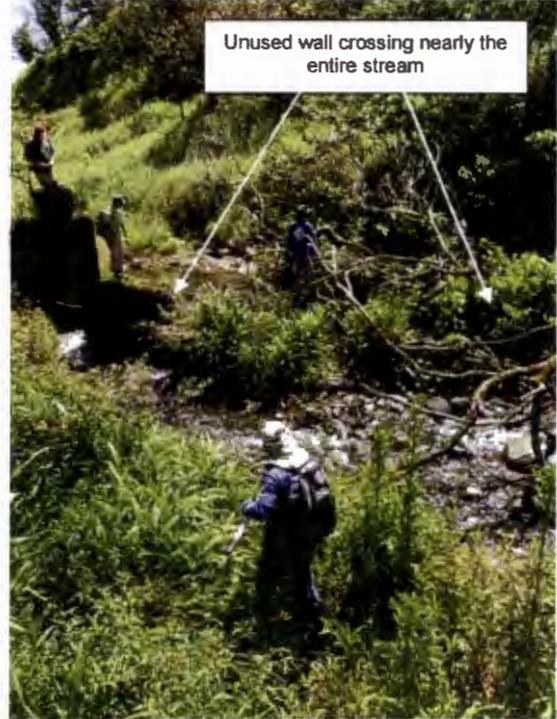

Figure 8. East Wailuanui at Koolau ditch (K-18). Stagnant water outside the west wall (top left), wall crossing stream (top right), stagnant water on the east side of the stream.

ii) East Wailuanui to Koolau ditch at control house (K-19)

(1) Comments

- (a) Diversion consists of walls that channel the stream flow over the ditch where a collection grate allows the water to fall into the ditch.
- (b) The application proposes to cover and seal the grate so that water will continue downstream.

(2) Recommendations

- (a) The channel that is created by the walls is relatively narrow and low. It is unknown whether it may should be monitored regularly to ensure that it does not become obstructed by debris.
- (b) The control house and related structures should be removed if they are no longer in use.

Figure 9. Channel to enable stream to cross ditch (left). Control house at K-19 (right).

iii) West Wailuanui intake #7 at Koolau ditch

(1) Comments

- (a) Diversion at a tributary that consists of a wing wall on the west side of the stream that directs flow into a set of slots in a wall on the east side.
- (b) Application proposes to fill the collection slots to enable stream to flow down. Where the stream crosses the access road, a pipe under the road directs water under the road. The road has a concrete swale.
- (c) The wing wall appears to be creating pooling of stagnant water and the pipe was found to be clogged. The pipe obstructs movement of fish upstream.

(2) Recommendations

- (a) Remove the wing wall to prevent standing water
- (b) Seal the pipe so that water will flow freely over the swale and enable fish movement upstream.

Figure 10. Wing wall causing pooling of stagnant water at K-20.

iv) West Wailuanui at Koolau ditch (K-21)

(1) Comments

- (a) Diversion consists of a large dam that directs the stream flow into collection slots on the east side of the stream.
- (b) The dam is fitted with a sluice and gate to enable water to flow downstream when it is not being diverted.
- (c) The application proposes to cover the collection slots and permanently remove the gate.

(2) Recommendations

- (a) The sluice is relatively narrow and may become clogged. Monitoring is recommended to ensure it does not become clogged.
- (b) If the gate house structure is no longer used it should be removed.
- (c) The dam will also not be used. However, since it is of substantial size and mass, we recommend that consideration of its disposition be deferred until further assessments can be conducted to determine the best course of action.

Figure 11. Dam, gate, and control structure at K-21.

Honolulu, HI 96813

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Smith:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The Division of Forestry and Wildlife (DOFAW) acknowledges receipt of your letter dated September 23, 2019, recognizing DOFAW's comments and concerns during the early consultation process regarding the DEIS and proposed water lease for the Nahiku, Ke'anae, Honomanu, and Huelo License Areas. While some of DOFAW's comments (letter dated December 19, 2016) were included in Appendix J of the DEIS, others were not, including a letter dated January 24, 2017. Below we provide additional comments.*

Response 1: We acknowledge that the DOFAW received our letter dated September 23, 2019, recognizing DOFAW’s comment and concerns in response to DOFAW’s comments dated December 16, 2016, and December 16, 2016, during the early consultation process but did not include DOFAW’s January 24, 2017 letter during the EISPN process. However, please note that

while DOFAW's January 24, 2017, letter was not reproduced within the Appendix J of the Draft EIS, our response letter acknowledged that letter and appropriately responded to that letter. Please note that Appendix J of the Final EIS will DOFAW's January 24, 2017, letter.

Comment 2: *Please see our comments of January 24, 2017, provided here as Attachment 1.*

Response 2: Please note that at this stage, we are no longer responding to comments on the EISPN. The EISPN is used as the initial stage of the EIS process in order to scope the Draft EIS. Moreover, as noted in Response #1 above, while DOFAW's January 24, 2017, letter was not reproduced within the Appendix J of the Draft EIS, our response letter acknowledged that letter and appropriately responded to that letter. Please note that Appendix J of the Final EIS will DOFAW's January 24, 2017, letter.

Comment 3: *Public access.*

The DEIS proposed action to include lease of the entire Ko'olau Forest Reserve (FR) and Hanawi Natural Area Reserve (NAR) is not appropriate. The area to be leased should include only the water diversion and delivery structures that are required to be accessed and maintained by A&B/EMI for water use purposes.

Response 4: We acknowledge your comments. Section 1.3.1 and 3.2.2.2 of the Final EIS has been updated to acknowledge that under the water revocable permits (RPs) issued for 2020 and approved for 2021, the Hanawī Natural Area Reserve (NAR) was removed the License Area under the revocable permits as shown on page 1-2 and page 3-22 of the Final EIS. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR.

Comment 5: *DOFAW advised A&B/EMI in its letters dated December 19, 2016 and January 24, 2017, and in a meeting with representatives of A&B/EMI in September 2019, that it does not intend to lease the entire Ko'olau FR and Hanawi NAR to A&B/EMI for this proposed action. The Board of Land and Natural Resources (BLNR), at its October 11, 2019 meeting, affirmed that the license area would not include Hanawi NAR and would not comprise the entire Ko'olau FR, and conditioned its approval of the annual Revocable Permit (RP) that is currently issued to A&B/EMI subject to A&B/EMI continuing discussions with DOFAW to identify additional Ko'olau FR lands that will be removed from the license area.*

Response 5: We acknowledge your comments and you are correct. As noted in Response #4 above, Section 1.3.1 and 3.2.2.2 of the Final EIS has been updated to acknowledge that under the water revocable permits (RPs) issued for 2020 and approved for 2021, the Hanawā Natural Area Reserve (NAR) was removed the License Area under the revocable permits as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR.

Comment 6: *The DEIS does not provide an adequate assessment of impacts to public access to the natural resources of the proposed lease area resulting from the proposed action. Pursuant to §11- 200.1-13 (b)(2), an action shall be determined to have a significant effect on the environment if it may curtail the range of beneficial uses of the environment. The proposed action to lease lands within the Ko'olau FR, which comprises nearly 50% of the public trust lands held in the forest reserve system on Maui, will significantly curtail beneficial uses of the forest reserves, including hiking, outdoor experience, recreation, hunting, gathering, and traditional and customary practice.*

Response 7: We respectfully disagree with your comment. Public access within portions of the License Area has been provided, as discussed in Section 4.8 of the Draft EIS, and it is expected either that public access will continue if the scope of the License Area remains the same, or, if the License Area is reduced, that public access within the former License Area lands will be dictated by a State agency. However, please note that Section 4.8 of the Final EIS has been updated to include more recreational facilities and an accurate discussion regarding access into the License Area as it relates to recreational activities as shown on pages 4-305 to 4-309.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access

into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access to areas that are not within the License Area. Please also see Response #4 above regarding the revised License Area under the most recent revocable permits and projections related to the geographical extent of the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding impacts to the areas that would allow for more public access. Moreover, impacts of the Modified Lease Area alternative are discussed in Section 3.4 of the EIS (Comparative Evaluation of Reasonable Alternatives) against different environmental resource categories.

Comment 8: *Disposition of structures, equipment, and items no longer in use.*

The DEIS does not adequately assess the environmental impacts that may result from the abandonment of structures, equipment, and items no longer in use. The DEIS should assess those impacts and provide a schedule and plan for their removal.

Response 8: Upon making the voluntary commitment to permanently restore the stream flows in the “taro streams”, EMI returned approximately 90-95% of the natural flow of the streams—all that could be done by adjusting (opening or closing) the diversion gates. The final 5-10% to achieve complete restoration requires modifications to diversions, essentially construction projects, thus triggering various permitting processes that continue to be pursued.

Potential impacts from the abandonment of structures and equipment as it relates to native stream habitat was assessed and discussed in Appendix A, the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report.

The work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows.

The CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. CWRM ordered in relevant part (see CWRM D&O at p. 269):

- I. It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.*
- J. This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process*
- K. The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.*

CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

However, please note that generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best. The presence of cement or wood near or partially within the stream channel is not inherently bad for stream animals.

Conversely, meeting the instream flow standard at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the water flowing into the diversion and back to the stream from another location in the diversion ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

The two primary conditions where diversion structures could impact native stream species are structures where diversion and ditch water still comingle or structures that create a barrier to upstream migration. A diversion structure could also impact native stream animals as they move upstream if it creates an unnatural barrier. If no wetted pathway exists, upstream passage will be stopped.

Altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns.

In summary, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts. The above is discussed in more detail in Section 4.2.1 of the Final EIS as shown on pages 4-63 to 4-67.

Moreover, it should be noted that EMI continually maintains the EMI Aqueduct System. They evaluate areas of the EMI Aqueduct System regularly to identify where maintenance / repair activities are necessary and add them to a list of maintenance projects. Moreover, in response to the Draft EIS comments regarding the condition of the EMI Aqueduct System, EMI staff have been conducting sweeps to locate / remove unnecessary ditch debris from the License Area. This discussion has been added to Section 2.1.2 of the Final EIS as shown on page 2-7.

Moreover, regarding the Central Maui Field Irrigation System, Mahi Pono expects to invest over \$20 million to increase the efficiency of its on-farm irrigation system in Central Maui (i.e. Distribution from Kamole-Weir WTP to the agricultural fields). Mahi Pono's irrigation engineering team is also designing a high-efficiency irrigation system. The new irrigation system will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycle and re-use all water used in Mahi Pono's processing plants; and (3) integrate various live technology feeds to constantly monitor plant, soil, and tree health. This discussion has been added to Section 2.1.4 of the Final EIS as shown on page 2-25.

Hence, the current water delivery system is adequate; both the EMI Aqueduct System and the Central Maui Field Irrigation System. Moreover, Mahi Pono plans to invest money to improve the efficiency of the Central Maui Field Irrigation System and EMI continually maintains the EMI Aqueduct System.

Comment 9: *DOFAW and partners, including the Division of Aquatic Resources (DAR), recently conducted inspections of stream diversion sites that A&B/EMI intended to discontinue use of for water diversion purposes. DOFAW noted at those sites structures, equipment, and items that upon abandonment would serve no functional purpose, that would have negative impacts on the environment, including creating breeding sites for mosquitoes that serve as*

vectors for diseases that impact humans and endangered birds, altering the natural condition of stream flows, and causing erosion that impacts coral reef and near shore marine habitats.

Response 9: As noted in Response #8 above, potential impacts from the abandonment of structures and equipment as it relates to native stream habitat was assessed and discussed in Appendix A, the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report.

The work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows. CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

However, please note that generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best. The presence of cement or wood near or partially within the stream channel is not inherently bad for stream animals. Conversely, meeting the instream flow standard at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the water flowing into the diversion and back to the stream from another location in the diversion ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

The two primary conditions where diversion structures could impact native stream species are structures where diversion and ditch water still comingle or structures that create a barrier to upstream migration. A diversion structure could also impact native stream animals as they move upstream if it creates an unnatural barrier. If no wetted pathway exists, upstream passage will be stopped.

Altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these

negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns.

In summary, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts. The above is discussed in more detail in Section 4.2.1 of the Final EIS as shown on pages 4-63 to 4-67.

As it relates to your comment about mosquito breeding grounds, please note that the surrounding forests are a huge rainfall catchment area with innumerable opportunities for standing water to occur long enough for mosquitos to breed. Therefore, any suggestion that dewatered stream beds due to the abandonment of structures that could serve as identifiable corridors for mosquitos into native upland forests is also unfounded. Nevertheless, the instream amount of potential mosquito habitat was quantified using the HSHEP model presented in Appendix A and summarized in Section 4.2.1 of the EIS. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat. Thus, an increase in mosquito habitat was predicted to occur at diverted flows. In all cases, no increase in stream discharge diversion has been proposed. This is a result of the diversions already conveying baseflow from the diverted streams. Therefore, the Proposed Action will not increase mosquito habitat even in locations where the flow restoration has not been proposed. Based on the modeled relationship between increased streamflow and decreased mosquito habitat, in all cases where flow restoration has been proposed there is expected to be a decrease in mosquito breeding habitat as discussed in Section 4.2.1 and Section 4.4.2 of the Draft EIS. While the HSHEP analysis was focused only on mosquito breeding habitat, given the impact of avian malaria on native stream birds, the Proposed Action will do nothing to increase mosquito breeding habitat and therefore should not negatively impact listed native birds.

Your speculation that dewatered streams from the abandonment of structures that could serve as a corridor for mosquitos transmitting avian malaria to reach upland forest habitats may be based on a misunderstanding of why protected bird species remain in those areas. There is evidence of a thermal barrier to mosquitos at higher elevations where the temperature declines. Currently, Hawaiian honeycreepers (including ‘akohekohe, ‘i‘iwi, and kiwikiu that you mention) are already impacted by avian malaria below this thermal barrier, which occurs above 4,921 feet above sea level in the winter months and above 6,234 feet above sea level in the summer months, to the degree that they are rarely found at lower elevations (USFWS 2006, Warner 1968). In other words, this disease and the presence of disease-carrying mosquitos, has already nearly extirpated low-elevation populations of these birds. If there is a thermal barrier to mosquitos,

other protected bird populations at higher elevations would also have less potential for contracting avian malaria.

This information has been clarified in Section 4.4.2 of the Final EIS as shown on pages 4-126 to 4-127, and pages 4-130 to 4-131.

As it relates to nearshore environments, the collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may

have a small estuarine reaches, Pa‘akea will have connectivity flow restoration, while ‘O‘opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi‘ina‘au Stream) have estuarine reaches, four of which were noted by Trutta’s HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR’s methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi‘ina‘au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa‘akea) have connectivity flow restoration ordered. Pa‘akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83 of the Final EIS.

Comment 10: *A report of our findings was submitted as comments to the Commission on Water Resource Management (CWRM), dated June 28, 2019, regarding A&B/EMI's application for a stream diversion works permit for abandonment of certain stream diversions. We refer you to those comments, included here as Attachment 2, for a description of some of the environmental impacts that are expected to result from the proposed action. Please note that we did not survey every diversion site with structures, equipment, and items no longer in use, and we provide those comments as examples to illustrate the issues of concern.*

Response 10: We note that the DOFAW submitted a report of their findings to the CWRM, dated June 28, 2019, regarding the application for a stream diversion works permit for

abandonment of certain stream diversions, which is included to your letter as Attachment 2. As discussed in Response #8 above, potential impacts from the abandonment of structures and equipment as it relates to native stream habitat was assessed and discussed in Appendix A, the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report.

The work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows. CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

However, please note that generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best. The presence of cement or wood near or partially within the stream channel is not inherently bad for stream animals. Conversely, meeting the instream flow standard at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the water flowing into the diversion and back to the stream from another location in the diversion ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

The two primary conditions where diversion structures could impact native stream species are structures where diversion and ditch water still comingle or structures that create a barrier to upstream migration. A diversion structure could also impact native stream animals as they move upstream if it creates an unnatural barrier. If no wetted pathway exists, upstream passage will be stopped.

Altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns.

10238-04
Letter to Mr. David Smith
Page **12** of **12**
September 3, 2021

In summary, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts. The above is discussed in more detail in Section 4.2.1 of the Final EIS as shown on pages 4-63 to 4-67.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

SUBJECT: Comments on the Draft Environmental Impact Statement (DEIS) for a Water Lease for the Nahiku, Keanae, Honomanu, and Huelo License Areas Located at East Maui, Hawaii
Tax Map Keys (TMKs): (2) 1-2-004 :005, 007 (por); 1-1-002:002; 1-1-001:044 and 050; 2-9-014: 001, 005, 011, 012 and 017

Dear Mr. Matsukawa:

Thank you for the opportunity to review and comment on the Draft Environmental Impact Statement (DEIS). The Land Division offers the following comments:

1. Please clarify the cumulative impacts of Mahi Pono's proposed diversified agriculture project, the Kula Agricultural Park (KAP) expansion, the Nahiku Community potable water usage, and the County's Upcountry Maui Water System as it relates to the proposed action (EMI Water Lease or Water Lease). While this point is relatively clear in the executive summary, it becomes muddled throughout the DEIS.
2. Please confirm whether the KAP expansion is reliant on the EMI Water Lease. While the KAP expansion is referenced throughout the DEIS, the project description and analysis omits relevant water calculations and is silent on the expansion's cumulative impacts. According to the DEIS, KAP currently requires 1.5 mgd, however the DEIS fails to specifically address the amount of water the KAP expansion will require.

According to a Maui News Article from January 3, 2019, "*an agreement with A&B will provide an additional 1 million gallons of water a day to the new land.*" Please provide clarity and further analysis regarding the additional water needed and expand on its cumulative impacts.

3. While our comments above note that the cumulative results of users benefitting from the Water Lease should be addressed, we wish to point out that pursuant to Hawaii Revised Statutes (HRS), Chapter 343, and Hawaii Administrative Rules (HAR) Chapter 11-200.1, an environmental assessment is required for actions that “[p]ropose the use of state or county lands...” The definition of land as it relates to public lands, pursuant to HRS Chapter 171, “includes all interests therein and natural resources including water, minerals, and all such things connected with land, unless expressly provided.”

As the Mahi Pono Farm Plan involves the use of State lands (75% of the water being requested in this case), and plays a large role in the cumulative impacts of the proposed Water Lease, and the KAP expansion encumbers both State and County lands as well as County funds, the DEIS should cover all actions (acquisition of a water lease, farm plan and expansion) as part of its proposed action.

4. Regarding the Mahi Pono Farm Plan, we note that it is very conceptual in nature and lacks details which would allow for a proper analysis of its impacts. The DEIS should be revised to include as much available details including, but not limited to, the siting of structures, utilities, and other improvements that would be necessary for the project to be considered operational, as well as a production timeline, general operating practices, alternative strategies, etc.

We note that several newspaper articles, found on the Mahi Pono website has more information regarding the Farm Plan than the DEIS has.

5. Throughout the document, the DEIS references streams in the license area, streams subject to the IIFS contested case, and streams subject to the CWRM D&O. However, the number of streams affected by the proposed action appears to not always be consistent. For example, the footnote on page iii, states that CWRM found there to be 24 streams, not 27, that were subject to the IIFS contested case. On page 1-13, the DEIS again states that Table 1-3 includes the CWRM D&O referenced 24 streams subject to the IIFS Petitions. However, Table 1-3 reflects 37 streams that are subject to the CWRM D&O. Further, Section 4.2.1, footnote 1, states that the CWRM D&O identified 36 streams associated with the license area but the DEIS identifies 37 streams within the license area. Later, however, pages 4-56 state that “[t]he license area also includes streams that were not the subject of the CWRM D&O but are diverted into the EMI Aqueduct system.” It would be helpful if there was a concise discussion that gives an overview of the streams that are within the license area and, of those streams, which streams were subject to the contested case and which streams were subject to the conditions of the CWRM D&O.
6. Why does the Executive Summary not include the calculations of the proposed water diversions when that is the primary use being proposed under the Water Lease?
7. The projections of the amount of water available from the license area at Honopou stream, after taking into account the CWRM D&O, is approximately 87.95 mgd. The

87.95 mgd plus 4.37 from private lands total 92.32 mgd which would be conveyed to supply DWS for users in Upcountry, Nahiku and the agricultural fields in Central Maui. The 92.32 mgd does not appear, however, to consider the basal aquifer wells which delivers 4.9 mgd. Please provide a comprehensive table on the amount of water available and the amount of water sought from the specific streams and wells so the reader can have a clear picture on the amount and its specific source.

8. On October 11, 2019, the Board considered the Continuation of Revocable Permits for Water use for the Island of Maui, Hawaii, and Kauai. As a part of the consideration, the Department asked that the Board consider, as a future action, requiring A&B/EMI to make available an additional 5 mgd for use by the State for projects at Pulehunui, Maui, which includes projects for the Department of Hawaiian Homelands (DHHL). In the alternative, the Department would ask that A&B/EMI make available an additional 5 mgd of water to the County Department of Water Supply (DWS) in connection with the County providing water for the State projects at Pulehunui. The EIS should address this potential scenario as an alternative to the proposed action.
9. The second paragraph on page iii uses the acronym “IIFS” without first introducing the compound term, Interim Instream Flow Standards, however, we note that the compound term with the acronym in parenthesis is in the third paragraph on the same page. The same comment applies for the first use of “CWRM D&O”.
10. Chapter 2 states that “*it is anticipated that EMI and/or Mahi Pono will continue to pursue watershed management activities.*” Please note that whoever is the applicant for the Water Lease will ultimately be held responsible for fulfilling the requirements of HRS §171-58 (e).
11. Throughout the document, it has been mentioned that community members and the like have concerns regarding the upkeep of the EMI system. Within the proposed action section (Chapter 2), the DEIS should provide some type of description regarding the existing condition of the system and any maintenance and repairs proposed should the Water Lease be granted.

We further note, at the October 11, 2019 Board of Land and Natural Resources (Board) meeting, a representative from Mahi Pono stated that Mahi Pono has plans to invest 20 million dollars over the next three years in more efficient irrigation systems. Will part of this investment be in the existing EMI system? If so, please discuss and if not, then what actions are being taken by EMI to ensure that the system being efficiently operated?

12. On page 2-10 we note that the three surface sources relied upon for Upcountry Maui via Wailoa Ditch, processed by Kamole-Weir treatment plant, totals 17.9 mgd, yet only 9.1 mgd is reliable “due to limitations and maintenance requirements.” Please elaborate on this finding and what, if any, plans will address the reliability and maintenance issues.

13. In section 2.1.3.1, we note that currently DWS is being charged 6 cents per 1,000 gallons to receive East Maui surface water for KAP and other Upcountry Maui farm areas. Notably, DWS purchases water for domestic use from EMI's West Makapipi Tunnel 2, Well No. 4806-07, known as the Nahiku Tunnel. What is the approximate annual amount charged to DWS and does the amount charged take into consideration the two aqueducts above the license area in Haiku Uka owned by DWS?
14. Within Section 2.1.4 Central Maui Field System, there is no discussion on the current activities of Mahi Pono within the Central Maui Area. Please revise section accordingly given the fact that at the October 11, 2019 Board Meeting, a representative from Mahi Pono stated that they currently have 70 acres in production for potatoes.

We wish to note that this statement was confirmed via an article published in the Star Advertiser on September 1, 2019 which also indicated that these potatoes are being grown as a "signature" crop similar to that of the Maui pineapple and the Maui onion. This appears to be contradictory to one of their core principals, which is "growing food for local consumption." Further, several times during the Board meeting, the representative stated that the food grown would be for the Hawaii market. Based on the article, it seems to infer that the "Hawaii market" may not necessarily be the local Hawaii market. Mahi Pono should make clear their intentions regarding the business aspect of their Farm Plan.

15. Regarding ALISH classifications for East Maui, the discussion surrounding this section seems to be incomplete. Based on the map provided as Figure 4-10, it appears that no ALISH lands are located within the license area, however, it is unclear if some of the beneficiaries of the Water Lease are located outside of the license area, but within an ALISH designated area. If this is so, then this should be discussed accordingly.
16. On pages 4-56 of the 2018 CWRM D&O, under the section Setting the IIFS, it is noted that "[t]his scenario represents the flow conditions as described in the CWRM D&O setting the IIFS which included 24 streams and mandated restoration of flows in all but three streams." According to the information in section 1.3.4, the CWRM D&O required that 10 streams have no diversions, 5 streams were required to return to 64% of the median base flow, and 7 streams were required to have 20% of the median base flow. This totals 22 streams. Yet 24 streams were a part of the contested case. Please explain the discrepancies amongst the referenced "three streams", on pages 4-56, 22 streams, in section 1.3.4, and 24 streams that were part of the contested case.
17. Please elaborate on why the Mahi Pono Farm Plan will not require drainage improvements especially given the need for building construction and the increase in impervious surfaces.
18. Regarding the Impact and Mitigation section regarding Climate Change for Central Maui, it is unclear how Mahi Pono plans to counteract its carbon footprint. The DEIS give the reader the impression that agricultural operations may act as a carbon sink. While

research shows that agriculture has such potential, it is dependent on the farmer's practices and usage of a carbon farm plan, similar to that of the Marin Carbon Project, as the basis for its operations. This does not seem to be the case for Mahi Pono. Further it appears that the DEIS relies heavily on the fact that the amount of carbon produced by its proposed operations will be substantially less than what was released during sugarcane operations. The analysis should be based on current conditions and not on the historic condition of sugar, which not been in production since the beginning of 2016. Further, the analysis does not take into account any exportation of crops. Unless we are to assume that all crops produced will stay on Maui, some type of export will be required, even if that only includes interisland.

19. It is unclear why the discussion on sea level rise only took into account passive flooding as the State's Hawaii Sea Level Rise Vulnerability and Adaptation Report recommends using the sea level rise exposure area (SLR-XA) as the baseline for discussion.
20. Regarding the discussion for Central Maui under the hurricane and wind hazards section, it is stated that "*the proposed action does not include any construction in Upcountry Maui that would be at risk in the event of hurricanes and wind hazards.*" Does this imply that the KAP expansion has no associated structures?
21. Seismic hazards for Central Maui should address construction related to the Mahi Pono Farm Plan.
22. For the mitigation associated with the maintenance of the East Maui system, who is responsible for ensuring that the qualified biological monitor or inspector meets all the specifications as represented in the avoidance and minimization measures proposed as mitigation for impacts to flora? How will runoff from the washing areas be disposed of/mitigated/controlled?
23. For impacts and mitigation for flora in Central Maui, a discussion regarding any clearing, grading, or grubbing activities associated with the Mahi Pono Farm Plan should be included.
24. For impacts and mitigation of fauna in East Maui, mitigation measures should pertain to only maintenance activities as no land uses or construction is being proposed. Specifically, the DEIS notes that the use of barbless top-strand wire is recommended for all fence construction to avoid entanglement of the Hawaiian hoary bat. No fence construction was discussed as a part of the proposed action; therefore, this mitigation measure does not appear to apply. Further, tree removal would not be considered a maintenance activity unless it poses a risk to public health, safety, and welfare. In addition, please note that as the EMI system is located within the State Land Use Conservation District EMI is encouraged to speak with the Staff of the Office of Conservation and Coastal Lands to ensure proper permits and or approvals are received prior to conducting any work in the Conservation District. In addition, you state that the Modified Lease Area alternative may have a significant effect on flora, fauna, and

invertebrate species due to an increase in public access. Please include a discussion on how EMI currently maintains public access.

25. In the Historic Resources section, the DEIS states that the Modified Lease Area alternative may have the potential to impact historic properties if there is an increase in unmanaged public access to the license area. Please include a discussion regarding the specific historical sites you believe will be impacted by this alternative.
26. The impacts and mitigation measures section related to fauna in Central Maui appears to overlook that the proposed buildings could have potential impacts to fauna resources as grubbing and grading are normally associated with site preparation. Please revise your discussion accordingly. In addition, there seems to be a missing transition between pages 4-105 and 4-106.
27. Regarding Historic and Archaeological Resources, Hawaii's State Historic Preservation Division (SHPD) confirmed to the Department via an email dated September 24, 2019, that their review of the proposed action confirmed "no historic properties [will be] affected". This determination was based on the absence of ground disturbance activities. However, we note that as benefitters of the Water Lease, the Mahi Pono Farm Plan and the KAP expansion will necessitate ground disturbance and therefore be subject to SHPD's 6E Historic Preservation Review Process during their permitting processes.
28. In the Cultural Resources and Practices section, it should be clearly noted that the information gathered from community consultations happened prior to the issuance of the CWRM D&O in 2018, and that many of the concerns are being addressed through the IIFS.
29. In the Social Characteristics section for East Maui, under Impacts and Mitigation, it is mentioned that there should be a reconciliation with the Keanae-Wailuanui community. Why is A&B not listed as one of the key players? Also, who is responsible for leading this effort?
30. In the Social Characteristics section, we note that under the Impacts and Mitigation section for Upcountry Maui and Central Maui, it is recommended that interest groups or stakeholder groups be defined and that a core working group be established to work collaboratively with Mahi Pono should the Water Lease be approved. However, it is unclear who is supposed to spearhead this working group, who is supposed to fund this working group, and how Mahi Pono will be held accountable for not only participating in this working group, but also seriously considering and/or implementing the recommendations of the working group.
31. It is unclear why the economic and fiscal section, as well as the agricultural economy section of the DEIS, analyzed "typical sugarcane cultivation" versus "recent sugarcane cultivation." While we understand that the sugarcane industry can provide a somewhat relevant baseline, the "typical sugarcane cultivation" has not existed in the last 13 years.

At some point this was no longer the norm and it would probably be better to set the baseline at “recent sugarcane cultivation.”

32. Regarding the economic and fiscal impacts, the proposed action and the East Maui Impacts should be combined into one section as that is how the DEIS is organized. For Upcountry Maui, the economic and fiscal impacts from the KAP expansion should be included in the discussion. Regarding Central Maui, it should be noted that the economic and fiscal impacts from Mahi Pono’s solar farm could be excluded or considered a separate project not reliant on the Water Lease, as the solar farm could conceivably exist without the water license. Also, while the Mahi Pono Farm Plan anticipates that 790 jobs would be created, there is concern regarding how those positions will be filled and by who as Hawaii’s unemployment rate as of April 2019 is 2.8%.

Further, at the October 11, 2019 Board Meeting, a representative from Mahi Pono stated that 700 to 1,000 jobs may be created via their Farm Plan. The upper limit number is much larger than the analyzed 790 jobs. You may need to revise the studies accordingly if 1,000 jobs is a plausible employment projection for the project.

33. Regarding recreational resources in Central Maui, we note that the Maui Raceway park was not included.
34. We also note that under the Central Maui section, there is no discussion of how visual plains may change due to the solar farm or the proposed buildings.
35. Regarding the traffic section, not enough information has been provided to fully understand the impact of the Mahi Pono Farm Plan at full build out and a traffic impact study was not conducted so we are unsure how the conclusion was made that there will be minimal impacts on traffic on public roadways. This may also apply to the KAP expansion depending on the number of jobs created.
36. Regarding wastewater, the DEIS does not discuss the impact that the Mahi Pono Farm Plan will have on existing wastewater infrastructure. This should be discussed as they anticipate 790 jobs to be created and there are buildings which will most likely contain restroom facilities. It is also unclear how field workers would access toilet facilities and where. This should also be analyzed for the proposed KAP expansion.
37. Regarding electricity, the DEIS does not discuss the impact that Mahi Pono Farm Plan will have on the existing electrical grid except for that the energy generated from their commercial solar farm will be provided to Maui Electric Company (MECO). There is no discussion on whether they will be buying back energy from MECO to power their operations (including the proposed buildings) or be self-sustainable and rely solely on their solar panels. This should also be analyzed for the proposed KAP expansion.

Earl Matsukawa,
Wilson Okamoto Corporation

38. Section 5.1.3 State Land Use District mentions that the license area is located within the Conservation District, but the subzone and its objectives are omitted from needed discussion.

We trust that the grammatical errors throughout the DEIS will be corrected in the final EIS. While these comments are many, we note that the EIS Preparation Notice was published in the February 8, 2017 edition of the Office of Environmental Quality Control's *The Environmental Notice* and therefore did not cover the Mahi Pono Farm Plan nor the KAP expansion, since these land acquisitions did not take place until 2018. This would naturally explain the void in the DEIS and our substantial comments found herein. In addition, given our extensive comments on the document, we believe that once the deficiencies are addressed, the DEIS should be republished as a second DEIS in order to allow the public to have an opportunity to comment on any new/additional information provided regarding the project(s).

Should you have questions or concerns regarding our comments, please contact Lauren Yasaka at (808) 587-0431.

Sincerely,

RUSSELL Y. TSUJI
Land Division Administrator

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Tsuji:

Thank you for your comment letter dated October 15, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns, which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The responses below are provided to your comments on the subject Draft EIS.

Comment 1: *Please clarify the cumulative impacts of Mahi Pono's proposed diversified agriculture project, the Kula Agricultural Park (KAP) expansion, the Nahiku Community potable water usage, and the County's Upcountry Maui Water System as it relates to the proposed action (EMI Water Lease or Water Lease). While this point is relatively clear in the executive summary, it becomes muddled throughout the DEIS.*

Response 1: The Proposed Action that is under review in this EIS is explained in Section 2.1 of the Draft EIS which states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the “right, privilege, and authority to enter and go upon” the Lease Area for the “purposes of developing, diverting, transporting, and using government owned waters” through the existing EMI Aqueduct System which supplies

water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System. It will also allow the continued provision of water to approximately 30,000 acres of agricultural lands (formerly in sugarcane) in Central Maui.

Thus, the Proposed Action that is reviewed throughout the Draft EIS contemplates the uses of water you cite (i.e. diversified agriculture, water supplied to the Upcountry Maui Water System, and to the Nāhiku community). Secondary and cumulative impacts are discussed in Section 4.16 (Section 4.17 of the Final EIS) of the Draft EIS, and not only in the Executive Summary. Moreover, those impacts are analyzed throughout Chapter 4 (Description of Existing Environment, Impacts, and Mitigation Measures), which provides a description not only of the impacts in the location of the primary action, i.e., the License Area, but also of the areas proposed to utilize waters to be delivered through the EMI Aqueduct System, or that are otherwise reliant upon the issuance of the subject Water Lease. Those use areas are the Upcountry Maui area, including the Kula Agricultural Park (KAP), the Nāhiku community served by the Maui department of Water Supply (MDWS), and the Central Maui agricultural fields where the Mahi Pono farm plan will be implemented. The environmental topic areas addressed in Chapter 4 also address each use area, which are identified in separate subsections - East Maui, Upcountry Maui, and Central Maui. For example, for each environmental aspect that is described and analyzed, such as groundwater, Chapter 4 includes an assessment of the potential environmental impacts within the East Maui License Area including the Nāhiku community, followed by a discussion of impacts in the MDWS Upcountry Maui Service Area, and then by a discussion of impacts in Central Maui agricultural fields. That format is used consistently throughout Chapter 4.

Please note that the boundaries of these areas are discussed at the very start of Chapter 4 of the Draft EIS. For additional clarity, that same information has been added to the Executive Summary of the Final EIS at pages iii to iv

In response to your comment, the summary discussion of secondary and cumulative impacts in Section 4.17 has been revised for clarification. Similarly, Section 4.18 (Summary of Direct, Secondary and Cumulative Impacts) has been revised as follows (see FEIS page 4-335 to 4-336):

The Proposed Action is the award of a 30-year Water Lease. The lessee will conduct or authorize:

- *Management of the diversion of water by the EMI Aqueduct System consistent with the CWRM D&O, thereby establishing how much water will remain in the Petitioned HFS and Non-Petitioned non-HFS streams that have historically been diverted and how much water may be diverted for other uses; and,*
- *EMI access to maintain the EMI Aqueduct System;*

The direct, secondary, and cumulative effects of the Proposed Action and the sections of the DEIS in which the impacts are discussed include:

- *Direct ~~Impacts~~ impacts are the impacts to the natural environment as a result of changes in streamflow in the License Area - Section 4.2.1 Surface Waters, 4.2.3 Coastal Waters, 4.2.2 Groundwater, and Sections 4.4.1 and 4.4.2 Flora and Fauna.*
- *Direct ~~Impacts~~ impacts also involve the impacts to those who would use water from the HFS License Area streams, including for traditional agriculture as well as traditional cultural resources and practices related to streamflow in the HFS License Area streams – Section 4.6 Cultural Resources and Practices – as well as recreational users of the License Area or in the vicinity of the License Area (Section 4.8 Recreational Users and Park Facilities), in part depending upon the ultimate geographical extent of the License Area approved by BLNR.*
- *Secondary ~~Impacts~~ impacts are the impacts to consumers of water from the EMI Aqueduct System as served by the MDWS, including residential and agricultural uses in Upcountry Maui and Nāhiku – Section ~~3~~ 4.15.1 Water System.*
- *Secondary impacts are impacts to MDWS customers within Nahiku whose continued water service is contingent upon the Proposed Action (Water Lease) or continued revocable permits.*
- *Secondary ~~Impacts~~ impacts are the impacts of using water from the EMI Aqueduct System to develop diversified agriculture in Central Maui – Section 4.7 Socio-Economic Characteristics and Section 4.4 Flora and Fauna.*
- *Cumulative impacts are the impacts of diverting East Maui stream water through the EMI Aqueduct System for the Proposed Action over the long-term, which will be similar to the existing environmental conditions that are described in Chapter 4, as a result of the EMI Aqueduct System's diversion of water from the License Area streams for over a century, but under the Proposed Action the permitted diversion amounts will be less than what was*

historically diverted from those streams due to the flow restoration requirements under the CWRM D&O.

Comment 2: *Please confirm whether the KAP expansion is reliant on the EMI Water Lease. While the KAP expansion is referenced throughout the DEIS, the project description and analysis omits relevant water calculations and is silent on the expansion's cumulative impacts. According to the DEIS, KAP currently requires 1.5 mgd, however the DEIS fails to specifically address the amount of water the KAP expansion will require.*

According to a Maui News Article from January 3, 2019, "an agreement with A&B will provide an additional 1 million gallons of water a day to the new land." Please provide clarity and further analysis regarding the additional water needed and expand on its cumulative impacts.

Response 2: The KAP expansion is a County project; any reservoir or other water system improvements related to that action are entirely the responsibility of the County and are not part of the EMI Aqueduct System. The Applicant here is not and will not be seeking approvals to pursue the KAP expansion. The 262 acres that the County of Maui acquired in 2018 to expand the KAP are lands that had long been used for agricultural purposes (to farm sugarcane). The lessee under the Water Lease is not anticipated to have any involvement in the timing or use of the KAP expansion area, as that is entirely within the jurisdiction and authority of the County of Maui.

With respect to your comment that the Draft EIS omits relevant water calculations for the KAP expansion, please note that the Draft EIS provided information about the amount of water used at KAP and the source of water for the KAP expansion area in a number of sections. Section 2.1.3.2 of the Draft EIS states:

Presently, water demands at KAP are served by the County, which, by contractual agreement, is able to draw up to 1.5 mgd from the end of the Hāmākua Ditch and to utilize a former plantation reservoir to serve KAP. As noted previously, the Ditch is fed directly by the EMI Aqueduct System through the Wailoa Ditch. As of late 2015, the Maui County Office of Economic Development calculated that the current use for the KAP is approximately 548,191 gpd of which 80-90 percent of delivered water is from surface water sources with the remaining portion from basal aquifer wells. Due to the current design of the County's KAP distribution system (pump system in the reservoir), 1.5 mgd must be delivered to the County in order for it to provide the needed 548,191 gpd to the KAP users.

Section 4.7.4 of the EIS notes that in 2017, of the water delivered to MDWS through the EMI Aqueduct System, "About 0.46 mgd were for crops at the KAP, however, 1.5 mgd had to be supplied by the EMI Aqueduct System to produce the 0.46 mgd used by the farmers."

Moreover, the Draft EIS explains that the water delivery agreements in place with MDWS, which include water delivery for the KAP, are contingent upon issuance of the Water Lease. Section 3.3 of the Draft EIS states:

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. As a consequence, domestic and agricultural water needs in Upcountry Maui would need to be met by alternative water sources that would need to be developed by the MDWS. At this point in time, it is unknown whether sufficient groundwater resources exist in Upcountry Maui to meet these water demands. It is anticipated that the development of alternative water-source infrastructure would be prohibitively expensive, and depending upon the specific sources, or combination of sources, could result in significant direct adverse impacts to the environment.

Appendix H (Economic and Fiscal Impact Study) and Appendix I (Agricultural and Related Economic Impacts) further provide:

Under the Proposed Action, EMI will continue to supply water to the MDWS for Upcountry Maui, including for agricultural water use. It is also noted that as part of the County's purchase of the 262-acre expansion of the KAP, EMI has agreed to supply the water for the expansion. The additional water will come from water savings due to infrastructure improvements to the reservoir and pumps that serve the KAP that will reduce system losses (Plasch Econ Pacific, LLC, 2019). The actual amount of water delivered from the EMI Aqueduct System is not anticipated to increase in order to serve the 262-acre expansion.

Appendix H, Section B-2a and Appendix I, Section 6b of the Draft EIS provides:

In 2018, A&B sold 262 acres to the County for the expansion of the Kula Ag Park, and agreed to supply the MDWS with 1 mgd of surface water from the EMI System to meet the needs of the expansion area, subject to the continuation of State permits or issuance of the Water Lease. The needed water allocation will result from infrastructure improvements to the reservoir and pumps that serve the Ag Park, and use existing deliveries from the EMI System more efficiently. Thus,

the current level of water deliveries to the Kula Ag Park will suffice for both the existing and expanded Kula Ag Park areas.

This text has been added to Section 2.1.3.2 of the Final EIS at pages 2-20 to 2-21

Clearly the Maui News article from January 3, 2019, that you mentioned was incorrect. Under the Proposed Action it is assumed that the EMI Aqueduct System will continue to supply water that gets used at KAP, as well as the 262-acre KAP expansion.

Regarding your comment that the Draft EIS was silent about the cumulative impacts of the KAP expansion, they were considered in the Draft EIS. It is assumed that the expansion would serve to increase commercial farming in Upcountry Maui. The cumulative impacts of the expansion would be related to economic and fiscal impacts and are covered in Section 4.7.4 of the Draft EIS relating to Upcountry Maui. Specifically, Section 4.7.4 states:

A continuation of water supplied through the EMI Aqueduct System to serve Upcountry Maui, as planned under the Proposed Action, is projected to result in some 1,520 acres of farmland being irrigated by that source in 2030.

A continuation of water delivered through the EMI Aqueduct System to MDWS is assumed as part of the Proposed Action. Therefore, it is anticipated that the 262-acre expansion of KAP would go forward. That land would have to be converted from fallow sugarcane fields to productive fields for diversified agriculture, with an estimated cost of \$1.3 million. Related indirect sales are projected at \$320,000 per year over a 5-year period. Thus, expenditures plus indirect sales are expected to average approximately \$600,000 per year, and cumulative State tax revenues associated with this conversion would be approximately \$200,000.

Overall, farming in Upcountry Maui is expected to increase due to the KAP expansion. KAP farms and others in Upcountry Maui who will rely on water from the EMI Aqueduct System are projected to produce an estimated 15.1 million pounds of crops per year. Annual farm sales are expected to reach about \$15.1 million, and indirect sales about \$13.4 million. Total direct-plus-indirect sales will be about \$31.8 million per year, of which about \$26 million will be on Maui and about \$5.9 million on O'ahu. About \$3.2 million of consumption expenditures would be subject to the excise tax on final sales, and about \$28.6 million subject to the excise tax on intermediate sales. Rents paid to the County would total about \$900,000 per year. Profits from farm operations and indirect sales are expected to reach about \$3.2 million per year.

Employment will increase due to the KAP expansion. By 2030, farmers who rely on water from the EMI Aqueduct System are expected to provide about 100 jobs and generate about 50 indirect jobs, for a total of about 150 jobs. The payroll is expected to reach about \$3.5 million for the direct jobs and \$5.8 million for all direct and indirect jobs. The direct and indirect jobs provided will support an estimated 330 residents living in about 140 homes, with about 300 residents and 130 homes on Maui.

State taxes generated from Upcountry Maui farms that rely on water from the EMI Aqueduct System would generate about \$54,000 per year in State taxes. For the County, property taxes plus rents paid to the County by farmers at the KAP would total about \$85,000 per year. Most of the increase from 2017 would be due to the additional rental income from the anticipated KAP expansion.

Because the KAP expansion area had been used for commercial agricultural for decades (when it was farmed by A&B for sugarcane) no significant impacts are anticipated from continued agricultural activities in that area.

Comment 3: *While our comments above note that the cumulative results of users benefitting from the Water Lease should be addressed, we wish to point out that pursuant to Hawaii Revised Statutes (HRS), Chapter 343, and Hawaii Administrative Rules (HAR) Chapter 11-200.1, an environmental assessment is required for actions that "[p]ropose the use of state or county lands... " The definition of land as it relates to public lands, pursuant to HRS Chapter 171, "includes all interests therein and natural resources including water, minerals, and all such things connected with land, unless expressly provided. "*

As the Mahi Pono Farm Plan involves the use of State lands (75% of the water being requested in this case), and plays a large role in the cumulative impacts of the proposed Water Lease, and the KAP expansion encumbers both State and County lands as well as County funds, the DEIS should cover all actions (acquisition of a water lease, farm plan and expansion) as part of its proposed action.

Response 3: As a point of clarification, this EIS is not prepared under the new EA/EIS Hawaii Administrative Rules Chapter 11-200.1 that you cite. This EIS is grandfathered under the prior rules, HAR Title 11, Chapter 200.

We acknowledge that water can be viewed as "State lands" in the context of HRS Chapter 343, and the use of State lands is a trigger for environmental review under HRS § 343-5(a). It is for

that very reason that an EIS is required before the BLNR can offer a State water lease at public auction. However, equally important to that analysis are the requirements under HRS § 343-5(e) that sets forth the required process “whenever an **applicant** proposes an **action** specified by subsection (a) that requires **approval of an agency** and that is not a specific type of action declared exempt under § 343-6[.]” Under HRS § 343-2, an "action" is a program or project to be initiated by an agency or an applicant. An "applicant" is “any person who, pursuant to statute, ordinance, or rule, officially requests approval for a proposed action,” and the term “approval” means “a discretionary consent required from an agency prior to actual implementation of an action.” Thus, the requirements of HRS Chapter 343 call for there to be an action, a trigger (such as use of State lands), and a discretionary consent. The only applicant “action” at issue here is the proposed Water Lease because that is the only matter for which agency (i.e., BLNR) "approval" is being sought. The act of farming the Central Maui agricultural fields, which are privately owned and have been farmed for decades, does not trigger requirements under Chapter 343, HRS.

The Mahi Pono farm plan will take place entirely on privately owned lands and its implementation is not an "action" because it does not require approval from an agency. Activities that the County may or may not undertake on its property at the KAP expansion area are entirely outside of the control of the Applicant. The Applicant is not involved in any way with existing for future uses at KAP or the expansion area. Nor is the Applicant seeking any agency approvals related to the KAP expansion area. The County of Maui is solely responsible for the use of that land as well as for complying with any and all regulatory requirements that may arise from the County's use of that land. Nevertheless, as noted in Response #1, the EIS fully considers all direct or primary impacts of the Water Lease, i.e. the Proposed Action, along with associated indirect or secondary impacts and cumulative impacts. The impacts of the implementation of the Mahi Pono farm plan, and the potential farming impacts of the KAP expansion, are thus assessed in the EIS in Chapter 4. The structure of Chapter 4 of the Draft EIS consistently addresses environmental impacts within three distinct geographic areas, East Maui (the location of the Water Lease), and the two water use areas - Upcountry Maui and Central Maui. Cumulative impacts are thus addressed within the EIS. Moreover, a summary of cumulative impacts is within Section 4.16 of the Draft EIS (which is Section 4.17 of the Final EIS). Please see Final EIS pages 4-331 to 4-336.

Comment 4: *Regarding the Mahi Pono Farm Plan, we note that it is very conceptual in nature and lacks details which would allow for a proper analysis of its impacts. The DEIS should be revised to include as much available details including, but not limited to, the siting of structures, utilities, and other improvements that would be necessary for the project to be considered operational, as well as a production timeline, general operating practices, alternative strategies,*

etc. We note that several newspaper articles, found on the Mahi Pono website has more information regarding the Farm Plan than the DEIS has.

Response 4: The Mahi Pono farm plan is expressly intended to be conceptual as described in the Executive Summary and Section 2.1.4:

Mahi Pono’s farm plan as described in this Draft Environmental Impact Statement (DEIS) is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e. orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community. Mahi Pono’s goals for its diversified farm plan in Central Maui will be guided by its core principles of using reasonable and environmentally responsible “best management practices” (BMP), planting non-GMO crops, and growing food for local consumption. For the purpose of this DEIS, Mahi Pono’s Farm Plan projects use of the total amount of water available after compliance with the IIFS requirements of the CWRM D&O, although it is understood that the Department of Hawaiian Home Lands (DHHL) will eventually convert its water reservation to active use.

Any project of the size, scope and timetable as the Mahi Pono farm plan will undergo changes during its lifecycle. The information included in the Draft EIS and the Final EIS represents the general plan for the agricultural project, based on best information known at this early stage of the implementation of the Mahi Pono long-term farm plan. Given the nature of implementing an extensive diversified agricultural farming operation as proposed by Mahi Pono, from scratch, in a new market and with many factors out of its control, there will undoubtedly be changes and adjustments .

The Proposed Action is the issuance of the Water Lease that allows diversions of waters from State lands. However, the EIS addressed not only the direct impacts of the Water Lease, it also took into consideration the impacts of the Mahi Pono farm plan in Central Maui, as a proposed user of the diverted water. The implementation of Mahi Pono’s farm plan and vision for cultivation of the Central Maui fields will be a flexible and iterative process responsive to changing circumstances over the years. For more details see Section 2.1.4 of the EIS.

It should also be noted that implementation of the Mahi Pono farm plan has begun, and progress continues to be made. Section 2.1.4 of the Final EIS (pages 2-30 and 2-32) has been amended to

include information on Mahi Pono's recent and near-term projected water usage and agricultural activities.

Section 2.1.4 and Appendix I provide projections of acreages of cultivation by crop in 2030, the projected timeframe for full cultivation of the Central Maui agricultural fields. This information is consistent with information provided in press releases and public meetings by Mahi Pono.

While Mahi Pono will install new in-field irrigation systems, it will continue to use the existing irrigation infrastructure that brings water to the border of each individual field. Mahi Pono will also continue to use the existing electrical transmission lines, and will use existing buildings to the extent possible. The siting of new buildings and utilities will be determined as the farm plan develops over time. Regarding your comment about general operating practices, as noted in the Draft EIS, Mahi Pono will incorporate applicable best management practices (BMPs) approved by the State of Hawai'i Department of Health, the State of Hawai'i Department of Agriculture, the U.S. Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion. In response to public comments on the Draft EIS, the following additional information has been added to the Final EIS at Section 4.2.1, pages 2-25 to 2-27, regarding Mahi Pono's water saving strategies for the Central Maui agricultural fields including the following:

- Planting windbreaks in the fields.
- Incorporating significant uses of weed mat along plant lines, which will reduce evapotranspiration and erosion.
- Mowing rather than plowing inter-rows to preserve organic matter and keep cover to prevent soil erosion.
- Operating within the terms of a Conservation Plan from NRCS, which includes swales and diversions for erosion protection,
- Practicing rotational grazing of livestock,
- Planting permanent tree crops that will develop canopies that will assist with soil moisture retention and reduce evapotranspiration.

Mahi Pono's farm plan and its impacts are based on a production timeline of full operations by 2030. It is explained in Section 2.1.5 of the EIS that it will take approximately 10 years for Mahi Pono and its lessees to properly prepare their lands for cultivation including actions to remove volunteer sugarcane and weeds, amend soils, install field improvements, build the any needed agricultural structures, and plant crops. The predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. The approach to estimating impacts and the

level of detail are consistent with EIS requirements. The Central Maui agricultural fields now owned by Mahi Pono have been used for intensive agricultural purposes for generations.

Regarding alternative strategies, the EIS also includes a description of a farm plan that could be implemented without the Water Lease. The EIS includes discussions of the impacts of that farm plan on various environmental conditions. See Section 3.4.12 and Section 3.4.13 of the EIS, which includes a discussion of the economic, fiscal, and agricultural impacts of a no Water Lease farm plan, and see Table 3-2 at pages 3-49 to 3-80, which provides a summary comparison of the impacts of the various alternatives, including the no Water Lease alternative.

We do not know what newspaper articles you are referring to with respect to greater details on the Mahi Pono farm plan. There are articles related to planting potatoes, and references to lemons, limes, oranges, mandarins, avocados, papaya, coffee and macadamia nut crops. All of these crops are covered in the Mahi Pono farm plan. As discussed, the Mahi Pono farm plan is intended to and will continue to evolve, as any realistic and responsible farming plan of this size and scope would need to do, to be sustainable.

Comment 5: *Throughout the document, the DEIS references streams in the license area, streams subject to the IIFS contested case, and streams subject to the CWRM D&O. However, the number of streams affected by the proposed action appears to not always be consistent. For example, the footnote on page iii, states that CWRM found there to be 24 streams, not 27, that were subject to the IIFS contested case. On page 1-13, the DEIS again states that Table 1-3 includes the CWRM D&O referenced 24 streams subject to the IIFS Petitions. However, Table 1-3 reflects 37 streams that are subject to the CWRM D&O. Further, Section 4.2.1, footnote 1, states that the CWRM D&O identified 36 streams associated with the license area but the DEIS identifies 37 streams within the license area. Later, however, pages 4-56 state that "[t]he license area also includes streams that were not the subject of the CWRM D&O but are diverted into the EMI Aqueduct system." It would be helpful if there was a concise discussion that gives an overview of the streams that are within the license area and, of those streams, which streams were subject to the contested case and which streams were subject to the conditions of the CWRM D&O.*

Response 5: To address your comment we have made certain changes to terminology within the Final EIS. For example, the term "non-IIFS streams" has been revised for clarity to "non-petitioned streams" meaning those streams within the License Area that were not included in the 2001 IIFS Petitions filed by Native Hawaiian Legal Corporation (NHLC). The streams subject to the IIFS contested case, and the streams subject to the Commission on Water Resources Management (CWRM) Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O), are all petitioned streams.

Table 1-3 of the Draft EIS is intended to be the list of all the streams that are within the License Area, and has been revised to be more clearly titled and to note which streams are petitioned streams and which are non-petitioned streams and, for the former category, what the CWRM IIFS decision was for those petitioned streams. See Final EIS pages 1-19 to 1-22. Table 1-3 has been renamed “Streams in the License Area”; the fourth column has been renamed from "Subject to IIFS" to “Petitioned Streams”, and the fifth column has been renamed from "Restoration Status" to “CWRM Ordered Restoration Status”.

We agree that there are inconsistencies with the number and naming of streams. This also occurs within the CWRM D&O and other public sources of information. We have tried to reconcile the information as best we could. The discrepancies in the stream numbers are often due to terminology. In some cases, the tributaries are considered part of the same stream; in other cases, the tributary is listed separately. For example, Table 1-3 includes the same 36 streams identified by the CWRM as being in the License Area, except it separately lists two tributaries of streams that the CWRM included as part of the main streams (noted as #8A and #33A in Table 1-3), and adds one additional tributary that is in the License Area but was not identified by CWRM in the D&O (Puakea, #6 in Table 1-3). However, please note that in the Draft EIS Puakea was considered a separate stream but was later found to be a tributary to Pa‘akea Stream. This accounts for why Table 1-3 has 39 listings (36 streams plus three tributaries) as compared to the 36 streams listed in CWRM D&O at Finding of Fact (FOF) 58.

Moreover, as explained in Section 1.3.3 of the Draft EIS, in 2001 NHLC filed 27 petitions with CWRM, seeking to amend the IIFS for 27 streams. However, during the CWRM proceedings it was determined that only 24 of the 27 streams identified by NHLC were in fact streams. Waikani, which NHLC had identified as a stream, is not a stream but rather a waterfall on Wailuānui Stream as determined by the CWRM. Alo, which NHLC had identified as a stream, is a tributary of Waikamoi Stream as determined by the CWRM. Similarly, Pua‘aka‘a is a tributary of Kopili‘ula Stream, and not a separate stream itself. This is addressed in EIS footnote 7 in Section 1.3.4 of the Draft EIS as follows:

The difference being that (i) Waikani is not a stream but a waterfall of Wailuānui Stream; (ii) Alo is a tributary of Waikamoi Stream; (iii) Pua‘aka‘a is a tributary of Kopili‘ula Stream; and (iv) Pi‘ina‘au and Palauhulu are separate streams that join together before reaching the ocean (CWRM D&O, FOF 56).

Comment 6: *Why does the Executive Summary not include the calculations of the proposed water diversions when that is the primary use being proposed under the Water Lease?*

Response 6: For additional clarity, a statement regarding the calculations of the estimated water diversions under the Proposed Action has been added to the Executive Summary of the Final EIS at page viii. However, this information was discussed in detail in Section 2.1.2 of the Draft EIS. Moreover, for clarity, the following table has been added to Section 2.1.2 on page 2-12 of the Final EIS and to the Executive Summary at page viii.

Comment 7: *The projections of the amount of water available from the license area at Honopou stream, after taking into account the CWRM D&O, is approximately 87.95 mgd. The 87.95 mgd plus 4.37 from private lands total 92.32 mgd which would be conveyed to supply DWS for users in Upcountry, Nahiku and the agricultural fields in Central Maui. The 92.32 mgd does not appear, however, to consider the basal aquifer wells which delivers 4.9 mgd. Please provide a comprehensive table on the amount of water available and the amount of water sought from the specific streams and wells so the reader can have a clear picture on the amount and its specific source.*

Response 7: It is not clear from your comment if you are asking about the basal aquifer wells that service the MDWS Upcountry Maui Water System, or if you are asking about the wells that service the Central Maui agricultural fields. Therefore in this response we address both of these entirely separate water sources.

With respect to the MDWS Upcountry Maui Water System, it is recognized in Section 2.1.3.1 of the Draft EIS that 10-20 percent of the water delivered through the MDWS Upcountry Maui Water System comes from basal aquifer wells owned by MDWS. We acknowledge that the Draft EIS indicated that those wells delivered 4.9 mgd. However, this statement is incorrect and has been corrected in the Final EIS at page 2-17 as follows:

Together, ~~These four~~ these three wells account for a total of about ~~4.9~~ 3.3 mgd of water production capacity delivered. However, it should be noted that the CWRM D&O mistakenly (CWRM D&O, FOF 808) states that there are two Kaupakalua Wells and that the pumping capacity of Po'okela Well is 1.3 mgd rather than 1.2 mgd as noted by the MDWS in Appendix P.

The figure, which was taken from the CWRM D&O, represented the production capacity of the County's Upcountry wells, and not the delivery amount. Further, pursuant to a letter from the MDWS dated July 24, 2020 (see Appendix P of the Final EIS), the actual production capacity of the County's Upcountry wells is 3.3 mgd, not 4.9 mgd. The MDWS letter further notes that 1.2 mgd of this 3.3 mgd of production capacity is back-up source used only during periods of drought or periods of repair and maintenance at the Upcountry water treatment facilities. The

following corrections and clarifications to Section 2.1.3.1 have been made in the Final EIS after we received additional information from MDWS on pages 2-13 to 2-20.

None of these County wells are within the License Area. The County of Maui's ability to continue to make use of these wells is assumed in the EIS; the use of these wells is not contingent upon the Water Lease.

The remaining 80-90 percent of water delivered through the Upcountry Maui Water System comes from three surface water sources, one of which is the Kamole-Weir Water Treatment Plant (WTP), which is sourced directly by the Wailoa Ditch of the EMI Aqueduct System as explained in Section 2.1.3.1 of the Draft EIS.

An entirely different topic is the irrigation wells that supply brackish water to the Central Maui fields. Section 4.2.2 of the EIS, pertaining to Groundwater, in the Central Maui subsection, explains that under the Water Lease with full amount permitted under the CWRM D&O, 21.31 mgd of brackish groundwater is assumed to be pumped out of the underlying aquifers to supplement the surface irrigation water supplied from the East Maui streams. This estimated usage of groundwater, as well as historical usage from the Central Maui aquifers, is far in excess of the currently established Sustainable Yield of those aquifers. As explained in Section 3.1.1.1 of the Draft EIS, past pumping rates were achievable due to the large amount of recharge that was occurring when sugar was being cultivated and irrigated by surface water. Under the CWRM D&O and the proposed Mahi Pono farm plan, considerably less East Maui stream water will be available to irrigate the lands overlying these Central Maui aquifers that source the brackish water irrigation wells, and thus the recharge will be significantly less, very likely negatively affecting the available yield and the quality of water from these brackish water wells.

Regarding your request for a comprehensive table that indicates the amount of water from the specific streams, please note that data does not exist on a stream-by-stream basis. Also, the streams that are diverted by the EMI Aqueduct System are extremely flashy. In addition, one portion of the License Area could be completely dry, while another portion experiences heavy rainfall. Thus, stream diversions amounts are measured at Honopou Stream, the point at which the EMI Aqueduct System leaves the License Area, and at Māliko Gulch, where the EMI Aqueduct System stops diverting water. However, in response to your comment, as presented in Response #6 above, Table 2-1 has been added to the Final EIS showing the amount of water that is proposed for diversion from the License Area, the stream water to be diverted from outside of the License Area, and the amounts that are proposed to be used by MDWS in the Upcountry Maui Water System, and by Mahi Pono.

Comment 8: *On October 11, 2019, the Board considered the Continuation of Revocable Permits for Water use for the Island of Maui, Hawaii, and Kauai. As a part of the consideration, the Department asked that the Board consider, as a future action, requiring A&B/EMI to make available an additional 5 mgd for use by the State for projects at Pulehunui, Maui, which includes projects for the Department of Hawaiian Homelands (DHHL). In the alternative, the Department would ask that A&B/EMI make available an additional 5 mgd of water to the County Department of Water Supply (DWS) in connection with the County providing water for the State projects at Pulehunui. The EIS should address this potential scenario as an alternative to the proposed action.*

Response 8: Your comment regarding the DLNR staff recommendation to the BLNR is acknowledged and we further acknowledge that the 2020 permits approved by the BLNR at its October 11, 2019 meeting did not include any conditions regarding water for the State's project at Pulehunui, Maui. With respect to the EIS, Section 3.2.1 of the Draft EIS included an analysis of the scenario(s) where the Water Lease is issued for an amount less than the amount available after compliance with the CWRM D&O (the Proposed Action). This scenario is identified as the Reduced Water Volume alternative throughout Chapter 3 of the EIS, which is the chapter that assesses alternatives to the Proposed Action, including the alternative of No Action. The less water available for diversified agriculture in Central Maui (for whatever reason), the greater the expected reduction in the amount of water that the EMI Aqueduct System would provide for the agricultural uses of the Central Maui fields. In that way, the effects of lesser amounts of water being available for the Water Lease lessee, whether due to the DHHL reservation or otherwise, have been addressed through the EIS.

Section 13c of the Agricultural and Related Economic Impacts assessment (Appendix I) in the Draft EIS explains the anticipated impacts in Central Maui and Upcountry Maui from each 1 mgd reduction in water. This is also addressed in the Central Maui subsection of Section 3.4.13 of the Draft EIS:

The Reduced Water Volume alternative has the potential for a significantly adverse effect on agriculture production in Central Maui and the related economic impacts. For each 1 mgd less of surface water made available to the Central Maui fields, there is a related reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture, a reduction in direct sales on Maui of about \$1.7 million per year, a reduction in direct and indirect jobs on Maui and Oahu and a reduction in State revenues of about \$50,000 per year.

For illustration, if the Water Lease permitted diversions in the amount of 70 mgd (an estimated 22.32 mgd reduction from the Proposed Action), there would be 189 fewer jobs than expected under the Proposed Action (604 jobs under the Reduced Water Volume if diversions of 70 mgd were permitted v. 793 jobs under the Proposed Action). The detrimental effects of the Reduced Water Volume continue the greater the reduction in permitted diversions.

Section 2.1.1 of the Draft EIS recognizes the rights of DHHL to reserve water from a water lease under HRS § 171-58(g). The DHHL expected reservation amount, as approved by the Hawaiian Homes Commission, is approximately 11.5 mgd, of which approximately 1.0 mgd is identified for DHHL's use in Pulehunui. Please note that the Section 2.1.1 of the Final EIS has been updated to include the results of the Beneficiary Consultation presented to the Hawaiian Homes Commission on May 30, 2019, but the anticipated reservation amount has not changed. See Final EIS pages 2-4 to 2-7. The Final EIS also recognizes that, contrary to what was stated in the Draft EIS, because no water leases have been issued under HRS § 171-58, and the manner in which reservations are to be actualized has yet to be determined, in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessor and the DHHL will be necessary to allow any temporary use of water reserved for DHHL.

Comment 9: *The second paragraph on page iii uses the acronym "IIFS" without first introducing the compound term, Interim Instream Flow Standards, however, we note that the compound term with the acronym in parenthesis is in the third paragraph on the same page. The same comment applies for the first use of "CWRM D&O".*

Response 9: In response to this comment, this has been corrected in the Executive Summary of the Final EIS at page vi. The acronym is also provided in the "List of Acronyms Used" that follows the Table of Contents in both the Draft EIS and the Final EIS.

Comment 10: *Chapter 2 states that "it is anticipated that EMI and/or Mahi Pono will continue to pursue watershed management activities." Please note that whoever is the applicant for the Water Lease will ultimately be held responsible for fulfilling the requirements of HRS §171-58 (e).*

Response 10: It is acknowledged that any water lessee will be subject to all applicable requirements under HRS §171-58, which articulates terms for the disposition of a water lease. Section 2.1 of the Draft EIS states:

The amount of water awarded by the Water Lease is subject to all applicable requirements under HRS § 171-58. HRS § 171-58(c), (d), and (e) articulate terms for the disposition of the Water Lease. HRS § 171-58(e) requires that any new lease of water rights "shall contain a covenant that requires the lessee and the department of land and natural resources to jointly develop and implement a watershed management plan. The board shall not approve any new lease of water rights without the foregoing covenant or a watershed management plan.

A&B was a founding member of the East Maui Watershed Partnership (EMWP). Under the Proposed Action, it is anticipated that the Water Lease lessee will continue to pursue watershed management activities either through an existing watershed management plan or a newly developed watershed management plan or some combination of both. The existing East Maui Watershed Partnership Management Plan was prepared in July 2009 and amended in July 2018. A copy of the EMWP Management Plan has been added to the EIS as Appendix O. The EMWP Management Plan describes the watershed resources such as water, cultural / physical resources, native flora and fauna, and recreational resources. The EMWP Management Plan identifies the watershed threats and management objectives for the East Maui watershed. Under the Proposed Action, if the Applicant is awarded the Water Lease, it is anticipated that EMI and/or Mahi Pono will continue to pursue watershed management activities.

Section 2.1 of the Draft EIS described the State's action with respect to the minimum content requirements of a watershed management plan as of that point in time. However, this section of the Final EIS has been revised to take into account the BLNR's actions on October 11, 2019 under agenda item D-2, where BLNR approved the minimum content requirements for a watershed management plan. A copy of the BLNR-approved DLNR report has been added to the EIS as Appendix O-1. Section 2.1 of the Final EIS, pages 2-2 to 2-4, has been updated to reflect this more recent information regarding the State's requirements for watershed management plans.

Comment 11: *Throughout the document, it has been mentioned that community members and the like have concerns regarding the upkeep of the EMI system. Within the proposed action section (Chapter 2), the DEIS should provide some type of description regarding the existing condition of the system and any maintenance and repairs proposed should the Water Lease be granted.*

We further note, at the October 11, 2019 Board of Land and Natural Resources (Board) meeting, a representative from Mahi Pono stated that Mahi Pono has plans to invest 20 million dollars over the next three years in more efficient irrigation systems. Will part of this investment be in the existing EMI system? If so, please discuss and if not, then what actions are being taken by EMI to ensure that the system being efficiently operated?

Response 11: EMI continually maintains the EMI Aqueduct System, which is a highly efficient system. A 2012 United States Geological Survey (USGS) study, entitled “*Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawai’i*”, that was prepared in cooperation with the CWRM and cited in the 2018 CWRM D&O, concluded that it was unclear whether net seepage losses even occur in the EMI Aqueduct system, due to the large amount of tunnel in the system, as well as the seepage gains that enter the system. Thus, the system does not lose water. With regards to the Proposed Action, maintenance and repair activities involve keeping the waterways clear of trees, weeds, rocks, dirt and anything that will potentially impede the flow of water. This includes not only in ditches, but in tunnels and flumes as well. EMI evaluates areas of the EMI Aqueduct System regularly to identify where maintenance / repair activities are necessary and adds them to a list of maintenance projects. In response to questions raised through public comments, the following text has been added to the Final EIS at Section 2.1.2 page 2-7.

Moreover, while EMI continually maintains the EMI Aqueduct System, there are times when it focuses its efforts in critical areas that are utilized more frequently. However, this in no way implies that EMI leaves any portion of the system in disrepair.

As noted above, the EMI Aqueduct System is highly efficient. The investment planned by Mahi Pono is to improve the efficiencies of its Central Maui Field Irrigation System as noted in Section 2.1.4 of the Final EIS, which explains:

. . . Mahi Pono expects to invest over \$20 million to increase the efficiency of its private Central Maui Field Irrigation System (i.e. the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high efficiency irrigation systems. These new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health, thereby making a more sustainable use of the water resources.

Comment 12: *On page 2-10 we note that the three surface sources relied upon for Upcountry Maui via Wailoa Ditch, processed by Kamole-Weir treatment plant, totals 17.9 mgd, yet only 9.1 mgd is reliable "due to limitations and maintenance requirements." Please elaborate on this finding and what, if any, plans will address the reliability and maintenance issues.*

Response 12: To clarify, only one of the three surface water sources relied upon for the MDWS Upcountry Maui Water System is sourced by the EMI Aqueduct System and processed by the Kamole-Weir WTP. Section 2.1.3.1 of the Draft EIS states:

One of the three surface water sources is delivered directly by the EMI Aqueduct System, through the Wailoa Ditch. Average daily use by the MDWS from the Wailoa Ditch is about 7.1 mgd, which includes water processed by the Kamole-Weir Water Treatment Plant (WTP) (discussed in further detail below) and non-potable water for the KAP, which receives water from Reservoir 40.

However, as discussed in Response #7 above, some text in Section 2.1.3.1 has been updated with corrected information from MDWS. The other two surface water sources are fed from streams situated on privately-owned land, rather than the Wailoa Ditch, and the County's ability to access these stream waters are part of the same agreement that allows the County to take water from the Wailoa Ditch. The continuation of this agreement is predicated on EMI's securing water permits or a Water Lease from the State for the East Maui stream waters.

Regarding the statement in Section 2.1.3.1 of the EIS that you commented on, regarding MDWS's access to 17.9 mgd and only 9.1 mgd being reliable, that information came from the CWRM D&O, FOF 810 and 811, which was taken from statements made by the MDWS Director at that time, and provides as follows:

The combined surface and ground water sources have a production capacity of 17.9 mgd: 13.0 mgd from surface water, . . . and 4.9 mgd from ground water (including 1.5 mgd in emergencies from the Hamakuapoko wells). (FOF 810).

However, due to occasional maintenance requirements and limitations on the use of the Hamakuapoko Wells, reliable capacity stands at 9.1 mgd. This is premised on the following sources not being available: 1) the largest surface-water facility, the Kamole-Weir at 6.0 mgd production capacity; 2) the Pookela Well at 1.3 mgd production capacity; and 3) Hamakuapoko Wells at 1.5 mgd, which is only available at times of emergency. These three sources total 8.8 mgd, potentially reducing total production capacity of 17.9 mgd to 9.1 mgd. (FOF 811).

We are not aware of the rationale behind this finding on reliable capacity, which comes from the MDWS, nor of any improvements being currently planned by the MDWS to the Kamole-Weir WTP.

Comment 13: *In section 2.1.3.1, we note that currently DWS is being charged 6 cents per 1,000 gallons to receive East Maui surface water for KAP and other Upcountry Maui farm areas. Notably, DWS purchases water for domestic use from EMI's West Makapipi Tunnel 2, Well No. 4806-07, known as the Nāhiku Tunnel. What is the approximate annual amount charged to DWS and does the amount charged take into consideration the two aqueducts above the license area in Haiku Uka owned by DWS?*

Response 13: You are correct that the EIS purports that MDWS is charged 6¢ per 1,000 gallons to receive East Maui surface water. That text at Section 2.1.3.1 has been further clarified in the Final EIS as follows:

The MDWS has been able to receive its surface waters from all three Upcountry Maui water sources through a series of agreements with EMI. Because the EMI agreements with the MDWS provide that water supplied to the MDWS is contingent upon the Water Lease (or revocable permits) being issued, for purposes of this EIS, no water is presumed to be provided to the MDWS if the Water Lease is not issued. Currently the MDWS is being charged 6¢ per 1,000 gallons to receive East Maui surface water for the KAP, at Kamole-Weir, Nāhiku, and for the Waikamoi waters that feed the Upper and Lower Kula water systems and other Upcountry Maui farm areas.

Section 2.1.3.3 of the Draft EIS also states that MDWS purchases water delivery for domestic use from EMI's West Makapipi Tunnel 2 (Well No. 4806-07), aka the "Nāhiku Tunnel." However, please note that Section 2.1.3.3 of the Final EIS has been updated with correcting information regarding the MDWS Nāhiku Service Area as shown on pages 2-21 to 2-22.

In response to your comment about the approximate annual amount charged to MDWS, the following has been added to Section 2.1.3 of the Final EIS:

With the issuance of the Water Lease in the Proposed Action, the amount of water the MDWS would receive through the EMI Aqueduct System through the Wailoa Ditch is assumed to be consistent with prior use, identified in the CWRM D&O as an average of 7.1 mgd. Per the 1973 Memorandum of Understanding, 6 cents per thousand gallons has been the rate at which EMI charges the County of Maui for accessing raw, untreated water. This includes water for the Nāhiku community as well as the water drawn from the Wailoa Ditch at Kamole-Weir and both of the Ha'ikū Uka systems (which are not sourced by the EMI Aqueduct System). The total annual amount collected by EMI from deliveries sources ranges between approximately \$70,000 and \$150,000, depending on the demand for the year (Munekiyo, Updated 2020).

Comment 14: *Within Section 2.1.4 Central Maui Field System, there is no discussion on the current activities of Mahi Pono within the Central Maui Area. Please revise section accordingly given the fact that at the October 11, 2019 Board Meeting, a representative from Mahi Pono stated that they currently have 70 acres in production for potatoes.*

We wish to note that this statement was confirmed via an article published in the Star Advertiser on September 1, 2019 which also indicated that these potatoes are being grown as a "signature" crop similar to that of the Maui pineapple and the Maui onion. This appears to be contradictory to one of their core principals, which is "growing food for local consumption." Further, several times during the Board meeting, the representative stated that the food grown would be for the Hawaii market. Based on the article, it seems to infer that the "Hawaii market" may not necessarily be the local Hawaii market. Mahi Pono should make clear their intentions regarding the business aspect of their Farm Plan.

Response 14: As provided in Response #4 above, Section 2.1.4 of the Final EIS, pages 2-30 includes updated information about Mahi Pono's farming activities and water use projections as of October 2020.

As of November 2020, Mahi Pono's agricultural uses in Central Maui irrigated by the East Maui stream waters included:

- a. 1,398 acres in orchard.
- b. 633 acres in row crops
- c. 32 acres in energy/cover crops
- d. 23 acres in tropical fruits
- e. 12,000 acres in pasture for cattle

Regarding your comment about potatoes being grown as a signature crop and what is meant by food for local consumption, Mahi Pono's initial potato crop was largely donated to various charities and food bank programs in Hawai'i. No potatoes were sold to locations outside of the State of Hawai'i. These actions are in-line with the statements made by Mahi Pono representatives at the BLNR meeting of October 11, 2019.

Regarding your comment about whether the food to be grown by Mahi Pono under the farm plan will be for the local market, "food for local consumption" means crops grown for Hawai'i residents and visitors. Section 4.7.4 of the of the Draft EIS states that at full operations, "... total farm sales would be about \$160.7 million per year, of which an estimated \$104.4 million (65%) would be Hawai'i sales and \$56.2 million export sales (35%)." Hence, it is anticipated that

approximately 65% of the farm sales would be local sales. However, the local market is too small to utilize all of the crops planned to be grown, and thus some export is necessary.

Comment 15: *Regarding ALISH classifications for East Maui, the discussion surrounding this section seems to be incomplete. Based on the map provided as Figure 4-10, it appears that no ALISH lands are located within the license area, however, it is unclear if some of the beneficiaries of the Water Lease are located outside of the license area, but within an ALISH designated area. If this is so, then this should be discussed accordingly.*

Response 15: There are no ALISH lands located within the License Area. The following statement has been added to the East Maui subsection of Section 4.1.2 on page 4-20 of the Final EIS, "However, there are no ALISH classified lands within the License Area itself."

Figure 4-10 depicts the East Maui License Area and clearly shows there are no ALISH designations for that land. It is stated repeatedly in the EIS that under the Proposed Action most of the water derived from the Water Lease will be used for agricultural purposes in Central Maui - Mahi Pono has not proposed any farming within the License Area. With respect to ALISH ratings in Central Maui, please see Fig. 4-16, which shows that the majority of the Central Maui lands are designated ALISH Prime. The Agricultural and Related Economic Impacts assessment (Appendix I) also provides a discussion of ALISH ratings for Upcountry Maui and Central Maui. Please note that a detailed description of NRCS, ALISH, and LSB classifications has been added to Section 4.7.4 of the Final EIS at pages 4-295 to 4-297, in the subsection addressing Central Maui - Agricultural Conditions.

Comment 16: *On pages 4-56 of the 2018 CWRM D&O, under the section Setting the IIFS, it is noted that "[t]his scenario represents the flow conditions as described in the CWRM D&O setting the IIFS which included 24 streams and mandated restoration of flows in all but three streams." According to the information in section 1.3.4, the CWRM D&O required that 10 streams have no diversions, 5 streams were required to return to 64% of the median base flow, and 7 streams were required to have 20% of the median base flow. This totals 22 streams. Yet 24 streams were a part of the contested case. Please explain the discrepancies amongst the referenced "three streams", on pages 4-56, 22 streams, in section 1.34, and 24 streams that were part of the contested case.*

Response 16: The reference you made to page 4-56 is to the Draft EIS (Section 4.2.1) and not the CWRM D&O. The heading of that particular Draft EIS subsection is "2018 CWRM D&O - Setting the IIFS." You also pointed to Draft EIS Section 1.3.4 (titled "Interim Instream Flow Standard Decision and Order"). After reviewing those sections you asked for clarification on

number of streams subject to the CWRM D&O and the applicable restoration status ordered by CWRM under the CWRM D&O.

The CWRM D&O is confusing relative to the nomenclature and number of streams. We nonetheless have tried to reference the D&O as accurately as possible.

In FOF 56 of the CWRM D&O, the CWRM states that:

56. *There are 24, not 27, streams that are the subject of this contested case.*
 - a. *Waikani is not a stream....*
 - b. *Alo is a tributary.....*
 - c. *Pua'aka'a is a tributary*
 - d. *Pi'ina'au and Palauhulu are separate streams but join together before reaching the ocean....*

The above is also referenced as Footnote #7 in Section 1.3.4 of the Draft EIS. However, in Item h of the CWRM D&O (pp. 268-269), the CWRM lists Pi'ina'au and Palauhulu separately, thus bringing the total number of 'streams' listed in that table (which provides the restoration status ordered by CWRM) to 25. As noted in that table there are three streams whose restoration status is "None". That is the source of our use of "three streams."

As mentioned in Response # 5, NHLC filed petitions seeking IIFS for 27 streams. During the extensive proceedings on those petitions, CWRM determined that only 24 of the 27 qualified as streams. See CWRM D&O FOF 56, quoted above. In issuing the CWRM D&O, CWRM set new IIFS for 22 streams and tributaries.

As described in Section 1.3.4 of the Draft EIS, in setting the new IIFS for the petitioned-streams, CWRM ordered four different types of restoration status: Full, Connectivity, H₉₀, and None. Ten streams (one of which was recognized as a tributary) were ordered to be fully restored (1. Makapipi; 2. Waiohue; 3. West Wailuāiki; 4. Wailuānui; 5. Waiokamilo; 6. Palauhulu; 7. Pi'ina'au; 8. Hanehoi; 9. Huelo (Puolua) tributary; and 10. Honopou). In other words, these streams can no longer be diverted by the EMI Aqueduct System.

Seven streams (one of which is recognized as a tributary) were ordered for connectivity flow restoration, meaning 20% BFQ50 (1. Hanawī; 2. Kapā'ula; 3 Pa'akea; 4. Pua'aka'a; 5. Nua'ailua; 6. Ha'ipua'ena; and 7. Puohokamoā).

Five streams were ordered for H₉₀ flow restoration, meaning required to return 64% of BFQ50 (1. Kopili'ula; 2. East Wailuāiki; 3. Honomanu; 4. Punalau/Kōlea; and 5. Waikamoi).

No restoration status was ordered for three streams (1. Waia‘aka; 2. ‘Ōhi‘a/Waianu; and 3. Wahinepe‘e). The CWRM D&O did not set new IIFS for the 12 non-petitioned streams within the License Area that are diverted by the EMI Aqueduct System.

For clarity, Table 1-2 (License Area Streams as presented in Table 1-2 in the EISPN (February, 2017) Reconciled with Stream Names Used in the CWRM D&O (June 20, 2018)), has been amended to note the streams and tributaries as noted above.

Comment 17: *Please elaborate on why the Mahi Pono Farm Plan will not require drainage improvements especially given the need for building construction and the increase in impervious surfaces.*

Response 17: As stated in Section 4.2.4 of the Draft EIS, the Central Maui agricultural fields and infrastructure are designed and operated to efficiently utilize irrigation water received through the EMI Aqueduct System so that there is no surface runoff. Therefore, no significant changes to existing drainage patterns or systems within Central Maui are anticipated. The Final EIS includes a clarifying statement in Section 4.2.4 at page 4-87 as follows:

The Proposed Action is limited to the issuance of the Water Lease for the subject License Area, which would enable the lessee to continue operation of the EMI Aqueduct System that has been in operation for over a century. The Proposed Action continues the use of the EMI Aqueduct System ~~system~~ for the transport of surface water, which will allow for the transition of the agricultural fields in Central Maui to a diversified agriculture operation. In general, the Proposed Action will maintain existing conditions, in compliance with the CWRM D&O and any reservations in favor of the DHHL. No significant changes to existing drainage patterns or systems within Central Maui are anticipated. Any drainage concerns related to construction associated with the Mahi Pono farm plan (i.e., agriculturally related buildings, solar farm(s)) will be addressed through the applicable permitting processes. Irrigation water would be applied at rates that will not cause surface runoff. Severe rainfall can result in localized runoff or ponding but would be unrelated to the amount of irrigation water made available through the EMI Aqueduct System.

Comment 18: *Regarding the Impact and Mitigation section regarding Climate Change for Central Maui, it is unclear how Mahi Pono plans to counteract its carbon footprint. The DEIS give the reader the impression that agricultural operations may act as a carbon sink. While research shows that agriculture has such potential, it is dependent on the farmer's practices and usage of a carbon farm plan, similar to that of the Marin Carbon Project, as the basis for its*

operations. This does not seem to be the case for Mahi Pono. Further it appears that the DEIS relies heavily on the fact that the amount of carbon produced by its proposed operations will be substantially less than what was released during sugarcane operations. The analysis should be based on current conditions and not on the historic condition of sugar, which not been in production since the beginning of 2016. Further, the analysis does not take into account any exportation of crops. Unless we are to assume that all crops produced will stay on Maui, some type of export will be required, even if that only includes interisland.

Response 18: Mahi Pono’s goals for its diversified farm plan in Central Maui will be guided by its core principles of using reasonable and environmentally responsible “best management practices” (BMP), planting non-GMO crops, and growing food for local consumption.

Section 4.3.1 of the Draft EIS contemplates climate change and how Mahi Pono’s farm plan may contribute to climate change drivers. As stated in Section 4.3.1 of the Draft EIS:

As Mahi Pono’s farm plan becomes operational, GHG emissions from internal combustion engines in farming equipment, and transportation related to crop production and workers will increase over the current fallow conditions. When fully operational, the amount of GHG emissions compared to former sugarcane operations does not suggest that one would be significantly greater than the other. There will be seasonal differences in emissions with a sugar monocrop generating more emissions during seasonal harvests while diversified agriculture would likely be distributed due to differences in crop cycles. Sugar also involved burning but such emissions were not from fossil fuels. Sugar also involved transporting products overseas for processing and distribution while diversified agriculture could reduce the amount of food crops imported from overseas as it increases the amount of local food production. Mahi Pono’s farm plan proposes livestock operations on the agricultural fields in Central Maui. The livestock sector requires a significant amount of natural resources and has a role in GHG emissions, especially methane and nitrous oxide...

These GHG emissions will be offset to some degree due to the reduction of Hawai’i’s reliance on imported food due to the statewide availability of Mahi Pono’s locally grown crops. At full build-out, Mahi Pono’s farm is expected to produce in excess of 200 million pounds of fresh produce for Hawai’i that would otherwise be imported, thus significantly reducing the GHG impact of shipping these products from the mainland US. It is acknowledged that the steady increase in farming activities over time as the Mahi Pono farm plan gets fully implemented will involve some addition of carbon output related to a greater use of farming equipment than present conditions.

The exact nature of how the climate will change and impacts from any changes is unknown. As research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

As noted in Response #14, Appendix I and Section 4.7.4 of the Draft EIS does contemplate that some of the crops produced by Mahi Pono will be sent off island. Similar information has been added to the Central Maui subsection of Section 4.3.1 of the Final EIS at page 4-93 as follows:

As Mahi Pono's farm plan becomes operational, GHG emissions from internal combustion engines in farming equipment, and transportation related to crop production and workers will increase over the current fallow conditions. When fully operational, the amount of GHG emissions compared to former sugarcane operations does not suggest that one would be significantly greater than the other. There will be seasonal differences in emissions with a sugar monocrop generating more emissions during seasonal harvests while diversified agriculture would likely be distributed due to differences in crop cycles. Sugar also involved burning but such emissions were not from fossil fuels. Sugar also involved transporting products overseas for processing and distribution while diversified agriculture could reduce the amount of food crops imported from overseas as it increases the amount of local food production. To the extent economically feasible, Mahi Pono and other farmers on its land will grow food crops for the Hawai'i market. Generally, the reduction in imported food would reduce fossil fuel emissions from shipping and airline carriers. However, the Hawai'i market is too small to use all of the available farm product expected to be produced on the Central Maui agricultural lands, and thus some export is necessary. At full development of its farm plan, Mahi Pono expects that its local sales, including those of its farm tenants, will comprise roughly 65% of total sales generated from the Central Maui agricultural fields, with exports being 35%, which is a reduction in the exports and thus a reduction in GHG emissions as compared to a monocrop such as the former sugarcane operations.

Moreover, the Mahi Pono Farm Plan proposes approximately 250 acres of green energy, such as solar farm(s) with a capacity of approximately 37.5 MW of clean energy to be provided to the MECO grid and/or for Mahi Pono's farm operations, which would further reduce GHG emissions. In addition, as noted in the Draft EIS, Mahi Pono will use power from two existing hydro-electric facilities to power the many drip irrigation systems, groundwater well pumps, and facility/tenant buildings through a private 62-mile transmission grid throughout the Central Maui agricultural fields.

Comment 19: *It is unclear why the discussion on sea level rise only took into account passive flooding as the State's Hawaii Sea Level Rise Vulnerability and Adaptation Report recommends using the sea level rise exposure area (SLR-XA) as the baseline for discussion.*

Response 19: The Draft EIS utilized the State of Hawai'i's most current sea-level rise exposure maps. These maps were produced as part of the Hawai'i Sea Level Rise Vulnerability and Adaptation Report, which was stewarded by the Office of Conservation and Coastal Lands at the Department of Land and Natural Resources. The Hawai'i Sea Level Rise Vulnerability and Adaptation Report and its subsequent mapping products are currently the State's standard for assessing potential impacts along Hawai'i's shoreline. Each length of coastline was reviewed by the State's experts to select key natural phenomenon for assessment. Regarding the coastline below the License Area, the State only selected passive flooding for assessment, thus the only impacts identified, mapped, and presented in the report by the State of Hawai'i for East Maui are those associated with passive flooding. For preparation of the Draft EIS, we followed the State's guidance and utilized their preferred mapping products for assessment of sea-level rise impacts.

Comment 20: *Regarding the discussion for Central Maui under the hurricane and wind hazards section, it is stated that "the proposed action does not include any construction in Upcountry Maui that would be at risk in the event of hurricanes and wind hazards." Does this imply that the KAP expansion has no associated structures?*

Response 20: The Applicant has no involvement in the development of the KAP expansion area. The County of Maui is solely responsible for the use of that land as well as complying with any and all regulatory requirements. It is assumed that the County will ensure that construction, if any, that may take place within the KAP expansion area will be in compliance with Maui County Code requirements.

Comment 21: *Seismic hazards for Central Maui should address construction related to the Mahi Pono Farm Plan.*

Response 21: With respect to hurricanes and wind hazards, Section 4.3.4 of the Draft EIS provides the following with respect to Central Maui:

In Central Maui the Proposed Action largely entails diversified agriculture, which will not present a risk in the event of hurricanes or wind hazards. Construction related to the Mahi Pono farm plan (e.g. solar farm, agricultural processing facilities) is limited, and will be built to all appropriate standards to address risks related to hurricanes and wind hazards.

With respect to seismic hazards, Section 4.3.5 of the EIS (Seismic Hazard), has been revised to include a similar statement as found in Section 4.3.4 of the Draft EIS as follows:

The Proposed Action is limited to the issuance of the Water Lease for the subject License Area, which would enable the lessee to continue operation of the EMI Aqueduct System that has been in operation for over a century. The Proposed Action continues the use of the EMI Aqueduct System system for the transport of surface water, which will allow for the transition of the agricultural fields in Central Maui to a diversified agriculture operation, and the continued conveyance of water to the MDWS. In general, the Proposed Action will maintain existing conditions, in compliance with the CWRM D&O and any reservations in favor of the DHHL. For Upcountry Maui, the Proposed Action does not entail any new construction, and therefore maintains status quo with respect to seismic hazards. ~~In Central Maui, the 30,000 acres of fields will be used for farming, as it has been for over a century, and the Proposed Action is not anticipated to present any new risks with respect to seismic hazards.~~ In Central Maui the Proposed Action largely entails diversified agriculture, which will not present a risk in the event of seismic hazards. Construction related to the Mahi Pono farm plan (e.g. solar farms, agricultural processing facilities) is limited, and will be built to all appropriate standards to address risks related to seismic hazards.

Comment 22: *For the mitigation associated with the maintenance of the East Maui system, who is responsible for ensuring that the qualified biological monitor or inspector meets all the specifications as represented in the avoidance and minimization measures proposed as mitigation for impacts to flora? How will runoff from the washing areas be disposed of/mitigated/controlled?*

Response 22: The mitigation measures referenced in Comment #22 are discussed in the East Maui subsection of Section 4.4.1 of the Draft EIS. EMI owns and operates the EMI Aqueduct System and is responsible for the maintenance of the EMI Aqueduct System. It is assumed that the proposed Water Lease would require compliance with appropriate mitigation measures identified in the EIS, but the terms of the Water Lease are at the discretion of the BLNR and would have to be agreed to by the lessee.

It is not anticipated that there will be significant use of any washing areas related to the maintenance of the EMI Aqueduct System. The recommend mitigation measure applies only for maintenance activities that take place on cliff sides, near waterfalls, and in other native species–dominated areas in the License Area. Appendix C (Terrestrial Flora and Fauna Technical Report)

explains, as recited in the Draft EIS in Section 4.4.1, the limited scenario where such mitigation measures are recommended:

However, to the extent that maintenance activities are undertaken within the License Area in pristine areas, such as on cliffsides, nears waterfalls, or in other native species dominated areas, the following avoidance and minimization measures are recommended: . . .

To avoid the unintentional introduction or transport of new invasive plant species into more pristine portions of the License Area during aqueduct maintenance activities, all equipment and vehicles arriving from outside the License Area should be washed and inspected prior to any maintenance activities on cliffsides, near waterfalls, and in other native species–dominated areas in the License Area. Such washing and inspecting should be done at a designated location.

Based upon decades of operation of the EMI Aqueduct System, it is highly unlikely that maintenance activities will take place in such areas, as the maintenance activities are related to the maintenance and repair of existing access roads and trails that are currently used in connection with the EMI Aqueduct System, and maintenance on the EMI Aqueduct System itself. As such, maintenance activities would be within areas that are already in use. Nevertheless, the Terrestrial Flora and Fauna Technical Report recommends that "*Inspection and cleaning activities should be conducted at a designated location.*" Inspection and cleaning activities will occur prior to entering the License Area. Moreover, any construction materials to be used for repair and maintenance activities will be inspected and washed prior to entering the License Area. Washout locations will not drain into parks, open areas, or pristine environments. Washout procedures will follow applicable BMPs.

To date, EMI has worked closely with the Maui Invasive Species Committee (MISC) to assist in mitigating non-native weeds along the EMI Aqueduct System and access roads. In response to your comment, the East Maui subsection of Section 4.4.1 of the Final EIS at page 4-123 has been revised to reflect EMI's work with MISC as follows:

EMI has worked closely with the Maui Invasive Species Committee (MISC) to assist in mitigating non-native weeds along with the EMI Aqueduct System and access roads. Typical procedures involve EMI staff notifying MISC of sightings and locations of non-native weeds, and then facilitating access by MISC to these identified areas to conduct appropriate treatment methods. EMI has committed to continuing to work with MISC in order to institute more stringent protocols for equipment sanitization and protection of the License Area.

Moreover, pursuant to HRS § 171-58(e) a watershed management plan is required in connection with a water lease as discussed in Response #10 above.

Comment 23: *For impacts and mitigation for flora in Central Maui, a discussion regarding any clearing, grading, or grubbing activities associated with the Mahi Pono Farm Plan should be included.*

Response 23: Section 4.4.1 of the Draft EIS explains that the Central Maui agricultural fields have been in agricultural production for over 100 years. The Terrestrial Flora and Fauna Technical Report prepared by SWCA determined that no special status plant species exist within the Central Maui fields. As such, continuation of agricultural use of the Central Maui fields, as proposed under the Mahi Pono farm plan, cannot have impacts to flora, except to remove existing non-native flora. Section 4.4.1 of the Draft EIS explains that the diversified agriculture proposed by Mahi Pono could actually have a beneficial effect as, *"Increasing the diversity of crops, as is proposed with the Mahi Pono farm plan, increases the niches in which flora can establish and would therefore be beneficial to some flora because the agricultural lands would provide an increased diversity of foraging, breeding, and nesting resources. In general, increased diversity in croplands could lead to an increased diversity of flora."*

For clarity, the following statement has been added to the Central Maui subsection of Section 4.4.1 of the Final EIS at page 4-125: *"Agricultural activities, including but not limited to clearing, grading, and grubbing, related to the implementation of the Mahi Pono farm plan will not have an adverse impact on the existing flora in the Central Maui agricultural fields."*

Comment 24: *For impacts and mitigation of fauna in East Maui, mitigation measures should pertain to only maintenance activities as no land uses or construction is being proposed. Specifically, the DEIS notes that the use of barbless top-strand wire is recommended for all fence construction to avoid entanglement of the Hawaiian hoary bat. No fence construction was discussed as a part of the proposed action; therefore, this mitigation measure does not appear to apply. Further, tree removal would not be considered a maintenance activity unless it poses a risk to public health, safety, and welfare. In addition, please note that as the EMI system is located within the State Land Use Conservation District EMI is encouraged to speak with the Staff of the Office of Conservation and Coastal Lands to ensure proper permits and or approvals are received prior to conducting any work in the Conservation District. In addition, you state that the Modified Lease Area alternative may have a significant effect on flora, fauna, and invertebrate species due to an increase in public access. Please include a discussion on how EMI currently maintains public access.*

Response 24: It is acknowledged that mitigation measures should pertain only to repair and maintenance activities as no land uses or construction are being proposed within the License Area. These above-mentioned mitigation measures have been removed from the discussion in the East Maui subsection of Section 4.4.2 (Fauna and Invertebrates) of the EIS and the following footnotes at page 4-130 of the Final EIS added to explain the deletion:

Mitigation measures eliminated from the recommendations in this FEIS as not applicable to the License Area in East Maui because the Proposed Action does not include the removal of trees and there will not be any fence construction, as noted by the DLNR in its DEIS comment letter.

Mitigation was included here in error. It has been deleted here and retained in the Invertebrates subsection.

All repair and maintenance activities will, as they have been in the past, be in compliance with Title 13, Chapter 5, HAR, and Chapter 183C, HRS, which pertain to the Conservation District.

Currently, access within the License Area is regulated by EMI in collaboration with DLNR. EMI maintains locked gates on the main access roads that lead into the watershed. Section 4.8 of the Draft EIS described access, and minor clarifications to that description were made in the Final EIS as follows:

To hunt within the License Area, hunters must obtain a license from the DLNR and an EMI Permit / Waiver. Hunting grounds are limited to one hunting party per hunting area, as regulated by the DLNR. Hunters enter the hunting unit every Saturday and Sunday, as well as holidays observed by EMI. Prior to entering, hunting parties must sign in with the license number obtained from the DLNR, and upon exiting must log in any game that are taken. Access to the hunting grounds is managed by EMI through eight existing EMI access roads. Hunting is permitted year round. Hunting parties may enter the License Area by vehicular access, however, must traverse by foot in most areas.

Hiking is also a permitted recreational use within the License Area, ~~and is limited to hiking clubs~~. Access to the License Area for hiking is acquired through a Hiking Waiver from EMI. ~~Generally Only~~ two hiking clubs currently enter the License Area lands approximately four to six times a year; the Sierra Club Maui Group and Mauna Ala Hiking Club. They enter on foot, and are guided by a club hiking expert with a manageable number of people. However, individual hikers are also permitted to enter the License Area and are subject to the same requirements as the hiking clubs.

Other recreational uses are not permitted on the License Area for safety reasons, but trespassing and unpermitted access for hiking, gathering, and illegal hunting does occur on these State lands. It should be noted that in the past people have used the EMI Aqueduct System as a recreational resource and unfortunately have died as a result. The EMI Aqueduct System is not a recreational resource. As discussed in response to DEIS comments, EMI has taken many steps to promote ditch safety on Maui, including conducting a safety audit of the EMI Aqueduct System using local and national experts which resulted in a program of ditch improvements (e.g., fencing, physical barriers, signage) in an effort to help prevent future incidents. Safety grates have been installed on all siphons. EMI also intensified its existing school presentation programs, giving in person slide presentations about the EMI Aqueduct System and the dangers of playing in it. EMI initiated a program of print and radio safety ads, focused around school vacation periods. EMI also created the EMI Safety Program, partnering with eight youth clubs across Maui to conduct an annual “Play Hard, Play Safe” campaign, that includes an EMI Safety Selfie contest, that serves to increase Maui youth’s awareness of the dangers of playing in the ditches. Notwithstanding these efforts, trespassing cannot be completely controlled.

However, please note that should the License Area be modified, public access procedures may change as discussed in Section 3.2.2.2. of the EIS. In particular, if the License Area is decreased, the management of those lands not within the License Area would be under the control of the State. For example, in the renewal of the 2020 Revocable Permits, BLNR removed the approximately 7,500-acre Hanawā Natural Area Reserve (NAR) from the Revocable Permit area. This area was within a portion of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. There is little expectation that the eventual License Area will include the NAR. Public access to the NAR area is restricted by the DLNR. Please note that Section 3.2.2.2 of the Final EIS, pages 3-21 to 3-24 has been updated to include a more robust discussion regarding impacts to the areas that would allow for more public access as shown below, and Table 3-2 within Section 3.5 of the Final EIS at pages 3-49 to 3-80 providing a comparative evaluation of the alternatives also provides a summary of such impacts.

Comment 25: *In the Historic Resources section, the DEIS states that the Modified Lease Area alternative may have the potential to impact historic properties if there is an increase in unmanaged public access to the license area. Please include a discussion regarding the specific historical sites you believe will be impacted by this alternative.*

Response 25: Cultural Surveys Hawai‘i (CSH), the consultant that prepared the Archaeological Literature Review and Field Inspection (LRFI) report included in EIS Appendix E and

summarized in Section 4.5 of the EIS, has not identified specific historic sites that could be impacted. The report included an analysis of the natural and built environment of the License Area, a comprehensive review of traditional and historic background information of the region, a review of previous archaeological studies and findings in the region, and a field inspection of the License Area focused on inspecting the areas nearest to the EMI Aqueduct System infrastructure and access roads. No specific historic resources were located. However, sites are *presumed* to exist in the area due to the history of the area. As such, mitigation measures are proposed in the event of increased public access to the License Area. As discussed within the LRFI and Section 4.5 of the Draft EIS with respect to East Maui:

Previous archaeological research included a summary of approximately 45 archaeological studies conducted in the vicinity of the current License Area including early island-wide surveys, studies specific to the Hāna Highway, and studies conducted in the vicinity of each license area. In general, these studies document the rich archaeological landscape along the coast of the region and extending upward into many of the stream valleys. Findings include agricultural complexes, habitation areas, heiau, trails, walls, historic structures and remnants, WWII-era structures, and other associated artifacts and deposits. Few of these previous studies are within or overlap with the CSH's LRFI.

In response to comments received, the East Maui subsection of Section 4.5 of the Final EIS has been expanded to include CSH's work conducted in conjunction with the preparation of the LRFI and its findings, including updated work undertaken in response to comments received on the Draft EIS. However, no sites were identified as shown on pages 4-137 to 4-139.

proposed Water Lease, which merely continues the long-term use of the EMI Aqueduct System for the diversion of East Maui stream water, will not include partial or total destruction or alteration of any archaeological historic properties. The proposed Water Lease does not include project-related ground disturbance or changes in water flow greater than periodic natural stream freshets. As such, the Proposed Action will have no impact to archaeological historic properties. Nevertheless, while the Water Lease will not impact historic or archeological resources (because the patterns of use and operation will be the same as it has been over the last century), in an abundance of caution, CSH recommended that any persons who are required to enter the License Area in connection with the Water Lease be made aware of the potential for discovery of undocumented surface historic properties such as walls, trails, terraces, mounds, and/or caves. Any such items should be avoided, protected, and reported to the SHPD. The SHPD will determine if additional mitigation is required.

The potential of impacts from unmanaged access into the License Area is identified in the LRFI. Moreover, in response to comments received, the language has been added to Section 3.2.2.2 of Final EIS as shown on pages 3-21 to 3-24.

Comment 26: *The impacts and mitigation measures section related to fauna in Central Maui appears to overlook that the proposed buildings could have potential impacts to fauna resources as grubbing and grading are normally associated with site preparation. Please revise your discussion accordingly. In addition, there seems to be a missing transition between pages 4-105 and 4-106.*

Response 26: The Central Maui agricultural fields have been farmed for over 100 years and are not currently occupied by significant or endangered species as indicated by the Terrestrial Flora and Fauna Technical Report (Appendix C) prepared by SWCA. Faunal species observed include pigs and feral cats. All invertebrate species observed are commonly found in Central Maui. Construction of farm buildings would not have an impact on faunal species because there are no species of significance in the Central Maui agricultural fields. As discussed in Draft EIS Section 4.4.2 (Fauna and Invertebrates), the existing flora and fauna environment in Central Maui, due to decades of monocrop production in Central Maui, provided a monoculture environment for flora and fauna. Thus, revisions to the Central Maui subsection of Section 4.4.2 are not needed.

The missing transition between pages 4-105 and 4-106 of the Draft EIS is: *"To minimize potential impacts to fauna, the following measures should be implemented:"* This sentence has been added to the Final EIS at page 4-129.

Comment 27: *Regarding Historic and Archaeological Resources, Hawaii's State Historic Preservation Division (SHPD) confirmed to the Department via an email dated September 24, 2019, that their review of the proposed action confirmed "no historic properties [will be] affected". This determination was based on the absence of ground disturbance activities. However, we note that as benefitters of the Water Lease, the Mahi Pono Farm Plan and the KAP expansion will necessitate ground disturbance and therefore be subject to SHPD's 6E Historic Preservation Review Process during their permitting processes.*

Response 27: The Central Maui agricultural fields that Mahi Pono owns, and is and will be farming, have been used for intensive agricultural purposes for over 100 years. Agricultural use of land necessarily involves ground disturbance, and that has been going on in the Central Maui agricultural fields for over 100 years. The proposed agricultural use by Mahi Pono in Central Maui will be confined to existing agricultural fields that, prior to the end of sugar production in 2016, were continuously plowed for more than a century. Additional plowing within an established agricultural plow zone will not pose a new or increased impact to historic properties any more so than past agricultural plowing. CSH through its work on the LRFI (Appendix E) determined that no impacts to historic properties are expected from continued agricultural use in those areas. Nevertheless, CSH provided the following recommendation which has been added to Section 4.5 of the Final EIS at page 4-155:

The Proposed Action is limited to the issuance of the Water Lease for the subject License Area, which would enable the lessee to continue operation of the EMI Aqueduct System that has been in operation for over a century. The Proposed Action continues the use of the EMI Aqueduct System ~~system~~ for the transport of surface water, which will allow for the transition of the agricultural fields in Central Maui to a diversified agriculture operation. In general, the Proposed Action will maintain existing conditions, in compliance with the CWRM D&O and any reservations in favor of the DHHL. No significant impacts on historic and archeological in Central Maui are anticipated as the agricultural fields in Central Maui have been subject to agricultural activities for over a century. Current and future activities will be kept within existing agricultural fields that, prior to the end of sugar production in 2016, were continuously plowed for more than a century. Additional plowing within an established agricultural plow zone will not pose a new or increased impact to historic properties any more so than past agricultural plowing. However, there may be a potential to impact historic properties if ground disturbance occurs outside of the established agricultural fields or significantly deeper than the established agricultural plow zone. Consultation with the SHPD is recommended in the event that agricultural use in Central Maui is proposed for areas outside of established agricultural zones or for projects that would involve ground disturbance beneath the agricultural plow zone.

As noted in Response #2, the Applicant has no involvement with any existing or proposed uses at KAP or the KAP expansion area. That is a matter entirely under the County's jurisdiction, as that is County land. The County of Maui is solely responsible for the use of that land as well as complying with any and all regulatory requirements. Nevertheless, we note that the KAP expansion land was long used for sugar cane production. We are not aware of what permits, if any, the County may be required to obtain in order to utilize the KAP expansion land, but we note that continued agricultural use, meaning continued ground disturbance, has been going on in those lands for many, many years. It is also important to note that the issuance of the Water Lease does not compel the County to take action at the KAP expansion area. Should the Water Lease be issued for the full amount allowed under the CWRM D&O, the County has the option to continue to rely on water from the EMI Aqueduct System.

Comment 28: *In the Cultural Resources and Practices section, it should be clearly noted that the information gathered from community consultations happened prior to the issuance of the CWRM D&O in 2018, and that many of the concerns are being addressed through the IIFS.*

Response 28: This was clearly stated within Section 4.6 of the Draft EIS that address Cultural Resources and Practices. Specifically, Section 4.6 of the Draft EIS stated:

In addition, CSH asked permission to use declarations made by members of the community and of Nā Moku Aupuni o Ko'olau that were given to the CWRM in late 2014, a couple of years prior to the issuance of the CWRM D&O, which was issued on June 20, 2018. Although the declarations are part of the public domain, CSH nevertheless attempted to contact each individual to obtain approval to include these declarations in the CIA.

However, this statement has been revised in the Final EIS 4-158 for further clarification as follows:

~~In addition, CSH asked permission to use declarations made by members of the community and of Nā Moku Aupuni o Ko'olau that were given to the CWRM in late 2014, a couple of years prior to the issuance of the CWRM D&O, which was issued on June 20, 2018. Due to the low response rate, CSH incorporated numerous declarations that had been made by community members and Nā Moku Aupuni o Ko'olau in 2014, during the extensive CWRM IIFS proceeding, i.e., declarations provided to CWRM before it issued the CWRM D&O in June 2018. Although the declarations are part of the public domain, CSH nevertheless attempted to contact each individual to obtain approval to include these declarations in the CIA. Below is a list of individuals who approved use of their declaration as part of the CIA~~

Moreover, the CIA did include interviews that were conducted after the CWRM D&O. Additionally, following public review of and comment on the Draft EIS, CSH conducted additional consultation that was targeted to those who had provided comments on the Draft EIS and raised specific issues of a cultural impact nature. Section 4.6 of the EIS at pages pages 4-158 to 4-159 take this additional consultation into account. As you noted, the water restoration required under the CWRM D&O has addressed many cultural concerns. Cultural practices and impacts are further refined at pages 4-171 to 4-254 of the Final EIS.

Comment 29: *In the Social Characteristics section for East Maui, under Impacts and Mitigation, it is mentioned that there should be a reconciliation with the Keanae-Wailuanui community. Why is A&B not listed as one of the key players? Also, who is responsible for leading this effort?*

Response 29: A&B is not listed as one of the key players who would be involved in the Core Working Group or in the Ke'anae-Wailuānui community group because A&B no longer owns or farms the Central Maui agricultural lands. Note that EMI is listed together with Mahi Pono as a

recommended participant in the Core Working Group. See Social Impact Assessment (Appendix G) at Section 6.2.1 which states:

Two areas of mitigative measures are recommended for consideration, should the proposed water lease be granted by the BLNR. These measures are intended to establish an ongoing working relationship between the community, Mahi Pono and EMI, and related public agencies, as well as continue resolution with the East Maui communities.

With respect to the Ke‘anae – Wailuanui community, as explained in the SIA at Section 6.2.2:

. . . to move past historical impacts, there needs to be established a point of departure. Mitigation needs to go beyond the physical restoration of streams. It needs to address the social context and include apology and reconciliation. This needs to be done within a cultural foundation that binds the community together, and key players, including Mahi Pono, public agencies and elected officials. The manner and forum for this process should be defined by cultural leaders integral with the process.

As such, it is assumed that Mahi Pono and EMI would be responsible for leading this community outreach effort. However, the terms and conditions of the Water Lease will be determined by BLNR, including the extent to which mitigation measures that are provided in the EIS are incorporated into terms under the Water Lease.

Comment 30: *In the Social Characteristics section, we note that under the Impacts and Mitigation section for Upcountry Maui and Central Maui, it is recommended that interest groups or stakeholder groups be defined and that a core working group be established to work collaboratively with Mahi Pono should the Water Lease be approved. However, it is unclear who is supposed to spearhead this working group, who is supposed to fund this working group, and how Mahi Pono will be held accountable for not only participating in this working group, but also seriously considering and/or implementing the recommendations of the working group.*

Response 30: An EIS is a disclosure document provided for informational purposes so that decision makers can make informed decisions about proposed actions. An EIS does not, in and of itself, authorize any activities. Consistent with the provisions of HAR § 11-200-17(m), the Draft EIS provides suggested “mitigation measures proposed to avoid, minimize, rectify, or reduce impact, including provision for compensation for losses of cultural, community, historical, archaeological, fish and wildlife resources, including the acquisition of land, waters, and interests therein” with the expectation that such measures would be implemented in the

event that the Water Lease is approved. However, we defer to BLNR regarding what terms it chooses to impose under the Water Lease and the extent to which mitigation measures that are provided in the EIS are incorporated into terms under the Water Lease.

Comment 31: *It is unclear why the economic and fiscal section, as well as the agricultural economy section of the DEIS, analyzed "typical sugarcane cultivation" versus "recent sugarcane cultivation." While we understand that the sugarcane industry can provide a somewhat relevant baseline, the "typical sugarcane cultivation" has not existed in the last 13 years. At some point this was no longer the norm and it would probably be better to set the baseline at "recent sugarcane cultivation."*

Response 31: In that the Central Maui agricultural fields had been cultivated in sugarcane and irrigated with East Maui stream water for over a hundred years, these conditions provide a relevant historical context as well as an actual measurement of certain types of past impacts that inform the analysis of the Proposed Action. That is because the Mahi Pono farm plan involves the farming of the same fields and the use of the same source of irrigation water (East Maui stream waters), albeit at a significantly lower level than in the past. The Draft EIS included information on both "typical" and "recent" sugarcane operations to provide a thorough portrayal of past conditions. The recent sugarcane operations are not representative of the historical long-term sugarcane operations and do not accurately indicate the typical conditions that existed for the majority of time that HC&S farmed sugarcane on those fields. The 2008 to 2013 time period was used for the "recent" sugarcane operations, a period during which rainfall was below normal, and the amount of water returned to East Maui streams was large enough to adversely affect sugarcane operations, and HC&S struggled to achieve profitable operations. This was not representative of the conditions for most of HC&S' 146-year history of operations. As such, the 1987 to 2006 period of "typical" sugarcane operations was also analyzed and presented as a benchmark, with data from the year 2006 representative of this period. In 2006, rainfall in East Maui was regarded as normal, the restoration of stream flows was not large enough to significantly affect HC&S sugar cane operations, and the plantation was economically healthy. This is explained in Section 4.7.3. of the Draft EIS.

Comment 32: *Regarding the economic and fiscal impacts, the proposed action and the East Maui Impacts should be combined into one section as that is how the DEIS is organized. For Upcountry Maui, the economic and fiscal impacts from the KAP expansion should be included in the discussion. Regarding Central Maui, it should be noted that the economic and fiscal impacts from Mahi Pono's solar farm could be excluded or considered a separate project not reliant on the Water Lease, as the solar farm could conceivably exist without the water license. Also, while the Mahi Pono Farm Plan anticipates that 790 jobs would be created, there is concern regarding*

how those positions will be filled and by who as Hawaii's unemployment rate as of April 2019 is 2.8%.

Further, at the October 11, 2019 Board Meeting, a representative from Mahi Pono stated that 700 to 1,000 jobs may be created via their Farm Plan. The upper limit number is much larger than the analyzed 790 jobs. You may need to revise the studies accordingly if 1,000 jobs is a plausible employment projection for the project.

Response 32: The Draft EIS is not organized as you stated. The structure of the Draft EIS consistently addresses impacts in three separate geographic areas, East Maui; Upcountry Maui; and Central Maui. The economic and fiscal impacts of the Proposed Action in East Maui are addressed in Section 4.7.3.2 of the Draft EIS. The economic and fiscal impacts of the Proposed Action in Upcountry Maui are addressed in Section 4.7.3.3 of the Draft EIS. The economic and fiscal impacts of the Proposed Action in Central Maui are addressed in Section 4.7.3.4 of the Draft EIS.

This same format is used throughout Chapter 4, of looking at conditions and impacts in three separate geographic areas, East Maui; Upcountry Maui; and Central Maui. The section titled "Upcountry Maui: Agricultural Impacts of the Proposed Action" addresses anticipated impacts related to the KAP and KAP expansion.

The economic impacts associated with the solar farm(s) proposed by Mahi Pono are addressed both in connection with the Proposed Action and also in connection with the No Action (i.e. no Water Lease) alternative. With respect to impacts under the Proposed Action, please see Section 4.7.4.d titled "Central Maui Agricultural Impacts of Proposed Action", which is discussed in two subsections: (i) Proposed Action - Agricultural Impacts During Development Period; and (ii) Proposed Action - Agricultural Impacts During Full Operations. The EIS acknowledges that it is conceivable that solar farm(s) could be developed in the absence of a Water Lease. That scenario is addressed in Chapter 3, which analyzes the alternatives to the Proposed Action. Specifically, that scenario is assessed as part of the No Action (no Water Lease) alternative in the Central Maui subsection of Section 3.4.13. This information is also within the analysis provided in Appendix I (the Agricultural and Related Economic Impacts assessment report).

Regarding your comment about employment, the Draft EIS estimates that at full implementation of the Mahi Pono farm plan, currently estimated to occur around 2030, farm employment is expected to reach about 790 jobs (about 160 more jobs than provided by HC&S sugar operations in 2006). As explained in Section 4.7.4 of the Draft EIS, in the section addressing Central Maui and agricultural impacts during full operations of the Mahi Pono farm plan:

The increase in employment would be gradual, with most jobs filled by former sugarcane workers, skilled workers from Maui and other islands, recent graduates of agricultural-schools and colleges, and unskilled workers who would receive on-the-job training.

In its first 18 months of existence Mahi Pono had hired over about 200 workers, all of whom were living on Maui when hired. They were attracted by the type of work, wages and benefits. Based on past hiring, nearly all future employees are expected to come from Maui. Also, attracting workers should be easier than in the recent past because of the long-term adverse economic effects of COVID-19 on tourism and Maui's economy. It may take years to rebuild the economy, and the Mahi Pono farm plan will contribute significantly to this rebuilding.

Regarding your comment about the upper limit of jobs as described by a Mahi Pono representative at the BLNR hearing in October 2019, please note that the studies, specifically the Economic and Fiscal Impact Study and the Agricultural and Related Economic Impacts report provided as Appendix H and I, explain that *direct* farm employment at full build out is estimated at 790 jobs. The studies further explain that related *indirect* employment, i.e., the purchase of goods and services by farmers and ranchers and by the families of their employees would generate an estimated 350 jobs. Thus, the total direct plus indirect jobs is 1,140 with an estimated 1,000 such jobs being on Maui. See Appendix H at p. 53; App I at p. 49-50; and see Draft EIS at 4-159. Accordingly, we do not think that any changes to studies are needed.

Comment 33: *Regarding recreational resources in Central Maui, we note that the Maui Raceway park was not included.*

Response 33: It is acknowledged that Maui Raceway Park was not included as a recreational resource in Central Maui. In response to your comment, the following has been added to the Central Maui subsection of Section 4.8 of the Final EIS at page 4-310, which is the section addressing Recreational Uses and Park Facilities:

There are no parks or permitted recreational activities, including hunting, within the agricultural fields in Central Maui. The County's Department of Parks and Recreation operates and maintains several parks and recreational facilities within Central Maui, in the vicinity of the Central Maui agricultural fields, including the following: Kahului Community Center, Kahului Park, Kamali'i Park, and Baldwin Park. Several golf courses are also located in the vicinity of Central Maui, including the King Kamehameha Golf Club, Dunes at Maui Lani Golf Course, and Maui Country Club. As noted in a comment letter to the DEIS, also located in the region is Maui Raceway Park which operates out of a 220-acre facility managed by the County of Maui. There are also several public and private pools that serve

the communities in the area. Water derived from the EMI Aqueduct System is not used for any recreational facilities in Central Maui.

Comment 34: *We also note that under the Central Maui section, there is no discussion of how visual plains may change due to the solar farm or the proposed buildings.*

Response 34: Visual resources are discussed in Section 3.4.15 and 4.9 of the Draft EIS. The discussion was more formulated around the amount of green open space that would result from the implementation of the Mahi Pono farm plan. There are structures leftover from sugar cultivation operations that will be repurposed for implementation of the Mahi Pono farm plan.

As noted in the Draft EIS, Mahi Pono proposes to construct approximately 319,000 square feet of building space to support its agricultural operations such as washing and packing areas, storage, etc. The processing facilities will be located within a half-mile from the former HC&S sugar mill. The height of these proposed structures will not exceed the height of the HC&S sugar mill. The heights are not anticipated to exceed 30 feet. View planes should not be significantly affected. We further note, as discussed in Section 5.6 of the Draft EIS, the majority of the approximate 30,000-acre Central Maui agricultural fields are situated in Maui County's AG-Agriculture zoning district. Within the AG district, the County limits heights to 30 feet.

Section 4.9 of the Final EIS has been supplemented with this information, as shown on pages 4-312 to 4-313.

Regarding your comment about potential visual impacts from solar farms in Central Maui, there could be glint / glare impacts associated with a solar farm. As standard with solar farm projects, Mahi Pono will need to consult with the Federal Aviation Administration (FAA) which requires technical assessments in the interest of safety for the Kahului Airport. Depending on the proximity and the size of the solar farm, a glint / glare assessment may need to be conducted in conjunction with the technical assessments required by the FAA. This has been added to the Section 4.9 of the Final EIS as shown on 4-312 to 4-313.

Comment 35: *Regarding the traffic section, not enough information has been provided to fully understand the impact of the Mahi Pono Farm Plan at full build out and a traffic impact study was not conducted so we are unsure how the conclusion was made that there will be minimal impacts on traffic on public roadways. This may also apply to the KAP expansion depending on the number of jobs created.*

Response 35: With respect to the Central Maui agricultural fields, the traffic projections discussed in Section 4.13 of the Draft EIS are based upon prior traffic generation from HC&S employees at the HC&S sugar mill as compared to the anticipated number of Mahi Pono farm

employees at full implementation of the farm plan (year 2030). It is anticipated that traffic from the Mahi Pono farm plan will be of a different nature (much less concentrated) than the HC&S traffic, as explained in Section 4.13 of the Draft EIS. The traffic will be spread out over the 30,000-acre operation in Central Maui and will mostly be contained to the internal roadway network within the agricultural fields.

Regarding the KAP expansion, the Agricultural and Related Economic Impacts assessment (Appendix I), explains that if the Water Lease is issued allowing the full amount as permitted under the CWRM D&O, and if the County of Maui pursued the KAP expansion, the related development work would provide an average of about 7.5 direct-plus-indirect jobs during the assumed 5-year development period. At completion, the KAP expansion area is projected to provide 20 more direct jobs than currently provided at KAP. See Appendix I at Section 13; see also Draft EIS at Section 3.4.13. As such, the KAP expansion, should it go forward, is expected to have a negligible impact on traffic.

Comment 36: *Regarding wastewater, the DEIS does not discuss the impact that the Mahi Pono Farm Plan will have on existing wastewater infrastructure. This should be discussed as they anticipate 790 jobs to be created and there are buildings which will most likely contain restroom facilities. It is also unclear how field workers would access toilet facilities and where. This should also be analyzed for the proposed KAP expansion.*

Response 36: As explained in Draft EIS Section 4.7.4. (Agricultural Economy), in the subsection dealing with Central Maui, under the Proposed Action at full implementation of the Mahi Pono farm plan, farm employment is expected to reach about 790 jobs, or about 160 more jobs than were in place in that location in 2006. As noted in the section of Chapter 4 that addresses wastewater systems, Section 4.15.2 of the Draft EIS, the Proposed Action is not anticipated to result in significant impacts to the existing wastewater infrastructure in the Central Maui agricultural fields and will maintain existing conditions. However, for clarity and in response to your comment, the following revisions have been made to the Central Maui subsection of Section 4.15.2 at page 4-329:

There are no County operated wastewater disposal facilities in the Central Maui ~~region~~ agricultural fields. However, the Pu'unēnē Mill facility has a private system which is connected to the County wastewater system in the region. Individual wastewater disposal needs in the area are currently addressed either by cesspools, septic tanks or individual wastewater treatment systems. Except for HC&D's (HC&D is also known Amerson) facility restrooms, none ~~None~~ of these systems use water from the EMI Aqueduct System. Currently, most workers in the Central Maui agricultural fields use porta potties and this is expected to continue through full impmentation of the Mahi Pono farm plan, as the need and number of porta potties is largely dependent on planting / harvesting schedules.

Impacts and Mitigation Measures

The Proposed Action is limited to the issuance of the Water Lease for the subject License Area, which would enable the applicant to continue operation of the EMI Aqueduct System that has been in operation for over a century. The Proposed Action continues the use of the EMI Aqueduct System system for the transport of surface water, which will allow for the transition of the agricultural fields in Central Maui to a diversified agriculture operation. In general, the Proposed Action will maintain existing conditions, in compliance with the CWRM D&O and any reservations in favor of the DHHL. It is anticipated that all proposed water used in the office and processing facilities associated with the Mahi Pono farm plan (except for restrooms) will be recycled and re-used as part of Mahi Pono's Central Maui Field Irrigation System. Any limited needs for restroom facilities (which is projected to be even less than the prior uses during sugar cultivation and processing), may be served by transmission lines to the County wastewater system and/or by connecting to the Pu 'unēnē Mill facility, if permitted. As such, no ~~No~~ significant impacts on wastewater systems in the region are anticipated.

As discussed in Response #2, the 262-acres that the County of Maui acquired to expand the KAP are lands that A&B previously owned and used to farm sugarcane. A&B has no involvement in the timing of the County of Maui's use of the KAP expansion area, and no involvement in what the County of Maui will be doing with that land. The County of Maui is solely responsible for the use of that land as well as complying with any and all regulatory requirements.

Comment 37: *Regarding electricity, the DEIS does not discuss the impact that Mahi Pono Farm Plan will have on the existing electrical grid except for that the energy generated from their commercial solar farm will be provided to Maui Electric Company (MECO). There is no discussion on whether they will be buying back energy from MECO to power their operations (including the proposed buildings) or be self-sustainable and rely solely on their solar panels. This should also be analyzed for the proposed KAP expansion.*

Response 37: Regarding Draft EIS Section 4.15.3 (Electrical System), in the section addressing Central Maui, with respect to electrical generation and electrical demands from the implementation of the Mahi Pono farm plan, at this time it is infeasible to project what the electrical needs will be at full implementation of the farm plan. However, it should be noted that the Central Maui agricultural fields have the ability to access power from MECO and for the purposes of clarity that statement has been added to the Final EIS at page ___ as follows: "

There are two hydroelectric facilities that utilize water derived from the EMI Aqueduct System. One is located in the area historically known as Kaheka Village, and the other at Pā'ia. Currently, only Kaheka Hydroelectric plant is generating at a low load to fulfill house power demand for the office buildings, well security systems and well motor heaters. Excess generation is supplied to the utility grid with no compensation.

Generating hydroelectric power is a non-consumptive use of water and the water can subsequently be used for agricultural purposes after flowing through the hydroelectric facilities. Kaheka and Pā'ia Hydroelectric Plants generate power to supply the many drip irrigation systems, groundwater well pumps, and facility/tenant buildings through a private 62-mile transmission grid throughout the Central Maui agricultural fields.

The Central Maui agricultural fields also have the ability to access power from MECO.

The Water Lease will allow the continued use of surface water for hydroelectric generation at the Kaheka and Pā'ia plants.

Impacts and Mitigation Measures

The Proposed Action is limited to the issuance of the Water Lease for the subject License Area, which would enable the applicant to continue operation of the EMI Aqueduct System that has been in operation for over a century. The Proposed Action continues the use of the EMI Aqueduct System system for the transport of surface water, which will allow for the transition of the agricultural fields in Central Maui to a diversified agriculture operation. The farm plan contemplated in relation to the Proposed Action includes a solar farm(s) to generate 37.5 MW mW of clean energy to be provided to the MECO grid and/or for Mahi Pono's farm operations. Although Mahi Pono does not intend to rely on MECO power, Mahi Pono intends to retain a connection to the MECO grid in any event, and that connection would support back up and off-peak power needs, if needed. In general, the Proposed Action will maintain existing conditions, in compliance with the CWRM D&O and any reservations in favor of the DHHL. No significant impacts on electrical systems in the region are anticipated.

The Central Maui subsection of Section 4.15.3 also explains that power needs for the Central Maui agricultural fields are also supplied by two hydroelectric power sources that supply the many drip irrigation systems, groundwater well pumps, and facility/tenant buildings through a private 62-mile transmission grid throughout the Central Maui agricultural fields. Use of those

power sources has been in place for years, starting prior to Mahi Pono's acquisition of the Central Maui agricultural lands.

Mahi Pono proposes up to two solar farms within the Central Maui agricultural fields, and has identified the areas for those farms. See EIS Figure 2-6 (Mahi Pono Farm Plan) “Green Energy” locations. However, at this point the timing and development of these solar farms is uncertain. As planned, one of these solar farms would supply energy to the electrical grid and not to power any uses within the Central Maui fields. The other solar farm would be used for power to Mahi Pono’s facilities. The use of a solar farm for Mahi Pono’s facilities may also be supplemented by separately installed solar panels at the farm processing facilities and well sites. In sum, although the Central Maui agricultural fields have access to MECO power, it is anticipated that power need will be largely self-supplied. Thus, for clarity and in response to your comment, the following additional text as shown above has been added to the Central Maui subsection of Section 4.15.3:

In response to your comment about the KAP, as previously noted, the County of Maui has sole responsibility for the development of the KAP expansion area. The County of Maui is solely responsible for the use of that land as well as complying with any and all regulatory requirements.

Comment 38: *Section 5.1.3 State Land Use District mentions that the license area is located within the Conservation District, but the subzone and its objectives are omitted from needed discussion.*

Response 38: The majority of the License Area is located within the “Protective” subzone of the Conservation District while portions are within the “Limited” and “Resource” subzones. This information and a discussion regarding the Conservation District subzones and objectives has been added to Section 5.1.3 of the Final EIS at pages 5-36 to 5-39

Comment 39: *We trust that the grammatical errors throughout the DEIS will be corrected in the final EIS. While these comments are many, we note that the EIS Preparation Notice was published in the February 8, 2017 edition of the Office of Environmental Quality Control's The Environmental Notice and therefore did not cover the Mahi Pono Farm Plan nor the KAP expansion, since these land acquisitions did not take place until 2018. This would naturally explain the void in the DEIS and our substantial comments found herein. In addition, given our extensive comments on the document, we believe that once the deficiencies are addressed, the DEIS should be republished as a second DEIS in order to allow the public to have an opportunity to comment of any new/additional information provided regarding the project(s).*

Response 39: We have carefully attempted to correct all grammatical errors in the Final EIS. With respect to your comment about the EISPN, you are correct that at the point of publication of the EISPN the Mahi Pono farm plan was unknown, as Mahi Pono had not yet purchased the Central Maui agricultural lands from A&B/HC&S. However, even at the point of the EISPN publication, the transition from sugarcane to diversified agriculture in the approximately 30,000 acres in Central Maui was contemplated. However, more importantly, the parameters of the Mahi Pono farm plan were presented in the Draft EIS, which was published well after Mahi Pono acquired the Central Maui land, and the text of the Draft EIS and the applicable technical studies took the Mahi Pono farm plan into account. As such, your statement about a “void” is unclear. Information responding to your comments about the Mahi Pono farm plan is contained in this letter and in the EIS. The Draft EIS fully assessed the anticipated impacts in the Central Maui agricultural fields related to the issuance of the proposed Water Lease. All relevant technical reports contemplate the implementation of the Mahi Pono farm plan. It is unclear what deficiencies you are referring to. Data and analyses in an EIS shall be commensurate with the importance of the impact. HAR § 11-200-19. The EIS contains appropriate data and analysis of the matters of environmental relevance to the Water Lease.

Similarly, the County's ability to continue to make use of East Maui surface water at the KAP, or the KAP expansion area, if the Water Lease gets issued, was disclosed from the start. To the extent the KAP expansion could have any impacts to agricultural or other fiscal and economic impacts, those impacts are addressed within the technical reports within the sections addressing impacts in the Upcountry Maui area. For the avoidance of any confusion, we repeat that the Applicant is not involved in any way with existing or future uses at KAP or the expansion area, as activities to be taken at the KAP expansion area, if any, are not a project within the scope of this Water Lease EIS. The Proposed Action, i.e. the proposed Water Lease, is independent from any future activities at KAP. As discussed throughout this response letter, the County of Maui is solely responsible for the use of that land as well as for complying with any and all regulatory requirements related to that use.

We respectfully disagree with your comment that a second Draft EIS should be published. The Draft EIS fully complied with all relevant requirements, including the content requirements set forth in § 11-200-16 and 11-200-17, and the Draft EIS also included a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement. Alternatives to the proposed Water Lease, including the alternative of no Water Lease, are thoroughly assessed within Chapter 3.

The impacts of the proposed Water Lease are addressed in Chapter 4, which provides a comprehensive description and impact analysis of the East Maui License Area, as well as the water use areas of Upcountry Maui and the Central Maui agricultural fields. The analysis in Chapter 4 considered conditions, impacts, and mitigations under numerous environmental

measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts. The Draft EIS also included and relied upon nine technical studies, provided as Appendix A through I, as follows : Appendix A, Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP Model); Appendix B, East Maui Irrigation Assessment of Streams and the Ocean; Appendix C, Terrestrial Flora and Fauna Technical Report; Appendix D, Historical Structure Assessment; Appendix E, Archaeological Literature Review and Field Inspection; Appendix F, Cultural Impact Assessment; Appendix G, Social Impact Assessment; Appendix H, Economic and Fiscal Impact Study; and Appendix I, Agricultural and Related Economic Impacts.

The Hawaii Environmental Policy Act (HEPA) establishes “a system of environmental review which will ensure that environmental concerns are given appropriate consideration in decision making along with economic and technical considerations” and is intended to “integrate the review of environmental concerns with existing planning processes” and to “alert decision makers to significant environmental effects which may result from the implementation of certain actions.” Kilakila 'O Haleakala v. University of Hawaii, 138 Hawaii 364, 369-370 (2016), citing HRS § 343-1. However,

. . . an EIS need not be exhaustive to the point of discussing all possible details bearing on the proposed action but will be upheld as adequate if it has been compiled in good faith and sets forth sufficient information to enable the decision-maker to consider fully the environmental factors involved and to make a reasoned decision after balancing the risks of harm to the environment against the benefits to be derived from the proposed action, as well as to make a reasoned choice between alternatives.

Hanabusa v. Department of Environmental Services, 133 Hawai'i 452 (2014) (quoting Price v. Obayashi Hawaii Corp., 81 Hawai'i 171, 182 (1996). "The environmental laws were neither meant to be used as a “crutch” for chronic fault-finding, nor as a means of delaying the implementation of properly accepted projects." Price v. Obayashi Hawaii Corp., 81 Hawai'i at 182-3 n. 12.

As the Hawaii Supreme Court has explained that HEPA, like the National Environmental Policy Act of 1969 (NEPA), serves primarily as a procedural framework under which an agency may evaluate and consider the environmental, social, and economic factors of a proposed action prior to taking action. *Id.* As confirmed by the Hawaii Supreme Court, HEPA was patterned after NEPA. See *id.* at n. 7. Republication of a Draft EIS is not the norm unless there have been substantial changes to the proposed action. NEPA does not require an additional round of public comment every time an applicant revises, supplements, or improves its analysis in response to comments received on the Draft EIS. To the contrary, such changes are expected and encouraged. If republication were required for every revision made between a Draft and Final EIS, that would only serve to discourage applicants from making corrections and improvements in response to public comments, which is entirely contrary to the purposes of HEPA. See *Mid States Coalition for Progress v. Surface Transp. Bd.*, 345 F.3d 520, 548 (8th Cir. 2003). The measure of whether republication is appropriate is not the literal number of changes or "redlines" in the Final EIS. The decision turns on whether the Final EIS discloses changes to the project or its impacts that are both substantial and relevant to environmental concerns. i.e. new information that is likely to affect the quality of the environment in a significant manner or to a significant extent not already considered. *Swanson v. U.S. Forest Service*, 87 F.3d 339, 344 (9th Cir. 1996) citing *Marsh v. Oregon Natural Resources Council*, 490 U.S. 360, 374, 109 S.Ct. 1851, 1859, 104 L.Ed.2d 377 (1989).

The revisions made between the Draft and Final EIS were to address public comments; to include updated/public information on topics addressed in the Draft EIS; to provide clarification or expanded explanations of topics covered in the Draft EIS, often in response to comments received; or to pull information from the Draft EIS appendices into Final EIS. As required under HAR § 11-200-18, a Final EIS consists of "the draft EIS revised to incorporate substantive comments received during the consultation and review processes." Under HAR § 11-200-23(b), the Final EIS must show that comments submitted during the review process have received satisfactory responses and have been incorporated in the Final EIS. In other words, HEPA, like NEPA, contemplates that the Draft EIS document will change in response to public comments, exactly as happened in this case. There have not been any changes to the proposed Water Lease or its impacts that are likely to affect the quality of the environment in a significant manner or to a significant extent that was not already raised in the Draft EIS. As such, we disagree that republication is appropriate.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

HOUSE OF REPRESENTATIVES

STATE OF HAWAII
STATE CAPITOL
HONOLULU, HAWAII 96813

November 14, 2019

Christopher Benjamin
President & Chief Executive Officer
Alexander & Baldwin Inc. (A&B)/East Maui Irrigation Company, Limited (EMI)
822 Bishop Street
Honolulu, HI 96813

Dear Mr. Benjamin,

**SUBJECT: Request for Second 45 Day Comment period for East Maui Water
Draft EIS**

On behalf of my constituents I would like to request that you agree to issue a second 45-day comment period for the East Maui Water Draft EIS.

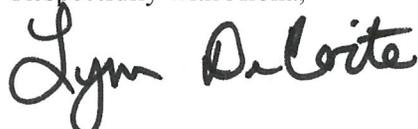

I am aware that the first comment period was announced in the Office of Environmental Quality Control's September 23, 2019 Issue of *The Environmental Notice* with the comment period ending November 7, 2019. Many of my constituents have reached out to my office to request that the comment period be extended due to the length of the Draft EIS (2700 pages) and the impact that this document has on the East Maui Community and their water.

Also, due to the fact that the Governor just issued new rules to the EIS process on August 9, 2019, there was confusion as to how many opportunities the community would have to comment and under what timeframe.

While I recognize that this Draft EIS is grandfathered in under the rules that were in place when you issued your prep notice in February of 2017, issuing a second 45-day comment period would show a good faith effort to the community that A&B gave every opportunity for them to submit their comments and concerns.

Thank you for your consideration on this matter. If you would like to speak to me directly about this request, please call my office at (808)586-6790.

Respectfully with Aloha,

Lynn DeCoite
State House of Representatives

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas

Dear Representative DeCoite:

Thank you for comments dated November 14, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am aware that the first comment period was announced in the Office of Environmental Quality Control's September 23, 2019 Issue of The Environmental Notice with the comment period ending November 7, 2019. Many of my constituents have reached out to my office to request that the comment period be extended due to the length of the Draft EIS (2700 pages) and the impact that this document has on the East Maui Community and their water.*

Response 1: We acknowledge your comments noting for a time extension to allow for additional public comment. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai'i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 2: *Also, due to the fact that the Governor just issued new rules to the EIS process on August 9, 2019, there was confusion as to how many opportunities the community would have to comment and under what timeframe.*

Response 2: We acknowledge your comments. However, please note that the period for public comment associated with the Draft EIS under both the old rules and the new rules for the EIS process is the same – 45-days.

Comment 3: *While I recognize that this Draft EIS is grandfathered in under the rules that were in place when you issued your prep notice in February of 2017, issuing a second 45-day comment period would show a good faith effort to the community that A&B gave every opportunity for them to submit their comments and concerns.*

Response 4: As noted in Response #1 above, the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai'i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

waterleaseeis@wilsonokamoto.com

Dear Mr. Matsukawa:

Subject: Draft Environmental Impact Statement (EIS) for the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū and Huelo License Areas

The Department of Hawaiian Home Lands (DHHL) acknowledges receiving the request for comments on the above-cited project which concerns waters developed and delivered by the East Maui Irrigation (EMI) system. The project may have a material and adverse effect on the Department and its rights, including its ability to fulfill the goals for its lands in the DHHL Maui Island Plan. DHHL offers the background information and comments below.

Trust and Legal Background

DHHL has substantial and broad interests in state water leases, including the one sought here. DHHL and our beneficiaries have at least three distinct interests when water leases are pursued by private parties under HRS 171-58.

DHHL water reservations related to state water leases

First, as the EIS notes on page 2-2, HRS 171-58 (g) requires that "The Department of Land and Natural Resources shall notify the Department of Hawaiian Home Lands of its intent to execute any new lease, or to renew any existing lease of water rights. After consultation with affected beneficiaries, these departments shall jointly develop a reservation of water rights sufficient to support current and future homestead needs. Any lease of water rights or renewal shall be subject to the rights of the department of Hawaiian home lands as provided by section 221 of the Hawaiian Homes Commission Act."

This part of Hawai`i law has not been fully implemented since its passage by the Legislature in 1991, as the state has yet to issue a water lease under HRS 171-58. However, we have been working closely for at least the last two years with our beneficiaries, staff from the Department of Land and Natural Resources (DLNR), and other potential lessors in order to efficiently implement this requirement. Together, DLNR and DHHL staff have determined that reservation requests for surface and/or groundwater associated with a proposed lease will be made by the Commission on Water Resource Management (CWRM) before being incorporated into any lease from DLNR. Reservation requests are based on the water demands associated with DHHL lands, if any, that could foreseeably use some portion of the demised water. DHHL first holds a formal consultation process with its beneficiaries prior to requesting the reservation from CWRM and the inclusion of any related lease provisions by the Board of Land and Natural Resources (BLNR) into the DLNR lease

DHHL Beneficiary water rights related to state water leases

In addition to the rights to reserved water in state water leases, DHHL beneficiaries may conduct traditional and customary practices associated with the waters that entities may seek to lease from the state. In the particular case of the water lease you seek, there is extensive evidence that there are significant traditional and customary practices that have been exercised in the areas from which water is diverted.

DHHL rights to revenue associated with state water leases

Finally, DHHL is entitled by Constitutional provision to 30% of the revenue generated by state water leases (Hawai`i Constitution Article XII Section I). Funds from this source are devoted exclusively to the Native Hawaiian Rehabilitation Fund, which supports projects on DHHL lands and for beneficiaries.

Specific Comments

For the following comments, the pagination noted is first for the number on the bottom of the EIS page, and then in parentheses for the page number of the pdf.

Page iv (25): EIS states that “Until that reservation is physically claimed, however, the water will remain available for use by the lessee under the Water Lease.” Similarly:

Page 2-2 (63): EIS states that “Until that reservation is physically claimed, however, it will be available for use by the lessee.”

- DHHL believes that this language is presumptive and may not be accurate, as no water lease has yet to be issued in compliance with HRS 171-58 and the manner in which reservations are actualized has yet to be determined. In addition to any specifications made by the CWRM and BLNR regarding a water lease, a separate agreement between

the lessor and the DHHL will be necessary to allow any temporary use of water reserved for DHHL.

Page 3-1 (84) 3.1.1 Water Sources Alternatives

- DHHL believes that the dismissal of full examination of alternative sources of water, particularly water from lands in central Maui and water derived from lands owned by EMI, Alexander & Baldwin and/or Mahi Pono in East Maui, which are also developed and delivered by the EMI system, is unjustified. Mere assertions that an alternative is not viable does not meet the requirements or intent of HRS 343 which governs the preparation of an EIS.
- Moreover, the EIS must assist the BLNR in fulfilling its constitutional and statutory duties to protect Public Trust uses of water and traditional and customary practices of Native Hawaiians. The dismissal by assertion that alternate sources of water are not a viable alternative completely fails to provide to BLNR the informational bases necessary for BLNR to make specific findings and provide mitigative conditions as required and explained by the Hawai`i Supreme Court in its Kaua`i Springs (Kauai Springs, Inc. v. Planning Commission of the County of Kaua`i, 133 Hawai`i 141) and Ka Pa`akai (94 Haw. 31) decisions.

Page 4-116 et. Seq. (229 et. Seq.): Analysis of cultural impacts

- The analysis of potential cultural impacts is inadequate under the Ka Pa`akai decision (94 Haw. 31). In that decision the state Land Use Commission was reversed for determining the level of impacts after a permit was issued and attempting to delegate mitigation to the developer, as is proposed here.
- DHHL also believes the analysis is inadequate under HRS Ch. 343, as it does not examine any way in which mitigation of impacts on traditional and customary practices could be accomplished through either lowering diversion amounts and/or modification of diversion structures that could decrease impacts on biocultural resources.

Page V (26): "The Water Lease would allow the use of government-owned waters from the License Area through the EMI Aqueduct System."

- This statement is legally incorrect as there is no private property in water in Hawai`i, and hence no "government-owned" waters or "privately-owned" waters." All waters are controlled by the state for the benefit of its people. See *McBryde Sugar Co. v. Robinson*, 54 Haw. 174

Page 5-1 et. Seq (313 et. seq.) Section 5.0 Relationships to Plans, Policies & Controls.

- The Draft EIS identifies DHHL's water reservations and planning system in section 2.1.1. However, consistency DHHL's General Plan, Water Policy Plan, Maui Island Plan, Regional Plan and Development Plans must be assessed and included in section 5.

NAME: MR. EARL MATSUKAWA
DATE: NOVEMBER 7, 2019

The proposed project has the potential to impact DHHL's Maui land holdings and beneficiaries. We highly encourage you to consult with Hawaiian Homestead community associations and other (N)ative Hawaiian organizations to better assess potential impacts to cultural and natural resources, access and other rights of Native Hawaiians. A list of some of our DHHL homestead associations may be found at <https://dhhl.hawaii.gov/homestead-associations/>.

Mahalo for the opportunity to provide comments. If you have any questions, please call Malia Cox, at 620-9485 or contact via email at malia.m.cox@hawaii.gov.

Aloha,

William J. Ailā Jr., Chairman
Hawaiian Homes Commission

C: Mr. Ian Hirokawa, Board of Land and Natural Resources- via email

APPLICANT PUBLICATION FORM

Project Name: Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas
Project Short Name: DEIS East Maui Water Lease
HRS §343-5 Trigger(s): Use of State land
Island(s): Maui
Judicial District(s): Makawao and Hāna
TMK(s): 1-2-004:005, 007; 1-1-002:002; 1-1-001:44, 050; and, 2-9-014:001, 005, 011, 012, 017
Permit(s)/Approval(s): Application for a long-term lease of State land in the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas
Approving Agency: Board of Land and Natural Resources
Contact Name, Email, Telephone, Address Mr. Ian Hirokawa, ian.c.hirokawa@hawaii.gov, (808) 587-0400, 1151 Punchbowl St. Honolulu, HI 96813
Applicant: Alexander & Baldwin Inc. (A&B)/East Maui Irrigation Company, Limited (EMI), collectively referred to as "A&B"
Contact Name, Email, Telephone, Address A&B / EMI, waterleaseeis@wilsonokamoto.com
Consultant: Wilson Okamoto Corporation
Contact Name, Email, Telephone, Address Mr. Earl Matsukawa AICP, waterleaseeis@wilsonokamoto.com, (808) 946-2277, 1907, S. Beretania Street, Suite 400 Honolulu, HI 96826

Status (select one)

DEA-AFNSI **Submittal Requirements**
 Submit 1) the approving agency notice of determination/transmittal letter on agency letterhead, 2) this completed OEQC publication form as a Word file, 3) a hard copy of the DEA, and 4) a searchable PDF of the DEA; a 30-day comment period follows from the date of publication in the Notice.

FEA-FONSI **Submittal Requirements**
 Submit 1) the approving agency notice of determination/transmittal letter on agency letterhead, 2) this completed OEQC publication form as a Word file, 3) a hard copy of the FEA, and 4) a searchable PDF of the FEA; no comment period follows from publication in the Notice.

FEA-EISPN **Submittal Requirements**
 Submit 1) the approving agency notice of determination/transmittal letter on agency letterhead, 2) this completed OEQC publication form as a Word file, 3) a hard copy of the FEA, and 4) a searchable PDF of the FEA; a 30-day comment period follows from the date of publication in the Notice.

Act 172-12 EISPN ("Direct to EIS") **Submittal Requirements**
 Submit 1) the approving agency notice of determination letter on agency letterhead and 2) this completed OEQC publication form as a Word file; no EA is required and a 30-day comment period follows from the date of publication in the Notice.

DEIS **Submittal Requirements**
 Submit 1) a transmittal letter to the OEQC and to the approving agency, 2) this completed OEQC publication form as a Word file, 3) a hard copy of the DEIS, 4) a searchable PDF of the DEIS, and 5) a searchable PDF of the distribution list; a 45-day comment period follows from the date of publication in the Notice.

FEIS **Submittal Requirements**
 Submit 1) a transmittal letter to the OEQC and to the approving agency, 2) this completed OEQC publication form as a Word file, 3) a hard copy of the FEIS, 4) a searchable PDF of the FEIS, and 5) a searchable PDF of the distribution list; no comment period follows from publication in the Notice.

FEIS Acceptance Determination **Submittal Requirements**
 The approving agency simultaneously transmits to both the OEQC and the applicant a letter of its determination of acceptance or nonacceptance (pursuant to Section 11-200-23, HAR) of the FEIS; no comment period ensues upon publication in the Notice.

FEIS Statutory Acceptance **Submittal Requirements**
 The approving agency simultaneously transmits to both the OEQC and the applicant a notice that it did not make a timely determination on the acceptance or nonacceptance of the applicant's FEIS under Section 343-5(c), HRS, and therefore the applicant's FEIS is deemed accepted as a matter of law.

Supplemental EIS Determination **Submittal Requirements**
 The approving agency simultaneously transmits its notice to both the applicant and the OEQC that it has reviewed (pursuant to Section 11-200-27, HAR) the previously accepted FEIS and determines that

a supplemental EIS is or is not required; no EA is required and no comment period ensues upon publication in the Notice.

- Withdrawal Identify the specific document(s) to withdraw and explain in the project summary section.
- Other Contact the OEQC if your action is not one of the above items.

Project Summary

Provide a description of the proposed action and purpose and need in 200 words or less.

The Proposed Action constitutes the issuance of a long-term (30-year) Water Lease from the BLNR that grants the lessee the *"right, privilege, and authority to enter and go upon"* the License Area for the *"purpose of developing, diverting, transporting, and using government owned waters"* through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System. It will also allow the continued provision of water to approximately 30,000 acres of agricultural lands (formerly in sugarcane) in Central Maui.

Mr. William Ailā Jr.
Chairperson
Department of Hawaiian Home Lands
State of Hawai‘i
P.O. Box 1879
Honolulu, HI 96805

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Chairperson Ailā Jr.:

Thank you for comments dated November 7, 2019 (Ref. No. PO-19-247) regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The Department of Hawaiian Home Lands (DHHL) acknowledges receiving the request for comments on the above-cited project which concerns waters developed and delivered by the East Maui Irrigation (EMI) system. The project may have a material and adverse effect on the Department and its rights, including its ability to fulfill the goals for its lands in the DHHL Maui Island Plan. DHHL offers the background information and comments below.*

Response 1: We acknowledge your comment asserting that the Proposed Action may have a material and adverse effect on the Department of Hawaiian Home Lands (DHHL) and its rights, including its ability to fulfill the goals for its lands described in the DHHL Maui Island Plan. It is not clear from your comment, however, how the proposed Water Lease would have an adverse effect on DHHL or DHHL's ability to fulfill its goals for DHHL lands in the DHHL Maui Island Plan. The Draft EIS clearly stated in Section 2.1.1 that the proposed Water Lease is subject to DHHL's rights to reserve water as provided under Hawai‘i Revised Statutes (HRS) § 171-58(g),

and that such reservation would serve to support DHHL by serving as the water source for DHHL's planned activities. It is our understanding that the DHHL Maui Island Plan is one component of a planning system developed by the DHHL to guide the use of Hawaiian home lands Statewide and that island plans are the primary policy documents that guide land-uses for Hawaiian home lands. The purpose of the DHHL Maui Island Plan is to support the DHHL and the beneficiaries in participating in the County of Maui's planning for the future. We understand that the DHHL land-use planning goals and objectives include the following:

- Using Hawaiian home lands for uses most appropriate to meet the needs and desires of the beneficiary population; and
- Directing urban growth to priority development areas based on infrastructure availability, feasible site conditions, beneficiary preferences and job opportunities.

Hence, the DHHL Maui Island Plan provides baseline physical and demographic information; establishes land-use designations to encourage orderly social, physical, and economic development; identifies priority areas for homestead development over a set timeframe; and estimates the costs for both on- and off-site infrastructure needed to advance the goals and objectives of the homesteading program on the island of Maui.

With that understanding, it is our belief that the Proposed Action will not have an adverse effect on the DHHL and its rights, including the ability to fulfill the goals for its lands in the DHHL Maui Island Plan as the Proposed Action is subject to DHHL's rights to reserve water as provided under HRS § 171-58(g), and that such reservation would serve to support DHHL by serving as the water source for DHHL's planned activities as discussed in Section 2.1.1 of the Draft EIS.

Comment 2: Trust and Legal Background. *DHHL has substantial and broad interests in state water leases, including the one sought here. DHHL and our beneficiaries have at least three distinct interests when water leases are pursued by private parties under HRS 171-58.*

Response 2: We acknowledge your comments asserting DHHL's substantial and broad interests in State water leases, including the proposed Water Lease assessed in the EIS. We further acknowledge that DHHL and its beneficiaries have at least three distinct interests in water leases when pursued by private parties under HRS § 171-58, as addressed below.

Comment 3: DHHL water reservations related to state water leases. *First, as the EIS notes on page 2-2, HRS 171-58 (g) requires that "The Department of Land and Natural Resources shall notify the Department of Hawaiian Home Lands of its intent to execute any new lease, or to renew any existing lease of water rights. After consultation with affected beneficiaries, these*

departments shall jointly develop a reservation of water rights sufficient to support current and future homestead needs. Any lease of water rights or renewal shall be subject to the rights of the department of Hawaiian home lands as provided by section 221 of the Hawaiian Homes Commission Act."

This part of Hawai'i law has not been fully implemented since its passage by the Legislature in 1991, as the state has yet to issue a water lease under HRS 171-58. However, we have been working closely for at least the last two years with our beneficiaries, staff from the Department of Land and Natural Resources (DLNR), and other potential lessors in order to efficiently implement this requirement. Together, DLNR and DHHL staff have determined that reservation requests for surface and/or groundwater associated with a proposed lease will be made by the Commission on Water Resource Management (CWRM) before being incorporated into any lease from DLNR. Reservation requests are based on the water demands associated with DHHL lands, if any, that could foreseeably use some portion of the demised water. DHHL first holds a formal consultation process with its beneficiaries prior to requesting the reservation from CWRM and the inclusion of any related lease provisions by the Board of Land and Natural Resources (BLNR) into the DLNR lease.

Response 3: Your comments regarding the DHHL water reservation process, which is described in Chapter 2 of the Draft EIS, are acknowledged. We also concur with your comment that the State has yet to issue a water lease under HRS § 171-58, and, therefore, the implementation of a DHHL reservation under subsection (g) has yet to be realized. We understand that the DHHL water reservation process involves several steps before a water reservation is formally requested. One step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following acceptance by the Hawaiian Homes Commission (HHC) of the Beneficiary Consultation Report, and an authorization to the Chairperson of the HCC to formally request a water reservation, the Chairperson submits a request for a water reservation to the Commission on Water Resource Management (CWRM). CWRM approval is required to establish a DHHL water reservation for purposes of a water lease.

Section 2.1.1 of the Draft EIS explains that the DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B / EMI, Mahi Pono, the DLNR's Land Division, and DHHL staff and consultants. Section 2.1.1 has been updated in the Final EIS as shown on pages 2-4 to 2-7 to acknowledge that the results of the Beneficiary Consultation were subsequently presented to the HHC on May 30, 2019, as agenda item G-2. The HHC then passed a motion to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for a water lease from DLNR, and to reauthorize the Chairperson to formally request a related water reservation from CWRM for

Hawaiian Home Lands on Maui. The reservation amount in the request approved by the HHC is for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Kēōkea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This reservation amount is consistent with that projected in the Draft EIS. The revisions updating Section 2.1.1 in the Final EIS, as discussed above, are shown on pages 2-4 to 2-7. As of the time that this response letter was drafted, it is our understanding the water reservation request has not been made to CWRM.

Comment 4: DHHL Beneficiary water rights related to state water leases. *In addition to the rights to reserved water in state water leases, DHHL beneficiaries may conduct traditional and customary practices associated with the waters that entities may seek to lease from the state. In the particular case of the water lease you seek, there is extensive evidence that there are significant traditional and customary practices that have been exercised in the areas from which water is diverted.*

Response 4: We acknowledge that Native Hawaiian traditional and customary practices are protected under Article XII, § 7 of the Hawai‘i Constitution:

The State reaffirms and shall protect all rights, customarily and traditionally exercised for subsistence, cultural and religious purposes and possessed by ahupua‘a tenants who are descendants of native Hawaiians who inhabited the Hawaiian Islands prior to 1778, subject to the rights of the State to regulate such rights.

As observed by the CWRM in its Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O), at Conclusions of Law (COL) 56:

56. A claimed right is constitutionally protected as a customary or traditional native Hawaiian right under article XII, § 7 of the Hawai‘i Constitution, or §§ 1-1 or 7-1, HRS if the following is shown:
 - a. The practice must be related to extended family needs; the purpose must be to fulfill a responsibility related to subsistence, religious or cultural needs of one’s family or extended family;
 - b. The traditional or customary native Hawaiian practice must be traceable to at least November 25, 1892;
 - c. The practice cannot be for a commercial purpose; and

- d. The manner in which the practice is conducted must be consistent with the tradition and custom and the practice must be conducted in a respectful manner.

(citing *State v. Pratt*, 124 Hawai‘i 329, at 349-55, 243 P.3d 289, at 309-315 (App. 2010).

The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “*existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.*” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “*for domestic purposes and the irrigation of kuleanas entitled to the same.*” See CWRM D&O, Finding of Fact (FOF) 55.

Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water. . .*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated to honor all constitutionally protected traditional and customary rights.

We believe that the Draft EIS adequately discusses the impacts of the Proposed Action both in terms of the effects on habitat and resources and on traditional and customary Native Hawaiian practices. Specifically, in terms of habitat, Appendix A and Section 4.2.1 of the Draft EIS presented the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model that was used to quantify the impacts of flow restoration on native stream animal habitat to determine an appropriate balance between instream and offstream water uses. Impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B (East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry) of the EIS. Impacts to terrestrial flora and fauna, including threatened and endangered species, are analyzed in Section 4.4 and Appendix C (Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease) of the EIS. As it relates to archaeological resources, please note that Cultural Surveys Hawai‘i (CSH) provides a detailed and comprehensive Archaeological Literature Review and Field Inspection (LRFI) accounting the history of East Maui. This report is included in Appendix E and summarized in Section 4.5 of the EIS. The EIS also includes an assessment of effects on the Native Hawaiian traditional and customary resources and practices through the Cultural Impact Assessment (CIA) prepared by CSH and provided as Appendix F to the EIS. The CIA follows the Environmental Council’s Guidelines for Assessing Cultural Impacts, including the following protocol: 1) identification of and consultation with individuals and organizations with expertise in the resources, practices and beliefs found within the broad geographical area or ahupua‘a; 2) identification of and consultation with those of knowledge of the potentially

affected area; 3) gathering information and conducting interviews with those of knowledge of the potentially affected area; 4) conducting historical and other culturally related documentary research; 5) identifying and describing the cultural resources, practices, and beliefs connected to the potentially affected area; and, 6) assessing the impact, alternatives, and measures to mitigate the proposed action on the cultural resources, practices and beliefs identified through this process.

The information provided satisfies the EIS content requirements. This information will also inform BLNR when it is deliberating on the issuance and terms of the Water Lease. Under the Public Trust Doctrine, BLNR will have to balance competing considerations before making a decision on the Water Lease. The balancing that BLNR is required to perform under the Public Trust Doctrine was described at length by the Hawai‘i Supreme Court in *In Re Water Use Permit Applications*, 94 Hawai‘i 97, 9 P. 3d 409 (2000) (“Waiahole I”) and summarized in Section 1.5 of the Final EIS as shown on pages 1-25 to 1-27.

With regard to the potential effects of the Proposed Action on traditional and customary practices, as discussed in the *Ka Pa ‘akai* decision, we acknowledge that BLNR will be required to “to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible.” *Ka Pa ‘akai O Ka ‘Aina v. Land Use Comm’n*, 94 Hawai‘i 31, 35, 7 P. 3d 1068, 1072 (2000) (“*Ka Pa ‘akai*”). BLNR has previously so stated in its Findings of Fact, Conclusions of Law, and Decision and Order filed on March 23, 2007 in the contested case proceeding that is still pending regarding the Proposed Action (the 2007 D&O) as follows:

Public trust principles require that adequate provision be made for the protection of ***traditional and customary Hawaiian rights***, the protection and procreation of fish and wildlife, the maintenance of proper ecological balance and scenic beauty, and the preservation and enhancement of waters of the State for municipal uses, public recreation, public water supply, agriculture and navigation.

2007 D&O COL No. 6 at page 41 (citing *Waiahole I*). CWRM, in its June 20, 2018 D&O, also recited the State’s constitutional obligation to consider the impacts of stream diversions in East Maui on traditional and customary practices of Native Hawaiians at pages 242 through 245, including the Supreme Court of Hawai‘i’s more recent holding on this subject in *State v. Pratt*, 127 Hawai‘i 206, 277 P. 3d 300 (2012).

The CIA prepared by CSH (included as Appendix F to the Draft EIS) identified several practices related to the License Area. The CIA identified the following traditional and customary cultural practices associated with natural and cultural resources which are presented in Section 4.6 of the Draft EIS:

- 1) *Foraging, traditional, and generational gathering of freshwater species for personal consumption. These species include but are not limited to ‘ōpae, ‘o‘opu,*

pūpūlo‘i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa).

- 2) *Foraging, traditional, and generational gathering of plants that may be in or adjacent to tributaries for personal consumption. These species include but are not limited to pohole (native fiddlehead fern) and watercress.*
- 3) *Traditional and generational gathering of introduced plants that can be cultivated or foraged. These species include but are not limited to (young taro tops), guava, ‘uala (sweet potato), ‘awapuhi (wild ginger), tī, oranges, hāhā, avocado, puakenikenī (ornamental, flowers used for lei), and medicinal plants for lā‘au lapa‘au (curing medicine).*
- 4) *Traditional and generational gathering of plants that can only be foraged. This includes but is not limited to pepeiao, various types of ferns (ornamental), and hau (beach hibiscus; Hibiscus tiliaceus).*
- 5) *Traditional and generational gathering of rocks that are used for traditional food preparation. These activities include but are not limited to imu (underground oven) and the production of stone tools for traditional food preparation (i.e., pōhaku ku‘i ‘ai).*
- 6) *Traditional and generational fishing and gathering methods utilized for the shoreline and offshore. Species gathered include but are not limited to limu (seaweed), ‘opihi (limpets), lobster, enenuē, kole, ulua, moi, aholehole, ‘anae, kumu, tako, moanakali, ‘ōmilu, ‘ū‘ū/menpachi (soldierfish; Holocentridae), ‘āweoweo (Bulleye; eki), pāpio, pa‘ananu, ‘ō‘io, uhu, lae, kala, black crab, hā‘uke‘uke, and kūpipi.*

Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in Section 4.6 of the Final EIS, which has been updated to include the information obtained in the additional consultation as shown on the pages 4-158 to 4-159. The CIA, and Section 4.6 of the Final EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action as shown on pages 4-239 to 4-252. Section 4.6 of the Final EIS also includes three tables which identify cultural practices in the License Area via: (1) approved interviews and the declarations submitted in the petitions to amend the Interim Instream Flow Standards (IIFS) proceedings before the CWRM that resulted in the CWRM D&O (Table 4-13); (2) declarations submitted in the IIFS proceedings (anonymous tally) (Table 4-14); and (3) approved interviews and the declarations organized by stream (Table 4-15).

It is also noted that following receipt of the Draft EIS comments, CSH invited Chairperson Aila to participate and engage in consultation, as summarized in Section 5.4 of the CIA (Appendix F). However, Chairperson Aila did not respond to CSH's requests.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and those mitigation measures within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of optical encoders with float tape and data loggers within the EMI Aqueduct System; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures. Section 4.6 of the Final EIS has been updated to include the recommendations by CSH, as shown on pages 4-239 to 4-252.

Comment 5: *DHHL rights to revenue associated with state water leases. Finally, DHHL is entitled by Constitutional provision to 30% of the revenue generated by state water leases (Hawai'i Constitution Article XII Section I). Funds from this source are devoted exclusively to the Native Hawaiian Rehabilitation Fund, which supports projects on DHHL lands and for beneficiaries.*

Response 5: We acknowledge, as stated in Section 2.1.1 of the Draft EIS, that the DHHL has rights to a portion of the funds received by the State under a water lease. Section 2.1.1 provides in relevant part, "*thirty percent (30%) of the revenues derived from all water leases issued by the State are deposited into the Native Hawaiian Rehabilitation Fund pursuant to Hawai'i State*

Constitution Article XII, Section 1, and is used to fund programs as prioritized in the Native Hawaiian Development Program Plan adopted by the Hawaiian Homes Commission."

Moreover, the anticipated 30% revenue generated by the proposed State Water Lease is further discussed in detail in Section 4.7.3.1 of the EIS. Specifically, Section 4.7.3.1 of the Final EIS which has been updated to take into account the most recent revocable permit for 2021 states:

The amount paid to the State Special Land Development Fund for the Water Lease would be based on an appraisal conducted prior to issuance of the Water Lease which is within the purview of the BLNR as required under HRS Chapter 171. Assuming the amount of the Water Lease is based on the equivalent per unit cost under the existing revocable permits, the annual payment to the Special Land Development Fund would be ~~\$846,700~~ \$427,000. Of this, ~~\$169,300~~ \$85,400 would be disbursed to OHA and ~~\$254,000~~ \$128,100 would be set aside for the DHHL. GET revenue would be estimated at ~~\$37,000~~ \$41,000 while payroll tax would be \$45,400 per year.

Comment 6: Specific Comments. *For the following comments, the pagination noted is first for the number on the bottom of the EIS page, and then in parentheses for the page number of the pdf.*

Page iv (25): EIS states that "Until that reservation is physically claimed, however, the water will remain available for use by the lessee under the Water Lease." Similarly:

Page 2-2 (63): EIS states that "Until that reservation is physically claimed, however, it will be available for use by the lessee."

- DHHL believes that this language is presumptive and may not be accurate, as no water lease has yet to be issued in compliance with HRS 171-58 and the manner in which reservations are actualized has yet to be determined. In addition to any specifications made by the CWRM and BLNR regarding a water lease, a separate agreement between the lessor and the DHHL will be necessary to allow any temporary use of water reserved for DHHL.*

Response 6: We concur that the statements in the Draft EIS claiming that the lessee under the proposed Water Lease would be able to use the water reserved by DHHL under HRS § 171-58(g) until such time that DHHL has an actual need for that water should not have been made. Such temporary uses of the DHHL reservation water are not addressed under HRS § 171-58. We further concur that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessor and the DHHL would be necessary to allow any temporary use of water reserved for DHHL.

With regard to considering the impacts of DHHL physically claiming its reservation, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water) and in that way addresses the possible reduction due to the DHHL reservation. The DHHL reservation was acknowledged in the Draft EIS ("Projections of the amount of government water available from the License Area at Honopou stream after taking into account the CWRM D&O, is approximately 87.95 mgd. This amount would be subject to further reduction in accordance with the DHHL reservation once called upon for use by the DHHL.").

Specific information regarding the DHHL's future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the HHC actions of May 30, 2019 as shown on pages 2-4 to 2-7. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

Within the EIS, the analysis of this reduction in available water for the Water Lease lessee falls under the Reduced Water Volume alternative. Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has subsequently been updated in the Final EIS to include a comparative table in Section 3.5 as shown on pages 3-49 to 3-80.

Comment 7: Page 3-1 (84) 3.1.1 Water Sources Alternatives

- *DHHL believes that the dismissal of full examination of alternative sources of water, particularly water from lands in central Maui and water derived from lands owned by EMI, Alexander & Baldwin and/or Mahi Pono in East Maui, which are also developed and delivered by the EMI system, is unjustified. Mere assertions that an alternative is not viable does not meet the requirements or intent of HRS 343 which governs the preparation of an EIS.*

Response 7: The Draft EIS included a robust analysis of alternatives to the Proposed Action. Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were well-discussed, but ultimately not assessed to the same degree as (a) through (d). Additionally, Chapter 3 acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible for the reasons discussed in Chapter 3. Moreover, based on comments received on the Draft EIS, the alternatives analysis in Chapter 3 has been further expanded within the spectrum of alternatives presented in the Draft EIS. See pages 3-2 to 3-19 of the Final EIS.

Regarding groundwater resources in Central Maui, the "groundwater alternative" discussed in Section 3.1.1.1 of the EIS, is intended to reduce the amount of surface water required for irrigation to support diversified agriculture in the Central Maui agricultural fields. If a sufficient groundwater source can be developed, then groundwater coupled with the amount of surface water available under the "No Action" alternative or the "Reduce Water Volume" alternative could, conceivably, meet the objectives of the Proposed Action. In this regard, the Draft EIS considered drilling new groundwater wells in Central Maui and East Maui (a total of 53 new wells were considered as a replacement to the water sought through a Water Lease). This analysis has been supplemented in the Final EIS, using the environmental criteria identified therein, to review the possibility of drilling approximately 26 new well sites to supplement, rather than replace, the surface water that could be authorized under the Water Lease.

Mahi Pono has groundwater wells that can supplement surface water to approximately 17,200 acres of the Central Maui agricultural fields at the lower elevations. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water.

During sugarcane operations, the combined pumping capacity of HC&S's 15 brackish water wells was 228 mgd of brackish water, but the true instantaneous pumping capacity of the wells – the most that could be pumped over 3 to 5 days – was 115 mgd during sugar cultivation, after which sump levels started to decline. From 1986 to 2013, HC&S pumped an average of 71 mgd from the brackish water wells; during the 2008-to-2013 period, these wells delivered about 70 mgd of brackish groundwater to the lower-elevation fields. This was a suitable source of water for sugarcane during droughts because sugarcane can tolerate periodic use of water with higher salinity levels. However, please note that Section 2.1.4 of the Final EIS regarding the description of the brackish groundwater wells that serve the Central Maui Field Irrigation System has been revised to accurately reflect the fact that Mahi Pono only has 10 wells that can provide brackish groundwater to the Central Maui agricultural fields, as shown on page 2-25.

It should be noted that the dynamic relationship between surface and groundwater in the Central Maui agricultural fields affects the amount and quality of groundwater available for Mahi Pono's farm plan. Sections 3.1.1.1 and 4.2.2 of the Draft EIS explain the major role that surface water losses through the Central Maui Field Irrigation System, and, even more significantly, the percolation of applied surface water below the root zone of crops, has on groundwater recharge.

Once percolating surface water enters the groundwater table, however, it is substantially more saline when pumped to the surface for irrigation. As discussed in Section 2.1.4 of the Draft EIS, the crops planned to be cultivated by Mahi Pono are not as salt tolerant compared to sugarcane. In comparison to the former period during sugarcane cultivation, far less surface water will be imported for irrigation and correspondingly less of that water will enter the groundwater table for potential irrigation use. Factoring in the limited salt tolerance of diversified agricultural crops, the use of brackish water on the lower fields is assumed to be limited to about 30% of the water applied. As discussed in Section 4.7.4 of the Draft EIS, combining the upper and lower fields, the overall water split across all 30,000 acres would be approximately 80% surface water and 20% brackish groundwater water. If insufficient water is available from the EMI Aqueduct System, then crop farming will have to be reduced no matter how much brackish water is available.

The Central Maui aquifers have a limited amount of natural groundwater resources due to low rainfall in the area, as discussed in Section 3.1.1.1 of the Draft EIS. The pumping of brackish groundwater from the Central Maui aquifers has been sustained at levels that far exceed the CWRM designated sustainable yield (SY). This has been possible due to aquifer recharge that took place as a result of using East Maui surface water to irrigate the Central Maui agricultural fields. With respect to groundwater pumping in the Central Maui agricultural fields, Section 3.1.1.1 of the Draft EIS explains:

The average pumping rate from 1987 to 2006 was about 26,663 mg per year. This volume equates to a pumping average of 73 mgd. Brackish groundwater used on the Central Maui agricultural fields during that time was approximately 42.5 mgd. (Plasch, 2019). This average daily pumping rate is well above the Sustainable Yield (SY) of 8 mgd (7 mgd for the Pā‘ia aquifer and 1 mgd for Kahului aquifer), as determined by the CWRM (see detailed discussion in Section 4.2.2). This high pumping rate may have been achievable in the past due to the large amount of recharge that was occurring when sugar was being cultivated and irrigated by surface water. During this same period, irrigation from surface water in Central Maui was approximately 112 mgd, and an additional approximately 44 mgd of surface water was applied to the fields through system losses (evaporation and leakage) within the Central Maui field system. The recharge from these system losses were replenishing the Kahului and Pā‘ia aquifers and is likely the reason that pumping groundwater at rates greater than the SY was achievable.

Hence, high pumping rates in the past were possible as significantly more surface water was being diverted by the EMI Aqueduct System from East Maui to Central Maui and utilized to irrigate the Central Maui agricultural fields overlying the Central Maui aquifers, thereby recharging those aquifers. Under the Proposed Action, it is estimated that approximately 87.95 mgd could be diverted from the License Area after compliance with the CWRM D&O and an additional 4.37 mgd from private lands between Honopou Stream and Māliko Gulch, for a total of 92.32 mgd. However, after surface water distribution to County of Maui Department of Water Supply (MDWS), approximately 85.22 mgd of gross total potential surface water would be available for the Central Maui agricultural fields prior to system losses within the Central Maui Field Irrigation System. This is far less than was diverted and therefore used to irrigate the Central Maui agricultural fields in the past (as discussed above) and therefore less recharge of the Central Maui aquifers is projected to occur. It is anticipated that this will decrease the amount of groundwater that can be pumped from the Central Maui wells.

The Mahi Pono farm plan is a diversified agricultural plan as discussed in Section 2.1.4 of the Draft EIS, which proposes orchards, tropical fruits, row and annual crops, and energy crops. Hence, use of brackish groundwater would be limited. Specifically, Section 2.1.4 of the Draft EIS states:

From 1986 to 2013, A&B pumped an average of 71 mgd from the brackish water wells; during the 2008-to-2013 period, these wells delivered about 70 mgd of brackish groundwater to the lower-elevation fields. This was a suitable source of water for sugarcane during droughts because sugarcane can tolerate periodic use of water with higher salinity levels.

When the sugarcane fields were in cultivation, well water was being applied typically during dry periods, when surface water was not available for sustained periods. Sugar cane was cultivated in a twenty-four month crop cycle, providing ample time for the crop to recover from a prolonged use of brackish water. The crops planned for Mahi Pono's diversified agricultural operation may have a shorter crop cycle and be much less tolerant than sugar cane of higher salinity levels. Thus, the planned crops will generally be more vulnerable to the negative impacts on crop growth associated with prolonged exposure to brackish water and lower crop yields.

Notwithstanding all of these limitations, the Draft EIS did consider the alternative of drilling additional wells in the Central and East Maui aquifers as an alternative to using surface water pursuant to a Water Lease. Specifically, Section 3.1.1.1 of the Draft EIS states:

To increase groundwater yields, additional wells could be drilled in other aquifers in Central and East Maui. Assuming that a single well is normally allowed to pump about 1 mgd within its area, 53 new well sites would need to be developed, each requiring site acquisition, drilling, testing and if adequate, brought into production. These wells would need to be spaced far enough to avoid salt water intrusion into the aquifer. Each well site would have an estimated development cost of \$6 million. (Akinaka, 2019). To plan, obtain permits for, and construct 53 wells would probably be in the order of \$318 million. Added to this cost would be transmission pipes, additional pumping and related energy consumption to reach higher elevations, and reservoirs. It is anticipated to be very unlikely that 53 new wells could be constructed within the Central and East Maui areas, as the environmental impacts would be considerable and permit approvals would be prohibitive. Therefore, the groundwater alternative is viewed as an unreasonable alternative with greater risks of adverse environmental effects than the Proposed Action, and was dismissed from further review.

For the reasons discussed above and in Section 3.1.1.1 of the Final EIS, this alternative was dismissed from further consideration. However, Section 3.1.1.1 of the Final EIS has been revised to consider further variations of this alternative, as shown on pages 3-3 to 3-9.

The "added storage" alternative discussed in Section 3.1.1.3 of the Draft EIS considered, but ultimately dismissed, the alternative of upgrading existing, but out of service, reservoirs and constructing a large new reservoir. Regulatory, environmental, and safety concerns make these options, which involve major ground disturbance activities, infeasible.

Ultimately, added storage capacity cannot serve as a substitute for a source of water, but only to assure a more consistent availability of water between periods of surplus and deficit from a source. While reservoir/storage improvements might improve the efficiency of the Central Maui Field Irrigation System, those improvements would be at the cost of providing less recharge to the underlying Central Maui aquifers, which in turn will decrease the amount of brackish well water Mahi Pono can rely on for its irrigation needs. Moreover, the reservoir/storage improvements do not constitute a discrete alternative for providing an additional source of needed water, and instead represent at best a means by which the operational efficiency of the Central Maui Field Irrigation System may be improved. To provide more clarity on this alternative, Section 3.1.1.3 of the Final EIS has been revised to consider further variations of this alternative, as shown on pages 3-11 to 3-14.

Comment 8: *Moreover, the EIS must assist the BLNR in fulfilling its constitutional and statutory duties to protect Public Trust uses of water and traditional and customary practices of Native Hawaiians. The dismissal by assertion that alternate sources of water are not a viable alternative completely fails to provide to BLNR the informational bases necessary for BLNR to make specific findings and provide mitigative conditions as required and explained by the Hawai'i Supreme Court in its Kaua'i Springs (Kauai Springs, Inc. v. Planning Commission of the County of Kaua'i, 133 Hawai'i 141) and Ka Pa'akai (94 Haw. 31) decisions.*

Response 8: We acknowledge that the Proposed Action, which is the issuance of a 30-year Water Lease by BLNR, requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawaii constitutional and statutory provisions that, together with relevant case law, such as *Kauai Springs, Inc v. Planning Comm'n of the Cnty. of Kauai*, 133 Hawai'i 141, 324 P. 3d 951 (2014) ("*Kauai Springs*") and *Ka Pa'akai*, comprise the Public Trust Doctrine.

We note that the *Kauai Springs* decision, in an appeal from action by the Planning Commission of the County of Kaua'i that did not involve any companion proceedings or other consideration by CWRM, held that the requirements the Public Trust Doctrine must be complied with by all political subdivisions of the state irrespective of whether they are statutorily tasked with that responsibility under the State Water Code (HRS Chapter 174C). Here, in contrast, there has been extensive involvement by CWRM in the analysis of the diversion of water from East Maui and an express recognition by BLNR of its role as a Public Trustee. Indeed, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given

regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

Moreover, as noted at 1.3.4 of the Draft EIS, the CWRM D&O was issued on June 20, 2018 and “establishes a quantity of water that must remain in each stream at specified locations subject to the IIFS Petitions.” In doing so, CWRM noted that it was required by HRS § 174C-71(2)(D), to “weigh the importance of the present or potential instream values with the importance of the present or potential uses of water for noninstream purposes, including the economic impact of restricting such uses.” D&O at COL 20.

Under the current CWRM D&O, CWRM also recited the state’s constitutional obligation to consider the impacts of stream diversions in East Maui on traditional and customary practices of Native Hawaiians at pages 242 through 245, including the Supreme Court of Hawaii’s more recent holding on this subject in *State v. Pratt*, 127 Hawai‘i 206, 277 P. 3d 300 (2012).

In order to facilitate BLNR’s compliance with this obligation, the Draft EIS discussed impacts to identified cultural resources and practices in Section 3.4.10 and in Section 4.6. The Draft EIS also included a CIA at Appendix F. The CIA identified impacts to the regional environment, taro farming, and freshwater resources within the entirety of the License Area based consultation with the community. The information obtained from community consultation prior to the publication of the Draft EIS was based on participants commenting on their knowledge about the License Area. Moreover, as noted in Response # 4, the CIA has been further supplemented based upon additional consultation done in response to comments submitted on the Draft EIS, and is provided as Appendix F of the Final EIS. A summary of the consultation done as part of the CIA is provided in Section 4.6 of the Final EIS as shown on pages 4-158 to 4-159.

The EIS (including Appendix F), together with the CWRM D&O, provide ample information for the BLNR to consider regarding potential impacts to traditional and customary practices and resources, and that information will enable BLNR when considering the Water Lease, to fulfill its constitutional obligation “to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible.” *Ka Pa‘akai* at, 94 Hawai‘i at 35, 7 P. 3d at 1072.

Furthermore, as discussed in Response #7 above, the Draft EIS did explore all reasonable alternatives, including alternative groundwater resources. Based on comments received on the Draft EIS, Sections 3.1.1 and 3.4 of the Final EIS have been supplemented with additional discussion and analyses of alternative and supplemental water sources, as shown on pages 3-2 to 3-19.

Comment 9: *Page 4-116 et. Seq. (229 et. Seq.): Analysis of cultural impacts*

- *The analysis of potential cultural impacts is inadequate under the Ka Pa'akai decision (94 Haw. 31). In that decision the state Land Use Commission was reversed for determining the level of impacts after a permit was issued and attempting to delegate mitigation to the developer, as is proposed here.*

Response 9: As recited in the CIA, in *Ka Pa'akai*, the Hawai'i Supreme Court held that State and County agencies, when making decisions that may impact cultural, historical, or natural resources or Native Hawaiian traditional and customary practices, must, at a minimum, make specific findings and conclusions on: (1) the identity and scope of valued cultural, historical, or natural resources in the petition area, including the extent to which traditional and customary native Hawaiian rights are exercised in the petition area; (2) the extent to which those resources—including traditional and customary native Hawaiian rights—will be affected or impaired by the proposed action; and (3) the feasible action, if any, to be taken by the [agency] to reasonably protect native Hawaiian rights if they are found to exist. Your comment, by the reference to *Ka Pa'akai*, suggests that you believe that the level of impacts will be determined after issuance of the Water Lease, and that mitigation measures to protect cultural resources will be determined solely by the Water Lease lessee. This is not accurate. As discussed below and in Section 4.6 and Appendix F of the Final EIS, the CIA prepared for this EIS identifies the valued cultural resources and practices in the License Area, the extent to which those resources and practices will be impacted by the Proposed Action, and recommends mitigation measures related to any anticipated impacts.

As discussed in Response #4 above, the CIA prepared by CSH is included as Appendix F to the Draft EIS, identified several practices related to the License Area. The CIA identified the following traditional and customary cultural practices associated with natural and cultural resources which are presented in Section 4.6 of the Draft EIS:

- 1) *Foraging, traditional, and generational gathering of freshwater species for personal consumption. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graiosa).*
- 2) *Foraging, traditional, and generational gathering of plants that may be in or adjacent to tributaries for personal consumption. These species include but are not limited to pohole (native fiddlehead fern) and watercress.*
- 3) *Traditional and generational gathering of introduced plants that can be cultivated or foraged. These species include but are not limited to (young taro tops), guava, 'uala (sweet potato), 'awapuhi (wild ginger), tī, oranges, hāhā, avocado, puakenikenī (ornamental, flowers used for lei),*

and medicinal plants for lā‘au lapa‘au (curing medicine).

- 4) *Traditional and generational gathering of plants that can only be foraged. This includes but is not limited to pepeiao, various types of ferns (ornamental), and hau (beach hibiscus; Hibiscus tiliaceus).*
- 5) *Traditional and generational gathering of rocks that are used for traditional food preparation. These activities include but are not limited to imu (underground oven) and the production of stone tools for traditional food preparation (i.e., pōhaku ku‘i ‘ai).*
- 6) *Traditional and generational fishing and gathering methods utilized for the shoreline and offshore. Species gathered include but are not limited to limu (seaweed), ‘opihi (limpets), lobster, enenue, kole, ulua, moi, aholehole, ‘anae, kumu, tako, moanakali, ‘ōmilu, ‘ū‘ū/menpachi (soldierfish; Holocentridae), ‘āweoweo (Bulleye; eki), pāpio, pa‘ananu, ‘ō‘io, uhu, lae, kala, black crab, hā‘uke‘uke, and kūpipi.*

Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in Section 4.6 of the Final EIS, which has been updated to include the information obtained in the additional consultation as shown on the pages 4-158 to 4-159. The CIA, and Section 4.6 of the Final EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action as shown on pages 4-239 to 4-252. Section 4.6 of the Final EIS also includes three tables which identify cultural practices in the License Area via: (1) approved interviews and the declarations submitted in the petitions to amend the Interim Instream Flow Standards (IIFS) proceedings before the CWRM that resulted in the CWRM D&O (Table 4-13); (2) declarations submitted in the IIFS proceedings (anonymous tally) (Table 4-14); and (3) approved interviews and the declarations organized by stream (Table 4-15).

It is also noted that following receipt of the Draft EIS comments, CSH invited Chairperson Aila to participate and engage in consultation, as summarized in Section 5.4 of the CIA (Appendix F). However, Chairperson Aila did not respond to CSH's requests.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and those mitigation measures within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of optical encoders with float tape and data loggers within the EMI Aqueduct System; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures. Section 4.6 of the Final EIS has been updated to include the recommendations by CSH, as shown on pages 4-239 to 4-252 .

Comment 10: *DHHL also believes the analysis is inadequate under HRS Ch. 343, as it does not examine any way in which mitigation of impacts on traditional and customary practices could be accomplished through either lowering diversion amounts and/or modification of diversion structures that could decrease impacts on biocultural resources.*

Response 10: Regarding your comment about the analysis of the EIS being inadequate under the content requirements of Chapter 343, HRS, the Draft EIS included a "Content Checklist" identifying each element under HAR § 11-200-17 and where within the text of the Draft EIS information on each particular element could be found. Please note that the Content Checklist has been updated based on updated discussions and additions added to the Final EIS subsequently after the front cover.

We disagree with the assertion that the Draft EIS is inadequate without examining *“any way in which mitigation of impacts on traditional and customary practices could be accomplished through either lowering diversion amounts and/or modification of diversion structures that could decrease impacts on biocultural resources.”* Chapter 4 of the Draft EIS (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields, including a description of the existing environment. Furthermore, the analyses are not limited to the streams subject to the CWRM D&O but rather include all streams within the License Area that were historically or will be diverted under the Proposed Action by

the EMI Aqueduct System. That analysis considered conditions, impacts, and mitigations under numerous measurements. The Draft EIS also included and relied upon nine technical studies (Appendix A, Assessment of The Environmental Impacts of Stream Diversions on 33 East Maui Streams Using the HSHEP Model); Appendix B, East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry; Appendix C, Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease; Appendix D, Historical Structure Assessment East Maui Aqueduct System; Appendix E, Archaeological Literature Review and Field Inspection for the Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas; Appendix F, Cultural Impact Assessment for the Nāhiku, Ke‘anae, Honomanū and Huelo License Areas; Appendix G, A&B Proposed Water Lease for the Nāhiku, Ke‘anae, Huelo, and Honomanū Social Impact Assessment (SIA); Appendix H, Economic and Fiscal Impact Study Proposed Water Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Area; and Appendix I, East Maui Water Lease: Agricultural and Related Economic Impacts). We acknowledge, pursuant to HAR § 11-200-17(m), an EIS must consider "mitigation measures proposed to avoid, minimize, rectify, or reduce impact[.]" A brief summary of anticipated impacts and recommended mitigations measures is provided below with references made to the more detailed sections of the EIS that fully address these matters.

Regarding stream habitats, Section 4.2.1 of the Final EIS has been updated to include a discussion of general mitigation measures as shown on pages 4-61 to 4-67.

Contrary to your comment, the Draft EIS does discuss lowering diversion amounts. As discussed in Section 2.1 of the EIS, up until 1986, when the first return of water was made to the East Maui Streams, the long-term average delivery by the EMI Aqueduct System was approximately 165 mgd (CWRM D&O, FOF 519) before any use of water by the MDWS or HC&S. As discussed in Response #7 above, under the Proposed Action, it is estimated that approximately 87.95 mgd could be diverted from the License Area after compliance with the CWRM D&O and an additional 4.37 mgd from private lands between Honopou Stream and Māliko Gulch, for a total of 92.32 mgd. However, after surface water distribution to MDWS, approximately 85.22 mgd of gross total potential surface water would be available for the Central Maui agricultural fields prior to system losses within the Central Maui Field Irrigation System. This is far less than was diverted when sugar was in operation.

Furthermore, Section 3.2.1 of the Draft EIS includes an analysis of a Water Lease being issued authorizing less than the maximum allowed under the CWRM D&O, the Reduced Water Volume Alternative, including quantifying the effects based upon each 1 mgd reduction in water.

Field surveys and habitat modeling for the Proposed Action were conducted by Trutta Environmental Solutions, Inc. (Parham 2019). Native species habitat that were evaluated as part

of the study included ‘O‘opu nākea (freshwater fish family Gobiidae), ‘O‘opu alamo‘o (freshwater fish family Gobiidae), ‘O‘opu naniha (freshwater fish family Gobiidae), ‘O‘opu nōpili (freshwater fish family Gobiidae), ‘O‘opu akupa (freshwater fish family Eleotridae), ‘Ōpae kala‘ole (freshwater shrimp), ‘Ōpae ‘oeha‘a (freshwater prawn), and Hīhīwai (freshwater snail). The IIFS requirements under the CWRM D&O have resulted in the restoration of significant amounts of flowing stream habitat. As noted in the HSHEP report, "Overall, the analysis resulting from the combination of field surveys and habitat modeling supports the flow restoration under the CWRM D&O 2018 IIFS in improving habitat conditions for native amphidromous stream animals." Please note that the HSHEP model focuses on changes in instream habitat, entrainment, or barriers to passage for these migratory native stream species with respect to modifications of the stream environment. In the case of the East Maui streams covered by the Draft EIS, the primary impact is streamflow diversion. While the HSHEP model does account for changes in habitat with respect to instream structures, these are minuscule in comparison to the loss of habitat in dewatered stream segments and the entrainment of animals into the EMI Aqueduct System. Thus, the primary mitigation measure is flow restoration (the greater percentages of total streamflow diverted generally resulted in lower amounts of instream habitat for native stream species). The HSHEP modeling intent was to quantify the flow restoration effect on the native stream species. Thus, the results of the HSHEP model document mitigation measures to restore native stream life to various restoration targets. Appendix A to the EIS also recognizes other potential mitigation factors, such as engineering changes to increase fish passage and decrease larval entrainment, diversion locations, and the number of diversions.

Regarding your comment that the EIS does not discuss modification of diversion structures that could decrease impacts on biocultural resources, as discussed in Appendix A and summarized in EIS Section 4.2.1, which has been updated as shown on pages 4-63 to 4-67, given the 250+ diversions within the EMI Aqueduct System, incremental changes to each aspect of diversion amount on habitat, entrainment, and passage for each diversion individually and all diversion combinations would result in too many model results for rational use (the number of possible combinations with just one change at each diversion is far over a billion different results, 2^{250-1} = combinations). Therefore, the HSHEP model discusses general guiding concepts associated with flow modification and changes to diversion design to minimize barriers to passage and larval entrainment:

With respect to diversion location:

- When comparing the location of a diversion, diverting comparable amounts of water at higher elevation diversions was less damaging to instream habitat for native stream species than diverting that water at lower elevation diversions.

With respect to a single diversion in comparison to multiple diversions:

- A single diversion at the upstream most diversion location capturing X amount of stream flow will result in more instream habitat than multiple stream diversions throughout the stream diverting the same amount of stream flow in total (sum of multiple diversions = X). The lower amount of total habitat under the partial water diversion at multiple diversions was the result of compounding impact on entrainment/passage barriers at each diversion.

With respect to modifications of the diversion for improved passage and decreased entrainment:

- Improvements in diversion passage resulted in more suitable habitat at most flow levels.
- At lower flow restoration amounts, modifications to improve passage resulted in greater gains in suitable habitat than at higher flow restoration level.

As discussed in Section 4.2 and Appendix A of the EIS, it was not possible to model every scenario and determine the “optimal” solution within the complex EMI Aqueduct System and thus the above are guiding concepts which may allow more specific actions to be determined as broader flow modification quantities are determined.

It is also important to note that diversions closer to the stream mouth have more of an impact on habitat units (HU) than those farther back from the stream mouth. Also, some diversion designs can entrain larvae or block passage more than other designs, and the amount of water passing the diversion structure is also important to consider when quantifying impacts on HU. However, as long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best. This is discussed in more detail in Section 4.2.1 of the EIS, as shown pages 4-63 to 4-67.

The CIA, updated in the Final EIS to reflect a second round of consultation with those who provide comments on the Draft EIS and raised specific issues related to potential impacts on traditional or cultural practices and resources, and, as discussed in Response #4 above, does propose mitigation measures should the proposed Water Lease be issued. CSH recommends mitigative measures to address taro farming impacts, freshwater ecosystem impacts, cultural sites, and access related to the Proposed Action. These mitigation measures are described in more detail in Section 4.6 of the EIS as shown on pages 4-239 to 4-252.

In addition to the recommendations provided by the other technical studies conducted as part of the EIS (discussed below), CSH recommends that the Proposed Action include monitoring and public reporting of stream flow volumes. At present, EMI maintains a system of optical

encoders with float tape and data loggers within the EMI Aqueduct System. The information obtained is reported to CWRM on a monthly basis. CSH recommends that this system is maintained and upgraded as needed in order to report accurate information on stream flow and diversion amounts to the community.

The terrestrial flora and fauna study prepared by SWCA Environmental Consultants (2019) as part of the EIS has determined that the Proposed Action, specifically the diversion of water within the existing EMI Aqueduct System, will have no impact on terrestrial flora and fauna resources, nor will the Proposed action increase habitat fragmentation over current conditions subject to avoidance and minimization measures.

As summarized in Section 4.4.1 of the EIS, the terrestrial flora and fauna study recommended the following avoidance and minimization measures to address impacts to flora (SWCA Environmental Consultants 2019:24):

- A botanical monitor should be on-site during any maintenance activities on cliffsides, near waterfalls, and in other native species-dominated areas to ensure that no listed or candidate species are impacted.
- To avoid the unintentional introduction or transport of new invasive species into more pristine portions of the License Area during aqueduct maintenance activities, all equipment and vehicles arriving from outside the License Area should be power washed and inspected prior to any maintenance activities and any time equipment is relocated on cliffsides, near waterfalls, and in other native species-dominated areas in the License Area.
- Construction material arriving from outside Maui should also be washed and/or visually inspected (as appropriate) for excessive debris, plant materials, and invasive or harmful non-native species (plants amphibians, reptiles, and insects).
- When possible, any raw material used in maintenance activities should be purchased from a local supplier on Maui to avoid introducing non-native species not present on the island.
- Inspection and cleaning activities should be conducted at a designated location. The inspector must be a qualified botanist/entomologist able to identify invasive species that are of concern relevant to the point of origin of the equipment, vehicle, or material.

As discussed in Section 4.4.2 of the EIS, the terrestrial flora and fauna study recommended the following avoidance and minimization measures to address impacts to fauna (SWCA Environmental Consultants 2019:24-25):

- Regular on-site staff should be trained to identify special-status species with the potential to occur on-site and should know the appropriate measure to be taken if they are present.
- If tree trimming occurs in the *'i'iwi*, Maui parrotbill and crested honeycreeper range (as defined by SWCA Section 5.2.5) from November to June, a qualified biologist should survey the trees for active nests of these species.
- If a downed tree must be removed from a road, trail, or other passageway, it will be inspected for the presence of active bird nests, specifically the nest of an MBTA-protected species, that may have been present prior to the tree falling. If an active nest is found, it should be protected in place until the chicks fledge.
- If a Hawaiian goose, Hawaiian stilt, or Hawaiian coot is observed in the area during construction activities, all activities within 100 ft (30 m) of the species should cease, and work should not continue until the species leaves the area on its own accord.
- If a Hawaiian goose nest is discovered, all activities within 150 ft (46 m) of the nest should cease, and the USFWS should be contacted. Work should not resume until directed by the USFWS.
- If felling of standing trees occurs during the bat breeding season, direct impacts could occur to juvenile bats that are too small to fly but too large to be carried by a parent. To minimize this impact, no trees taller than 15 ft (4.6 m) should be trimmed or removed between June 1 and September 15.
- The use of barbless top-strand wire is recommended for all fence construction to avoid entanglement of Hawaiian hoary bat.
- A qualified biologist should work closely with the USFWS and monitor ESA-listed damselflies to ensure activities do not have a negative impact.

The terrestrial flora and fauna study recommended the following avoidance and minimization measures to address impacts to seabirds (SWCA Environmental Consultants 2019:25):

- Construction activity should be restricted to daylight hours as much as practicable during the seabird peak fallout period (September 15 to December 15) to avoid the use of nighttime lighting that could attract seabirds.
- All outdoor lights should be shielded to prevent upward radiation. This has been shown to reduce the potential for seabird attraction. A selection of acceptable, seabird-friendly lights can be found online at the Kauai Seabird Habitat Conservation Program website: <http://www.kauai-seabirdhcp.info/lighting-homes-businesses/>.
- Outside lights not needed for security and safety should be turned off from dusk through dawn during the fledgling fallout period (September 15 to December 15).

The terrestrial flora and fauna study has recommended the following avoidance and minimization measures to address impacts to the Blackburn's Sphinx Moth (SWCA Environmental Consultants 2019:37):

- A biologist familiar with the species should survey areas of proposed activities for Blackburn's sphinx moth and its larval host plants prior to work initiation. Surveys should be conducted during the wettest portion of the year (usually November–April or several weeks after a significant rain) and within 4 to 6 weeks prior to construction. Surveys should include searches for eggs, larvae, and signs of larval feeding (chewed stems, frass, or leaf damage). If moths or the native aiea (*Nothocestrum* spp.) or tree tobacco over 3 feet tall are found during the survey, USFWS should be contacted for additional guidance to avoid take.
- If no Blackburn's sphinx moth, aiea, or tree tobacco are found during surveys, measures should be taken to avoid attraction of Blackburn's sphinx moth to the project location to prohibit tree tobacco from entering the site. Tree tobacco can grow greater than 3 feet tall in approximately 6 weeks. If it grows over 3 feet, the plants may become a host plant for Blackburn's sphinx moth. Therefore, any tree tobacco less than 3 feet tall should be removed. The site should be monitored every 4 to 6 weeks for new tree tobacco growth before, during, and after the proposed ground-disturbing activity. Monitoring for tree tobacco can be completed by any staff, such as groundskeeping or regular maintenance crew, provided with picture placards of tree tobacco at different life stages.

The SIA prepared by Earthplan as part of the EIS has recommended the establishment of “Core Working Group” comprised of geographic communities, environmental, agriculture, and business interests, and public agencies. The group would serve as a forum for exchanging ideas and collaborative efforts, as well as provide feedback and suggestions to Mahi Pono. Each member of the Core Working Group would be expected to reach out to their own networks to extend the discussion beyond the Core Working Group. While there would likely be strong differences in perspectives and opinions, the Core Working Group would need to find ways to establish core principles, common ground and manageable solutions.

As discussed in Section 6.2.2 of the SIA also recognizes that East Maui residents have a unique relationship with the Proposed Action. While impacts are first and foremost culture-related, they are also entrenched in a social context that is the basis for this mitigation recommendation. The social impact of diverting water is generational, one that has affected livelihoods, family cohesion, the ability to integrate with environment for food gathering and recreation, resource stewardship, and personal connections or disconnections with values inherent in their lifestyles.

For the Ke‘anae – Wailuānuī community to move past historical impacts, the SIA recommends that there needs to be established a point of departure. Mitigation needs to go beyond the physical restoration of streams. It needs to address the social context and include apology and reconciliation. This needs to be done within a cultural foundation that binds the community together, and key players, including Mahi Pono, public agencies and elected officials. The manner and forum for this process should be defined by cultural leaders integral with the process.

As discussed in Section 4.5 of the EIS, Mason Architects recommends documentation of the sluice gates with photos and location sketch plans conforming to the Historic American Engineering Survey (HAER) standards where sluice gates are to be removed or altered is proposed. Many of the sluice gates are unique to a particular stream, and documentation will ensure that nothing is lost over time. Section 4.5 of the Final EIS as well as Appendix E (Archaeological Literature Review and Field Inspection) have been revised to include the current inventory of roads and trails in the License Area as shown on pages 4-147 to 4-148. CSH completed a geographic analysis of trails and roads that appear within the License Area as depicted on maps between 1869 and 1992 and available to the public domain. The majority of roads and trails within the License Area are associated with access to the EMI Aqueduct System and these road and “ditch trails” are likely contemporary with the construction of the EMI Aqueduct System.

Figure 4-39 has been added to the Final EIS at page 4-149 to correspond with the above text (Figure 48 in Appendix E).

Comment 11: *Page V (26): "The Water Lease would allow the use of government-owned waters from the License Area through the EMI Aqueduct System."*

- *This statement is legally incorrect as there is no private property in water in Hawai‘i, and hence no "government-owned" waters or "privately-owned" waters." All waters are controlled by the state for the benefit of its people. See McBryde Sugar Co. v. Robinson, 54 Haw. 174*

Response 11: We concur that the nomenclature “government-owned waters” may be an antiquated term. The intent of the sentence was to refer to water arising on government-owned lands which the BLNR can lease the right to collect pursuant to HRS § 171-58(c).

We note, as discussed in Section 3.3 (No Action) of the Draft EIS, should no Water Lease be issued to EMI, EMI would continue to have access to approximately 30% of the water from the License Area. Under a 1938 Agreement between the Territory of Hawai‘i (now the state) and EMI, EMI was given a perpetual right and easement to convey water through those portions of

the EMI Aqueduct System located within State lands, and to divert the water so conveyed through the EMI Aqueduct System, and EMI granted the Territory a similar perpetual right and easement. This agreement is still in place and valid irrespective of the issuance of any Water Lease. Under the 1938 agreement and a related calculation involving isohyet analysis of rainfall patterns, it is understood that approximately 30% of the water in the License Area arises on lands that are privately owned. As such, in the absence of a water lease or water license, EMI would be entitled to divert approximately 30% of the waters in the License Area, and continue to make use of the minimal diversions located purely on private lands, for a total of approximately 30.76 mgd of water, which would provide approximately 24 mgd for actual irrigation purposes in the Central Maui agricultural fields (i.e., after taking into account system losses within the Central Maui field irrigation system). Please note that Section 3.3 of the Final EIS has been updated as shown on pages 3-24 to 3-25 to expand on the above discussion based on comments received on the Draft EIS.

Comment 12: *Page 5-1 et. Seq (313 et. seq.) Section 5.0 Relationships to Plans, Policies & Controls.*

- *The Draft EIS identifies DHHL's water reservations and planning system in section 2.1.1. However, consistency DHHL's General Plan, Water Policy Plan, Maui Island Plan, Regional Plan and Development Plans must be assessed and included in section 5.*

Response 12: Please note that we respectfully disagree with your comment that the Proposed Action's consistency must be assessed against the above plans. According to HAR § 11-200-16(h): an EIS must include a statement of the relationship of the proposed action to land use plans, policies, and controls for the affected area. Discussion of how the proposed action may conform or conflict with objectives and specific terms of approved or proposed land use plans, policies, and controls, if any, for the area affected shall be included. Where a conflict or inconsistency exists, the statement shall describe the extent to which the agency or applicant has reconciled its proposed action with the plan, policy, or control, and the reasons why the agency or applicant has decided to proceed, notwithstanding the absence of full reconciliation. Chapter 5, titled "Relationship to Land Use Plans, Policies, and Controls" provides the analysis of the Proposed Water Lease and related land use plans, policies, and controls. Please note that the Water Lease will include a reservation of water for the DHHL. Non-potable water needs for the DHHL's lands in Ke'anae-Wailuānuui amount to 6,868,000 gpd. Although the DHHL holds a reservation for 3,000 gpd of potable water for this area for development over the next 20 years, another 7,000 gpd of potable water may be required for longer-term development. Thus, a potential reservation for this area amounts to 6,875,000 gpd. For its agricultural and residential lots in Keokea-Waiohuli, the DHHL has already secured a potable water reservation from the CWRM. Non-potable water demand amounts to 10,428,000 gpd for which a water reservation

would have to be secured. The DHHL's current plans for its Pulehunui lands in Central Maui include agricultural, commercial, industrial and civic uses. A reservation of 1,734,000 gpd of ground water has already been secured from the CWRM. A non-potable water demand of 1,027,510 gpd has been identified, and water delivered through the EMI Aqueduct System has been identified as a potential source of this water. However, the Proposed Action does not entail direct use or direct impact to any DHHL planning areas.

Comment 13: *The proposed project has the potential to impact DHHL's Maui land holdings and beneficiaries. We highly encourage you to consult with Hawaiian Homestead community associations and other (N)ative Hawaiian organizations to better assess potential impacts to cultural and natural resources, access and other rights of Native Hawaiians. A list of some of our DHHL homestead associations may be found at <https://dhhl.hawaii.gov/homestead-associations/>.*

Response 13: As described in Section 4.6 of the Draft EIS, in preparing the CIA:

CSH's consultation efforts utilized previous contact lists, in-house database of kūpuna (elders), kama'āina (native born), cultural practitioners, lineal and cultural descendants, Native Hawaiian Organizations (NHO; includes Hawaiian Civic Clubs and those listed on the Department of Interior's NHO list), and community groups. CSH also contacted agencies such as SHPD, OHA, and the appropriate Island Burial Council regarding the License Area located for their response to identify lineal and cultural descendants, individuals, and or NHO with cultural expertise and or knowledge of the License Area.

As discussed in Section 4.6 of the EIS, the Hawaiian Homestead community associations and other Native Hawaiian organizations were contacted prior to and subsequent to the publication of the Draft EIS. CSH contacted 136 parties as shown in Table 12 of the CIA, including the DHHL beneficiaries, NHOs such as Aha Moku o Maui, Inc., Kuloloia Lineage-I Ke Kai o Kulolia, Waiehu Kou Phase 3 Association and knowledgeable community members. NHOs consulted included: Aha Moku o Maui, Inc. (Ke'eumoku Kapu and Kyle Nakanelua); Kuloloi'a Lineage – I Ke Kai o Kuloloi'a (Les Kuloloi'a); Waiehu Kou Phase 3 Association (Roy Oliveira); Moku o Kaupō (Jade Alohalani Smith); and Aha Moku o Kahikinui (Donna Sterling).

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū
and Huelo License Areas

Dear Ms. Shimabukuro-Geiser:

Notice of the availability of the Draft Environmental Impact Statement (DEIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas will be published in the September 23, 2019 issue of the Office of Environmental Quality Control’s *The Environmental Notice*. Written comments received in response to this DEIS will be considered in the preparation of the Final EIS (FEIS). The deadline for comments is November 7, 2019. Please address comments to:

Mr. Earl Matsukawa Wilson Okamoto Corporation 1907 S, Beretania St., Suite 400 Honolulu, HI 96826	with a cc to:	Mr. Ian Hirokawa Land Division, DLNR 1151 Punchbowl St. Room 220 Honolulu, HI 96813
--	---------------	--

Or, via email to: waterleaseeis@wilsonokamoto.com and ian.c.hirokawa@hawaii.gov

All comment letters must be post-marked, or email received, by the deadline date to be included in the Final EIS.

The DEIS is available for review on the OEQC Website at the following URL address:

Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Kau:

Thank you for comments dated November 25, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *We have no comment at this time. However, we reserve the right to comment in the event of any changes.*

Response 1: We acknowledge that the State of Hawai‘i Department of Agriculture does not have any comments at this time.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

Proposed Water Lease for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas
Multiple Ahupua'a, Hāna and Makawao Moku, Maui Moku
Tax Map Key: (2) 1-1-001:044, 50; 1-1-002:002; 1-2-004:005, 007 (por.); 2-9-014:001, 005, 011, 012, 017

Aloha e Mr. Matsukawa:

The Office of Hawaiian Affairs (OHA) is in receipt of your September 23, 2019 letter notifying us of the Alexander & Baldwin, Inc., and East Maui Irrigation Company, Ltd. (A&B/EMI) Draft Environmental Impact Statement (DEIS) in support of a proposed water lease for Nāhiku, Ke'anae, Honomanū, and Huelo License Areas in Hāna and Makawao, Maui (License Area). Wilson Okamoto Corporation has been contracted by A&B/EMI to complete this DEIS in accordance with Hawai'i Revised Statutes (HRS) Chapter 343 and Hawai'i Administrative Rules (HAR) Chapter 11-200. OHA understands that pursuant to HRS 171-58, A&B/EMI will still have to acquire the water lease via public auction and also develop a watershed management plan in collaboration with the State of Hawai'i Department of Land and Natural Resources (DLNR) as these waters originate on and traverse State lands.

The sought water lease would be a long-term, 30-year lease from the DLNR and Board of Land and Natural Resources (BLNR), for the diversion, transport, and use of government owned public trust waters in the License Area via the existing EMI Aqueduct System. Currently, it's expected that 65.88 million gallons per day (mgd) of water will be utilized from surface water sources, while 16.47 mgd will be utilized from ground water sources. The BLNR cannot approve any water lease without completion of an applicable environmental review pursuant to HRS Chapter 343. The DEIS states that the water lease will further enable A&B/EMI to access State-owned lands for the purposes of maintaining and repairing existing access roads and trails for the EMI Aqueduct System. The EMI Aqueduct System, which has been in use for generations, has been designed and used to convey stream waters from East Maui to over 30,000 acres of land for domestic and

commercial agricultural purposes in portions of Upcountry, East, and Central Maui. Although the water lease was originally obtained by A&B in 1876 to facilitate sugarcane production, A&B has since ceased its sugarcane activities and recently divested itself of its landholdings in the serviced areas. Current landowners, like farming company Mahi Pono, utilize water for diversified (commercial) agricultural purposes. Mahi Pono has developed a Farm Plan for these properties that drives some of the water use decisions within the DEIS. Some of this water is also provided to the County of Maui Department of Water Supply (MDWS) for municipal uses.

While OHA has endeavored to provide as comprehensive review of the DEIS as practicable within the time allotted, OHA notes that requests for a time extension of the public review period from numerous stakeholders, including Maui county officials and OHA staff, were not accommodated. Accordingly, OHA makes no representation that the comments below are an exhaustive and complete review of all potential issues and concerns with this 2,700 page document; the comments provided nevertheless highlight representative areas of particularly salient concern. OHA looks forward to reviewing a revised DEIS that reflects a good faith effort to address the categorical concerns raised in this letter, and by other stakeholders representing Native Hawaiian interests and concerns.

OHA offers the following comments regarding the DEIS' (1) alternative actions analyses, (2) cultural impacts analysis, and (3) HRS 6E (historic preservation) compliance:

1. The analyses and rejection of alternatives are inconsistent, incomplete, and insufficiently detailed

OHA previously commented on the Environmental Impact Statement Preparation Notice (EISPN) for the subject DEIS and water lease in April 2017, recommending that alternatives to the proposed water lease action (inclusive of shorter lease terms and the no-action alternative of discontinuing water diversions entirely) be considered as HAR § 11-200-17(f) requires a comparative analysis of such alternatives. Per the rules, the comparative analysis "shall describe . . . alternatives which could attain the objectives of the action, regardless of cost, in sufficient detail to explain why they were rejected," with a "rigorous exploration and objective evaluation of the environmental impacts of all such alternative actions. Particular attention shall be given to alternatives that might enhance environmental quality or avoid, reduce, or minimize some or all of the adverse environmental effects, costs, and risks" (emphases added).

In the spirit of the law and rules, alternatives are not to be evaluated with a myopic focus on the alternatives' potential adverse effects on the applicant's profits. While OHA appreciates the inclusion of an alternatives analysis that generally considers the approaches OHA previously suggested, OHA believes the: (1A) dismissed alternatives rely on unrealistic or extreme demands that deprives them of their eligibility for comparative analysis; and, (1B) "reasonable" alternatives are poorly explored without sufficient justification for their rejection, thus improperly favoring the preferred alternative.

1A. Dismissed alternatives rely on unrealistic or extreme demands

Section 3.1 of the DEIS lists two “dismissed” alternatives that OHA is particularly concerned with having unrealistic demands: groundwater use and added storage capacity. These alternatives were eliminated from a detailed comparative analysis as they were considered impractical (i.e., drilling multiple new wells, installing pumps, building storage tank capacity). To quote the DEIS, it states that these dismissed alternatives “are not considered viable for various reasons including the expected intensification of environmental effects and lack of feasibility.”¹ Their subsequent summary dismissals unreasonably foreclose any meaningful exploration of how the “alternative” approaches may in fact be used to mitigate adverse environmental effects and achieve perhaps a more appropriate/reasonable balance between the agricultural development of Central Maui and the protection of East Maui’s environment.

For example, the dismissed groundwater alternative is described as potentially reducing the amount of East Maui surface water required for irrigation in Central Maui, but seems to actually eliminate and essentially replace all surface water demands. The DEIS speculates that since current aquifers (Pā‘ia and Kahului) can’t support more than 4 mgd due to reductions in aquifer recharge rates, additional wells would need to be drilled in other aquifers in order for this method to effectively contribute to water needs. The DEIS, however, appears to use this speculative “safe pumping rate” as a means to propose that “53 new well sites would need to be developed” with pumping capacity of 1 mgd each. Hydrological speculation aside, the total amount of water produced from these 53 wells would be about 80% of the expected 65.88 mgd surface water draw and more than three times the expected 16.47 mgd draw on ground water under the proposed water lease. The DEIS then cites that costs, property acquisitions, and environmental impacts from these 53 wells would make the alternative unfeasible. There is no clear explanation for why such an arbitrary large number of wells is needed to “reduce” the amount of East Maui surface water to meet the objectives of the proposed action. By unreasonably recharacterizing this alternative as one that would essentially replace, rather than moderately reduce East Maui surface waters with Central Maui groundwater sources, the DEIS avoids any detailed analysis of a less extreme increased groundwater alternative that might strike a better balance between the environmental, cultural, and other public trust purposes of East Maui’s streams with the agricultural needs of Central Maui. OHA thus recommends that the DEIS explore less extreme options of this alternative that are more balanced.

Similarly, the dismissal of the “added storage capacity” alternative is based upon an assertion that upgrading all of Central Maui’s 48 existing major reservoirs or constructing a large reservoir to store a commensurate level of water are the only scenarios. Not surprisingly, such a huge endeavor would cost an unfeasible \$50 to \$100 million for upgrades, or \$300 million for a single large reservoir. There is no moderate alternative proposed as the DEIS does not explore any other possibility other than repairing all reservoirs or the construction of a singular large reservoir with a capacity of 1,200 mg. Furthermore, there is no explanation behind the apparent assumption that this alternative requires all surface water flows to be replaced by stored water for an entire month. With the summary rejection of this “added storage capacity” alternative, the DEIS avoids any detailed consideration or comparative analysis of a less extreme added storage capacity scenario

¹ See DEIS page 3-1, Section 3.1.

that could reduce the environmental impacts of the proposed alternative on East Maui's streams, while protecting Central Maui farmers with the reliability of additional water stored during periods of high rainfall. As with the ground water alternative, OHA recommends that the DEIS explore less extreme options of this alternative that are more balanced.

1B. The "reasonable" alternatives are poorly explored without sufficient justification for their rejection

The DEIS does offer three "reasonable" alternatives for its "detailed" comparative analyses: shorter water lease durations, reduced water volumes, and a modified water lease area option. Ultimately, although the reasonable alternatives would potentially mitigate adverse impacts resulting from the disruption and diversion of stream flow under the proposed action, OHA believes detailed analyses were not sufficiently provided. The rejection of these alternatives appear based on how agricultural investment returns and financing options in Mahi Pono's current Farm Plan for their East Maui properties may be affected, rather than on an objective and comprehensive consideration of their relative beneficial and adverse environmental effects.

Regarding the financing concerns cited as a basis for rejecting the shorter lease length and reduced water allocation alternative, OHA notes that insufficient detail is shared on how or what exactly will be financed, and more importantly, how a longer-term water lease or larger initial water allocation will somehow alleviate the apparent financing uncertainties to an extent that justifies the rejection of these less impactful alternatives. For example, in light of the fact that a water lease of any length is always subject to the public trust and the State Water Code, the State can and should adjust or amend water allocations consistent with changing conditions and impacts. Other uncertainties, as further described below, may also impact water allocations under a water lease of any length, regardless of what quantities might be initially diverted under a lease. Thus, OHA believes that sufficient clarification and detail regarding financing needs should be included in the DEIS as it is currently one of the reasons used to reject the proffered "reasonable" alternatives.

Regarding the "return on investment" that would be compromised by the shorter lease length alternative, the over-reliance on long-term investment crops also appears to be an unnecessarily rigid application of what is otherwise described as an adaptive and flexible Farm Plan. The use of the Farm Plan as a means to dismiss alternatives seems to contradict the way the Farm Plan is portrayed in the DEIS, which states that the Farm Plan is a "fluid and responsive" plan that responds to the ever-changing agricultural market.² OHA believes a more detailed explanation should be provided that can sufficiently describe the specific costs and benefits of the Farm Plan's multiple contingencies prior to rejecting alternatives.

Notably, the DEIS argues that the long term lease is needed for Mahi Pono to get their return on long term investment crops. The rigid adherence to the Farm Plan's long term investment drivers discounts uncertainties that may counsel a much shorter lease term than contemplated under the proposed action. For example, the DEIS includes reference to an e-mail from Skippy Hau, an aquatic biologist with the State of Hawai'i Division of Aquatic Resources, noting the lack of information on the amount of water diverted from East Maui, and urging a five-year lease "with

² See page 2-17 of the DEIS.

constant updates” based on water use and other information gathered during that time. As further suggested by Mr. Hau’s e-mail, climate change may also have profound impacts on rainfall patterns, ecosystem dynamics, and the very stability of our ways of life in the near future, potentially requiring adjustments to lease conditions and water allocations consistent with the State Water Code, and the public trust. While the EIS does acknowledge the existence of climate change, it leans towards an overly optimistic take on such impacts and accordingly rejects the shorter lease term alternatives. A rigid adherence to one return on investment scenario and unreasonably dismissive attitude towards uncertainties should not be used to justify the rejection of shorter and more adaptive lease term alternatives that may mitigate or better accommodate uncertain adverse environmental effects. OHA believes that the Farm Plan should include scenarios that do not require or limit the need for long term investment crops. With such a consideration added to the Farm Plan, the DEIS can reassess reasonable alternatives accordingly.

Furthermore, similar to the superficial characterizations of the “dismissed” alternatives, OHA notes that the shorter term water lease alternative is presented broadly and without any exploration of the varying term lengths that could and should be considered under this alternative. For example, the DEIS could develop a tiered approach by exploring and comparing the differences in effect and feasibility of varying, specific lease durations. A shorter-term water lease could be anything less than 30 years. Even if Mr. Hau’s well-reasoned 5-year lease recommendation is considered unfeasible, a 10- or 15- year lease could still be utilized to successfully facilitate Mahi Pono’s Farm Plan while at the same time providing substantially greater opportunity to understand and address changing environmental conditions and effects. However, the consideration of any lease under 30 years is dismissed in the DEIS, as it declines to propose any specific shorter term lease length in favor of lumping all leases less than 30 years in a single, short-term water lease category. Assessing the impact of a shorter-term water lease with specific durations would be more effective in determining how much of a burden these shorter-term water leases really are on Mahi Pono’s Farm Plan, its “return on investment,” or other cited reasons for their generic dismissal. Thus, OHA recommends that multiple short term lease options be examined with each option showing impacts to investment returns within Mahi Pono’s Farm Plan.

2. Impacts to cultural resources and practices are inadequately described with little to no consideration of mitigation efforts beyond complying with the already binding 2018 CWRM D&O

The DEIS argues that available water will be limited due to existing Department of Hawaiian Homelands (DHHL) water entitlements³ and interim instream flow standard (IIFS) restorations ordered by the Commission on Water Resource Management (CWRM) in a 2018 Decision & Order (D&O). According to the DEIS, this 2018 D&O, which restored all or partial natural IIFS to 22 streams in the License Area, has the potential to “reduce or eliminate cultural impacts.” OHA believes such a statement is continually misused throughout the DEIS to (2A) avoid cultural impact considerations for streams not covered by the D&O; and, (2B) ignore concerns regarding cultural access to the License Area.

³ See HRS 171-58(g) which requires the DLNR to consult with DHHL prior to the issuance of a water lease to ensure that the water lease does not take away from the water needs of future homestead needs.

2A. The DEIS avoids cultural impact considerations for streams not covered by the D&O

Cultural practices and subsistence lifestyles unique to the communities in East Maui have a direct relationship with the health and abundance of native stream and estuarine life, as well as the region's overall environmental integrity. Meanwhile, as recognized in the DEIS and its appendices, even with the D&O in place, the proposed action could reduce available habitat units and result in lost mauka-to-makai connectivity for a substantial number of streams in East Maui not covered by the D&O. These streams are all ecologically interconnected through the amphidromous nature of the native species they support. According to the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) done as part of the DEIS, there is a potential for an 85% loss of habitat in streams not covered by the D&O when water is fully diverted. The proposed action at these streams would have a direct impact on native stream and estuarine life throughout the region that would in turn potentially limit or foreclose the perpetuation of cultural practices, the intergenerational transmission of cultural knowledge, and the maintenance of traditional subsistence lifestyles. The DEIS thus cannot reasonably characterize the D&O as somehow reducing or even eliminating all of the proposed action's cultural impacts. OHA recommends the DEIS provide a more detailed evaluation of the numerous cultural concerns and possible mitigation measures for streams not covered by the D&O.

The HSHEP is arguably also incomplete as it states that it evaluated all streams within the License Area except for one, Puakea Stream. OHA believes the reasoning for its exclusion from HSHEP analysis is not made clear. Absent a valid reason, OHA requests that impacts to culturally significant flora and fauna species at Puakea Stream be assessed, as leaving it out renders the cultural impact portion of the DEIS incomplete.

The HSHEP does further note that entrainment of aquatic larvae at stream diversions remains an issue that contributes to the loss of habitat units for many flora and fauna species dependent on stream flow. Interestingly, the DEIS does acknowledge this point by indicating that habitat units may be increased through the modification of diversions to reduce entrainment. However, the DEIS does not appear to offer such alternatives and again relies on the D&O to reduce or eliminate cultural impacts. OHA thus recommends that alternate diversion designs be considered to reduce entrainment.

On a final note, although OHA certainly does not oppose ethically responsible scientific analyses and understands the important role these studies serve, scientific findings are not always absolute and are often refined through follow up testing, monitoring, or research. In this particular case, the claim that the D&O has the "potential" to reduce or eliminate cultural impacts is not a definite nor are the findings of the HSHEP. As findings note a "potential" and not a guarantee, OHA believes that follow up monitoring on water quality, stream flow, and flora and fauna life should be arranged prior to issuance of a water lease. Such monitoring could perhaps be integrated into the watershed management plan to be collaboratively developed by A&B/EMI and the BLNR pursuant to HRS 171-58(e).

2B. The DEIS ignores concerns regarding cultural access to the License Area

The DEIS lacks any explicit consideration of the proposed action's potential impacts to access by cultural practitioners, who may wish to gather or visit resources and sites in the License Area. There is only a hint of discouragement to unregulated public access to the License Area in the DEIS, where it states that unauthorized personnel could present a potential vector for invasive species and traditional resources could be over consumed.⁴ OHA argues that since traditional customary practices are occurring in the area and that these rights are protected by the State of Hawai'i Constitution, then A&B/EMI should minimally commit to developing a procedure for addressing cultural access and keeping individuals informed of activities occurring in the License Area. This procedure should be in place even if A&B/EMI defers access responsibility to the State. With only 15 of 136 people responding to the cultural impact assessment consultations, with potentially many more who were and are reluctant to participate in the process,⁵ it is likely that many cultural users of the area are not accounted for and that potential access impacts may be much greater than anticipated. Accordingly, the DEIS should consider an array of approaches to mitigate potential impacts to practitioner access and use of the License Area, such as the maintenance of a consultation list of willing practitioners that can be used to communicate with and accommodate these individuals and their networks. Notably, this may help A&B/EMI develop a respectful relationship with cultural practitioners rather than creating an adversarial lessee-versus-cultural practitioner situation. With an established procedure to handle cultural access, A&B/EMI or the State should also consider signage that encourages cultural use pursuant to the State of Hawai'i Constitution, Article XII, as not to have them unduly harassed by any form of onsite security or enforcement personnel. In any case, the DEIS must address what may be significant and unaccounted-for impacts to practitioner access under the proposed action.

3. HRS 6E, Historic Preservation, Compliance

As the State Historic Preservation Division (SHPD) is tasked with administering HRS 6E, SHPD comments were sought when the EISPN was published in 2017. Per the January 25, 2017 SHPD letter provided in Appendix E of the DEIS, SHPD originally could not make a determination of the water lease's impact on historic properties, and thus recommended that an archaeological inventory survey (AIS) be completed in accordance with an AIS plan (AISP). However, following several SHPD consultations with the contractor, SHPD rescinded its request for an AIS in a letter dated October 6, 2017, as SHPD was led to believe that no ground disturbing work would take place as part of the water-lease issuance. OHA questions this portrayal of the proposed water lease as having no ground disturbing work since the DEIS states that the water lease will allow for A&B/EMI to maintain and repair existing access roads and trails that are part of the EMI Aqueduct System. Such repair work often includes ground disturbing activities.

The specific details (i.e., locations, staging areas, construction access routes, and scope of work) of the maintenance and repair work are not detailed within the DEIS. Including these improvements without a clear scope in the DEIS arguably could lead A&B/EMI to think that these actions do not require HRS 6E review. OHA requests that details be provided regarding proposed

⁴ See pages 3-6 and 3-14 of the DEIS.

⁵ See page ix of the DEIS.

Mr. Earl Matsukawa

November 6, 2019

Page 8

maintenance and repair work as withholding the scope and breadth of such actions may mislead the evaluation of impacts to historic properties.

The DEIS goes on to state that should there be inadvertent cultural finds, including human remains, in the License Area, that these discoveries will be immediately reported to SHPD. OHA notes however that simply contacting SHPD does not ensure compliance with relevant rules governing inadvertent discoveries. Procedures for inadvertent discoveries, other than a burial site, is governed by HAR 13-280. These rules require that work in the immediate area halt and that nothing will be removed until SHPD can evaluate the find. Depending on the findings, SHPD may require a mitigation plan. Procedures for inadvertent human burials are governed by HAR 13-300-40. These rules also require that work in the immediate area halt, but further requires that the coroner and the police department be contacted in addition to SHPD. OHA thus recommends that the DEIS include a clause that ensures compliance with these rules.

OHA looks forward to reviewing a revised DEIS that addresses our concerns regarding alternatives, cultural impacts, and HRS 6E compliance. If needed, OHA is willing to engage in any future discussions or consultations. Should you have any questions, please contact our Lead Compliance Specialist, Kamakana C. Ferreira, at (808) 594-0227, or by email at kamakanaf@oha.org.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas

Dear Dr. Hussey:

Thank you for comments dated November 6, 2019 (ref. HRD19-8044C), and emailed to us on November 7, 2019, regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The Office of Hawaiian Affairs (OHA) is in receipt of your September 23, 2019 letter notifying us of the Alexander & Baldwin, Inc., and East Maui Irrigation Company, Ltd. (A&B/EMI) Draft Environmental Impact Statement (DEIS) in support of a proposed water lease for Nahiku, Ke'anae, Honomanū, and Huelo License Areas in Hana and Makawao, Maui (License Area). Wilson Okamoto Corporation has been contracted by A&B/EMI to complete this DEIS in accordance with Hawai'i Revised Statutes (HRS) Chapter 343 and Hawai'i Administrative Rules (HAR) Chapter 11-200. OHA understands that pursuant to HRS 171-58, A&B/EMI will still have to acquire the water lease via public auction and also develop a watershed management plan in collaboration with the State of Hawai'i Department of Land and Natural Resources (DLNR) as these waters originate on and traverse State lands.*

Response 1: We acknowledge that the aforementioned Office of Hawaiian Affairs' (OHA) comment letter pertains to the Draft EIS for the proposed Water Lease. We also concur that,

pursuant to Hawai'i Revised Statutes § 171-58, any Water Lease lessee would need to acquire the proposed Water Lease in a public auction process as described in Section 1.4 of the Draft EIS. The Water Lease lessee will also have obligations related to the development of a watershed management plan in conjunction with the Department of Land and Natural Resource (DLNR). This is addressed in Section 2.1 of the Draft EIS, which has been updated in the Final EIS to address the actions of the DLNR and the Board of Land and Natural Resource (BLNR) taken after publication of the Draft EIS regarding the minimum content requirements of a watershed management plan. See pages 2-2 to 2-4 of the Final EIS.

Comment 2: *The sought water lease would be a long-term, 30-year lease from the DLNR and Board of Land and Natural Resources (BLNR), for the diversion, transport, and use of government owned public trust waters in the License Area via the existing EMI Aqueduct System. Currently, it's expected that 65.88 million gallons per day (mgd) of water will be utilized from surface water sources, while 16.47 mgd will be utilized from ground water sources.*

Response 2: We concur with your characterization of the proposed Water Lease and the amount of surface water that could be conveyed under the lease to the Central Maui agricultural fields now owned by Mahi Pono. We also concur with the amount of groundwater you cite that may be available to supplement surface water in those agricultural fields. However, it should be noted that these water amounts are after system losses occur within the Central Maui Field Irrigation System. The Draft EIS in Section 2.1.2 explains how the surface and groundwater amounts were derived. The surface water amount for the Central Maui agricultural fields includes compliance with the Commission on Water Resources Management (CWRM) Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O); deduction of amounts conveyed to the Maui Department of Water Supply (MDWS) for users in Upcountry Maui, including the expanded Kula Agricultural Park (KAP); and system losses within the on-farm Central Maui Field Irrigation System.¹ Accounting for these factors, approximately 65.88 mgd of surface water will be available for application to the Central Maui agricultural fields, as cited in your comment.

Also cited in your comment is the 16.47 mgd of brackish groundwater from sources in Central Maui that is estimated to supplement the 65.88 mgd of surface water for a total of 82.35 mgd as explained in Section 2.1.4 of the Draft EIS. Mahi Pono has groundwater wells that can supplement surface water to approximately 17,200 acres of the Central Maui agricultural fields at

¹ The assumption of 22.7% for system losses from the Mahi Pono Field Irrigation System includes water lost to evaporation and leakage from reservoirs and ditches (although the leaked water seeps down and recharges the aquifer), and water for fire protection and dust control. Some surface water is used to power a hydroelectric facility, but this is a non-consumptive use of the water. The assumed percentage for system losses does not take into account possible improvements to the on-farm irrigation system that could reduce water losses.

the lower elevations. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water. During sugarcane operations, the combined pumping capacity of A&B's 15 brackish water wells was 228 mgd of brackish water, but the true instantaneous pumping capacity of the wells – the most that could be pumped over 3 to 5 days – was 115 mgd during sugar cultivation, after which sump levels started to decline. From 1986 to 2013, A&B pumped an average of 71 mgd from the brackish water wells; during the 2008-to-2013 period, these wells delivered about 70 mgd of brackish groundwater to the lower-elevation fields. This was a suitable source of water for sugarcane during droughts because sugarcane can tolerate periodic use of water with higher salinity levels. However, please note that Section 2.1.4 of the Final EIS regarding the description of the brackish groundwater wells that serve the Central Maui Field Irrigation System has been revised to accurately reflect the fact that Mahi Pono only has 10 wells that can provide brackish groundwater to the Central Maui agricultural fields, as shown on page 2-25.

It should be noted that the dynamic relationship between surface and groundwater in the Central Maui agricultural fields affects the amount and quality of groundwater available for Mahi Pono's farm plan. Sections 3.1.1.1 and 4.2.2 of the Draft EIS explain the major role that surface water losses through the Central Maui Field Irrigation System, as mentioned above and, even more significantly, the percolation of applied surface water below the root zone of crops, has on groundwater recharge.

Once percolating surface water enters the groundwater table, however, it is substantially more saline when pumped to the surface for irrigation. As discussed in Section 2.1.4 of the Draft EIS, the crops planned to be cultivated by Mahi Pono are not as salt tolerant as was sugarcane. In comparison to the former period during sugarcane cultivation, far less surface water will be imported for irrigation and correspondingly less of that water will enter the groundwater table for potential irrigation use. Factoring in the limited salt tolerance of diversified agricultural crops, the use of brackish water on the lower fields is assumed to be limited to about 30% of the water applied. Combining the upper and lower fields, the overall water split across all 30,000 acres would be approximately 80% surface water and 20% brackish groundwater water. If insufficient water is available from the EMI Aqueduct System, then crop farming will have to be reduced no matter how much brackish water is available.

Also factoring into the amount of water that may be available through the proposed Water Lease for the Central Maui agricultural fields is the Department of Hawaiian Home Lands' (DHHL) rights to reserve water sufficient to support current and future homestead needs, as discussed in Section 2.1.1 of the Draft EIS. Specific information regarding the DHHL future water

reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019 as shown on pages 2-4 to 2-7. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM. Consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture.

Comment 3: *The BLNR cannot approve any water lease without completion of an applicable environmental review pursuant to HRS Chapter 343. The DEIS states that the water lease will further enable A&B/EMI to access State-owned lands for the purposes of maintaining and repairing existing access roads and trails for the EMI Aqueduct System.*

Response 3: We acknowledge that a compliance with HRS Chapter 343 is a prerequisite for the BLNR to issue the Water Lease. Should the proposed Water Lease be issued, it would allow the BLNR-awarded lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System and the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users as

discussed in Section 2.1 of the Draft EIS. Moreover, as discussed in Section 1.4 of the Draft EIS:

For the purposes of HRS Chapter 343, the applicant for the Water Lease is A&B, pursuant to orders of the BLNR in April and June of 2016, directing A&B to prepare an EIS. In accordance with HAR of the State of Hawai‘i Department of Health (DOH), Section 11-200-4(b), the BLNR, as the executive board of the DLNR, is the accepting authority for the proposed EIS because the DLNR is the agency initially receiving and agreeing to process the request for the issuance of a Water Lease at public auction.

Comment 4: *The EMI Aqueduct System, which has been in use for generations, has been designed and used to convey stream waters from East Maui to over 30,000 acres of land for domestic and commercial agricultural purposes in portions of Upcountry, East, and Central Maui. Although the water lease was originally obtained by A&B in 1876 to facilitate sugarcane production, A&B has since ceased its sugarcane activities and recently divested itself of its landholdings in the serviced areas. Current landowners, like farming company Mahi Pono, utilize water for diversified (commercial) agricultural purposes. Mahi Pono has developed a Farm Plan for these properties that drives some of the water use decisions within the DEIS. Some of this water is also provided to the County of Maui Department of Water Supply (MDWS) for municipal uses.*

Response 4: As discussed in Section 2.1 of the Draft EIS, the EMI Aqueduct System, assuming the proposed Water Lease is issued for the maximum amount of water that may be awarded, would continue to convey diverted surface water to MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, and use by Mahi Pono and its lessees for agricultural, reservoir, and agriculturally related industrial needs (including dust control, hydroelectric, and fire suppression needs), and, for an interim period, for the continuation of certain historic uses, including water for pasture, livestock, non-profit irrigation and fire suppression at/around the Pu‘unene Mill area, including for non-profits and a federal post office, as well as for related uses around the County's Central Maui landfill (quarry, composting, and C&D landfill for purposes such as restrooms, dust control That Water Lease will also insure the continued delivery of water for a portion of the Nāhiku community, which, through the MDWS, draws water from EMI's West Makapipi Tunnel 2 (Well No. 4806-07), a development tunnel located on EMI's land, directly adjacent to in the Ko‘olau Ditch near Makapipi Stream, which is has been clarified in Section 2.1.3.3 as shown on pages 2-21 to 2-22.

As discussed in Draft EIS Section 1.1, in December 2018 A&B sold the majority of its former sugarcane lands in Central Maui to Mahi Pono, whose objective is to continue to transition as

much of the former sugarcane land as possible to diversified agriculture. The Mahi Pono farm plan is presented in Section 2.1.4 of the Draft EIS and is depicted on Draft EIS Figure 2-6, which is now Figure 2-9 in the Final EIS. Please note that the Mahi Pono farm plan is like any responsible farming plan, a fluid and responsive plan that will make adjustments to the type of agricultural activity to be pursued (i.e. orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.) in response to the ever-changing agricultural market demands, to agronomic conditions and to economic and other variables such as the availability and cost of water for crop irrigation.

Comment 5: *While OHA has endeavored to provide as comprehensive review of the DEIS as practicable within the time allotted, OHA notes that requests for a time extension of the public review period from numerous stakeholders, including Maui county officials and OHA staff, were not accommodated. Accordingly, OHA makes no representation that the comments below are an exhaustive and complete review of all potential issues and concerns with this 2,700 page document; the comments provided nevertheless highlight representative areas of particularly salient concern. OHA looks forward to reviewing a revised DEIS that reflects a good faith effort to address the categorical concerns raised in this letter, and by other stakeholders representing Native Hawaiian interests and concerns.*

Response 5: Under the applicable laws (HRS, Chapter 343 and HAR Title 11, Chapter 200), the review and comment period for the Draft EIS is 45 days. Neither the statute nor the rules provide a mechanism or authority by which the Applicant can extend the comment period. (See HRS § 343-5(e) ("The draft statement shall be made available for public review and comment through the (OEQC) for a period of forty-five days.")) The Draft EIS has been revised to incorporate substantive comments received during the consultation and review processes, consistent with HAR § 11-200-18 and has been published as the Final EIS.

Comment 6: *OHA offers the following comments regarding the DEIS' (1) alternative actions analyses, (2) cultural impacts analysis, and (3) HRS 6E (historic preservation) compliance:*

Response 6: We have responded to the three sets of comments you offer, and have provided section headings for each topic below. Your comments have been divided and sequentially numbered to facilitate providing our point-by-point responses, which are correspondingly numbered.

ALTERNATIVES COMMENTS

Comment 7: *The analyses and rejection of alternatives are inconsistent, incomplete, and insufficiently detailed. OHA previously commented on the Environmental Impact Statement*

Preparation Notice (EISPN) for the subject DEIS and water lease in April 2017, recommending that alternatives to the proposed water lease action (inclusive of shorter lease terms and the no-action alternative of discontinuing water diversions entirely) be considered as HAR § 11-200-17(f) requires a comparative analysis of such alternatives. Per the rules, the comparative analysis "shall describe...alternatives which could attain the objectives of the action, regardless of cost, in sufficient detail to explain why they were rejected," with a "rigorous exploration and objective evaluation of the environmental impacts of all such alternative actions. Particular attention shall be given to alternatives that might enhance environmental quality or avoid, reduce, or minimize some or all of the adverse environmental effects, costs, and risks" (emphases added).

Response 7: We acknowledge receipt of OHA's previous letter dated April 4, 2017, commenting the EIS Preparation Notice (EISPN). Although that letter was received after the 30-day EISPN comment period, which ended on March 10, 2017, a response letter dated September 23, 2019, was prepared and sent to OHA. Your comments were taken into consideration in preparing the Draft EIS and both your comment letter and our response letter were also reproduced in Appendix M of the Draft EIS.

HAR §11-200-17(f) requires an analysis of alternatives to the proposed action "which could attain the objectives of the action." The objectives of the Proposed Action, as stated in Section 1.2 of the Draft EIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku.

In its EISPN comment letter, OHA suggested that the EIS consider the effects of differing diversion volumes, including the discontinuation of diversions altogether, and that the EIS consider the effects of shorter lease term. These alternatives were addressed in Chapter 3 of the Draft EIS, which includes an analysis of: (a) a Reduced Water Volume alternative (Section 3.2.1); (b) an Alternative Lease Duration alternative (Section 3.2.2.1); (c) a Modified Lease Area alternative (Section 3.2.2.2); and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued and the Applicant would be limited to 30% of the water diverted from the License Area, plus the modest amount of water that is diverted from outside of the License Area (Section 3.3). The impacts of these scenarios were assessed through a comparative evaluation in Section 3.4 of the Draft EIS across a spectrum of environmental factors (topography, soils, surface water and aquatic environment, groundwater, coastal waters, drainage, natural hazards, flora, fauna, invertebrates, historic resources, cultural resources and practices, social characteristics, economic and fiscal impacts, agricultural and related impacts, recreational

resources, visual resources, air quality, noise, hazardous materials, traffic, public water systems, and public services and facilities) within East Maui, Upcountry Maui and the Central Maui agricultural fields. Please note that a summary of the comparative evaluation has been added to Section 3.5 of the Final EIS as shown on pages 3-49 to 3-80 as Table 3-2.

Moreover, Chapter 3 of the Draft EIS also identified other alternatives that were reviewed for their potential to meet the objectives, but which were ultimately determined to be infeasible. That analysis has been further supplemented based on comments received on the Draft EIS as shown on pages 3-2 to 3-19, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility, and desalination were all considered. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects, and therefore those alternatives were discussed, but ultimately not assessed to the same degree as (a) through (d). Additionally, Section 3.1.2 of the Draft EIS acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by another entity other than EMI. However, that alternative was also deemed to be infeasible, as discussed in the Draft EIS.

Section 3.4 of the Draft EIS includes a comparative evaluation of the environmental "benefits, costs, and risks" of the proposed Water Lease, the no Water Lease alternative, and "each reasonable alternative" i.e. (a) through (c). Table 3-2 has been added to Section 3.5 of the Final EIS so that readers can more easily compare the varying environmental benefits, costs, and risks of the Proposed Action at full implementation of the Mahi Pono farm plan, the "no action" alternative, and the reasonable alternatives to the Proposed Action. See pages 3-49 to 3-80 of the Final EIS.

Comment 8: *In the spirit of the law and rules, alternatives are not to be evaluated with a myopic focus on the alternatives' potential adverse effects on the applicant's profits. While OHA appreciates the inclusion of an alternatives analysis that generally considers the approaches OHA previously suggested, OHA believes the: (1A) dismissed alternatives rely on unrealistic or extreme demands that deprives them of their eligibility for comparative analysis; and, (1B) "reasonable" alternatives are poorly explored without sufficient justification for their rejection, thus improperly favoring the preferred alternative preferred alternative*

Response 8: The alternatives considered in Chapter 3 of the EIS, including those evaluated but determined to be infeasible to attain the objectives of the Proposed Action, and therefore dismissed from further review, and the alternatives that were fully assessed for comparative purposes, were not selected with a focus on potential profits for the Applicant. The focus was

on what is practical or feasible from the technical and environmental point of view and would achieve the objectives of the Proposed Action. Your specific comments identified as (1A) and (1B) are addressed below.

The alternatives analysis did not favor the proposed Water Lease over the other reasonable alternatives that could attain the objectives of the Proposed Action. The Draft EIS considered the environmental effects of each reasonable alternative and the No Action alternative on a range of environmental factors (topography, soils, surface water and aquatic environment, groundwater, coastal waters, drainage, natural hazards, flora, fauna, invertebrates, historic resources, cultural resources and practices, social characteristics, economic and fiscal impacts, agricultural and related impacts, recreational resources, visual resources, air quality, noise, hazardous materials, traffic, public water systems, and public services and facilities) within East Maui, Upcountry Maui and the Central Maui agricultural fields. The analysis of environmental factors and impact areas of the proposed Water Lease is found in Chapter 4 of the Draft EIS. Moreover, the alternatives that were assessed through a comparative evaluation of reasonable alternatives in Chapter 3 were not "rejected" as you suggest they were. The EIS was prepared to provide disclosure on the potential impacts of the Proposed Action and the reasonable alternatives. That said, as noted in Response #7, Table 3-2 has been added to Section 3.5 of the Final EIS so that readers can more easily compare the varying environmental effects of the alternatives and the Proposed Action. See pages 3-49 to 3-80 of the Final EIS. Moreover, as discussed in Response #7 above, in response to comments on the Draft EIS, the analysis of the alternatives that had been dismissed from in depth review has been further supplemented within Chapter 3 of the Final EIS, as shown on pages 3-2 to 3-19.

Comment 9: *Dismissed alternatives rely on unrealistic or extreme demands. Section 3.1 of the DEIS lists two "dismissed" alternatives that OHA is particularly concerned with having unrealistic demands: groundwater use and added storage capacity. These alternatives were eliminated from a detailed comparative analysis as they were considered impractical (i.e., drilling multiple new wells, installing pumps, building storage tank capacity).*

Response 9: We concur that the groundwater use and added storage alternatives were considered in the Draft EIS, but ultimately dismissed as they were not considered viable options for various reasons, including the intensification of environmental effects and lack of feasibility and inability to meet the goals and objectives of the Proposed Action. As discussed in Section 3.1 of the Draft EIS:

This chapter also reviews alternative means of achieving some of the objectives of the Proposed Action through alternative sources of water. However, a preliminary analysis determined that these options are not considered viable for

various reasons including the expected intensification of environmental effects and lack of feasibility. Therefore, these options are considered but dismissed from further study.

Regarding the “groundwater alternative” discussed in Section 3.1.1.1 of the EIS, this alternative is intended to reduce the amount of surface water required for irrigation to support diversified agriculture in Central Maui. If a sufficient groundwater source can be developed, then groundwater coupled with the amount of surface water available under the “No Action” alternative or the “Reduce Water Volume” alternative could, conceivably, meet the objectives of the Proposed Action. In this regard, the Draft EIS considered drilling new groundwater wells in Central Maui and East Maui (a total of 53 new wells were considered as a replacement to the water sought through a Water Lease). This analysis has been supplemented in the Final EIS, using the environmental criteria identified therein, to review the possibility of drilling approximately 26 new well sites to supplement, rather than replace, the surface water that could be authorized under the Water Lease.

As an overview, please refer to our previous Response #2 that explains the dynamic relationship of surface water and groundwater in Central Maui and the salt-tolerance of diversified agricultural crops in Mahi Pono’s farm plan. The Central Maui aquifers have a limited amount of natural groundwater resources due to low rainfall in the area, as discussed in Section 3.1.1.1 of the Draft EIS. The pumping of brackish groundwater from the Central Maui aquifers has been sustained at levels that far exceed the CWRM designated sustainable yield (SY). This has been possible due to aquifer recharge that took place as a result of using East Maui surface water to irrigate the Central Maui agricultural fields. With respect to groundwater pumping in the Central Maui agricultural fields, Section 3.1.1.1 of the Draft EIS explains:

The average pumping rate from 1987 to 2006 was about 26,663 mg per year. This volume equates to a pumping average of 73 mgd. Brackish groundwater used on the Central Maui agricultural fields during that time was approximately 42.5 mgd. (Plasch, 2019). This average daily pumping rate is well above the Sustainable Yield (SY) of 8 mgd (7 mgd for the Pā‘ia aquifer and 1 mgd for Kahului aquifer), as determined by the CWRM (see detailed discussion in Section 4.2.2). This high pumping rate may have been achievable in the past due to the large amount of recharge that was occurring when sugar was being cultivated and irrigated by surface water. During this same period, irrigation from surface water in Central Maui was approximately 112 mgd, and an additional approximately 44 mgd of surface water was applied to the fields through system losses (evaporation and leakage) within the Central Maui field system. The recharge from these system losses were replenishing the Kahului and Pā‘ia aquifers and is likely the reason that pumping groundwater at rates greater than the SY was achievable.

Hence, high pumping rates in the past were possible as significantly more surface water was being diverted by the EMI Aqueduct System from East Maui to Central Maui and utilized to irrigate the Central Maui agricultural fields overlying the Central Maui aquifers, thereby recharging those aquifers. Under the Proposed Action, it is estimated that approximately 87.95 mgd could be available to divert from the License Area after compliance with the CWRM D&O and an additional 4.37 mgd from private lands in between Honopou Stream and Māliko Gulch, for a total of 92.32 mgd. However, after surface water distribution to MDWS, approximately 85.22 mgd of gross total potential surface water would be available for the Central Maui agricultural fields prior to system losses within the Central Maui Field Irrigation System. This is far less than was diverted and therefore used to irrigate Central Maui in the past (as discussed above) and therefore less recharge of the Central Maui aquifers is projected to occur. This will decrease the amount of groundwater that can be pumped from the Central Maui wells.

Response #2 also discusses the saline content of the groundwater in the Central Maui aquifers, which is considered brackish and, therefore, is less suitable for diversified agriculture than for sugarcane, which is more salt tolerant. The Mahi Pono farm plan is a diversified agricultural plan as discussed in Section 2.1.4 of the Draft EIS, which proposes orchards, tropical fruits, row and annual crops, and energy crops. Hence, use of brackish groundwater would be limited. Specifically, Section 2.1.4 of the Draft EIS states:

From 1986 to 2013, A&B pumped an average of 71 mgd from the brackish water wells; during the 2008-to-2013 period, these wells delivered about 70 mgd of brackish groundwater to the lower-elevation fields. This was a suitable source of water for sugarcane during droughts because sugarcane can tolerate periodic use of water with higher salinity levels.

When the sugarcane fields were in cultivation, well water was being applied typically during dry periods, when surface water was not available for sustained periods. Sugar cane was cultivated in a twenty-four month crop cycle, providing ample time for the crop to recover from a prolonged use of brackish water. The crops planned for Mahi Pono's diversified agricultural operation may have a shorter crop cycle and be much less tolerant than sugar cane of higher salinity levels. Thus, the planned crops will generally be more vulnerable to the negative impacts on crop growth associated with prolonged exposure to brackish water and lower crop yields.

Notwithstanding all of these limitations, the Draft EIS did consider the alternative of drilling additional wells in the Central and East Maui aquifers as an alternative to using surface water pursuant to a Water Lease. Specifically, Section 3.1.1.1 of the Draft EIS states:

To increase groundwater yields, additional wells could be drilled in other aquifers in Central and East Maui. Assuming that a single well is normally allowed to pump about 1 mgd within its area, 53 new well sites would need to be developed, each requiring site acquisition, drilling, testing and if adequate, brought into production. These wells would need to be spaced far enough to avoid salt water intrusion into the aquifer. Each well site would have an estimated development cost of \$6 million. (Akinaka, 2019). To plan, obtain permits for, and construct 53 wells would probably be in the order of \$318 million. Added to this cost would be transmission pipes, additional pumping and related energy consumption to reach higher elevations, and reservoirs. It is anticipated to be very unlikely that 53 new wells could be constructed within the Central and East Maui areas, as the environmental impacts would be considerable and permit approvals would be prohibitive. Therefore, the groundwater alternative is viewed as an unreasonable alternative with greater risks of adverse environmental effects than the Proposed Action, and was dismissed from further review.

Hence, for the various reasons discussed above, this alternative was dismissed from further consideration. However, Section 3.1.1.1 of the Final EIS has been revised to consider further variations of this alternative, as shown on pages 3-3 to 3-9.

The "added storage" alternative discussed in Section 3.1.1.3 of the Draft EIS considered, but ultimately dismissed, the alternative of upgrading existing, but out of service, reservoirs and constructing a large new reservoir. Regulatory, environmental, and safety concerns make these options, which involve major ground disturbance activities, infeasible.

Ultimately, added storage capacity cannot serve as a substitute for a source of water, but only to assure a more consistent availability of water between periods of surplus and deficit from a source. While reservoir/storage improvements might improve the efficiency of the Central Maui Field Irrigation System, those improvements would be at the cost of providing less recharge to the underlying Central Maui aquifers, which in turn will decrease the amount of brackish well water Mahi Pono can rely on for its irrigation needs. Moreover, the reservoir/storage improvements do not constitute a discrete alternative for providing an additional source of needed water, and instead represent at best a means by which the operational efficiency of the Central Maui Field Irrigation System may be improved. To provide more clarity, Section 3.1.1.3

of the Final EIS has been revised to consider further variations of this alternative, as shown on pages 3-11 to 3-14.

Comment 10: *To quote the DEIS, it states that these dismissed alternatives "are not considered viable for various reasons including the expected intensification of environmental effects and lack of feasibility." Their subsequent summary dismissals unreasonably foreclose any meaningful exploration of how the "alternative" approaches may in fact be used to mitigate adverse environmental effects and achieve perhaps a more appropriate/reasonable balance between the agricultural development of Central Maui and the protection of East Maui's environment.*

Response 10: Regarding the foreclosure of any meaningful exploration of the dismissed alternatives, Section 3.1.1 of the Draft EIS provides a robust discussion and assessment of three Water Sources Alternatives, and that discussion has been further supplemented in the Final EIS to address these alternatives as a means to augment the Water Lease water (rather than replace the Water Lease water entirely). See pages 3-2 to 3-19 of the Final EIS. We also note that the Draft EIS, at Section 3.2.1, describes the anticipated impacts of the Reduced Water Volume Alternative which is then fully assessed in Section 3.4, a Comparative Evaluation of the Reasonable Alternatives.

Section 3.4.3 includes a discussion of impacts resulting from diverting less streamflow on the Surface Water and Aquatic Environment in the License Area. It addresses your comment about the protection of East Maui's environment. In the section, the results of the Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model) are applied to the No Action alternative and is discussed in terms of gains in Habitat Units (HU). The HSHEP model estimates that under a No Action scenario, approximately 1,394,508 potential HU (i.e., approximately 79.8 percent of potential HU) would be available within the License Area for native species population. Put another way, the No Action alternative decreases the amount of available habitat units by approximately 20.2 percent. Whereas, under the proposed Water Lease, the potential number of HU within the License Area is estimated at 1,116,581 (or, approximately 63.9% of the potential maximum).

Addressing the balance in your comment, Section 3.4.13 (Agricultural and Related Economic Resources) discusses the impacts that reduced volumes of surface water would have on Mahi Pono's farm plan and related economic and fiscal impacts.

Comment 11: *For example, the dismissed groundwater alternative is described as potentially reducing the amount of East Maui surface water required for irrigation in Central Maui, but seems to actually eliminate and essentially replace all surface water demands. The DEIS*

speculates that since current aquifers (Pa'ia and Kahului) can't support more than 4 mgd due to reductions in aquifer recharge rates, additional wells would need to be drilled in other aquifers in order for this method to effectively contribute to water needs. The DEIS, however, appears to use this speculative "safe pumping rate" as a means to propose that "53 new well sites would need to be developed" with pumping capacity of 1 mgd each. Hydrological speculation aside, the total amount of water produced from these 53 wells would be about 80% of the expected 65.88 mgd surface water draw and more than three times the expected 16.47 mgd draw on ground water under the proposed water lease.

Response 11: As discussed above in Response #9, the “groundwater” alternative has the potential to reduce the amount of surface water required. However, it cannot eliminate or replace all surface water demands as asserted in your comment above. In Central Maui the aquifers have very low SY rates that cannot meet irrigation demands without some surface water recharge which would allow some pumping exceeding the SY. Moreover, the groundwater in Central Maui is brackish, which further restricts its use for irrigating diversified agricultural crops, also as discussed in Response #9. Moreover, groundwater development in the East Maui aquifers has been analyzed as shown on pages 3-3 to 3-9 of the Final EIS which was also deemed infeasible.

Regarding your comment about the speculative “safe pumping rate”, we reiterate that the Central Maui aquifers have very low SY rates that cannot meet the irrigation demands of Mahi Pono’s proposed farm plan without surface water recharge. This is in contrast to when sugarcane was being cultivated and authorized diversions from East Maui were much higher than currently proposed for the Water Lease. Past pumping rates could substantially exceed the SY rates because a significant amount of surface water was being delivered to the Central Maui agricultural fields for irrigation purposes. However, the permitted diversions under the CWRM D&O, should the Water Lease be issued, would provide significantly less surface water for irrigation and, correspondingly, to recharge the Central Maui aquifers.

The alternative of drilling 53 new wells (as discussed in Chapter 3 of the Draft EIS under the groundwater alternative) would not, as you suggest, "eliminate and essentially replace all surface water demands." Those new wells would supplement the limited surface water diversions (approximately 30.76 mgd) that are allowed by right, as described in Section 3.3 of the Draft EIS in the No Action alternative, where no Water Lease is issued. With approximately 53.00 mgd of groundwater supplementing the 30.76 mgd of surface water, a total of 83.76 mgd could be used to support the Mahi Pono farm plan in Central Maui. This contrasts to the Proposed Action, where Draft EIS Table 2-1, shows the farm plan dependent of a total of 82.33² mgd of irrigation

² Note that Table 2-1 of the Draft EIS identified the Mahi Pono farm plan as requiring approximately 82.33 mgd of water at full build out. Table 2-1 in the Final EIS has been corrected to reflect that the water requirement for the Mahi Pono farm plan is approximately 82.34 mgd.

water, comprised of 16.47 mgd of groundwater (the availability of which is highly dependent upon the use of East Maui surface water to irrigate the underlying Central Maui aquifers), plus 65.86 mgd of surface water (after system losses in the Central Maui Field Irrigation System). While the total volumes of irrigation water available for the Proposed Action and No Action alternative may be comparable, the substantially greater proportion of brackish groundwater in the No Action alternative would severely limit its use in the Mahi Pono farm plan for reasons discussed previously.

Moreover, as discussed in Section 3.1.1.1 of the Draft EIS, these wells would need to be spaced far enough apart to avoid even greater salt water intrusion into the aquifer, creating extensive new land use demands. There would also be considerable environmental and economic costs. It is estimated that to plan, obtain permits for, and construct 53 wells would probably be in the order of \$318 million. Added to this cost would be transmission pipes, additional pumping and related energy consumption to reach higher elevations, and reservoirs. It is anticipated to be very unlikely that 53 new wells could be constructed within the Central and East Maui areas, as the environmental impacts would be considerable and permit approvals would be prohibitive. As in the case of the added storage alternative, the infeasibility of the groundwater alternative means accepting a lower volume of surface water without the cost and environmental impacts of developing additional groundwater sources, even if it means that the objective of implementing Mahi Pono's farm plan cannot be fully realized. As discussed previously, this is the Reduced Water Volume Alternative described in Section 3.2.1 and evaluated in Section 3.4 Comparative Evaluation of Reasonable Alternatives.

Notwithstanding these significant environmental and practical issues associated with drilling additional wells to supplement a limited amount of East Maui surface water, as noted in Response #9, Chapter 3 has been updated in the Final EIS to include a further discussion of the groundwater alternative, whereby 26 new well sites were identified for consideration (6 in the Ke'anae Aquifer, 7 in the Waikamoi Aquifer, 7 in Honopou Aquifer, and 6 in the Ha'ikū Aquifer), which could provide up to 26 mgd of replacement water, which is a fraction of what the Mahi Pono farm plan needs at full implementation. See pages 3-3 to 3-9 of the Final EIS. Note that the updated analysis in Chapter 3 considers the drilling of the approximately 26 new well sites to supplement, rather than replace, the surface water that could be authorized under the Water Lease, in an effort to assess a less extreme alternative than the drilling of the 53 new wells that was discussed in the Draft EIS.

Comment 12: *The DEIS then cites that costs, property acquisitions, and environmental impacts from these 53 wells would make the alternative unfeasible. There is no clear explanation for why such an arbitrary large number of wells is needed to "reduce" the amount of East Maui surface water to meet the objectives of the proposed action. By unreasonably recharacterizing this*

alternative as one that would essentially replace, rather than moderately reduce East Maui surface waters with Central Maui groundwater sources, the DEIS avoids any detailed analysis of a less extreme increased groundwater alternative that might strike a better balance between the environmental, cultural, and other public trust purposes of East Maui's streams with the agricultural needs of Central Maui. OHA thus recommends that the DEIS explore less extreme options of this alternative that are more balanced.

Response 12: As explained in Response #11, the groundwater alternative addressed in Section 3.1.1.1 of the Draft EIS did not contemplate replacing all East Maui surface water with new groundwater wells. Contrary to your comment, 53 new wells is not an "arbitrary large number" but rather a number that would replace the surface water that would otherwise be provided from the East Maui streams under the Proposed Action. Nevertheless, as noted in Response #11, Chapter 3 of the Final EIS has been updated to further supplement the groundwater analysis. See pages 3-3 to 3-9 of the Final EIS.

Comment 13: *Similarly, the dismissal of the "added storage capacity" alternative is based upon an assertion that upgrading all of Central Maui's 48 existing major reservoirs or constructing a large reservoir to store a commensurate level of water are the only scenarios. Not surprisingly, such a huge endeavor would cost an unfeasible \$50 to \$100 million for upgrades, or \$300 million for a single large reservoir. There is no moderate alternative proposed as the DEIS does not explore any other possibility other than repairing all reservoirs or the construction of a singular large reservoir with a capacity of 1,200 mg. Furthermore, there is no explanation behind the apparent assumption that this alternative requires all surface water flows to be replaced by stored water for an entire month.*

Response 13: As discussed in Response #9, added storage capacity cannot serve as a substitute for a source of water but only to assure a more consistent availability of water between periods of surplus and deficit from a source. Reducing the amount of water from the source would require progressively more storage capacity with associated costs and environmental impact in order to achieve Mahi Pono's farm plan. However, as previously noted, Chapter 3 has been revised in the Final EIS to supplement the alternatives discussion that was provided in the Draft EIS, including a further review of the Added Storage Alternative addressed in your comment. See pages 3-11 to 3-14 of the Final EIS.

Comment 14: *With the summary rejection of this "added storage capacity" alternative, the DEIS avoids any detailed consideration or comparative analysis of a less extreme added storage capacity scenario that could reduce the environmental impacts of the proposed alternative on East Maui's streams, while protecting Central Maui farmers with the reliability of additional water stored during periods of high rainfall. As with the ground water alternative, OHA*

recommends that the DEIS explore less extreme options of this alternative that are more balanced.

Response 14: HAR § 11-200-17 (f) states: “The draft EIS shall describe in a separate and distinct section alternatives which could attain the objectives of the action, regardless of cost, in sufficient detail to explain why they were rejected.” The Draft EIS states the objectives and describes the Proposed Action in Sections 1.2 and 2.1, respectively. The Proposed Action is based on a Water Lease being issued for the maximum amount water available after compliance with the flow standards under the CWRM D&O in order to achieve its multiple objectives. As discussed in Response #13, the addition of water storage capacity does not replace the need for water source. Nevertheless, as previously noted, Chapter 3 has been revised in the Final EIS to supplement the alternatives discussion that was provided in the Draft EIS, and includes a review of, to use your terminology, a "less extreme" added storage capacity scenario. See pages 3-2 to 3-19 of the Final EIS.

Comment 15: *The "reasonable" alternatives are poorly explored without sufficient justification for their rejection. The DEIS does offer three "reasonable" alternatives for its "detailed" comparative analyses: shorter water lease durations, reduced water volumes, and a modified water lease area option. Ultimately, although the reasonable alternatives would potentially mitigate adverse impacts resulting from the disruption and diversion of stream flow under the proposed action, OHA believes detailed analyses were not sufficiently provided. The rejection of these alternatives appear based on how agricultural investment returns and financing options in Mahi Pono's current Farm Plan for their East Maui properties may be affected, rather than on an objective and comprehensive consideration of their relative beneficial and adverse environmental effects.*

Response 15: Under HAR § 11-200-17, the analysis of reasonable alternatives must be "sufficiently detailed to allow the comparative evaluation of the environmental benefits, costs, and risks of the proposed action and each reasonable alternative." As discussed in Response #7 and #8 above, Chapter 3 provides a detailed comparative analysis of the environmental effects of each of the reasonable alternatives as they would affect East Maui, Upcountry Maui, and Central Maui, and Chapter 4 provides an analysis of the environmental effects of the proposed Water Lease along the same environmental criteria, and also within East Maui, Upcountry Maui, and Central Maui. For example, as discussed in Section 3.4.8 of the Draft EIS, anticipated impacts to flora, fauna and invertebrates under the Modified Lease Area alternative could be significant and adverse if the Modified Lease Area alternative resulted in more public access within the 33,000-acres of State land and if that access resulted in vegetation trampling or the introduction of weeds and invasive species. While this might be the result in East Maui, no particular effects are anticipated in Upcountry Maui as a result of the Reduced Lease Area alternative because that

alternative would not alter any activities in Upcountry Maui. Similarly, the Reduced Lease Area alternative is not expected to impact the Central Maui agricultural fields because the potential for increased public access would be within the State-owned lands in East Maui and not within the Central Maui agricultural fields, and the geographical area of the Water Lease would not alter the amount of surface water that could be diverted. While the Reduced Lease Area alternative has the potential to affect flora, fauna and invertebrates in East Maui, it also has the potential to have new and potentially beneficial impacts on recreational resources in East Maui as discussed in Section 3.4.14, depending upon the extent and manner in which the State allows public access within the 33,000-acres of State land. As a point of clarification, Mahi Pono's farm plan is being implemented in Mahi Pono's Central Maui fields, not in East Maui as you may have misstated.

Regarding the comparative analysis of economic and fiscal impacts under the proposed Water Lease and the reasonable alternatives, this analysis is not exclusively focused on investment returns or financing for Mahi Pono. The analysis covers projected impacts in East Maui, Upcountry Maui, and in/arising from the Central Maui agricultural fields. It examines impacts bracketed by the Proposed Action at one end, the No Action alternative on the other, and the Reduced Water Volume alternative spectrum between them. For example, under the Proposed Action and all water volume alternatives, there are no significant economic and fiscal impacts in East Maui as much of the agricultural, economic and fiscal benefits would have been achieved by implementing the CWRM D&O. In Upcountry Maui and in the Nāhiku community currently served by the MDWS, there is no impact under the Proposed Action but potentially adverse economic and fiscal impacts would mount as the amount of water provided through the Water Lease declines through the Reduced Water Volume alternative toward the No Action Alternative. Similarly, adverse economic and fiscal impacts to Central Maui would increase with a reduction in the amount of water available through the Water Lease. To some degree, however, impacts to Upcountry Maui could be staved off if supplying MDWS is prioritized over supplying water to Central Maui in the Reduced Water Volume alternative. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nahiku is presumed to terminate.

However, as noted in Response #7 Table 3-2 has been added to Section 3.5 of the Final EIS so that readers can more easily compare the varying environmental effects of the reasonable alternatives, the Proposed Action and the No Action/No Water Lease scenario. See pages 3-49 to 3-80 of the Final EIS.

Comment 16: *Regarding the financing concerns cited as a basis for rejecting the shorter lease length and reduced water allocation alternative, OHA notes that insufficient detail is shared on how or what exactly will be financed, and more importantly, how a longer-term water lease or larger initial water allocation will somehow alleviate the apparent financing uncertainties to an*

extent that justifies the rejection of these less impactful alternatives. For example, in light of the fact that a water lease of any length is always subject to the public trust and the State Water Code, the State can and should adjust or amend water allocations consistent with changing conditions and impacts. Other uncertainties, as further described below, may also impact water allocations under a water lease of any length, regardless of what quantities might be initially diverted under a lease. Thus, OHA believes that sufficient clarification and detail regarding financing needs should be included in the DEIS as it is currently one of the reasons used to reject the proffered "reasonable" alternatives.

Response 16: The State has the authority to issue a water lease for a 65-year term. However, the term of the proposed Water Lease is 30 years. Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live

technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

We acknowledge that should the Water Lease be issued, it will be subject to the Public Trust Doctrine as well as the State Water Code. Section 1.5 has been added to the Final EIS to explicitly address the Public Trust Doctrine. See pages 1-25 to 1-27 of the Final EIS. We note that CWRM, which has jurisdiction and final authority in all matters relating to implementation and administration of the State Water Code, at p. iii of the Executive Summary of the CWRM D&O, characterized the EMI Aqueduct System as “a valuable asset that delivers offstream public trust benefits such as drinking water, as well as irrigation water for reasonable and beneficial uses.” CWRM further stated, at p. vi: “The Commission’s intent in this decision is to ensure that a sufficient amount of offstream water is available to support the cultivation of diversified agricultural crops on the lands designated as IAL [Important Agricultural Lands] in central Maui.” Moreover, the Proposed Action must be in compliance with the CWRM D&O. Impacts arising from reductions in the amount of East Maui surface water that can be diverted (i.e. diversions in amounts less than authorized under the CWRM D&O) are assessed under the Reduced Water Volume alternative.

Comment 17: *Regarding the "return on investment" that would be compromised by the shorter lease length alternative, the over-reliance on long-term investment crops also appears to be an unnecessarily rigid application of what is otherwise described as an adaptive and flexible Farm Plan. The use of the Farm Plan as a means to dismiss alternatives seems to contradict the way the Farm Plan is portrayed in the DEIS which states that the Farm Plan is a "fluid and responsive" plan that responds to the ever-changing agricultural market. OHA believes a more detailed explanation should be provided that can sufficiently describe the specific costs and benefits of the Farm Plan's multiple contingencies prior to rejecting alternatives.*

Response 17: As noted in Section 2.1.4 of the Draft EIS, the Mahi Pono farm plan must be fluid and responsive to the needs of an ever-changing agricultural market as described, as well as responding to other variables such as the availability and cost of water for crop irrigation. Another factor in developing the farm plan is to be sensitive to the existing local farming community. Mahi Pono does not want to displace local farmers by planting competing crops or artificially accelerating the ramp-up of operations, both of which could have the potential to drive local farmers out of the market. This responsiveness is largely due to the proposed 30-year Water Lease, as well as the time it takes other crops to grow and mature. With a longer-term lease, it will be more feasible for Mahi Pono to fulfill its diversified agricultural farm plan by growing orchard crops in Hawai'i that take longer to mature, but that eventually produce fruit

that is currently imported into the State. If the long-term investments in crops are not considered, it becomes more likely that exports would have to increase. For example, Mahi Pono would grow an abundance of short-term row crops, which have only a limited market within Hawaii. In contrast, orchard crops can take up to 12 years to produce fruit, but then can provide yields for 35 to over 100 years. If a reliable, long-term, source of irrigation water is not available, the Mahi Pono farm plan would, by necessity, be more rigid due to a focus on short-term feasibility, for example, it would be extremely reliant on short-term row crops and cattle ranching.

Comment 18: *Notably, the DEIS argues that the long term lease is needed for Mahi Pono to get their return on long term investment crops. The rigid adherence to the Farm Plan's long term investment drivers discounts uncertainties that may counsel a much shorter lease term than contemplated under the proposed action. For example, the DEIS includes reference to an e-mail from Skippy Hau, an aquatic biologist with the State of Hawai'i Division of Aquatic Resources, noting the lack of information on the amount of water diverted from East Maui, and urging a five-year lease "with constant updates" based on water use and other information gathered during that time. As further suggested by Mr. Hau's e-mail, climate change may also have profound impacts on rainfall patterns, ecosystem dynamics, and the very stability of our ways of life in the near future, potentially requiring adjustments to lease conditions and water allocations consistent with the State Water Code, and the public trust. While the EIS does acknowledge the existence of climate change, it leans towards an overly optimistic take on such impacts and accordingly rejects the shorter lease term alternatives. A rigid adherence to one return on investment scenario and unreasonably dismissive attitude towards uncertainties should not be used to justify the rejection of shorter and more adaptive lease term alternatives that may mitigate or better accommodate uncertain adverse environmental effects. OHA believes that the Farm Plan should include scenarios that do not require or limit the need for long term investment crops. With such a consideration added to the Farm Plan, the DEIS can reassess reasonable alternatives accordingly.*

Response 18: The alternatives analysis in Chapter 3 serves the purposes required under the law. It does not "argue" that a long-term lease is required. The alternatives analysis in Chapter 3 of the EIS allow for "the comparative evaluation of the environmental benefits, costs, and risks of the proposed action [i.e the Water Lease] and each reasonable alternative." See HAR § 11-200-17(f). Such a comparative analysis is intended to inform decision-makers on the relative environmental effects of a range of options. Ultimately, the term of any Water Lease will be set by the BLNR.

We refer you back to our Responses #16 and #17, which discuss the long-term considerations for the proposed 30-year Water Lease. Such long-term considerations, whether in terms of bringing

the entire 30,000 acres formerly in sugar cane into viable diversified agriculture, the progressive investments in associated farming infrastructure, the maturation of orchard crops, as well as any adaptation to unforeseen climate change require a long-term commitment. The EIS seeks to disclose the anticipated impacts from the Water Lease and reasonable alternatives that are capable of attaining the objectives of the action. As noted in Section 1.1 of the EIS, one of the objectives of the Proposed Action is to "Continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses)." Respectfully, we do not view this as an excessively narrow objective.

The EIS assesses the impacts of a 30-year Water Lease (in Chapter 4), and in Chapter 3 (Alternatives) it also assesses the impacts of a water lease of a different term, dubbed the Alternative Lease Duration alternative. Mr. Hao suggests in his email that there is a lack of information on the amount of water being diverted at each diversion and that climate change could affect this amount; hence, a shorter lease term would allow flexibility in adjusting diversion volumes. It is important to keep in mind that no matter what the term of the Water Lease, or the effects of climate change, the lessee will be limited to the instream flow standards established by the CWRM D&O. In other words, if there is a change in rainfall patterns that affect the streams in the License Area, the CWRM flow standards would still have to be maintained. As discussed in Section 4.3.1 of the Draft EIS, "climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours." Since the EMI Aqueduct System is incapable of diverting such high flows, climate change is unlikely to provide a boon in the availability of surface water to Mahi Pono. If, in the future, there is less water available because of climate change, or DHHL's water reservation, or for any other reason, the Mahi Pono farm plan would have to adapt to use the amount of water that remains available. Unless otherwise changed, the existing contracts would be honored, which would mean that EMI would need to provide the MDWS with approximately 7.1 MGD as discussed in Section 2.1.3 of the Draft EIS (even if this necessitated a cut back on the irrigated farming).

Further to your comment about Mr. Hau's email regarding climate change having profound impacts on rainfall patterns, ecosystem dynamics, and the very stability of our ways of life in the near future, note that Section 4.3.1 of the Draft EIS analyzed current climate change data against the Proposed Action. It is generally acknowledged that current climate change trends which suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. The expected climatic changes in precipitation patterns and streamflow will influence the quantities and concentration of stormwater runoff entering the nearshore environments and coastal waters, resulting in increased sedimentation, impacting coral reefs. Moreover, climate change could

result in lower rainfall and thus lower levels of streamflow. Notwithstanding, compliance with the IIFS under the CWRM D&O will be required. Hence less flow would be available for the EMI Aqueduct System to divert, which in turn means less water for MDWS and less water to irrigate the Central Maui agricultural fields. However, the exact nature of how the climate will change and impacts from any changes is unknown. As research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies for climatic changes. Please note that Section 4.3.1 of the Final EIS has been updated to include further climate change data and its impacts on various environmental resources as shown on pages 4-89 to 4-94.

As stated in Section 2.1.4 of the Draft EIS and discussed in Response #17 above, the Mahi Pono farm plan, like any responsible farming plan, is a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e. orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community. However, the EIS also described a version of the Mahi Pono farm plan that could be implemented if no Water Lease was issued. In other words, the EIS does "include scenarios that do not require or limit the need for long term investment crops" as suggested in your comment. Table 3-1 of the EIS depicts a Mahi Pono farm plan in the event that no Water Lease is issued. As a point of comparison, under the "No Action/No Lease" alternative, Mahi Pono's farm plan reduces the Orchard crops acreage from 12,850 acres to 4,180 acres, decreases the Community Farm acreage from 800 acres to 300 under the No Lease alternative, and reduces the acreage for Row and Annual Crops from 1,200 acres to 400 acres.

Comment 19: *Furthermore, similar to the superficial characterizations of the "dismissed" alternatives, OHA notes that the shorter term water lease alternative is presented broadly and without any exploration of the varying term lengths that could and should be considered under this alternative. For example, the DEIS could develop a tiered approach by exploring and comparing the differences in effect and feasibility of varying, specific lease durations. A shorter-term water lease could be anything less than 30 years. Even if Mr. Hau 's well-reasoned 5-year lease recommendation is considered unfeasible, a 10- or 15- year lease could still be utilized to successfully facilitate Mahi Pono's Farm Plan while at the same time providing substantially greater opportunity to understand and address changing environmental conditions and effects. However, the consideration of any lease under 30 years is dismissed in the DEIS, as it declines to propose any specific shorter term lease length in favor of lumping all leases less than 30 years in a single, short-term water lease category. Assessing the impact of a shorter-term water lease with specific durations would be more effective in determining how much of a burden these shorter-term water leases really are on Mahi Pono's Farm Plan, its "return on investment," or*

other cited reasons for their generic dismissal. Thus, OHA recommends that multiple short term lease options be examined with each option showing impacts to investment returns within Mahi Pono's Farm Plan.

Response 19: As discussed above in Response #18, the term of the proposed Water Lease will be set by the BLNR. The EIS assessed the impacts of a 30-year Water Lease, and assumes 10 years is needed for full implementation of the Mahi Pono farm plan. Chapter 3 (Alternatives) assessed the impacts of a water lease of a different term, dubbed the Alternative Lease Duration alternative. Furthermore, as discussed in Response #16 above, under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. This is not consistent with goals and objectives of the Proposed Action.

Moreover, as discussed in Response #16, the Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops planned by Mahi Pono will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. As explained in the Agricultural and Related Economic Impacts report provided as Appendix I:

A short-term Water Lease would derail development of the Mahi Pono Farm Plan as well as any plan to convert the Central Maui lands to diversified agriculture because of the risk of not being able to farm for a long enough period to recover their planned investment. Conversely, the longer the term of the Water Lease, the greater the beneficial agricultural and economic impacts because of the certainty that comes from a long-term lease, which could encourage greater investment in long-term improvements. The State has the authority to issue a Water Lease with up to a 65-year term. However, the analysis used herein assumes issuance of the final proposed 30-year Water Lease. As mentioned, a longer term Lease would generate greater beneficial impacts.

In other words, a lease of a short term, or even a potential series of shorter term leases, would not provide the security and incentive to implement the Mahi Pono farm plan as a diversified farm plan with a long-term commitment to agriculture. The uncertainty that would accompany a short term lease would alter the nature of the farming, as discussed in Response #17.

CULTURAL IMPACT COMMENTS

Comment 20: *Impacts to cultural resources and practices are inadequately described with little to no consideration of mitigation efforts beyond complying with the already binding 2018 CWRM D&O. The DEIS argues that available water will be limited due to existing Department of Hawaiian Homelands (DHHL) water entitlements and interim instream flow standard (IIFS) restorations ordered by the Commission on Water Resource Management (CWRM) in a 2018 Decision & Order (D&O). According to the DEIS, this 2018 D&O, which restored all or partial natural IIFS to 22 streams in the License Area, has the potential to "reduce or eliminate cultural impacts." OHA believes such a statement is continually misused throughout the DEIS to (2A) avoid cultural impact considerations for streams not covered by the D&O; and, (2B) ignore concerns regarding cultural access to the License Area access to the License Area*

Response 20: Section 2.1 of the Draft EIS describes the Proposed Action and its relationship to the CWRM D&O:

*Independent of the Proposed Action, on June 20, 2018, the CWRM issued its D&O setting IIFS for numerous streams and tributaries of streams in the License Area, which includes water originating and flowing from both State and privately owned lands within East Maui. The CWRM D&O establishes a quantity of water that must remain in each stream at specified locations. The CWRM D&O ordered full stream restoration for 10 streams and partial flow restoration on 12 additional streams. Therefore, the maximum amount of water that can be awarded through the Water Lease is what is available for diversion after the CWRM D&O is implemented. This is the premise of the Proposed Action.
(Footnote and reference omitted)*

The Draft EIS acknowledges that the CWRM D&O has the potential to mitigate impacts to taro farming, the regional environment, and freshwater ecosystems relative to the time when sugar was in cultivation and no such limits were imposed on stream diversions in East Maui. As noted in the HSHEP model (Appendix A) and in Section 4.2.1 of the EIS, "[f]rom a habitat availability perspective, the [CWRM D&O] does a good job at improving stream habitat over a wide range of streams within the License Area." The phrase "potential to reduce or eliminate this cultural impact" is only used in the context of streams that were diverted during sugar cultivation and

then had their flows fully or partially restored under the CWRM D&O. The term “eliminate” can only apply to streams whose flows were fully restored. Hence, the extent to which stream diversions had restricted traditional and cultural practices up to the point that the CWRM D&O was implemented, such restrictions were partially or fully lifted. There is nothing in the context of how the phrase “potential to reduce or eliminate this cultural impact” is used to suggest that flow restoration through the CWRM D&O is anticipated to address the streams that were not covered by the CWRM D&O (i.e., the 12 non-petitioned streams). Moreover, the Cultural Impact Assessment (CIA) prepared by Cultural Surveys Hawaii was a regional study, and not limited to only the petitioned-streams. It CIA found that the CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, pages 4-158 to 4-159 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action as shown on pages 4-239 to 4-252.

We also note that the CIA, updated in the Final EIS to reflect a second round of consultation with those who had provided comments on the Draft EIS and raised specific issues related to potential impacts on traditional or cultural practices, does propose mitigation should the proposed Water Lease be issued. The proposed mitigation addresses issues related to stream flow as well as access. Furthermore, particularly with respect to access issues, the CIA reflects feedback provided by Mr. Ferreira and Mr. Tanaka of OHA. CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

Comment 21: *The DEIS avoids cultural impact considerations for streams not covered by the D&O. Cultural practices and subsistence lifestyles unique to the communities in East Maui have a direct relationship with the health and abundance of native stream and estuarine life, as well as the region's overall environmental integrity. Meanwhile, as recognized in the DEIS and its appendices, even with the D&O in place, the proposed action could reduce available habitat units and result in lost mauka-to-makai connectivity for a substantial number of streams in East Maui not covered by the D&O. These streams are all ecologically interconnected through the amphidromous nature of the native species they support. According to the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) done as part of the DEIS, there is a potential for an 85% loss of habitat in streams not covered by the D&O when water is fully diverted. The proposed action at these streams would have a direct impact on native stream and estuarine life throughout the region that would in turn potentially limit or foreclose the perpetuation of cultural practices, the intergenerational transmission of cultural knowledge, and the maintenance of traditional subsistence lifestyles. The DEIS thus cannot reasonably characterize the D&O as somehow reducing or even eliminating all of the proposed action's cultural impacts. OHA recommends the DEIS provide a more detailed evaluation of the numerous cultural concerns and possible mitigation measures for streams not covered by the D&O.*

Response 21: We acknowledge that cultural practices and subsistence lifestyles that are unique to East Maui communities can be affected by the health and abundance of native stream and estuarine habitats in East Maui, as well as the region's overall environmental integrity. We respectfully disagree with your comment that the Draft EIS did not assess the cultural impacts of the non-petitioned streams. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream, but it has since been determined that Puakea is actually a tributary to Pa'akea Stream which was designated under the CWRM D&O for connectivity restoration.

With regard to the CWRM D&O, we reiterate that it was an effort independent of the Proposed Action to address historic stream diversions by the EMI Aqueduct System. Through its D&O, the CWRM sought to restore streamflow to taro streams, habitat streams, and to increase stream connectivity. The Proposed Action will abide by the flow restoration requirements of the CWRM D&O.

We concur that the CWRM D&O did not establish IIFS for all streams in the License Area that were historically and/or will continue to be diverted by the EMI Aqueduct System under the Proposed Action. Excluded from flow restoration consideration were 12 non-petitioned streams in the License Area as well as streams beyond the License Area, which are not subject to the proposed Water Lease. Note that although the CWRM D&O did not set new IIFS for the 12 non-

petitioned streams, the CWRM did take those streams into account. See CWRM D&O at ii. Moreover, while the 12 non-petitioned streams were not assessed pursuant to specific petitions to establish IIFS, those streams are subject to the 1988 IIFS set for the East Maui streams. Please note that the CWRM, as is evident from its website, both from its own research and in conjunction with USGS, has information on the License Area streams, including the non-petitioned streams, which information has been made available to the BLNR. Furthermore, under the revocable permits, annual reports, and now quarterly reports, are submitted by EMI to the BLNR, which identify the total amount of water being diverted from License Area measured at Honopou Stream, i.e. water from both petitioned streams and non-petitioned streams. Hence, the 12 non-petitioned streams were included as part of the overall analysis of the EIS and associated technical studies. In terms of stream habitat, the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model provided as Appendix A analyzed those streams to assess changes in native amphidromous stream animal habitat with respect to stream diversions which is summarized in Section 4.2.1 of the EIS in the section covering East Maui.

As for the diverted License Area streams, including the 12 non-petitioned streams, the Draft EIS regards the original construction and subsequent operation of the diversion structures over the course of more than a century as providing historic context. Due to the passage of time, the environmental impacts emanating from those past actions cannot be evaluated with any certainty, as no studies exist from that time. The HSHEP model provided in EIS Appendix A, however, offers an opportunity to evaluate, within the limits of the model, the effect of hypothetically altering stream diversion amounts on habitats for stream animals, as measured in numerical Habitat Units (HU). While the HSHEP model does not address cultural impacts, a similar HSHEP model commissioned by the Division of Aquatic Resources of DLNR was used by the CWRM to relate HU resulting from streamflow restoration to providing additional opportunities for cultural and traditional gathering rights. As stated in the CWRM D&O at COL 61:

The restoration of stream flows in this manner is intended to both restore stream life and to provide additional opportunities for the exercise of customary and traditional gathering rights.

By evaluating a hypothetical full stream flow restoration of the 12 non-petitioned streams in the License Area, the HSHEP model was able to calculate the resulting HU. Interpreting that result would suggest that historic diversions of those streams had reduced stream habitats by 88.2%. The Proposed Action would not incrementally increase that impact, and in fact the overall HU under the Proposed Action retains almost 64% of the potential HU within the License Area streams. The text in the Final EIS has been revised to clarify that the Proposed Action does not cause the reduction in HU's in the non-petitioned streams but rather sustains the status quo, as shown pages 4-61.

Since the Proposed Action would not incrementally increase habitat degradation in the 12 non-petitioned streams, there would be no basis for suggesting that it would, in turn, “*potentially limit or foreclose the perpetuation of cultural practices, the intergenerational transmission of cultural knowledge, and the maintenance of traditional subsistence lifestyles.*” By offering the HSHEP model evaluation of full stream flow restoration for the 12 non-petitioned streams, however, the Draft EIS provides information to the BLNR for consideration in issuing the Water Lease. Since the BLNR can impose limits and conditions on the Water Lease, it could, for example, impose mitigation requirements upon the lessee of the Water Lease. Please note, as discussed in Section 4.2.1 of the EIS, potential mitigation measures are presented based upon the HSHEP model.

The primary mitigation measure for the instream habitat lost to the water diversion is flow restoration. The intent of the HSHEP model is to quantify the flow restoration effect on the native stream species habitat. The HSHEP model addresses impacts to habitat, entrainment and passage. Given the 250+ diversions within the EMI Aqueduct System, incremental changes to each aspect of diversion amount on habitat, entrainment, and passage for each diversion individually and all diversion combinations would result in too many model results for rational use (the number of possible combinations with just one change at each diversion is far over a billion different results, $2^{250}-1 =$ combinations). Once a specific scenario is determined such as the 2018 IIFS or the No Action Alternative, then the HSHEP model can be used to quantify the changes that occur.

From a technical perspective, there are more than 300 individual nodes (stream mouths, diversions, springs and sinks) in the EMI Aqueduct System. Potentially any of these diversions within the node group could (1) have different levels of water restoration mandated at the diversion location (2) could have engineering changes to increase fish passage and decrease larval entrainment and/or (3) have the sequence of water restoration or engineering changes include numerous different scenarios with for example, 50% water return on diversion 1, an engineering fix to eliminate a barrier on diversion 2, a 60 % water return and an engineering fix to decrease entrainment on diversion 3, and so on. This could result in many different scenarios. To be more specific on the number of potential iterative scenarios, there is a formula for the number of permutations = n^r . So, in a stream with 3 diversions, if we are interested different flow restoration levels 0 to 100% in 10% intervals, we get 11^3 which equals 1331 different scenarios. If we add a single engineering fix (2 options of no change and new design), we get 22^3 which equals 10,648 scenarios. Clearly, the number of possibilities increased quickly.

For example, there are 10 diversions on Nāili‘ili‘haele Stream. If we were interested in different flow restoration levels ranging from 0 to 100 in 10% intervals, we get 25,937,424,601 scenarios. Twenty-five billion scenarios are far too many to reasonably understand or consider for management actions (and these vast number of scenarios does not even account for any engineer changes to those diversions to increase fish passage or decrease larval entrainment). In short, the number of permutations involved in considering all options for all diversions in the East Maui streams precluded a systematic optimization of all possible scenarios.

With that understanding, the HSHEP model report presented general guiding concepts associated with flow modification and changes to diversion design to minimize barriers to passage and larval entrainment.

With respect to diversion amount:

- Regardless of the way the water was diverted, greater percentages of total streamflow diverted generally resulted in lower amounts of instream habitat for native stream species.

With respect to diversion location:

- When comparing the location of a diversion, diverting comparable amounts of water at higher elevation diversions was less damaging to instream habitat for native stream species than diverting that water at lower elevation diversions. In this case, as the diversion occurred further upstream in the stream, more natural stream flow recovered downstream of the diversion. Additionally, any water passing the diversion resulted in more instream habitat with unobstructed connection (no entrainment or passage issues) to the ocean.

With respect to a single diversion in comparison to multiple diversions:

- Similar to the previous statement, a single diversion at the upstream most diversion location capturing X amount of stream flow will result in more instream habitat than multiple diversions throughout the stream diverting the same amount of stream flow in total (sum of multiple diversion = X). The lower amount of total habitat under the partial water diversion at multiple diversions was the result of the compounding impact of entrainment/passage barriers at each division.

With respect to modifications of the diversion for improved passage and decreased entrainment:

- Improvements in diversion passage resulted in more suitable habitat at most flow levels.
- At lower flow restoration amounts, modifications to improve passage resulted in greater gains in suitable habitat than at higher flow restoration level.

For the native damselflies and invasive mosquito, a return to natural flow conditions should improve damselfly habitat and decrease mosquito habitat where these species use instream habitats. The potential beneficiaries were the endangered damselfly, *Megalagrion xanthomelas* and *Megalagrion pacificum*. Small gains in potential suitable habitat units occurred in these streams and restoration of flow to a more natural condition should directly benefit the species. The restoration of baseflow however will likely also improve habitat conditions for a number of introduced predator and competitor species of the native damselflies and thus may not in itself increase damselfly populations. It should be noted that although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with the concept controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the *Culex* mosquitos are crevice breeders and small pockets of water

throughout the forest will still exist under any streamflow scenario. Second, Hawaiian streams are naturally flashy (i.e., they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many different levels of streamflow. It may be difficult to control *Culex* mosquito by increased streamflow alone.

As set forth in the HSHEP model report, the analysis resulting from the combination of field surveys and habitat modeling supports the flow restoration under the CWRM D&O 2018 IIFS in improving instream habitat conditions for native amphidromous stream animals. While suitable habitat is fundamental for a species' persistence and is the focus of the HSHEP model, it may not be the only thing that may affect species populations. Other factors, such as pollution, disease, or competition with introduced species, may also influence the observed distribution and densities of native animals. Yet understanding the natural distribution of animals without the presence of these additional factors is still important. From a habitat availability perspective, the 2018 IIFS does a good job at improving instream habitat over a wide range of streams within the License Area. As noted above, the 2018 IIFS results in 1,116,581 HU within the License Area, which is equivalent to 63.9% of the highest possible amount of HU within the License Area.

Overall, the CWRM D&O will restore approximately 84.3% of total HU available for native stream animals in the 33 streams in the License Area subject to the CWRM D&O. This is an increase of over 240,564 HU as compared to conditions modeled under full diversion for sugarcane production. It does so while seeking to balance instream and off stream uses of water. While it is understood and documented that natural stream animal habitats in the License Area will not be fully restored under the CWRM D&O and, therefore, under the Proposed Action, overall instream conditions would be far better than in the past.

Although the CWRM used its HSHEP model output in HU as a general indicator of "*creating additional opportunities for traditional and cultural practices*", this interpretation has severe limitations for actually understanding if any such opportunities can or would be manifested, available and accessible for engaging in such practices. Therefore, the number of HU gained by restoring streamflow cannot simply be equated to a measure of additional opportunities gained for traditional and cultural practices.

On the other hand, traditional and cultural practices are addressed by the Cultural Impact Assessment (CIA) included in Appendix F and summarized in Section 4.6. The CIA was prepared as a regional study that was not limited to only the streams that had new IIFS set by the CWRM D&O; the CIA considered the impacts of the Proposed Action on all License Area streams. Moreover, it was prepared to provide a historical perspective of cultural impacts associated with the EMI Aqueduct System to establish a baseline from which to discuss the incremental cultural impact emanating from the Proposed Action. The CIA provides a synopsis of anticipated impacts of the Proposed Action upon identified cultural resources and practices and offers mitigation recommendations gathered from the community and other consultant studies, as discussed in Response #20, above.

With regard to your comment that the Draft EIS avoids discussion of cultural impacts stating that the CWRM D&O has the potential to reduce the Proposed Action's cultural impacts, the Draft EIS and CIA recognize that consideration of the CWRM D&O is part of the overall analysis. The CWRM D&O was an effort taken by CWRM to mitigate impacts from the stream diversions to taro streams, habitat streams, and to increase stream connectivity. These efforts have the potential to mitigate impacts to taro farming, the regional environment, and freshwater ecosystems. However, it is understood and noted that the CWRM D&O did not eliminate all impacts that result from the Proposed Action. Hence, we do believe that the CWRM D&O was reasonably characterized.

The CIA has been supplemented based on feedback provided on the Draft EIS. Section 4.6 of the Final EIS has been revised to describe the cultural practices and related impacts for each stream within the License Area, including those not subject to the CWRM D&O as shown on pages 4-171 to 4-254. With respect to potential regional impacts, in the CIA included with the Draft EIS, as discussed in Response #20 above, Cultural Surveys Hawai'i recommended that qualified professionals who possess an understanding of stream flow mechanics, water diversion, and climate statistics within the License Area address certain questions that were raised during consultation. Questions such as "how much water is being diverted at each location of intakes, ditches, dams, pipes, and flumes?", "how much water is being diverted from East Maui to Central Maui?", and "is climate change accounted for?" Since the publication of the Draft EIS, CSH has reviewed the other technical studies prepared for the EIS and added that in addition to the recommendations provided by the other technical studies, that the Proposed Action include monitoring and public reporting of stream flow volumes. Note that no additional cultural impacts or resources were identified by commenters on the Draft EIS or those who participated in the supplemental consultation on the CIA.

Finally, your mention of estuarine life is among several comments on estuaries received on the Draft EIS. In response, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on the pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33

subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83.

Comment 22: *The HSHEP is arguably also incomplete as it states that it evaluated all streams within the License Area except for one, Puakea Stream. OHA believes the reasoning for its exclusion from HSHEP analysis is not made clear. Absent a valid reason, OHA requests that impacts to culturally significant flora and fauna species at Puakea Stream be assessed, as leaving it out renders the cultural impact portion of the DEIS incomplete.*

Response 22: As discussed in Response 21 above, Puakea stream was assessed in the HSHEP model provided in Draft EIS Appendix A. Puakea Gulch/stream was identified in the Draft EIS as a separate stream, but this has been corrected in the Final EIS as it was determined that Puakea stream is a tributary of Pa'akea Stream, which has clarified in Section 1.3.4 of the Final EIS as shown on pages 1-16.

Comment 23: *The HSHEP does further note that entrainment of aquatic larvae at stream diversions remains an issue that contributes to the loss of habitat units for many flora and fauna species dependent on stream flow. Interestingly, the DEIS does acknowledge this point by indicating that habitat units may be increased through the modification of diversions to reduce entrainment. However, the DEIS does not appear to offer such alternatives and again relies on the D&O to reduce or eliminate cultural impacts. OHA thus recommends that alternate diversion designs be considered to reduce entrainment.*

Response 23: We wish to offer a clarification to your statement on the “*loss of habitat units for many flora and fauna species dependent on stream flow.*” The HSHEP model’s HU calculation is based on specific stream animals and, while the HU based on these animals can be interpreted to indicate the overall health of stream ecosystems, including other stream animals inhabiting them, the study does not specifically address stream flora.

With regard to diversion modification alternatives, note that the Proposed Action does not propose any physical diversion modifications. With respect to modifications that need to be done in order to restore streams under the CWRM D&O, that work is being done to comply with the CWRM D&O and is required irrespective of the issuance of the proposed Water Lease and is thus not within the scope of the Proposed Action. However, as a part of understanding how the existing EMI Aqueduct System affects stream habitats, the HSHEP discusses the loss of HU resulting from entrainment of stream animals. As noted on p. 61 of the HSHEP report:

Therefore, only major diversion conditions were modified in the HSHEP model and no specific passage or entrainment modifications were applied except of the effects provided by increased water passing downstream at the major diversions. Any action or modification of the diversion to decrease entrainment would increase the total restored habitat units without any additional water released to the stream.

The Proposed Action would not additionally modify diversions beyond what is necessary for compliance with the CWRM D&O. Nevertheless, the HSHEP study’s disclosure of the potential for stream diversion modifications to reduce entrainment is offered for consideration by the BLNR in its subsequent Water Lease deliberations.

The HSHEP analysis accounted for the likely amount of upstream and downstream entrainment and passage barriers at each diversion and how these impacts would change with respect to changes in amounts of streamflow at the diversions. The model also quantified the accumulation of entrainment and passage impacts where multiple diversions were found on a single stream. Specific upstream and downstream entrainment and passage impacts for each diversion are documented in Appendix 2a of the HSHEP study.

The HSHEP's primary purpose is to quantify the flow restoration effect on the native stream species habitat. Thereby, the HSHEP model addresses effects to habitat, entrainment and passage at diversions by applying varying levels of streamflow. Due to common sense technical challenges to the HSHEP model, not all scenarios were presented or analyzed. To provide context, there are approximately 388 individual diversions in the EMI Aqueduct System. Potentially any of these diversions could: (1) have different levels of water restoration mandated at the diversion location; (2) could have engineering changes to increase fish passage and decrease larval entrainment; and/or (3) have the sequence of water restoration or engineering changes include numerous different scenarios with for example, 50% water return on diversion 1, an engineering change on diversion 2, a 60 % water return and an engineering change on diversion 3, and so on. This could result in many different scenarios - too many for meaningful review, and each potential adjustment would not alter the overall findings as presented in the HSHEP Model. To be more specific on the number of potential iterative scenarios, there is a formula for the number of permutations = n^r . So, in a stream with 3 diversions, if we wanted to present different flow restoration levels, 0 to 100% in 10% intervals, we get 11^3 which equals 1,331 different scenarios. If a single engineering adjustment is added (2 options of no change and new design), the result is 22^3 , which equals 10,648 scenarios.

For example, there are 10 diversions on Nā'ili'ilihaele Stream, which is one of the non-petitioned streams. Applying different flow restoration levels 0 to 100 in 10% intervals, as discussed above, there are approximately 25,937,424,601 scenarios. Twenty-five billion scenarios are far too many to reasonably understand or consider for management actions. Also note that no engineering changes to those diversions to increase fish passage or decrease larval entrainment were considered in the example. Thus, the number of permutations involved in considering all options for the 300+ diversions in the East Maui streams precludes a systematic optimization of all possible scenarios.

In other words, the difficulty lies in the complexity and the number of possibilities created by those questions regarding the restoration of the non-petitioned streams while attempting to determine the answers to best balance the offstream uses related to the Proposed Action. Therefore, while questions regarding restoration of the non-IIFS streams are valid, the questions

need to be constrained to a smaller subset of possibilities to make optimization testing possible. With that caveat stated, some general guiding concepts can be concluded to minimize impacts to the non-petitioned streams from stream diversions.

With respect to diversion locations and amount for non-petitioned streams:

1. Regardless of the way the water is diverted, greater percentages of total streamflow diverted generally result in lower amounts of instream habitat for native stream species. However, when diversion amounts are similar among scenarios,
 - a. Diverting comparable amounts of water at higher elevation diversions is less damaging to instream habitat for native stream species than diverting that water at lower elevation diversions.
 - b. Returning comparable amounts of water at the higher elevation diversions and allowing it to flow downstream without additional diversion will result in more instream habitat than partial water diversion at all diversions due to the compounding impact of entrainment at each diversion.

With respect to modifications of the diversion for improved passage and decrease entrainment:

2. Improvements in diversion passage result in more suitable habitat at most flow amounts.
3. At lower flow restoration amounts, modifications to improve passage result in greater gains in suitable habitat than at higher flow restoration amounts.

Please note that Section 4.2.1 of the Final EIS has been revised to include a general discussion more specific to the impacts and mitigation measures associated with the non-petitioned streams, and how stream flow restoration will influence HU in the License Area as shown on pages 4-61 to 4-67

Finally, we take exception to your comment regarding the Draft EIS' alleged reliance on the CWRM D&O to reduce or eliminate cultural impacts. As explained above in Response 21, the incremental cultural impacts that the Proposed Action would have beyond the implementation of the CWRM D&O are not anticipated to be significant. With respect to cultural impacts that were identified along the License Area streams through the CWRM proceedings and the EIS, particular cultural impacts and resources were identified as shown in Table 4-13 to 4-15 in Section 4.6 of the Final EIS as shown on pages 4-171 to 4-239.

With respect to potential impacts to taro farming, the specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui

(Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili‘ula, Pua‘aka‘a, Pa‘akea, Waia‘aka, Kapā‘ula, Hanawī, Makapīpī, and Waiohue. Cultural Surveys Hawaii noted that these streams were addressed through the CWRM D&O proceedings. With respect to impacts to freshwater ecosystems, CSH identified the potential for impacts to Wahinepe‘e, Puohokamoā, Ha‘ipua‘ena, Honopou (Puniawa Tributary), Punala‘u (Kōlea and Ulunui Tributaries), Honomanū, Nua‘ailua, Pi‘ina‘au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili‘ula, Pa‘akea, Kapā‘ula, Hanawī, Makapīpī, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua‘aka‘a Tributary, and Waia‘aka. And CSH also noted that these streams were addressed through the CWRM D&O proceedings. To address the potential for impacts to these resources/practices, similar to the recommendation noted above, CSH recommends that the Proposed Action include monitoring and public reporting of stream flow volumes, and that EMI's current system of flow meters and totalizers that are reported to CWRM on a monthly basis be maintained and upgraded as needed in order to report accurate information on stream flow and diversion amounts to the community.

With respect to cultural sites, CSH acknowledged that no studies had identified any burial sites within the License Area. Nevertheless, CSH recommended that any personnel involved in access, maintenance, or any other related activities within the License Area be informed of the possibility of inadvertent cultural finds, including human remains, and that in the event any such sites are inadvertently discovered within the License Area, those discoveries should be reported immediately to the State Historic Preservation Division (SHPD). Moreover, CSH recommended that in the event that iwi kūpuna and/or cultural finds are encountered, consultation with lineal and cultural descendants of the area should be conducted. CSH also recommended, as a proactive measure, that there be an access policy for cultural practitioners within the License Area, similar to the access policy in use for hiking groups. Any such policy would need to be developed in consultation with the State (as landowner of the License Area), and the Water Lease lessee, and in consideration of applicable law related to traditional and customary Native Hawaiian rights. It is noted that in issuing the CWRM D&O, the CWRM identified the minimum criteria to be satisfied in order for a traditional and customary right to be protected by the constitution and State law. See CWRM D&O pages 242 through 245, citing the Supreme Court's holding on this subject in *State v. Pratt*, 127 Hawai‘i 206, 277 P.3d 300 (2012).

Toward addressing the cumulative cultural impact of the Proposed Action, the Draft EIS includes a CIA that, among other areas, delves into the cultural history of the License Area. This was done to establish the cultural context in which the Proposed Action would be implemented. And, as mentioned previously, the CIA has also been supplemented in the Final EIS to describe the cultural practices and related impacts for all streams within the License Area, including the non-

petitioned streams. Refer to the updated Section 4.6 in the Final EIS, included as pages 4-171 to 4-254.

In addition, while the HSHEP model has its limitations for inferring the creation of additional opportunities to exercise traditional and cultural practices, it did not only calculate HU for the Proposed Action under the CWRM D&O, but also provides a basis for comparative analysis by analyzing a "Natural Condition" where no stream diversions occur, a "Full Diversion" scenario, where all diversions were diverting 100% of available low flows, and the "No Action" alternative where no Water Lease is issued and only 30% of the remaining flow is diverted after compliance with the CWRM D&O is diverted. These analyses provide several alternative scenarios for BLNR to consider in its Water Lease deliberations.

Comment 24: *On a final note, although OHA certainly does not oppose ethically responsible scientific analyses and understands the important role these studies serve, scientific findings are not always absolute and are often refined through follow up testing, monitoring, or research. In this particular case, the claim that the D&O has the "potential" to reduce or eliminate cultural impacts is not a definite nor are the findings of the HSHEP. As findings note a "potential" and not a guarantee, OHA believes that follow up monitoring on water quality, stream flow, and flora and fauna life should be arranged prior to issuance of a water lease. Such monitoring could perhaps be integrated into the watershed management plan to be collaboratively developed by A&B/EMI and the BLNR pursuant to HRS 171-58(e).*

Response 24: Understanding that the scope of your comment regarding scientific analyses and cultural impacts pertains to the HSHEP model, we respond as follows. As stated in our Response #21, the HSHEP offers an opportunity to evaluate, within the limits of the model, the effect of hypothetically altering stream diversion amounts on habitats for stream animals, as measured in numerical Habitat Units (HU). While the HSHEP model does not address cultural impacts, a similar HSHEP model commissioned by the Division of Aquatic Resources of DLNR was used by the CWRM to relate HU resulting from streamflow restoration to providing additional opportunities for cultural and traditional gathering rights. The following citations from the CWRM D&O express the CWRM's rationale for believing that its decision will increase opportunities for the exercise of traditional and customary gathering rights:

- *Maintenance of fish and wildlife habitats to enable gathering of stream animals and increased flows to enable the exercise of appurtenant rights constitute the instream exercise of "traditional and customary native Hawaiian rights" (FOF 656)*
- *...the H90 flow is believed to provide suitable conditions for grown, reproduction, and recruitment of native stream animals as well as protection*

- of traditional and customary native Hawaiian gathering rights, which are affected by the size of native animal populations in a stream (COL 28)*
- *The Commission's expectation is that restoring flows to streams that are spread out geographically will: 1) provide greater protection against localized habitat disruptions; 2) produce a wider benefit to estuarine and near-shore marine species; and 3) result in more comprehensive ecosystem function across the entire East Maui watershed. (COL 33)*
 - *The restoration of stream flows in this manner is intended to both restore stream life and to provide additional opportunities for the exercise of customary and traditional gathering rights. (COL 61)*

Regarding your comment on “follow up testing monitoring and research”, independent of the proposed Water Lease, the CWRM D&O calls for monitoring. CWRM requested that BLNR authorize the DAR to monitor whether or not the flows implemented for East Wailuāiki of H₉₀ and full restoration of West Wailuāiki have resulted in any difference in the biology or ecology of these two streams as compared to the other. See CWRM D&O at 270.

Moreover, the CIA provides a synopsis of mitigation recommendations gathered from the community and other consultant technical studies and made recommendations that include follow-up monitoring activities. Specifically, CSH recommends that the Proposed Action include monitoring and public reporting of stream flow volumes. As discussed in Section 4.6 of the EIS, the CWRM D&O requires EMI to report on changes in stream diversions and ditch settings as irrigation requirements increase. Currently, EMI also maintains a system of optical encoders with float tape and data loggers within its ditch system. CSH also recommends that the EMI Aqueduct System continue to be maintained and upgraded as needed in order to report accurate information on stream flow and diversion amounts to the community.

Your suggestion for the incorporation of follow up monitoring on water quality, stream flow, and flora and fauna life into the watershed management plan required under HRS § 171-58 for a Water Lease is acknowledged. Section 2.1 of the Draft EIS described the State's action with respect to the minimum content requirements of a watershed management plan at that time. However, this section of the EIS has been revised to take into account the BLNR's actions on October 11, 2019 under agenda item D-2, where BLNR approved the minimum content requirements for a watershed management plan as shown on pages 2-2 to 2-4.

Comment 25: *The DEIS ignores concerns regarding cultural access to the License Area. The DEIS lacks any explicit consideration of the proposed action's potential impacts to access by*

cultural practitioners, who may wish to gather or visit resources and sites in the License Area. There is only a hint of discouragement to unregulated public access to the License Area in the DEIS, where it states that unauthorized personnel could present a potential vector for invasive species and traditional resources could be over consumed. OHA argues that since traditional customary practices are occurring in the area and that these rights are protected by the State of Hawai'i Constitution, then A&B/EMI should minimally commit to developing a procedure for addressing cultural access and keeping individuals informed of activities occurring in the License Area. This procedure should be in place even if A&B/EMI defers access responsibility to the State.

Response 25: Your comment that native Hawaiian traditional and customary practices are protected under Article XII, section 7 of the Hawai'i Constitution is acknowledged. It states, *"The State reaffirms and shall protect all rights, customarily and traditionally exercised for subsistence, cultural and religious purposes and possessed by ahupua'a tenants who are descendants of native Hawaiians who inhabited the Hawaiian Islands prior to 1778, subject to the rights of the State to regulate such rights."*

In explaining this provision, the framers of Article XII, section 7 also clarified that, while the State has the power and obligation to protect native Hawaiian traditional and customary practices, the State also has the power to regulate those rights: "Your Committee did not intend these rights to be indiscriminate or abusive to others. While your Committee recognizes that, historically and presently, native Hawaiians have a deep love and respect for the land, called aloha aina, reasonable regulation is necessary to prevent possible abuse as well as interference with these rights." Stand. Comm. Rep. No. 57, reprinted in 1 Proceedings of the Constitutional Convention of Hawai'i of 1978, at 639.

As discussed in Response #21, the CIA has been updated to include a discussion regarding impacts to access by cultural practitioners and recommended mitigation measures, as summarized in Section 4.6 of the Final EIS, provided on pages 4-239 to 4-252. These recommendations were informed by consultation with Mr. Ferreira and Mr. Tanaka of OHA. Regarding a means of keeping individuals informed of activities occurring in the License Area, CSH recommends that the access policy for the License Area include access by cultural practitioners via a similar process in use for hiking groups or via a consultation list of willing practitioners as suggested in comments received by Mr. Ferreira and Mr. Tanaka of OHA. Any access policy will need to be developed in consultation with the landowner (the State) and the Water Lease lessee and in consideration of applicable law related to traditional and customary Native Hawaiian rights as discussed in Section 4.6 of the Final EIS. However, it should be noted that EMI has confirmed that no individual who has approached EMI requesting access to the License Area for traditional and customary practices has ever been denied access.

Comment 26: *With only 15 of 136 people responding to the cultural impact assessment consultations, with potentially many more who were and are reluctant to participate in the process, it is likely that many cultural users of the area are not accounted for and that potential access impacts may be much greater than anticipated. Accordingly, the DEIS should consider an array of approaches to mitigate potential impacts to practitioner access and use of the License Area, such as the maintenance of a consultation list of willing practitioners that can be used to communicate with and accommodate these individuals and their networks. Notably, this may help A&B/EMI develop a respectful relationship with cultural practitioners rather than creating an adversarial lessee-versus-cultural practitioner situation.*

Response 26: CSH conducted two separate rounds of community consultation; one prior to the publication of the June 2019 CIA, and second in response to comments received on the Draft EIS. CSH reported that Mr. Ferreira and Mr. Tanaka of OHA provided feedback during that second round of consultation.

Although extensive consultation efforts were made in connection with the preparation of the June 2019 CIA, as detailed in the CIA, few individuals or organizations agreed to participate (only three individuals agreed to be interviewed in connection with the preparation of the June 2019 CIA), thereby leaving CSH with little option but to review the extensive testimony that had been submitted to CWRM in connection with the multi-year IIFS proceedings (which started in 2001 and had concluded in June 2018 with the issuance of the CWRM D&O). This rich source of information was valuable but of somewhat limited utility because it was based upon concerns about impacts that were reviewed and potentially addressed through the issuance of the CWRM D&O. CSH's second round of consultation was done in response to comments submitted on the Draft EIS that included the June 2019 CIA report. This consultation was targeted to those who had raised specific issues of a cultural impact nature. Although CSH sought to consult with some 14 individuals who wrote letters in response to the Draft EIS, only five were willing to engage in consultation to further inform the CIA.

During the preparation of the Draft EIS, CSH contacted a total of 136 parties including OHA, the State Historic Preservation Division (SHPD), the County of Maui, other agencies, Department of Hawaiian Homelands (DHHL) beneficiaries, Native Hawaiian Organizations (NHOs) and knowledgeable community members. NHOs consulted included: Aha Moku o Maui, Inc. (Ke'eaumoku Kapu and Kyle Nakanelua); Kuloloi'a Lineage – I Ke Kai o Kuloloi'a (Les Kuloloi'a); Waiehu Kou Phase 3 Association (Roy Oliveira); Moku o Kaupō (Jade Alohalani Smith); and Aha Moku o Kahikinui (Donna Sterling). Of the 136 parties consulted, a total of 15 people/agencies responded to the consultation letter. Three people participated in formal interviews. CSH initiated its outreach effort in November 2017 which included letters, phone

calls, emails, and in-person interviews. Below is a list of individuals and agencies who shared their *mana'o* (thoughts, opinions) and *'ike* (knowledge) about the License Area:

1. Dr. Kamana'opono Crabbe, Ka Pouhana – OHA
2. Pomaika'i Crozier, Conservation Manager – Pu'u Kukui Watershed Preserve
3. Skippy Hau, *Kama'āina* (native born) and Aquatic Biologist – Division of Aquatic Resources – State of Hawai'i
4. Garrett Hew, *Kama'āina*, Upcountry Maui farmer, and former East Maui Irrigation (EMI) employee
5. Robert Hobdy, Retired naturalist and forester
6. Roslyn Lightfoot, Director – Alexander & Baldwin Sugar Museum
7. Kyle Nakanelua, *Kama'āina*, Aha Moku o Maui, and *kalo* (taro; *Colocasia esculenta*) farmer
8. Jerry Sakugawa, Upcountry Maui farmer
9. Sandy Takeshita, Upcountry Maui farmer
10. Mahealani Wendt, Member of Nā Moku Aupuni o Ko'olau Hui
11. Mavis Oliveira-Medeiros, *Kama'āina* of Hāna
12. Dawn Lono, Long-time resident of Hāna
13. Shane Sinenci, holds the County Council seat for the East Maui residency area
14. Dorothy "Aunty Dottie/Kumu Kamalu" Kaho'okele and 'Ohana, *Kama'āina* of Nāhiku
15. Moses "Mokey Boy" Bergau, *Kama'āina* of Nāhiku

Following public review of and comment on the Draft EIS, CSH conducted additional outreach to 14 individuals or organizations including OHA, DHHL, Ha'ikū Community Association, Maui Tomorrow Foundation, Hui o Nā Wai 'Ehā, Mr. Daniel Grantham, Mr. Cody Nemet, Mr. Jordan Tabura, Mr. James Sagawinit, and the Medeiros 'Ohana, all of whom had provided comments on the Draft EIS specific to the CIA. Although these individuals and agencies had provided comments about the June 2019 CIA, several did not respond to CSH's request for consultation to further explore the issues raised in their comment letters. However, five parties were willing to engage in consultation:

1. Kamakana Ferriera, Lead Compliance Specialist, OHA
2. Wayne Tanaka, Public Policy Advocate, OHA
3. Lafayette Young, Board Member, Ha'ikū Community Association
4. Lucienne de Naie, Vice-President, Maui Tomorrow Foundation and member, Sierra Club of Hawai'i, Maui Group
5. Albert Perez, Executive Director, Maui Tomorrow Foundation

Your suggestion that the Water Lease lessee maintain a consultation list of practitioners who may serve as a communication intermediary between the lessee and any practitioners with constitutionally protected rights is appreciated. This suggestion has been incorporated into Section 4.6 as shown on pages 4-239 to 4-252 related to mitigation measures and recommendations. We understand that a claimed right is constitutionally protected as a customary or traditional native Hawaiian right under article XII, § 7 of the Hawai‘i Constitution, or §§ 1-1 or 7-1, HRS if the following is shown: a. the practice must be related to extended family needs; the purpose must be to fulfill a responsibility related to subsistence, religious or cultural needs of one’s family or extended family; b. the traditional or customary native Hawaiian practice must be traceable to at least November 25, 1892; c. the practice cannot be for a commercial purpose; and d. the manner in which the practice is conducted must be consistent with the tradition and custom and the practice must be conducted in a respectful manner. *See State v. Pratt*, 124 Hawai‘i 329, at 349-55, 243 P.3d 289, at 309-315 (App. 2010).

Comment 27: *With an established procedure to handle cultural access, A&B/EMI or the State should also consider signage that encourages cultural use pursuant to the State of Hawai ‘i Constitution, Article XII, as not to have them unduly harassed by any form of onsite security or enforcement personnel. In any case, the DEIS must address what may be significant and unaccounted-for impacts to practitioner access under the proposed action.*

Response 27: Your comment is acknowledged and your suggestion is consistent with the recommendations in the CIA We concur that with an established procedure to handle access into the License Area by those who have rights under Article XII of the Hawaii Constitution, effective signage could encourage such access. A part of such an established procedure could be as discussed in our Response #25. As recommended by CSH, cultural practitioners could gain access via a process currently established for hiking groups or via a consultation list of willing practitioners. CSH further recommends that any access policy be developed in consultation with the landowner (the State) and the Water Lease lessee and in consideration of applicable law related to traditional and customary Native Hawaiian rights. As mentioned previously, EMI has confirmed that no individual who has approached EMI requesting access to the License Area for traditional and customary practices has ever been denied access. Nevertheless, this approach would minimize the potential for undue harassment by on-site security or enforcement personnel, and is consistent with the suggestions offered by Mr. Ferreira and Mr. Tanaka of OHA during supplemental CIA consultation, and incorporated in the updated CIA, as discussed in our Response #25.

With respect to your comment about signage, CSH in the updated CIA, based upon feedback from Mr. Ferreira and Mr. Tanaka of OHA, recommends the installation of signage at common public access points to the License Area along Hāna Highway. This recommendation has been

added in Section 4.6 of the Final EIS as shown in pages 4-239 to 4-252 related to mitigation measures and recommendations.

HISTORIC PRESERVATION COMMENTS

Comment 28: 3. *HRS 6E, Historic Preservation, Compliance.* As the State Historic Preservation Division (SHPD) is tasked with administering HRS 6E, SHPD comments were sought when the EISPN was published in 2017. Per the January 25, 2017 SHPD letter provided in Appendix E of the DEIS, SHPD originally could not make a determination of the water lease's impact on historic properties, and thus recommended that an archaeological inventory survey (AIS) be completed in accordance with an AIS plan (AISP). However, following several SHPD consultations with the contractor, SHPD rescinded its request for an AIS in a letter dated October 6, 2017, as SHPD was led to believe that no ground disturbing work would take place as part of the water-lease issuance. OHA questions this portrayal of the proposed water lease as having no ground disturbing work since the DEIS states that the water lease will allow for A&B/EMI to maintain and repair existing access roads and trails that are part of the EMI Aqueduct System. Such repair work often includes ground disturbing activities.

Response 28: Issuance of the Water Lease is not anticipated to affect any historic property, aviation artifacts, or burial site. As discussed in Draft EIS Section 4.5 (Historic and Archaeological Resources) the Proposed Action does not involve any new construction or significant ground disturbance within undisturbed areas within the License Area. The Proposed Action continues the use of the EMI Aqueduct System for the transport of surface water, and allows the lessee or its permittees, to maintain and repair existing access roads and trails long-used as part of the EMI Aqueduct System. Moreover, as discussed in the Section 2.1.2 of the Final EIS as shown on page 2-7, under the Proposed Action, "maintenance and repair" involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System. Moreover, this was explained to SHPD as discussed in the Archaeological Literature Review and Field Inspection provided as Appendix E of the EIS ("Additional information regarding the proposed Water Lease was provided to the SHPD including the understanding that the proposed Water Lease will not involve any significant ground disturbance within undisturbed areas.").

Comment 29: *The specific details (i.e., locations, staging areas, construction access routes, and scope of work) of the maintenance and repair work are not detailed within the DEIS. Including these improvements without a clear scope in the DEIS arguably could lead A&B/EMI to think that these actions do not require HRS 6E review. OHA requests that details be provided regarding proposed maintenance and repair work as withholding the scope and breadth of such actions may mislead the evaluation of impacts to historic properties.*

Response 29: The EMI Aqueduct System includes approximately 50 miles of tunnels, 24 miles of ditches, 13 inverted siphons, approximately 388 intakes, six reservoirs, and 62 miles of private roads. Maintenance is done on an as-needed basis and therefore a detailed schedule of maintenance locations is not included in the EIS. The majority of repair and maintenance of the EMI Aqueduct System will take place at the ditch itself and the nature of the work is described above in Response # 28. It is also anticipated, based upon decades of maintenance and repair work, that any such work and related staging would be conducted in close proximity to the ditch and therefore long-accessed areas and that would prevent disturbance of the surrounding areas of the forest. Access routes to such sites, it is expected, would similarly be over well used roads and trails.

General maintenance has minimal impact on the surrounding areas because existing roads and trails used to access the EMI Aqueduct System have been in place for over a century and used for such purposes. This was explained to SHPD as discussed in the Archaeological Literature Review and Field Inspection provided as Appendix E of the EIS ("Additional information regarding the proposed Water Lease was provided to the SHPD including the understanding that the proposed Water Lease will not involve any significant ground disturbance within undisturbed areas.").

Comment 30: *The DEIS goes on to state that should there be inadvertent cultural finds, including human remains, in the License Area, that these discoveries will be immediately reported to SHPD. OHA notes however that simply contacting SHPD does not ensure compliance with relevant rules governing inadvertent discoveries. Procedures for inadvertent discoveries, other than a burial site, is governed by HAR 13-280. These rules require that work in the immediate area halt and that nothing will be removed until SHPD can evaluate the find. Depending on the findings, SHPD may require a mitigation plan. Procedures for inadvertent human burials are governed by HAR 13-300-40. These rules also require that work in the immediate area halt, but further requires that the coroner and the police department be contacted in addition to SHPD. OHA thus recommends that the DEIS include a clause that ensures compliance with these rules.*

Response 30: The Cultural Impact Assessment included as Appendix F of the Draft EIS contained a mitigation recommendation that *"any personnel involved in access, maintenance, or any other related activities within the License Area be informed of the possibility of inadvertent cultural finds, including human remains. In the event that any potential historic properties are inadvertently discovered within the License Area, these discoveries should be reported immediately to the State Historic Preservation Division (SHPD). In the event that iwi kūpuna and/or cultural finds are encountered, consultation with lineal and cultural descendants of the area is also recommended."* This is also reflected in Section 4.6 of the Draft EIS.

We acknowledge that HAR § 13-280 provides the Rules Governing General Procedures for Inadvertent Discoveries of Historic Properties During a Project Covered by the Historic Preservation Review Process, and that HAR § 13-280-3 sets forth the specific procedures to be followed for inadvertent discoveries. These procedures apply to the discovery of a historic property, other than a burial site, during the course of work on a project that has already gone through the historic preservation review process, and include the requirement that construction shall be halted in the immediate area and the historic property should not be disturbed any further, and that no item shall be moved from the ground at the discovery location without the SHPD's approval, to prevent damage to the historic property. HAR § 13-280-3 further provides that if the property is deemed significant, an appropriate mitigation plan shall be jointly developed by the SHPD and agency or person undertaking the project.

We further acknowledge that HAR § 13-300-40 addresses the process for the inadvertent discovery of human remains and requires notification to SHPD, the medical examiner or coroner from the county in which the inadvertent discovery occurred, and the County police department. This is discussed in further detail in the LRFI included in Appendix E of the EIS as well as Section 4.5 and 4.6 of the EIS (instructing that should human skeletal remains be identified within the License Area as part of the Proposed Action, any work in the immediate vicinity of the remains should be stopped and the discovery should be immediately reported to the SHPD (during regular business hours) or to DOCARE (outside of regular business hours) and to the Maui Police Department (to include notification to the medical examiner) in accordance with HAR § 13-300-40).

Comment 31: *OHA looks forward to reviewing a revised DEIS that addresses our concerns regarding alternatives, cultural impacts, and HRS 6E compliance. If needed, OHA is willing to engage in any future discussions or consultations. Should you have any questions, please contact our Lead Compliance Specialist, Kamakana C.Ferreira, at (808)594-0227, or by email at kamakanaf@oha.org.*

Response 31: Thank you for your participation in the Draft EIS review process. The Draft EIS has been revised to incorporate substantive comments received during the consultation and review process, including substantive comments from OHA. Moreover, additional outreach consultation with Cultural Surveys Hawai'i and OHA has been included in the updated Cultural Impact Assessment included as Appendix F to the Final EIS. As evident by our responses to OHA's comments herein and the comprehensive nature of the Draft EIS regarding alternatives, cultural impacts, and HRS 6E compliance, there is no need for a second, or revised, Draft EIS. The Draft EIS that was published included extensive information on the Proposed Action as well as its effects in East Maui, and anticipated effects on Upcountry Maui and in the Central Maui agricultural fields at full implementation of the Mahi Pono farm plan. Although some additional information is provided in the Final EIS for clarification or in response to Draft EIS comment letters, no significant new information is included that was not already addressed in the Draft EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.³ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Higashi:

Thank you for comments dated October 25, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200, Section 18. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The State of Hawaii, Department of Transportation, Airports Division, has reviewed the subject DEIS and has no comments.*

Response 1: We acknowledge that the State of Hawai‘i Department of Transportation – Airports Division has no comments at this time.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

OCT 07 2019
WILSON OKAMOTO COMPANY

September 27, 2019

To Whom It May Concern,

This is to acknowledge receipt of your letter requesting a review of an environmental assessment (EA) or environmental impact statement (EIS). The Environmental Center at the University of Hawai'i at Mānoa, which for a time was linked to the Water Resources Research Center (WRRC), has been discontinued. As a result of the closure of the Environmental Center, we regret that WRRC no longer has the capacity to review environmental documents.

Sincerely,

A handwritten signature in black ink, appearing to read 'Thomas Giambelluca'.

Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas

Dear Mr. Matsukawa and Mr. Hirokawa,

Following are the comments of Maui Tomorrow Foundation (MTF) re. the Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. Maui Tomorrow is part of a coalition that has long requested environmental review for the removal of such large quantities of water - which is a public trust resource held in trust for all the peoples of Maui - from public lands. Unfortunately, now that the process is underway, we are disappointed to see that the DEIS mischaracterizes many important facts, glosses over others, and incorrectly attempts to portray the resumption of major diversions of millions of gallons of stream water every day as a benign act. This is not consistent with public representations by Mahi Pono that they want to be transparent, they don't need much water, and will take only what they need.

The type of information that must be included in the Draft EIS is specified in the content requirements established by Hawai'i Administrative Rules (HAR) Sections 11-200-16 and 11-200-17. If these sections are not complied with, the document will not disclose enough information to government agencies, the general public, stakeholders, and decision-makers about the anticipated impacts of the project, alternatives to the proposed action and feasible measures that might be taken to mitigate potential impacts, sufficient to allow informed decision making.

Spirit of the Environmental Impact Statement Law, Chapter 343, HRS
HRS 343-1 provides, in pertinent part, that

“ . . . the process of reviewing environmental effects is desirable because environmental consciousness is enhanced, cooperation and coordination are encouraged, and public participation during the review process benefits all parties involved and society as a whole. It is the purpose of this chapter to establish a system of environmental review which will ensure that environmental concerns are given appropriate consideration in decision making along with economic and technical considerations.”

In addition, HAR 11-200-19 provides that

“In developing the EIS, preparers shall make every effort to convey the required information succinctly in a form easily understood, both by members of the public and by public decision-makers, giving attention to the substance of the information conveyed rather than to the particular form, or length, or detail of the statement.”

The 2,700-page length of this DEIS is excessive, to the point where it frustrates the legislative purpose of public participation (as expressed in HRS 343-1 and HAR 11-200-19 above) during the review process. As a result, the benefits that should accrue to “all parties involved and society as a whole” are diminished. In addition, due to its length, the legislature’s goal of ensuring that “environmental concerns are given appropriate consideration in decision making” is thwarted as well. The EIS should be made more concise, and should clearly describe the impacts of a resumption in stream diversion upon the environment.

This DEIS is more than just deficient; in its current form, there are so many inadequacies that it would be better to start over. The DEIS does not discuss much of the information that we asked to be included in our comments on the EISPN. As detailed in our latest comments below, this document fails to meet the standards for an environmental impact statement. It does not incorporate known information about the natural and cultural resources of this area, and it relies on misleading assumptions for its conclusions. The DEIS fails to disclose the amount of water taken from each stream, omits essential maps, and glosses over known impacts that have long been raised by various participants in this process. These deficiencies need to be corrected; the current DEIS should be withdrawn, and a new DEIS should be released for another full DEIS public comment period.

Following is a list of our concerns. Please make sure to respond in a point-by-point fashion in the Final EIS, as required by HRS 11-200-22(c)(1).

1. Scope of the Draft EIS

The Project Summary statement contains several inaccuracies that need to be corrected, as follows:

“The Water Lease . . . will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui ...”

This is misleading, because it is not a complete representation of the facts. A reader of this statement could come away with the idea that ALL of Upcountry Maui water needs are dependent on the granting of a lease. This is incorrect, because

- a) Upcountry water needs are also supplied by wells
- b) Upcountry water needs are predominantly supplied by surface water obtained outside of the Lease Area, and treated at the Piiholo and Olinda water treatment facilities.
- c) These surface water treatment facilities have storage reservoirs that can supply the Upcountry system for periods when there is no rainfall and little stream flow.
- d) Upcountry water needs have historically used water from the Kamole water treatment facility only during drought periods, or when the other water treatment facilities are offline for maintenance.
- e) The Maui County Department of Water Supply regularly uses its authority to declare several stages of water shortage, each of which results in conservation of water Upcountry, thus extending the supply.
- f) It is well known that as long as the County relies on surface water, periodic water shortages and shortage declarations will continue. A statement to this effect is included in the draft Maui County Water Use and Development Plan.
- g) Development tunnels in the Lease Area will continue to produce millions of gallons of water every day that will enter the EMI Aqueduct System, even during droughts; it will also continue to flow with or without a Lease.

The EIS needs to include and analyze data, available from CWRM, that provides monthly surface water production figures for the Piiholo, Olinda and Kamole surface water treatment plants, as well as the monthly pumpage reports for all of the wells that serve Upcountry Maui.

According to Stearns & McDonald, "East Maui has few perennial streams in proportion to its size, and they are chiefly small due to the water sheds being underlain with permeable lavas. Forty tunnels recover 6 million gallons a day of high-level water in East Maui and all from structures other than dikes."

The EIS needs to include and analyze data showing the amount of water obtained from all development tunnels and/or wells in the Lease Area. This water, which will continue to flow, even during drought, with or without a Lease, can be used to supply MDWS and/or the Mahi Pono fields in Central Maui. This information should be incorporated into evaluation of all Alternatives.

Similarly, the following statement in the Project Summary is potentially misleading: "The Water Lease . . . will allow for the continued operation of the EMI Aqueduct System . . . to deliver water . . . for the Nahiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System." The EIS needs to provide a diagram of the relationship of the Nahiku Water System to the EMI Aqueduct System, showing exactly where it obtains its water from, and demonstrating, if possible, why it would be impacted by failure to get a lease. For example, on East Makapipi Stream, there is a separate development tunnel inside the Koolau tunnel that gathers water and pipes it OVER the water that is flowing in the Koolau tunnel to a pipe that serves the Nahiku system. This water is not commingled with the Koolau tunnel water, and will continue to flow regardless of whether the proposed lease is obtained.

2. The DEIS document needs to acknowledge that "existing conditions" and operations of the East Maui Irrigation (EMI) system for over a century already have multiple impacts on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. These current conditions need to be discussed, and viable

alternatives to the status quo presented, in the alternatives section of the DEIS. The scope of alternatives discussed in the EISPN is too narrow to comply with the standards set out in HAR 11-200.

3. The EISPN states in many places that the Proposed Action will maintain existing conditions, and that no significant impacts are anticipated. This is a serious flaw that will invalidate the entire EIS if it remains unchanged. Currently, Alexander and Baldwin/East Maui Irrigation/Hawaiian Commercial & Sugar (A&B) is using less water than they were using prior to the end of sugar operations; it may be years before they use much more. In terms of environmental impacts of the Proposed Action, it does not matter what their stated future intent is. 'Opae and other stream life currently have access to habitat that currently exists. The Proposed Action will reduce or eliminate this existing habitat. The impacts of the proposed action must be analyzed in the current context.
4. Similarly, kalo farmers currently have water available for kalo that will be reduced or eliminated by the Proposed Action. The many impacts of a reduction in available water, as compared to existing conditions must be analyzed.
5. Many people at the EISPN hearings on February 22nd and 23rd, 2017 testified regarding positive impacts that they have already seen from increased stream flow resulting from the cessation of sugar operations. The EIS must discuss the following:
 - a) information about known impacts that occurred in the past, which are likely to occur again if water is diverted as it was in the past
 - b) present impacts that are continuing, such as watershed degradation as a result of invasive species having gained a foothold because of low stream flows.
6. Although the DEIS discusses a public auction of the proposed lease, it is clear that the DEIS is written from the perspective of EMI obtaining that lease. If this EIS is truly intended to be able to serve for a multiple bidder auction, many more scenarios need to be included, including the possibility of bids from government entities such as the state or Maui County, bids from nonprofits, water utilities, water authorities, or bids from other for-profit companies. The DEIS needs to discuss whether other potential bidders would need to comply with HRS 343 on their own, and if so, how the timing of submission of any associated HRS 343 documents would be coordinated to achieve the public benefits associated with making a public auction competitive.
7. Since the proposed action of issuing a lease is an agency action, the EIS also needs to discuss why it would not be more appropriate for the Board of Land and Natural Resources to prepare the EIS and consider all relevant factors associated with a multiple bid auction scenario.
8. The DEIS is inconsistent with regard to how the terms "lease area" and "license area" are used. In the Summary on page i, reference is made to "Issuance of one long-term lease of State land from the Board of Land and Natural Resources pursuant to Hawai'i Revised Statutes (HRS) Section 171-58(c) for the "right, privilege, and authority to enter and go upon" the State-owned Nāhiku, Ke'anae, Honomanū, and Huelo License Areas ..." Judging by this language, the "lease area" is comprised of four "license areas". However, this relationship is not maintained throughout the document; the relationship between "lease" and "license" is reversed in several sections. For the sake of clarity, our comments will refer to the "lease area" as being comprised of the four separate "license areas". The

relationship between the terms “lease area” and “license area” needs to be clearly described in the EIS, and this relationship must be maintained throughout the document in order for it to make sense.

9. We also note that the responses to our comments on the EISPN for this project were difficult to make sense of. Although we sent in 14 pages of very specific comments, the responses were very generic, and did not directly correspond to many of the points we raised. As stated previously, this frustrates the purpose and the spirit of the EIS law. As required by HRS 11-200-22(c)(1), the Final EIS must include a) a Point-by-point discussion of the validity, significance, and relevance of comments; and b) a discussion as to how each comment was evaluated and considered in planning the proposed action.
10. The Listing of Permits and Approvals section states that issuance of the Lease “would ... lead to construction activities such as expanding the KAP and building facilities in support of diversified agriculture in Central Maui.” The EIS needs to analyze the many impacts of other types of potential agricultural construction that could be facilitated by the issuance of a Lease, such as farm dwellings and/or farm labor dwellings in the event of creation of subdivisions or condominium property regimes.
11. The EIS needs to discuss the condominium property regimes that have already been created, or could be created in the future, within the land that was sold by A&B to Mahi Pono’s various LLCs. It also needs to discuss the potential impacts that would result if such dwellings were to obtain access to diverted surface water from East Maui.
12. The EIS needs to provide evidence, such as chain of title from Kingdom days, showing how each parcel of land in the lease area, as well as in the central Maui agricultural area was legally acquired, and is now the property of A&B, EMI, and/or Mahi Pono.
13. The EIS needs to identify the underlying ownership of every portion of every ditch and tunnel in the lease area, and provide evidence, such as chain of title from Kingdom days, showing how each parcel of land in the lease area, as well as in the central Maui agricultural area was legally acquired, and is now the property of A&B, EMI, and/or Mahi Pono.
14. The EIS needs to provide a clear explanation and diagram(s) of the management and financial relationships among A&B, EMI, the Canadian Public Sector Pension Investment Board, Trinitas, Pomona Farming, and Mahi Pono. It also needs to evaluate exogenous events like natural disasters, or changes in ownership or management objectives in any one of the above mentioned entities, could impact the natural, economic, cultural and/or social environment on Maui.
15. Over the past few months, huge plumes of dust have been seen over Central Maui, which are generated by Mahi Pono farming equipment. The EIS should provide information regarding the expected farming practices of Mahi Pono, which will be facilitated by issuance of the proposed Lease, and how they will impact air quality and offshore ecosystems, including sediment-sensitive species.
16. Under the DEIS Section 3 – Alternatives, Subsection 3.3 - No Action (page 3-6), Line 6, reads:

“However, under the **1938 agreement and a related calculation involving isohyet analysis of rainfall patterns**, it is understood that approximately 30% of the water in the License Area streams is derived from the privately-owned lands. Therefore, the EMI Aqueduct system could continue to divert approximately 30% of the water available from the Collection Area, plus...”
(emphasis ours)

The 1938 agreement, Section VIII, paragraph (4), by and between the Territory of Hawaii and East Maui Irrigation Company, Limited dated March 18, 1938, reads as follows:

“Long term average water yield” shall be the arithmetical average annual water yield which would have been diverted from any given drainage area under consideration had the aqueduct system, at the time of the determination, been in existence during the entire period in which

water records are available for such area, and shall be determined jointly by the Territory's and the Company's hydrographers based on all available applicable water measurements and long term rainfall records;"

The DEIS statement "that approximately 30% of the water in the License Area streams is derived from the privately-owned lands" is a significant water resource baseline metric. As such, the variables utilized to determine the "30%" are important to understand and verify. They need to be provide in this DEIS.

The 'related calculation involving isohyet analysis of rainfall patterns' referred to in Subsection 3.3 should be made available for public review and comment in this DEIS. This calculation should include the yield calculations as defined in the 1938 agreement: "...the arithmetical average annual water yield which would have been diverted from any given drainage area under consideration..."

This EIS needs to make available for public review and comment a detailed parcel listing & associated map(s) of the License Area's 'privately owned lands' from which the 30% right to the stream water flow referred to in Subsection 3.3 is derived.

This EIS should explicitly document the private land owner's source of rights, if any, to divert License Area stream flow for private purposes, in light of the adoption of the State Water Code and the mandated protection of the Public Trust.

The EIS should state what volume percentage of the asserted 'privately owned lands' water rights are defined and documented as "appurtenant water rights", as well as the volume of water yield ascribed to this water right.

The EIS should state what percentage of these private lands hold water rights only to the usufruct (riparian right) in each of the Lease Area Streams, as well as the volume of water yield ascribed to this particular water right.

17. The EIS should examine and disclose the relative local financial impact of a foreign-owned (California) company, in comparison to the relative local financial impact of granting the lease to either a Hawaii-based company, a Maui Water Authority, or a local nonprofit organization.
18. The EIS should describe the expected fair-market cost of water to the County that would be provided via the Wailoa Ditch/Tunnel. It should also describe the potential impacts to the Upcountry domestic water users if the cost of the small annual percentage of Upcountry water (about 26% annually) that is supplied by the lease area were to rise significantly. Similarly, the EIS should evaluate the impact on Upcountry farmers if this cost were to rise significantly.
19. The DEIS states that 7.1 million gallons per day of Upcountry Maui's water comes from the East Maui irrigation aqueduct system. This is VERY misleading, since only about 26 percent on an annual basis (depending on the year) is coming from the lease areas that are being analyzed in the EIS document. The rest is coming from other Mahi Pono lands, which are outside the proposed lease area, and are not the subject of this EIS. This statement needs to be corrected based on actual numbers based on CWRM water usage reports.

20. Impacts to Hawaiian Homelands Water Supply

§11-200-16 HAR Content requirements: The environmental impact statement shall contain an explanation of the environmental consequences of the proposed action. The contents shall fully declare the environmental implications of the proposed action and shall discuss all relevant and feasible consequences of the action. In order that the public can be fully informed and that the agency can make a sound decision based upon the full range of responsible opinion on environmental effects, a statement shall include responsible opposing views, if any, on significant environmental issues raised by the proposal.

The current DEIS contains no specific information regarding the water reservation amounts from the East Maui lease area needed by DHHL. This information is now available and was publicly offered by DHHL staff at the Oct 9, 2019 BLNR meeting. These specific legally protected water reservations should be INCLUDED in the DEIS, and Mahi Pono water use plans adjusted accordingly to reflect this amount, in order for the public and agency comment process to be based upon accurate information. The DEIS also assumes in the Executive Summary that Mahi Pono can utilize the East Maui Water until the time that DHHL needs its reservation.

The Mahi Pono Farm Plan figures presented in appendix I estimate that 68 mgd of East Maui stream water will be available for Mahi Pono crops after 22.7 percent system losses, and 7.1 mgd for the Maui County DWS system. No water is allotted for DHHL in the Mahi Pono Farm Plan calculations.

A discussion of whether it is legal for A&B/Mahi Pono to assume that the DHHL “water reservation” can be utilized by Mahi Pono until it is “needed by DHHL” should also be included in the DEIS. It is our understanding that the Waiola o Molokai vs DHHL case dealt with a similar situation, and the DHHL prevailed.

There is no indication in the DEIS how the Mahi Pono Farm Plan will be adjusted to accommodate the 11.5 mgd of East Maui Water that DHHL is reserving. The EIS should plainly discuss this, as well as whether such adjustment would be based upon a need for more water over the first few years of planting, and less water when crops are established, using regenerative agricultural methods, as was envisioned in the 2018 CWRM Decision and Order:

“115. The estimated water requirements will change not only because some potential partners and lessees are expected to rotate multiple crops that could potentially have different crop coefficients but also because water requirements could change significantly through the use of regenerative agricultural methods.”

If Mahi Pono Water demand is expected to decrease over the years, as suggested by the CWRM 2018 review, a timetable for restoration of non-IIFS streams in the Huelo Lease area should also be discussed in the EIS.

21. Lack of Accurate Information re. the Viability of the Mahi Pono Farm Plan

- The EIS should acknowledge that Mahi Pono has no track record of successful farming under Maui conditions.

A&B's SEC filings inform their shareholders of the risk that plans for diversified farming on their Maui lands may not work out, even given the Company's long history of farming. A&B's 2015 SEC filing states:

"The Company is currently evaluating several categories of replacement agricultural activities in the transition to the diversified model, including but not limited to energy crops, agroforestry, grass finished livestock operations, diversified food crops/agricultural park, and orchard crops. There is no assurance that the Company's replacement agricultural activities will be economically feasible or improve the Agribusiness segment's operating results."

The EIS needs to provide the same disclaimer, and should not predict the entire success of Mahi Pono farming operations based on how much East Maui water is sent to Central Maui.

- The EIS needs to provide accurate information about the benefits of Central Maui farming. The numbers provided for proposed Mahi Pono profits and past performances of HC&C sugar do not seem logical:

(Executive Summary, page v) "Mahi Pono farm plan is projected to generate more than 338 pounds per year of crops, generating \$155.9 million per year in annual food sales and \$329.5 million per year in combined direct and indirect sales." This would mean each pound of crop brought a return of \$461,242. The EIS needs to describe what kind of crop would bring this type of return, or correct what appears to be an obvious error in the calculation.

Table 6 in Appendix I lists "recent sugar" payroll of \$68,000,000 a year. HC&S had 675 workers when they announced that sugar would shut down in 2016. Did those workers earn an average of \$100,740 a year (\$68 mil divided by 675)? The EIS needs to provide a factual basis for this claim, and all claims, made in the document.

- The potential "recent sugar profits" presented in Table 6 of Appendix I also needs additional information.

A&B's SEC filings (10K reports) show a very different range of "profits" from 2009 to 2015 - the most recent era of sugar growing. In only 4 of those 7 years did the sugar operations show a profit (2010-2013.) The other three years showed sizable losses. The DEIS says that all these years (2008-2013) had poor crop yields due to low rainfall, but 2014 and 2015 also showed poor returns. The DEIS needs to discuss this evidence that water availability is not the only factor that determines crop success in Central Maui. Only one year (2011) had a profit of \$22 mil. The average of the 4 profitable years was \$14.9 mil. The figures in the EIS should reflect accurate amounts, not cherry pick one promising year.

- A&B's 2015 10-K statement (filed with the Securities & Exchange Commission) acknowledges that the four state lease areas supplied "approximately 58 percent of the irrigation water used by HC&S" and "A&B also holds rights to an irrigation system in West Maui, which provided approximately 15 percent of the irrigation water used by HC&S over the last ten years." This would indicate that 27% of irrigation water came from A&B wells.

- The EIS needs to include a list and map of the A&B/Mahi Pono wells available to help irrigate the Mahi Pono fields and the latest chloride tests and pumping abilities of each of those wells. The map should also depict the historical and prospective areas that can be irrigated using well water.
- The EIS states that Mahi Pono’s farm plan will use less water than the HC&S sugar operations, and provides elaborate tables in Appendix I. The Mahi Pono Farm Plan is one plan, which includes around 34,000 acres irrigated by both East Maui and West Maui stream waters.

The EIS content rules do not allow for segmentation of separate parts of the same project. The 4,000 acres of fields irrigated by West Maui Water should be included in the overall analysis of how much water is needed from which source to have a viable Mahi Pono Farm Plan.

The EIS needs to clearly describe the overall Mahi Pono Farm Plan, and indicate what amounts and proportions of water for the farm plan will come from East Maui streams, West Maui streams and Mahi Pono wells.

22. Public Trails:

a) The draft EIS is incomplete because it does not include an inventory of roads and trails in the Ko'olau Forest Reserve.

HRS 264 (Public Highways and Trails) protects public right-of-way on roads and trails owned by the state. When the Ko'olau forest reserve was created, all roads and trails in the forest reserve became protected rights-of-way. The draft EIS needs to be extended to show the protected roads and trails in the Ko'olau Forest Reserve.

HRS 171-35 (Lease provisions) requires leases to protect rights-of-way and access to other public lands. The draft EIS needs to be extended to show how the proposed water lease protects rights-of-way and access to other public lands.

The Hawaii Supreme Court has ruled (1908 19 H. 168) that the lease of public land can not affect a public right-of-way existing across it.

2) The draft EIS is incomplete because it does not include an inventory and history of roads and trails on East Maui Irrigation land.

HRS 264 (Pubic Highways and Trails) requires that historic roads and trails are protected rights-of-way. The draft EIS needs to be extended to show which historic roads and trail are protected.

HRS 115 (Public Access to Coastal and Inland Recreational Areas) requires public rights of way to be provided at reasonable intervals to inland recreational areas. Many parts of the Ko'olau Forest Reserve are land-locked by East Maui Irrigation property. The draft EIS needs to be extended to show public rights-of- way across EMI property to the Ko'olau Forest Reserve.

3) The Division of Forestry and Wildlife, in their December 19, 2016 letter, included in the draft EIS, says, “Thus the Division recommends that the areas to be conveyed for a water license be done so through a land agreement that is limited to the infrastructure required

for maintenance and conveyance of water, and that any terms of any agreement established for the delivery of water ensure unrestricted public access to the reserves and any state owned roads and trails.” The DEIS needs to address the positive impacts of implementing this recommendation as part of a considered Alternative action.

23. Stream and Ocean Assessment (appendix B)

Appendix B and the DEIS conclude that East Maui stream flows don't affect conditions for marine life in East Maui, and that East Maui has the wrong ocean conditions to have substantial fish populations. Appendix B offers these conclusions even though it includes no survey of ocean fish, and measures water chemistry at only 7 of the 36 streams in the lease area. Kumupono Assoc. study of East Maui: “Wai o ke Ola – He Wahi Mo'olelo no Maui Hikina” was prepared for A&B / EMI in 2001, and provides much historic and contemporary discussion of the robust presence of marine life along east Maui coasts and longtime dependence of East Maui communities on the sea for food supplies. The connection of fresh water stream flows to algae that feeds marine life is well established. The conclusions of Appendix B are erroneously used throughout the DEIS to justify the “lack of impacts” from EMI's proposed Alternative 1: diverting all the East Maui streams to the extent permitted by the 2018 CWRM D&O.

The EIS needs to acknowledge that an increase of diversion from present levels will impact ocean fisheries, describe those impacts, and propose mitigations.

24. Flora and Fauna Review (Appendix C)

This brief (4 days supposedly covering 33,000 acres on the ground and 1 day in the air) drive-by review of flora and fauna is entirely inadequate to inform decision makers of the impacts of the proposed action.

In addition, the following deficiencies in the DEIS need to be corrected:

None of the Endangered damselfly populations seen by DAR surveys in 2005-06 were seen. Are they no longer found in the 33,000 acre area, or were they just missed by the superficial review?

No plant list was included in the survey report.

The Survey does not refer to baseline data available from the extensive 1985 mapping of the East & West Wailuaiki stream basin area that was done as part of a Proposed Hydroelectric plant EIS (Kepler, 1985)

The Flora and Fauna survey also included the 30,000 acres of potential farm lands (referred to as the “use area”)in the 5 day visit and did a poor job of describing impacts there.

It was not clear if the gulches in the “use area” were surveyed - they often serve as habitat areas.

No acoustical survey for native bats was done at either survey location.

In section 5.2.3, the survey reported that no reptiles or amphibians were detected, but hikers regularly encounter a very small frog at Hanawi stream near the Wailoa ditch.

In section 6.1.1 of Appendix C the consultants conclude that under the proposed action (30-year lease) "Vegetation would remain substantially the same" in the state Lease Area. Given that Citizens have watched invasive species such as melastomes, Job's tears, gingers, African Tulip and other pests spread substantially through the Lease Area over the past 30 years of access hikes, while the density and variety of native species diminish, the EIS needs to change this conclusion, acknowledge this impact, and provide adequate mitigation.

The EIS needs to address what types of mitigation would be needed to make sure that a 30-year lease would not result in the disappearance of most native species in the 1,000 to 2,000 ft elevations in the Lease Area.

The EIS should have far more detailed information, and provide evidence before declaring that a 30-year extension of the current management style will result in "no impacts."

The East Maui Watershed Partnership includes the Lease area lands on their maps , but only actively manages of East Maui lands above 3,000' elevation, which is above the Lease Area. The EIS needs to make this fact clear.

The public waters diverted by the EMI systems are the product of two factors: a) natural rainfall, and b) the watershed lands that receive the rainfall and discharge it into springs and streams. The quantity and quality of future stream flows will depend upon the health of the surrounding watershed lands. The EIS needs to examine the impact of each Alternative on these flows.

In section 6. of Appendix C, the consultants conclude that the proposed action will have no Impacts- because "no habitat removal or loss is proposed..."

The EIS ignores the well documented fact that dewatered streams over time lead to the decimation of native ecosystems and flora and fauna.

The EIS proposes no mitigations to improve watershed health other than some mechanisms to prevent introduction of more invasive species on equipment or supplies.

The Appendix C survey provides no guidance for any restoration activities in the Lease Area, which is widely done in other EIS documents that are involved with projects, like this one, that will, by law, trigger future management plans.

Appendix C and the DEIS make the erroneous assumption that 140 years of EMI use and management has had no impact on the substantial loss of native flora and fauna on public lands in the Lease Area. This assumption needs to be corrected to reflect known studies that prove otherwise.

Section 6.2 of Appendix C concludes that the No Action alternative (no lease awarded) would mean that it would likely not be viable for EMI to maintain the ditch system. The EIS needs to include supporting information for this conclusion. It also needs to further explore the beneficial impacts of

the No Action alternative on native stream life, offshore fisheries, cultural use, recreational use, and aesthetic use.

The EIS needs to discuss and analyze the possibility of others such as County or State maintaining portions of ditch system for a much-reduced level of diversion. The idea is simple dismissed as “too speculative” at this time, although the Maui Board of Water Supply has issued a report after investigating the topic.

EIS needs to discuss the implications of the fact that EMI controls the 4 levels of ditch system west of the lease area, which are connected to the East Maui ditch system, but not affected by the lease decision.

Section 6.3 concludes that the Reduced Water alternative (alternative 2) would result in more ditch maintenance required and “more human activity in area and greater chance of potential for negative impacts.” This section also concludes (with no proof offered) that “increased water flows in the stream would likely have very little impact on native land-based flora and fauna” and that “Impacts on aquatic fauna (damselflies, etc.) would vary by stream.” The EIS offers no proof that either of these conclusions is true, yet they are offered as a rationale to decision makers to support the Alternative 1 lease.

Appendix C refers to a future Management Plan for the Lease area that will be done by the State of Hawaii for the lease lands as part of any future lease agreement. The lease requirements found in HRS 171-58 specify that A&B/Mahi Pono need to jointly prepare a management plan with the State:

“(e) Any new lease of water rights shall contain a covenant that requires the lessee and the department of land and natural resources to jointly develop and implement a watershed management plan. The board shall not approve any new lease of water rights without the foregoing covenant or a watershed management plan.”

Appendix C - “Assessment of Terrestrial Flora and Fauna” makes absolutely no reference to any need for restoration or management of the public lands in its analyses or recommendations. The DEIS clearly quantify the impacts of a long term lease, and must evaluate and mitigate those impacts.

Section 6.5 discusses Alternative ownership/ Management of the ditch system and lease area- and concludes that such management “would have effects identical to those described in the “proposed Action” on Terrestrial Flora-Fauna. The DEIS needs to include analysis of increased investment in watershed management that could come with a new “ownership” model.

Section 6.6 dismisses the Greater Public Access alternative (smaller lease area) and concludes that greater access would impact flora and introduce more alien species and impact habitat of native birds. The DEIS needs to analyze the beneficial impacts of increased access that results in greater restoration/management activities in the watershed lands, as has been the case in various areas on Maui that manage public access.

Section 7 offers Avoidance & Minimization measures such as :

- Biological monitor during maintenance in waterfall /cliffside areas
- Wash and inspect equipment before maintenance
- inspect any materials used for maintenance
- monitor ESA damselflies- work with USFWS
- training for onsite staff to recognize endangered species
- sensitivity to i'iwi nests during tree trimming
- use of barbless strand for top wire of fences to avoid bat injuries

While these would be a step forward from current conditions, there is no accountability for these practices actually being employed. Take the example of fencing mentioned. Thousands of acres of Mahi Pono land have recently been fenced, some of which has stands of trees that could serve as potential endangered bat habitat. All of the fencing observed has barbed wire on its top strand, which is detrimental to bat survival. Will all this be changed only if the lease is granted?

25. Historic Resources Assessment (Appendix E)

DEIS consultants have misrepresented East Maui Lease conditions to SHPD, after SHPD initially requested an AIS be done. The Action was described as “involving no ground altering activities” in order to be exempted for performing any ground based Archaeological Inventory Survey.

The 3-day field visit of 21 intakes on the EMI system cannot be held up as any proof that historic sites are not present either on state or EMI lands. The Fig 47 map in Appendix E indicates that 8 of those intakes were located on EMI land. Mahi Pono has informed the public that if they secure 30-year leases they plan to invest \$2 mil in ditch repairs. Other repairs and maintenance are needed on roads and ditch trails. A number of intakes on fully restored streams still need to have construction work undertaken. All of this ground altering construction activity has the potential to affect cultural and/or historic sites.

These are all secondary impacts of the 30 Year Lease being granted. SHPD should be fully informed of the secondary impacts and proposed activities in an area with no previous Archaeological review, and a full AIS should be completed,

EMI maintenance activities associated with the leases will take place both on State and EMI land, and both should be included in a full AIS as part of the EIS process.

The EIS needs to include ground surveys of the roads and trails found in the lease area, which are also historic properties. Many stone paved trails are found in the East Maui Lease area, but these are not mapped or referred to in Appendix E.

The Proposed action will involve, as secondary impacts, extensive mechanical clearing of these same roads, as well as EMI ditches and intake areas. It will also include the agreed upon modification of intakes to restored streams in the Lease Area ordered by CWRM.

The EIS cannot meet the HAR 11-200-16 content requirements “ to discuss all relevant and feasible consequences of the action” if it ignores the fact that these secondary impacts will occur as part of the granting of a 30-year lease to access state lands and maintain EMI ditch system and trails.

Whether these actions occur on state lease land or on EMI lands, our State Historic preservation laws would require an Archaeological field survey, to determine the presence or absence of historic properties, if the agency was aware of the true nature of the implications of the 30-year lease.

None of these sites have been recorded: Patsy's Minks family (Takemoto's) lived in the Waihinepe'e area and the same area included the legendary pohaku that gave the valley its name when it sheltered an escaping Ali'i wahine. This pohaku is near an EMI access road. The historic review also ignores historic sites located in Mahi Pono fields, like the Papanene Heiau in the Spreckelsville area and the cultural practice associated with the site. A&B operates a construction dumping ground adjacent to the heiau remains. No archaeological work has been done on the site.

These are just a few examples of why the EIS is not complete, and cannot be found to have discussed and mitigated all impacts, without the addition of an AIS.

Due to lack of management of heavily diverted dry stream beds over the years, storm surges have uprooted large trees along stream banks and carried them downstream, where they put historic kalo lo'i, house platforms and other structures at risk. None of these historic properties have been surveyed or recorded in the lease area, except by volunteers. After 140 years of diversions, it is time for EMI to undertake a proper historical survey. The EIS needs to include this information, analyze potential impacts, and propose appropriate mitigation.

Unintended destruction of Hawaiian historic sites also impacts native Hawaiian cultural practice, which the EIS should also discuss and mitigate by directly involving East Maui communities in historic site preservation activities. Aha Moku Council representatives also refer to historic sites in the state or EMI lands surrounding the EMI ditch system, and Aha Moku representatives for Hamakua and Ko'olau moku should be part of the AIS fieldwork process.

26. Cultural Impact Assessment (appendix F)

The EIS does not fully acknowledge the impact that past and proposed reduced stream flows have had on the native stream life and marine life that is so directly connect with the ability of Native Hawaiians to engage in traditional cultural practice of fishing and gathering in East Maui.

Appendix F, the Cultural Impact Assessment (CIA), concludes that as long as Stream Flow standards are met in the East Maui streams subject to the 2018 Water Commission decision, all other streams can be diverted with no impacts to traditional Hawaiian cultural practices. It also concludes that the East Maui coasts do not have reefs, and therefore do not support related marine species, even though information in Kama'aina interviews mentions the importance of stream flows to the abundance of ocean fisheries and related cultural practices of fishing and gathering. This conclusion does not reflect generational knowledge, or marine life and stream life studies from East Maui found in the statements of numerous East Maui kama'aina included in Appendix F.

Hawaiian cultural users whose interviews are in the CIA agree: increased stream flows are needed to support stream and marine life in enough abundance to allow traditional gathering from both streams and ocean coastlines. The EIS does not include recent studies of marine fish populations in East Maui or recent interviews with East Maui residents. These residents inform us they have

observed that the recent increase in East Maui flows due to the closure of sugar, with stream diversions reduced to 20-25 mgd, has already resulted in increased fish populations in East Maui.

The EIS needs to include studies on current fish populations, and needs to discuss how this trend of increasing fish populations that support traditional Hawaiian gathering practices can continue, rather than not mention that it is happening.

The EIS also needs to evaluate the Cultural impacts of diverting the 12 streams in the Huelo lease area that were not evaluated in the CWRM IIFS proceeding. These streams have had regular flows for the past two years, allowing residents of the surrounding communities a chance to gather native stream life.

27. Mitigation Measures

The mitigation measures proposed on page viii need to be strictly enforced; for example, it only takes one exception to introduce an invasive species.

In order to make them effective, all mitigation measures must be mandatory. For example, the wording “A monitor should have familiarity with plants of the area” needs to be changed to say “A monitor shall have familiarity with plants of the area.” Also, instead of “recommending” consultation with lineal and cultural descendants of the area in the event that iwi kūpuna and/or cultural finds are encountered, such consultation needs to be required.

The DEIS also needs to present a detailed plan – to include funding - about how these mitigation measures will be enforced.

28. The Draft EIS needs to clearly indicate how much diverted surface water, water from development tunnels, and/or water from wells will be available to meet A&B’s diversified ag needs from areas outside (east and west) of the proposed lease area. Specific information should be provided about these sources and their output to the EMI system. Currently, the DEIS **only discusses East Maui Lease stream water and well water**.
29. Information contained in the main body of the DEIS and its Appendices should be fully reflected in the Executive Summary.
30. Maps Need More Clarity:

The Fig 1-1 ditch system map does not very clearly delineate the EMI ditch systems. The colors used to indicate abandoned or active ditch sections are not very distinguishable. The dotted lines used to indicate ditch tunnel sections make the relationship of the various ditches hard to determine. Showing sections of the lease area at larger scale (zoomed in) and using contrasting colors to mark tunnel sections would facilitate public review.

The DEIS does provide several additional maps. (Fig 1-1, 1-3, 2-2, 2-2. All are more detailed, but they are still hard to understand.

Fig 1-3 shows the Alexander and Baldwin (A&B) use area for diverted water but does not indicate the County of Maui Department of Water Supply (MDWS) use area that depends upon the EMI diversions. The EIS needs to provide this information.

Fig 2-3 shows the MDWS service area, but needs to show which parts can be served by the Upper and Lower Waikamoi pipelines, which parts are served by the Wailoa ditch, and which parts are served by wells.

Fig 2-4 shows MDWS treatment plants and the upper Kula ditch, but needs to show which areas are served by these facilities.

- The location of the MDWS aqueduct systems (Upper and lower Kula Pipelines) which occur almost entirely outside the lease area and are not dependent upon continued water diversion from the lease area by EMI is not illustrated at all in the DEIS; it needs to provide this information.
- The DEIS needs to show and discuss the area containing streams outside the lease area that are diverted by EMI and provided to the A&B use area regardless of the outcome of the License agreements

All of these are important parts of the information the Board of Land and Natural Resources (BLNR) needs in order to understand what the EMI system does. If these items are not included on this map, new maps should be created to clearly include this information.

- In chapter 4, Fig 4-15, the “Haiku” label is actually in Hamakuapoko west of Maliko Gulch. Haiku is located east of Maliko Gulch.
31. In Appendix E, fig 47, the field inspections map has the label “Ho’olawa” where the stream and community of Honopou is located. It has the label “Haiku” where the Honopou stream intake on New Haiku ditch may be located. These labels create confusion, and need to be corrected.
 32. The DEIS states that, “Settlements along Hāna Highway from west to east, toward Hāna, include Huelo and Kailua makai of the Huelo License Area, Ke’anae and Wailua makai of the Ke’anae License Area and Nāhiku makai of the Nāhiku License Area.” Many communities in the lease area have no public water systems, and the DEIS needs to specifically discuss mitigation plans to restore sufficient flows to Puniawa, Ho’olawa, Mokupapa, Honokalā, Waipio, East Waipio, Waipio iki and Hanawana streams to provide domestic water to the hundreds of families who live in these communities. Their streams are not part of the 2001 IIFS petition for the East Maui Lease areas, yet the continued diverted conditions of their streams impacts their daily lives and their rights to have sufficient water for their domestic needs.
 33. Section 1.1 states that the “need” for the Water Lease is due to the lack of existing adequate alternative sources of water and infrastructure to meet these demands. This section of the DEIS needs to clearly define the amount and location of A&B acreage that actually needs irrigation, the availability of additional EMI sources of stream water outside the lease area, and the availability of reclaimed water from the Wailuku-Kahului wastewater treatment plant, to provide that irrigation. It also needs to note that a portion (roughly half) of the water in the Upcountry MDWS system comes from diversions outside the proposed lease area, or from fresh water wells, and is not dependent on the EMI system. The DEIS also needs to discuss the new Upcountry wells being planned by the MDWS and DHHL as potential “alternative sources”. None of this is made very clear by maps or text in the DEIS, and this needs to be corrected.
 34. The DEIS needs to discuss the current “Memorandum of Understanding” (MOU) executed between EMI and MDWS. It should also refer to the section of the MOU where both A&B and DWS agree to

work on plans to restore stream flows if agricultural needs change (which they already have!!) The DEIS should specify those plans for stream restoration that have been discussed by A&B and DWS.

35. The DEIS should have an accurate list of streams that are diverted by the Wailoa-Ko'olau Ditch: East & West Wailua Iki, and East & West Wailua Nui, Waipio, Hoalua, Ho'olawa, Na'ili'ili haele, Kailua, Waiohue, Kopili'ula, Wahinepe'e, Waiokamilo, Puakea, Puaka'a and Palauhulu.
36. The Alternative's section of the DEIS needs to discuss crops and growing methodologies that will use significantly less water than the maximum amount allowed by the IIFS. The Maui Tomorrow Foundation's report, "Mālama 'Āina: A Conversation About Maui's Farming Future," provides information on these proven methods. HC&S historically used their brackish wells for up to 40% of their water needs up to 2002. They are part of a reliable system. Despite this, A&B also reported being short of water 10 months out of the year, even though they had unrestricted access to all of the water they could divert from East Maui, and 25 mgd from Na Wai Eha and their system of 15 wells. This needs to be discussed in the EIS.
37. The Lowrie, New Hamakua, Manuel Luis, and Center Ditches intercept and divert dozens of streams. A complete chart of all the ditches and diversion points inside and outside of the lease area should be provided in the EIS. The County's upper and lower Kula pipelines traverse EMI lands, and are serviced by intakes on the upper reaches of several streams that flow through the East Maui lease area. The intakes, mostly above the East Maui lease area, are maintained by EMI, which charges the county for "water delivery" that arrives at the DWS reservoirs through the Kula pipelines. It is important that the DEIS clearly explains the workings of this system.
38. The DEIS should discuss the alternative of the system being managed as a public irrigation district, being managed by a partnership of agencies and stakeholders, and other possible management scenarios. Maui DWS also referred to a need to have the DEIS discuss these options in their comments. The DEIS should also discuss the option of individual lease areas being awarded to the residents of the area who depend upon the streams. Dismissal of this alternative as "speculation" and as offering "no environmental benefit" does not meet the required EIS content standard that requires a realistic examination of alternatives. The transition of other plantation ditches to irrigation districts has already happened to several Hawaii systems, and this alternative needs to be examined just as thoroughly as the evaluation of the alternative of Mahi Pono getting 88 mgd of East Maui water is examined.
39. The alternatives section needs to discuss a variety of updated fee schedules and a funding structure that creates enough revenue to actually actively manage the lease lands for watershed productivity.
40. The DEIS should clearly explain that no one else has bid on these East Maui leases, and A&B/EMI have had a defacto monopoly on their use.
41. Appendix B states that the amount of water flowing in streams has no impact on terrestrial flora and fauna. Appendix F says that cultural impacts are addressed by the 2018 CWRM decision. The DEIS needs to discuss how industrialization and dewatering of streams has left lasting and continuing impacts on the watersheds and the community members who dwell there, and who are trying to perpetuate native Hawaiian cultural practices despite artificially fluctuating water levels. The EIS should acknowledge those impacts and propose mitigation that will achieve the following:
 - a) restore watershed health and productivity in lease areas

- b) restore native stream life and viable stream flows for traditional agriculture, including in the Ha'ikū and Huelo communities.
- c) restore soil health and productivity, and adopt other regenerative practices such as windbreaks and Keyline contouring to reduce water demand in central Maui.

42. The DEIS must discuss the relative benefits of regenerative agricultural methods in future plans for the irrigated former sugar lands. Examples would be: rotational grazing; extensive cover cropping; contour plowing and water collection swales (see MTF "Mālama `Āina report referenced earlier). The DEIS cannot conclude that "sustainability" will be achieved by using the same outmoded methods that lead to past chronic water shortages and lost soil health.

43. The current set of Alternatives examined in the DEIS is extremely lacking. Dismissal of alternatives was done without factual information. The discussion of Alternatives must provide sufficient information for the reader to gain a good understanding of why particular alternatives are rejected. HAR 11-200-16 requires that:

"The draft EIS shall describe in a separate and distinct section alternatives which could attain the objectives of the action, regardless of cost, in sufficient detail to explain why they were rejected. The section shall include a rigorous exploration and objective evaluation of the environmental impacts of all such alternative actions. Particular attention shall be given to alternatives that might enhance environmental quality or avoid, reduce, or minimize some or all of the adverse environmental effects, costs, and risks."

Unfortunately, none of the 3 Alternatives considered; or the 3 Alternatives dismissed, were explored with enough rigor or objectivity to meet this standard of evaluation.

44. The DEIS needs to disclose impacts of continued large scale diversions in the event of climate change, and provide strategies for the EMI system to respond to changes in rainfall patterns. There also needs to be a discussion of funding needed to increase resiliency and increase the capacity of the East Maui watersheds to store and release surface and ground water that will continue to supply the EMI system during changing weather events. The continued mass dewatering of streams will have impacts if rainfall patterns change; the impact of this must also be discussed.

45. The DEIS needs to discuss impacts of proposed large-scale diversions on aesthetic resources. Examples include the dry and diminished appearance of streams, pools and waterfalls enjoyed by the public during hiking and nature study and by local residents in areas like Ho'olawa, Hanawana, Mokupapa and Waipio.

46. Current EMI use of the lease area limits public use and enjoyment of public lands, as noted in comments from DLNR lands division and Na Ala Hele. The proposed lease area also includes streams that are part of recreation use at such facilities as the Garden of Eden arboretum, Twin Falls Community and Camp Ke'anae. Recreational use of many streams in the lease area, especially in local neighborhoods such as Hanawana, Hoolawa, Mokupapa, Honokala, Honopou and Huelo is already significantly impacted under the former lease conditions. The proposed diversions will continue those impacts and need to be discussed in the EIS.

47. The DEIS needs to discuss removal of decades worth of debris and waste from ditch system maintenance that has been left to clutter the natural features of the lease area.

48. If stream water is used for central Maui development, there will be a cumulative impact on public facilities and services that must be considered. A&B has "provided" stream water allotments to Maui County in the past to secure additional water meters for developments on A&B's own former agricultural lands

(such as Haiku Hill, Haiku Makai). The full range of potential development impacts resulting from this type of water allotment should be discussed.

49. The EIS needs to discuss the potential for and cumulative effects of A&B and/or Mahi Pono having access to millions of gallons of water to use for development if Ag operations “fail to be profitable.”

50. The DEIS needs to provide information on every stream in the lease area, including the amount of water that is diverted or planned to be diverted, from each section of each stream, from each stream as a whole, from each license area, and from all licensed areas as a whole.

51. Aquifers from Nahiku to Ke’anae are believed to be fully saturated, with no separated levels between the Kula and Honomanū basalt layers. (Gingerich, 1998). This implication and the deep connection between surface and ground water in a “saturated” aquifer needs to be discussed in the EIS. It should also acknowledge that diversions over the last century have had significant impacts on the aquifers and watershed health, which continue to progress; the DEIS needs to discuss the impact associated with cause a resumption of diversions.

52. Existing and ongoing impacts to our coastal waters and fisheries need to also be discussed in the DEIS. It should also be acknowledged that East Maui diversions over the last century have had significant impacts on coastal waters and fisheries, not just on Maui, but throughout the Hawaiian Islands; the proposed lease would cause a resumption of those impacts, and those impacts need to be discussed.

53. Significant native plant communities are found above Puohakamoa, Waikamoi, Haipuaena. Impacts of maintenance equipment bringing in invasive species needs to be discussed and mitigated.

54. Impacts on endangered fauna and flora (plants and avian species) need to be discussed in the EIS, as well as impacts on existing native stream life resources and anticipated impacts on all native stream life species used for traditional practices. We concur with USFWS comments, which should be used to formulate content of the DEIS.

55. Previous and ongoing impacts to archaeological resources such as lo’i, ‘auwai and house sites in the lease areas need to be fully documented. The EIS needs to discuss the fact that these types of impacts can be expected to continue if the proposed lease is granted.

56. Hamakuapoko has cultural sites in A&B and/or Mahi Pono agricultural fields that need to be identified and protected; Hamakualoa also has cultural sites in the lease area lands that need to have proper recording and protection. Old ditch structures such as the Spreckels Old Haiku ditch, are also deteriorating and drifting downstream in chunks. Impacts to all of these sites and structures, and impacts to the gathering and cultivation of traditional crops need to be addressed in the DEIS. This needs to include a discussion of impacts in areas where no restoration is being proposed, such as the Hanawana and Kailua areas, Waipio and Waipio Iki, Hoolawa, Honokala, Makapipi and Mokupapa.

57. The DEIS needs to use Kapa Maly’s East Maui study as part of the Cultural Impact Assessment.

58. Cumulative Socio-Economic impacts of A&B controlling use of such a large amount of water for 30 years, as proposed, must also be discussed in the EIS.

59. The EIS needs to discuss abandonment of ditch structures on permanently restored streams and what happens to diverted water on streams while they await “permanent restoration.” It also needs to discuss the effect of diversion design and its impact on native streamlife migration, as well as the impacts/benefits of permanently removing all ditch structures on the permanently restored streams. In addition, there needs to be a discussion in the EIS of who controls the diversion structures, how any allowable streamflow amounts will be enforced, and the relationship that public access to the leased areas has on the likelihood of streamflow violations being reported.

60. Some DWS Kula Pipelines intakes appear to divert streams in the lease area. The intake for the Nahiku DWS supply is in the lease area. Community water systems for Huelo, Honopou, Ho’olawa, and Waipio residents are in the lease area. What happens there in the lease area affects many potable water users; this should be discussed in EIS.

61. The DEIS needs to include a discussion of impacts of utilizing water for any uses other than agriculture that are anticipated over the 30-year term of the proposed lease.

62. The DEIS needs to provide details of plans to restore stream courses and watersheds in the lease area where diversions are being permanently abandoned and removed, as well as any positive and/or negative impacts of such restoration.

Mahalo for the opportunity to comment.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Albert Perez:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Following are the comments of Maui Tomorrow Foundation (MTF) re. Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. Maui Tomorrow is part of a coalition that has long requested environmental review for the removal of such large quantities of water - which is a public trust resource held in trust for all the peoples of Maui - from public lands.*

Unfortunately, now that the process is underway, we are disappointed to see that the DEIS mischaracterizes many important facts, glosses over others, and incorrectly attempts to portray the resumption of major diversions of millions of gallons of stream water every day as a benign act. This is not consistent with public representations by Mahi Pono that they want to be transparent, they don't need much water, and will take only what they need.

The type of information that must be included in the Draft EIS is specified in the content requirements established by Hawai‘i Administrative Rules (HAR) Sections 11-200-16 and 11-200-17. If these sections are not complied with, the document will not disclose enough information to government agencies, the general public, stakeholders, and decision-makers about the anticipated impacts of the project, alternatives to the proposed action and feasible

measures that might be taken to mitigate potential impacts, sufficient to allow informed decision making.

Response 1: We appreciate the Maui Tomorrow Foundation's (MTF) participation in this EIS process. We respectfully disagree with your generalized assertions that the Draft EIS "mischaracterizes many important facts, glosses over others, and incorrectly attempts to portray the resumption of major diversions of millions of gallons of stream water every day as a benign act." The Draft EIS fully complied with all relevant requirements, including the content requirements set forth in §11-200-16 and 11-200-17, and the Draft EIS even includes a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement. The Draft EIS meets the necessary content requirements and for that reason we disagree with your comment that the Draft EIS does not disclose sufficient information about the anticipated impacts of the Proposed Action, alternatives to the Proposed Action, and feasible measures that might be taken to mitigate potential impacts, sufficient to allow informed decision making.

The representations made by Mahi Pono about its desire to be both transparent and to use only as much water as it needs to implement its farm plan are accurate. The Draft EIS is extremely detailed and provides a large amount of relevant information in an effort to meet that commitment to transparency. The Draft EIS also contains the Mahi Pono farm plan that shows the planned crops and the corresponding demand for water. This is true to Mahi Pono's commitment to using only as much water as it needs. Moreover, it should be noted Mahi Pono expects to invest over \$20 million to increase the efficiency of its Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to Section 2.1.4 of the Final EIS as shown on page 2-25.

Comment 2: *Spirit of the Environmental Impact Statement Law, Chapter 343, HRS.* HRS 343-1 provides, in pertinent part, that "... the process of reviewing environmental effects is desirable because environmental consciousness is enhanced, cooperation and coordination are encouraged, and public participation during the review process benefits all parties involved and society as a whole. It is the purpose of this chapter to establish a system of environmental review which will ensure that environmental concerns are given appropriate consideration in decision making along with economic and technical considerations."

In addition, HAR 11-200-19 provides that "In developing the EIS, preparers shall make every effort to convey the required information succinctly in a form easily understood, both by

members of the public and by public decision-makers, giving attention to the substance of the information conveyed rather than to the particular form, or length, or detail of the statement.”

The 2,700-page length of this DEIS is excessive, to the point where it frustrates the legislative purpose of public participation (as expressed in HRS 343-1 and HAR 11-200-19 above) during the review process. As a result, the benefits that should accrue to “all parties involved and society as a whole” are diminished. In addition, due to its length, the legislature’s goal of ensuring that “environmental concerns are given appropriate consideration in decision making” is thwarted as well. The EIS should be made more concise, and should clearly describe the impacts of a resumption in stream diversion upon the environment.

Response 2: We acknowledge the requirements and provisions of Hawai‘i Revised Statutes (HRS) § 343-1 and HAR § 11-200-19. However, we respectfully disagree with your comment that the Draft EIS is excessively long. The Proposed Action implicates complex substantive issues with long histories. The EMI Aqueduct System has been diverting East Maui stream water for over a century as discussed in Section 1.3.2 of the Draft EIS. A&B's request that the Board of Land and Natural Resources (BLNR) offer a long-term (30-year) water lease at public auction was made on May 14, 2001 and has yet to be acted upon due to a series of regulatory and legal challenges. The proceedings before the Commission on Water Resource Management (CWRM) started in 2001 and only concluded in June 2018. In May 2001, Native Hawaiian Legal Corporation (NHLC) filed 27 petitions to amend the interim instream flow standards (IIFS) for numerous streams within the License Area on behalf of Nā Moku ‘Aupuni ‘O Ko‘olau Hui (Nā Moku), Beatrice Kepani Kekahuna, Marjorie Walleth, and Elizabeth Lehua Lapenia (IIFS petitions). The IIFS proceedings concluded 17 years later, in June 2018, with CWRM's issuance of its Findings of Fact, Conclusion of Law and Decision and Order in CCH-MA13-01 (CWRM D&O). The Draft EIS addresses this historical perspective, as required under HAR § 11-200-17.

We also note that the actual text of the Draft EIS is approximately 560 pages, which includes numerous graphics, and there are a total of thirteen appendices, nine of which were completed by technical consultants. We also note that over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M). The Applicant made every reasonable effort to convey information through the Draft EIS in a manner that is accurate, thorough, and appropriately concise in order to provide the public with an opportunity to fairly analyze the potential impacts of the Proposed Action.

Comment 3: *This DEIS is more than just deficient; in its current form, there are so many inadequacies that it would be better to start over. The DEIS does not discuss much of the information that we asked to be included in our comments on the EISPN. As detailed in our latest comments below, this document fails to meet the standards for an environmental impact statement. It does not incorporate known information about the natural and cultural resources of*

this area, and it relies on misleading assumptions for its conclusions. The DEIS fails to disclose the amount of water taken from each stream, omits essential maps, and glosses over known impacts that have long been raised by various participants in this process. These deficiencies need to be corrected; the current DEIS should be withdrawn, and a new DEIS should be released for another full DEIS public comment period.

Response 3: HRS § 343-2 defines "environmental impact statement" as "*an informational document prepared in compliance with the rules adopted under section 343-6 and which discloses the environmental effects of a proposed action, effects of a proposed action on the economic welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects.*" The Draft EIS discloses the environmental effects of the proposed Water Lease, and the impacts of the proposed Water Lease on the economic welfare, social welfare, and cultural practices of the community and State, as well as the effects of the economic activities arising out of the proposed Water Lease, and presents measures to minimize adverse effects, and also presents alternatives to the Water Lease and the environmental effects of those alternatives. Moreover, the Draft EIS was prepared in compliance with the relevant rules, including HAR § 11-200-16 and 11-200-17, and the Draft EIS includes a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement as discussed in Response #1 above. MTF's comments (letter and testimony) provided during the EISPN comment period are included in Appendix L and M together with our response to those comments. As to your general comment above that "*The DEIS fails to disclose the amount of water taken from each stream, omits essential maps, and glosses over known impacts that have long been raised by various participants in this process*" please see our detailed, point-by-point responses to your more specific comments on these topics below, e.g., Responses #15, 55, and 136. We respectfully disagree with your statement that the Draft EIS is deficient and should be withdrawn.

Comment 4: *Following is a list of our concerns. Please make sure to respond in a point-by-point fashion in the Final EIS, as required by HRS 11-200-22(c)(1).*

Scope of the Draft EIS. The Project Summary statement contains several inaccuracies that need to be corrected, as follows: "The Water Lease . . . will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui ..." This is misleading, because it is not a complete representation of the facts. A reader of this statement could come away with the idea that ALL of Upcountry Maui water needs are dependent on the granting of a lease.

Response 4: Regarding your comment that we respond in a point-by-point fashion, please note that we have provided responses to each point that you bring up in your comment letter as required by HRS § 11-200-22(c)(1).

We respectfully disagree with your comment that the representation regarding the relationship between EMI, the EMI Aqueduct System, and the Maui Department of Water Supply (MDWS) Upcountry Maui Water System is misleading as further explained below in the Responses #5 through #13 below, as well as Section 2.1.3.1 of the Draft EIS.

Comment 5: *This is incorrect, because: a) Upcountry water needs are also supplied by wells*

Response 5: The Draft EIS acknowledges that the MDWS Upcountry Maui Water System receives water from wells. Section 2.1.3.1 of the Draft EIS notes 10-20% of the water delivered to the Upcountry Maui Water System is provided by wells. Information in the Draft EIS regarding the wells was taken from the CWRM D&O. However, following publication of the Draft EIS, we received additional information from the MDWS which resulted in edits to Section 2.1.3.1. as shown on pages 2-13 to 2-20. Specifically, as it relates to wells that serve the Upcountry Maui Water System, more detail was added to accurately describe the wells and their service areas. Hence, as described in Section 2.1.3.1 of the EIS and as shown on page 2-17 of the Final EIS, although the Upcountry Maui Water System is supplied by water from wells, well water only accounts for a small percentage of the total water being delivered and is not adequate to meet the current total demands on the Upcountry Maui Water System.

Comment 6: *This is incorrect, because: b) Upcountry water needs are predominantly supplied by surface water obtained outside of the Lease Area, and treated at the Piiholo and Olinda water treatment facilities.*

Response 6: Regarding your comment on Upcountry Maui water needs being predominantly supplied by surface water obtained outside of the License Area, this statement is true for a portion of the Upcountry Maui Water System, in the areas that are served by the Upper and Lower Kula Systems. These systems are supplied primarily by the Upper and Lower Waikamoi Flumes, respectively, and the waters are treated at the Piiholo and Olinda treatment facilities as you note. As discussed in Section 2.1.3.1 of the Draft EIS, these systems are situated on private lands now owned by EMI and are operated and maintained by EMI staff. However, please note that this section mistakenly referred to Mahi Pono as the landowner of the land that the Upper and Lower Waikamoi Flumes are situated on. This has been corrected in the Final EIS as shown on page 2-13.

The source of water for these systems comes from land owned by EMI and the MDWS' right to access this source on a long-term basis is contingent upon the issuance of the Water Lease. As discussed in Section 3.3 of the Draft EIS:

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. As a consequence, domestic and agricultural water needs in Upcountry Maui would need to be met by alternative water sources that would need to be developed by the MDWS. At this

point in time, it is unknown whether sufficient groundwater resources exist in Upcountry Maui to meet these water demands. It is anticipated that the development of alternative water-source infrastructure would be prohibitively expensive, and depending upon the specific sources, or combination of sources, could result in significant direct adverse impacts to the environment.

However, please note that the above discussion regarding the Upper and Lower Kula Systems have been supplemented with the additional figure as shown on page 2-16 which has been added to Section 2.1.3.1 of the Final EIS to accurately show which system is serving which community in Upcountry Maui.

As discussed in Section 2.1.3.1 of the Draft EIS, “*The Upcountry Maui Water System relies on three surface water sources, which accounts for approximately 80-90 percent (13 mgd) of water delivered through the Upcountry Maui Water System (CWRM D&O, FOF 799).*” In addition to the Upper and Lower Waikamoi flume sources, serving the Upper and Lower Kula Systems, there is the EMI Aqueduct System, which is the primary source for the Makawao System, which provides water via the Wailoa Ditch to the MDWS’ Kamole-Weir Water Treatment Plant (WTP). As discussed in Section 2.1.3.1 of the Draft EIS, “*average daily use by the MDWS from the Wailoa Ditch is about 7.1 mgd, which includes water processed by the Kamole-Weir Water Treatment Plant (WTP) (discussed in further detail below) and non-potable water for the KAP, which receives water from Reservoir 40.*” Reservoir 40 is sourced by the EMI Aqueduct System as well. This accounts for approximately more than half of the total surface water delivered to the entire Upcountry Maui Water System.

Moreover, the water delivered to the MDWS through Wailoa Ditch is an important back-up source for the Lower Kula and Upper Kula Systems during dry periods as the Wailoa Ditch is the more reliable of the three Upcountry surface water sources. Water is pumped uphill from the Kamole-Weir WTP to the Upper and Lower Kula systems during dry periods. Therefore, these systems also depend on the EMI Aqueduct System in crucial, drought times. Please note that Section 2.1.3.1 of the Final EIS has been supplemented to include this information as shown on pages 2-19 to 2-20.

Comment 7: *This is incorrect, because: c) These surface water treatment facilities have storage reservoirs that can supply the Upcountry system for periods when there is no rainfall and little stream flow.*

Response 7: You are correct. The water treatment facilities (i.e., Olinda and Pi‘iholo), do have storage reservoirs. However, the Kamole-Weir facility does not have a reservoir. Moreover, these reservoirs are not meant to supply water for extended periods of time. History has shown that pumping water from the Kamole-Weir WTP is required during extended drought periods as discussed in Response #6 above.

10238-04

Letter to Mr. Albert Perez

Page 7 of 118

September 3, 2021

Comment 8: *This is incorrect, because: d) Upcountry water needs have historically used water from the Kamole water treatment facility only during drought periods, or when the other water treatment facilities are offline for maintenance.*

Response 8: This is not correct. As stated above, Kamole-Weir WTP is the primary source of water for the Makawao Water System/service area of Upcountry Maui. However, while the Kamole-Weir WTP is not the primary source for the areas served by the Upper and Lower Kula Systems, as noted in Response #6 above, the Kamole-Weir WTP (and thus the EMI Aqueduct System) is an important source of water for the Upper and Lower Kula Systems during times of drought, when there is very little water coming from the Upper and Lower Waikamoi Flumes.

Comment 9: *This is incorrect, because: e) The Maui County Department of Water Supply regularly uses its authority to declare several stages of water shortage, each of which results in conservation of water Upcountry, thus extending the supply.*

Response 9: Regarding your comment on MDWS declaring shortages which result in extending the supply to Upcountry Maui, this statement is correct, but only on a temporary basis. The water shortage declarations and resulting reductions in water use cause disruption and harm to Upcountry residents, businesses, public facilities, and farmers - particularly during extended water shortages.

Comment 10: *This is incorrect, because: f) It is well known that as long as the County relies on surface water, periodic water shortages and shortage declarations will continue. A statement to this effect is included in the draft Maui County Water Use and Development Plan.*

Response 10: It seems evident that if the MDWS does not develop new sources of water, periodic water shortages for MDWS customers and MDWS shortage declarations are likely to continue. Similarly, if the MDWS loses access to existing sources of water, water shortages and shortage declarations for MDWS' Upcountry customers will only get worse. The Proposed Action assessed in this EIS contemplates that the surface water deliveries to the MDWS through the EMI Aqueduct System and otherwise (as discussed in the responses above), which together supply approximately 80 - 90% of the surface water delivered through the Upcountry Maui Water System would continue.

Comment 11: *This is incorrect, because: g) Development tunnels in the Lease Area will continue to produce millions of gallons of water every day that will enter the EMI Aqueduct System, even during droughts; it will also continue to flow with or without a Lease.*

Response 11: It is not clear what specific "development tunnels" in the Water Lease License Area you are referring to. However, with respect to droughts, and as discussed in Response #13, according to the Stearns & MacDonald report you cited, only certain types of tunnels in East Maui will continue to produce water in dry weather. The rest are affected by rainfall. Any water that presently comes from any EMI development tunnels within the License Area and is

transported through the EMI Aqueduct System is accounted for in the estimated ditch flow numbers and amounts of water delivered by the system and would be affected by the Water Lease.

Comment 12: *The EIS needs to include and analyze data, available from CWRM, that provides monthly surface water production figures for the Piiholo, Olinda and Kamole surface water treatment plants, as well as the monthly pumpage reports for all of the wells that serve Upcountry Maui.*

Response 12: Your comment is unclear as to the exact information you are requesting. However, we note that the EIS does include average production figures for the MDWS' Pi'iholo, Olinda, and Kamole-Weir WTP. Similarly, the scope of your request for monthly pumpage figures for "*all the wells that serve Upcountry Maui*" is not within the parameters of this EIS, which has been prepared to assess the impacts of the proposed Water Lease, which would continue to supply East Maui surface water through the EMI Aqueduct System. However, the long-term average production of the Upcountry Maui wells, which is more informative than monthly figures, which can have considerable variance, was provided in Section 2.1.4 and Section 3.1.1.1. Moreover, please review Section 2.1.3.1 of the Final EIS, which provides information regarding the Upcountry Maui Water System, as shown on pages 2-13 to 2-20.

Comment 13: *According to Stearns & McDonald, "East Maui has few perennial streams in proportion to its size, and they are chiefly small due to the water sheds being underlain with permeable lavas. Forty tunnels recover 6 million gallons a day of high-level water in East Maui and all from structures other than dikes."*

The EIS needs to include and analyze data showing the amount of water obtained from all development tunnels and/or wells in the Lease Area. This water, which will continue to flow, even during drought, with or without a Lease, can be used to supply MDWS and/or the Mahi Pono fields in Central Maui. This information should be incorporated into evaluation of all Alternatives.

Response 13: Your comment and reference to "forty tunnels" by Stearns & MacDonald lacks specificity as you did not provide a copy of the report nor the page references. However, assuming that you were referring to their report entitled "Geology and Ground-Water Resources of the Island of Maui, Hawaii" from 1942, we did find a reference made to "forty tunnels" (though not in the same context that you provided in quotes above), in a chapter on High-Level Ground Water in East Maui. On page 141, the report cites that "*Forty tunnels driven to develop water are shown on plates 1 and 12. Pertinent data regarding the tunnels are on page 213.*" The report goes on to say that six of those tunnels are "exploratory" only. Further, on the referenced page 213 of the report, which includes a table entitled "Water-development tunnels in East Maui", that table indicates that the forty tunnels were owned by a number of parties; they did not all belong to EMI, do not all contribute to the waters gathered and transported by the EMI Aqueduct System, and thus are not within the scope of this EIS.

With respect to your comment about tunnel water continuing to flow, even during drought, we note that in the Stearns & MacDonald report, a comment is made on page 139 that *“The chief gain from tunnels that failed to recover water in East Maui is the knowledge that only valleys containing perennial streams before burial by lava will yield water to tunnels in dry weather. While certainly not conclusive, this report you cited indicates that only certain types of tunnels in East Maui will continue to produce water in dry weather.”* The rest are affected by rainfall.

Regarding your comment that this water from development tunnels needs to be evaluated into all of the alternatives, including the Proposed Action, please note that any water contributed by EMI’s development tunnels for irrigation use in Mahi Pono’s Central Maui agricultural fields is delivered by the EMI Aqueduct System, and thus is accounted for in the estimated ditch flow numbers and amounts of water available to provide to the MDWS and the Mahi Pono fields for all the alternatives in this EIS.

Comment 14: *Similarly, the following statement in the Project Summary is potentially misleading: “The Water Lease . . . will allow for the continued operation of the EMI Aqueduct System . . . to deliver water . . . for the Nahiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.” The EIS needs to provide a diagram of the relationship of the Nahiku Water System to the EMI Aqueduct System, showing exactly where it obtains its water from, and demonstrating, if possible, why it would be impacted by failure to get a lease. For example, on East Makapipi Stream, there is a separate development tunnel inside the Koolau tunnel that gathers water and pipes it OVER the water that is flowing in the Koolau tunnel to a pipe that serves the Nahiku system. This water is not commingled with the Koolau tunnel water, and will continue to flow regardless of whether the proposed lease is obtained.*

Response 14: In response to your comment requesting diagrams specifically showing where Nāhiku water comes from, please see page 2-23, which Figure 2-6 has been added to the Final EIS. Please note that following publication of the Draft EIS, the applicant received additional information from the MDWS regarding the source of the water that services the Nāhiku community. A copy of the MDWS letter is included in Appendix P to the Final EIS. Please note, the description of the Nāhiku water service from Section 2.1.3.3 of the Draft EIS, has been revised to take into account clarifications from the MDWS, as shown on pages 2-21 to 2-22.

According to MDWS, EMI’s West Makapipi Tunnel 2, Well No. 4806-07, which is also known as the “Nāhiku Tunnel”, is the sole source of water for the MDWS Nāhiku Water Service Area. It is our understanding that EMI developed and owns the Nahiku Tunnel that is the source of the water. Per a 1973 Memorandum of Understanding with EMI and HC&S as amended, MDWS can draw only up to 20,000 gallons of water per twenty-four hour day to serve the Nāhiku community from properties owed by EMI and those under license from the State. EMI continues to deliver water to the Nāhiku community pursuant to a 2018 agreement which embodied the 1973 agreement as amended, which is premised upon EMI’s continued receipt of permits or a

lease from the State BLNR. Even though the agreement provides the MDWS a right to up to 20,000 gpd per twenty-four hour day, EMI has accommodated the needs of the Nāhiku community, which have ranged between approximately 8,345 (2018) to 40,925 (2007) gpd on a daily basis, although supply of amounts over 20,000 gpd on any given day is not required under the agreement.

Comment 15: *The DEIS document needs to acknowledge that "existing conditions" and operations of the East Maui Irrigation (EMI) system for over a century already have multiple impacts on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. These current conditions need to be discussed, and viable alternatives to the status quo presented, in the alternatives section of the DEIS. The scope of alternatives discussed in the EISPN is too narrow to comply with the standards set out in HAR 11-200.*

Response 15: Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model

(Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

Regarding your comment about scope of alternative discussed in the EISPN, only two alternatives to the Proposed Action were presented in the EISPN; a "No Action" alternative and an alternative Water Lease that permitted less than the maximum amount of water that could be potentially diverted after compliance with the CWRM D&O. However, the alternatives analysis was significantly expanded in the Draft EIS based on comments received during the scoping process, as shown in Chapter 3. HAR §11-200-17(f) requires an analysis of alternatives to the proposed action "*which could attain the objectives of the action.*" The objectives of the Water Lease (i.e., the Proposed Action), as stated in Section 1.2 of Draft EIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku.

Specifically, Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were well-discussed, but ultimately not assessed to the same degree as (a) through (d). Additionally, Chapter 3 acknowledged an

alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible for the reasons discussed in Chapter 3. Moreover, based on comments received on the Draft EIS, the alternatives analysis in Chapter 3 has been further expanded within the spectrum of alternatives presented in the Draft EIS. See pages 3-2 to 3-19 of the Final EIS.

Comment 16: *The EISPN states in many places that the Proposed Action will maintain existing conditions, and that no significant impacts are anticipated. This is a serious flaw that will invalidate the entire EIS if it remains unchanged. Currently, Alexander and Baldwin/East Maui Irrigation/Hawaiian [sic] Commercial & Sugar (A&B) is using less water than they were using prior to the end of sugar operations; it may be years before they use much more.*

Response 16: Please note that at this stage, we are no longer responding to comments on the EISPN. The EISPN is used as the initial stage of the EIS process in order to scope the Draft EIS. With respect to the Draft EIS, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts. As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area. These impacts are related to stream habitat, as there will be a reduction from natural flow conditions which can be mitigated by adjustments in diversions to minimize entrainment; terrestrial flora and fauna resources, as well as historic and archeological resources, from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; cultural resources and practices which can be mitigated by a myriad of recommendations proposed by Cultural Surveys Hawai'i; and socio-economic characteristics which can be mitigated by further public outreach and consultation.

With regards to your comment about A&B / Hawaiian Commercial & Sugar Company (HC&S) using less water than in the past, this is addressed in Section 2.1.2 of the Draft EIS as follows:

East Maui, specifically the License Area, has already been affected by increased stream flows resulting from less offstream diversions due to the closure of sugar

operations in December 2016. Currently, the EMI Aqueduct System is only diverting approximately 20 mgd. As a result, very little surface stream water is currently being diverted relative to what would be allowed should the Water Lease be awarded per the Proposed Action. However, the amount of water that may be diverted should the Water Lease be issued is substantially less than the amount that was diverted during normal sugar production. For example, in 2006 it is estimated that the EMI Aqueduct System delivered approximately 156.69 mgd at Maliko Gulch, whereas under the CWRM D&O, it is estimated that the delivery at Maliko Gulch will be approximately 92.32 mgd (Akinaka, 2019).

However, please note that Section 2.1.4 of the Final EIS has been revised to reflect Mahi Pono's current and near-term expected water use as shown on pages 2-30 and 2-32, which details average water being diverted from East Maui streams through the EMI Aqueduct System and how that water will be used. It important to note that as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet the needs of the approved water uses, including the MDWS and of Mahi Pono's agricultural operations in Central Maui.

Although the Proposed Action will divert more water than under current conditions and when compared to the amount of water being diverted immediately prior to the cessation of sugarcane operations, the Proposed Action is not anticipated to result in significant adverse impacts as discussed throughout Chapter 4 as discussed above in Response #15 above. The Proposed Action cumulatively will result in the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4 albeit to a lesser extent and conditions are not anticipated to significantly change under the Proposed Action.

Comment 17: *In terms of environmental impacts of the Proposed Action, it does not matter what their stated future intent is. 'Opae and other stream life currently have access to habitat that currently exists. The Proposed Action will reduce or eliminate this existing habitat. The impacts of the proposed action must be analyzed in the current context.*

Response 17: Regarding your comment about 'opae and other stream life having access to habitat that currently exists, please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the

maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown on pages 4-61 to 4-62 of the Final EIS. The above excerpt and the updated text on pages 4-61 to 4-62 of the Final EIS present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See on pages 4-61 to 4-62 of the Final EIS. Moreover, please note that the HSHEP model includes 'opae within its analysis.

Comment 18: *Similarly, kalo farmers currently have water available for kalo that will be reduced or eliminated by the Proposed Action. The many impacts of a reduction in available water, as compared to existing conditions must be analyzed.*

Response 18: Regarding your comment that kalo farmers currently have water available for kalo that will be reduced or eliminated by the Proposed Action, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for

these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on page 1-23. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration status); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamo Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the

necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 19: *Many people at the EISPN hearings on February 22nd and 23rd, 2017 testified regarding positive impacts that they have already seen from increased stream flow resulting from the cessation of sugar operations. The EIS must discuss the following: a) Information about known impacts that occurred in the past, which are likely to occur again if water is diverted as it was in the past*

Response 19: Regarding your comment that many people at the EISPN public scoping meetings on February 22nd and 23rd, 2017 testified noting positive impacts seen from increased stream flow resulting from the cessation of sugar operations, please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See pages 4-158 to 4-159 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted. This is expected as it was discussed in Section 4.2.1 of the Draft EIS that the Proposed Action would increase the number of HU as compared to sugarcane operations. Please note that that as of October 2020, an average of 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System. Hence it can be assumed that current water diversion rates from the License Area are comparable to the amount that would be diverted under the No Action alternative, which is estimated to be approximately 26.39 mgd. The HSHEP model estimated that approximately 79.8% of total HU would be available under the No Action alternative. However, please note that under the Proposed Action, the total HU would be less than projected under the No Action alternative as noted above in Response #17.

Regarding your comment that the EIS must discuss information about known impacts that occurred in the past, as discussed in Response #15 above, we acknowledge that an EIS must

consider cumulative impacts, which means "the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions." HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision-making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease. However, please note that streams in East Maui have been diverted for over a century and it is not scientifically possible to fully document impacts that first took place more than a century ago as pre-diversion data does not exist. Please note however, that contrary to your last statement in Comment #19, the Water Lease will not allow diversions similar to what took place in the past. Significantly less water will be diverted due to the limitations imposed under the CWRM D&O. Accordingly, considerably less East Maui surface water will be applied to the Central Maui agricultural fields than was applied in the past, when these fields were cultivated in sugarcane.

Comment 20: *b) present impacts that are continuing, such as watershed degradation as a result of invasive species having gained a foothold because of low stream flows.*

Response 20: The EIS does discuss relevant environmental impacts. Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures) of the EIS provides a comprehensive description and impact analysis of the License Area, including a description of the existing environment. Moreover, as discussed in Response #15 above, although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families.

Specifically, as it relates to invasive species, it is noted in Appendix C that that low-elevation portions of the License Area are already highly impacted by invasive plants. However, it is noted in Appendix C that high-elevation portions of the License Area are predominately dominated by native species and is very likely to contain habitat for several endangered or threatened species. Impacts related to flora and fauna as a result of the Proposed Action are discussed in Section 4.4 of the EIS. Please note that Section 4.4.1 and Section 4.4.2 have been revised in the Final EIS based on comments received on the Draft EIS to further outline the existing conditions of the License Area and more accurately reflect targeted mitigation measures based on feedback provided by the DLNR and USFWS. See pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS. Moreover, as discussed in Response #17 above, it is assumed that from current conditions (approximately 23.3 mgd diverted) to the point under the Proposed Action

(approximately 87.95 mgd), the number of HU in the License Area would decrease to 63.9% of the total HU possible within the License Area.

Comment 21: *Although the DEIS discusses a public auction of the proposed lease, it is clear that the DEIS is written from the perspective of EMI obtaining that lease. If this EIS is truly intended to be able to serve for a multiple bidder auction, many more scenarios need to be included, including the possibility of bids from government entities such as the state or Maui County, bids from nonprofits, water utilities, water authorities, or bids from other for-profit companies.*

Response 21: The EIS was prepared to support the application for the issuance of a long-term Water Lease for the purpose of developing, diverting, transporting and use of the State's East Maui waters through the EMI Aqueduct System for the uses described in the EIS. The EIS also contemplates the environmental effects of variations on the Proposed Action, including scenarios where the amount of water permitted for the Water Lease is insufficient to supply Central Maui and Upcountry Maui. Thus, the EIS analyzes proposed uses of the water, but is not necessarily tied to a specific applicant although Section 1.3.3 of the Draft EIS explains how A&B, on May 14, 2001, requested that the State offer at public auction a long-term water lease under HRS § 171-58 for the, "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. Hence, any party who intends to use the water in a manner consistent with the EIS analysis could, presumably, use the EIS to support a bid on the Water Lease at public auction.

Comment 22: *The DEIS needs to discuss whether other potential bidders would need to comply with HRS 343 on their own, and if so, how the timing of submission of any associated HRS 343 documents would be coordinated to achieve the public benefits associated with making a public auction competitive.*

Response 22: Please note that neither the Applicant, nor the preparers of this EIS, have the authority to determine when an EIS is needed and whether this EIS (assuming its acceptance by BLNR), would be deemed adequate to cover a water lease scenario of a different nature than what is considered in this EIS. That determination would have to be made by BLNR as the accepting authority under HRS Chapter 343. However, as discussed above in Response #21, this EIS was prepared to support the application for the issuance of a long-term Water Lease of the State's East Maui streams through the EMI Aqueduct System for the purpose of providing water to MDWS, as noted, and to Central Maui for agricultural purposes. Hence, any party who intends to use the water in a manner consistent with the EIS analysis could, presumably, bid on the lease at public auction.

Comment 23: *Since the proposed action of issuing a lease is an agency action, the EIS also needs to discuss why it would not be more appropriate for the Board of Land and Natural*

Resources to prepare the EIS and consider all relevant factors associated with a multiple bid auction scenario.

Response 23: BLNR determined that A&B was to prepare the EIS for the proposed Water Lease. As explained in Section 1.4 of the Draft EIS, in connection with A&B's May 2001 submittal to the BLNR requesting that the BLNR offer a long-term (30 year) water lease at public auction, A&B offered to perform the associated HRS, Chapter 343 environmental review. As part of the contested case hearing on the proposed Water Lease, NHLC, on behalf of Nā Moku, objected to A&B undertaking the environmental review process, and asserted that the BLNR was required to prepare conduct the environmental review. NHLC later orally withdrew its objection during oral arguments before the BLNR in May 2015. BLNR issued an order on April 14, 2016, directing A&B to scope the EIS, including the identification of the portions of the EIS that could proceed prior to the CWRM issuing a final IIFS decision, and those portions which could not. That scope was filed with the BLNR in June 2016. On July 8, 2016, the BLNR approved the scope and instructed that “A&B and EMI should proceed with the preparation of an environmental impact statement (EIS) in as expeditious manner as possible.” The EIS recites this history in Section 1.3.3 of the Draft EIS and recognizes that the Water Lease will be awarded by public auction.

Comment 24: *The DEIS is inconsistent with regard to how the terms “lease area” and “license area” are used. In the Summary on page i, reference is made to “Issuance of one long-term lease of State land from the Board of Land and Natural Resources pursuant to Hawai‘i Revised Statutes (HRS) Section 171-58(c) for the “right, privilege, and authority to enter and go upon” the State-owned Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas ...” Judging by this language, the “lease area” is comprised of four “license areas”. However, this relationship is not maintained throughout the document; the relationship between “lease” and “license” is reversed in several sections. For the sake of clarity, our comments will refer to the “lease area” as being comprised of the four separate “license areas”. The relationship between the terms “lease area” and “license area” needs to be clearly described in the EIS, and this relationship must be maintained throughout the document in order for it to make sense.*

Response 24: Regarding your comment about the use of terms of “lease area” versus “License Area,” in the Draft EIS, please note that the EIS uses the term “License Area” when referring collectively to the four State-owned Nāhiku, Ke‘anae, Honomanū, and Huelo areas that were separately licensed under the revocable permits (approximately 33,000 acres). The term “Lease Area” is only used when referring to the Modified Lease Area alternative analyzed in the EIS as presented in Section 3.2.2.2 of the EIS. This has been corrected throughout the Final EIS where incorrectly used.

Comment 25: *We also note that the responses to our comments on the EISPN for this project were difficult to make sense of. Although we sent in 14 pages of very specific comments, the responses were very generic, and did not directly correspond to many of the points we raised. As stated previously, this frustrates the purpose and the spirit of the EIS law. As required by HRS*

11-200-22(c)(1), the Final EIS must include a) a Point-by-point discussion of the validity, significance, and relevance of comments; and b) a discussion as to how each comment was evaluated and considered in planning the proposed action.

Response 25: MTF provided a 13-page written comment letter on the EISPN, dated March 10, 2017. We also note that you, Mr. Perez, attended the public scoping meeting held on February 22, 2017. A copy of MTF's letter, the transcript from the public scoping meeting, and our responses to the comments made, were included in Appendix M of the Draft EIS, as required under HAR § 11-200-17(p).

This response letter was drafted to satisfy the requirements under HAR § 11-200-18 and 11-200-22, to include a point-by-point discussion of the validity, significance, and relevance of comments on the Draft EIS, and a discussion as to how each comment was evaluated and considered in planning the Proposed Action. Because your comment is presented in generalized terms and does not point to any specific deficiency in the response to MTF's EISPN comment letter, we are not able to respond in further detail, except to note that the requirements for responding to comments sent in response to an EISPN are set forth under HAR § 11-200-15(d) and differ from the requirements to respond to a comment on a Draft EIS, and those requirements have been satisfied.

Comment 26: *The Listing of Permits and Approvals section states that issuance of the Lease “would ... lead to construction activities such as expanding the KAP and building facilities in support of diversified agriculture in Central Maui.” The EIS needs to analyze the many impacts of other types of potential agricultural construction that could be facilitated by the issuance of a Lease, such as farm dwellings and/or farm labor dwellings in the event of creation of subdivisions or condominium property regimes.*

Response 26: We respectfully disagree with your comment. The EIS must consider direct impacts of the Proposed Action, as well as cumulative and secondary impacts. Housing within the Central Maui agricultural fields is not a "reasonably foreseeable" impact from the Proposed Action. See HAR § 11-200-2 (Definitions). Please note that no such housing or similar development is proposed. Regarding the Kula Agricultural Park (KAP), as noted in the EIS, that is a County property and the County would be responsible for any required assessments that exceed the contemplated scope of activities in that land.

Comment 27: *The EIS needs to discuss the condominium property regimes that have already been created, or could be created in the future, within the land that was sold by A&B to Mahi Pono's various LLCs. It also needs to discuss the potential impacts that would result if such dwellings were to obtain access to diverted surfact [sic] water from East Maui.*

Response 27: There is no plan for the development of dwellings within the Central Maui agricultural fields now owned by Mahi Pono. The Mahi Pono farm plan sets forth Mahi Pono's plans for those lands. An analysis of the creation of condominium property regimes or

dwellings, none of which are contemplated in connection with the Water Lease, is beyond the scope of the EIS as mentioned above in Response #26.

Comment 28: *The EIS needs to provide evidence, such as chain of title from Kingdom days, showing how each parcel of land in the lease area, as well as in the central Maui agricultural area was legally acquired, and is now the property of A&B, EMI, and/or Mahi Pono.*

Response 28: Please note that this is not within the scope of the EIS. As discussed in Response #12 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B’s former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS. Additionally, please note that the License Area is not owned by A&B, EMI, or Mahi Pono. It is owned by the State of Hawai‘i as discussed in Section 1.3.1 of the Draft EIS.

Comment 29: *The EIS needs to identify the underlying ownership of every portion of every ditch and tunnel in the lease area, and provide evidence, such as chain of title from Kingdom days, showing how each parcel of land in the lease area, as well as in the central Maui agricultural area was legally acquired, and is now the property of A&B, EMI, and/or Mahi Pono.*

Response 29: This is not within the scope of the EIS. As discussed in Response #12 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B’s former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

However, please note that as described in Section 3.3 of the Draft EIS, the Territory (now the State) of Hawai‘i and EMI entered into an agreement (the “1938 Agreement”) to facilitate and govern the continued auction of long term water licenses of the State-owned portions of the Collection Area so that, regardless of who the successful bidder at auction may be, the EMI Aqueduct System could continue to be operated across both the State-owned and Mahi Pono/EMI owned lands by EMI, the licensee (if not EMI), the State, or both, as the case may be. Section 3.3 of the the EIS has been expanded to discuss this, as shown on pages 3-24 to 3-25. Moreover, please note that the 1938 Agreement has also been included in the Final EIS as Appendix R.

Comment 30: *The EIS needs to provide a clear explanation and diagram(s) of the management and financial relationships among A&B, EMI, the Canadian Public Sector Pension Investment Board, Trinitas, Pomona Farming, and Mahi Pono. It also needs to evaluate exogenous events like natural disasters, or changes in ownership or management objectives in any one of the above mentioned entities, could impact the natural, economic, cultural and/or social environment on Maui.*

Response 30: Any management or financial relationship between the entities you listed is beyond the scope of the EIS, is not relevant to disclosing and describing all identifiable environmental impacts (HAR § 11-200-23(a)), and does not address any specific aspect of the proposed Water Lease. The scope of the EIS is discussed in Response #12.

Regarding the effects of any presently unforeseen changes in management objectives, that too is outside of the scope of the EIS. The use of the water under the Water Lease is described in the EIS and contemplates that most of the water would be used for agricultural irrigation purposes. It is expected that the Water Lease will authorize a specific character of use for the leased water and any use that is outside of that authorization would not be permitted. Regarding potential impacts due to natural disasters, those are addressed in the Draft EIS. Draft EIS Section 4.3 (Natural Hazards) addresses the potential impacts from climate and climate change, sea level rise, floods and tsunami hazards, hurricanes and wind hazards, and seismic hazards.

Comment 31: *Over the past few months, huge plumes of dust have been seen over Central Maui, which are generated by Mahi Pono farming equipment. The EIS should provide information regarding the expected farming practices of Mahi Pono, which will be facilitated by issuance of the proposed Lease, and how they will impact air quality and offshore ecosystems, including sediment-sensitive species.*

Response 31: Section 4.10 of the Draft EIS describes conditions in Central Maui, including a recognition of wildfires (“wildfires in Central Maui on fallow fields formerly in sugar cultivation, have generated intense smoke and dust over relatively short periods of time until they have been extinguished.”) and projects that the transition from sugarcane to diversified agriculture may affect air quality from an increase in equipment emissions and in the very short-term, from dust from uncultivated land. As explained in the Section 4.10 of the Draft EIS, the diversified agricultural activities in Central Maui will be subject to HAR, § 11-60.1-33, Fugitive Dust, which states, in part: “11-60.1-33(a): No person shall cause or permit visible fugitive dust to become airborne without taking reasonable precautions.” And, § 11-60.1-33(b): “...no person shall cause or permit the discharge of visible fugitive dust beyond the property lot line on which the fugitive dust originates.” Given the expanse of the agricultural fields in Central Maui, extra precaution must be exercised near its boundaries. Particularly in these areas, mitigation measures will include keeping fallow land to a minimum, using cover crops to minimize exposed soil and limiting vehicular speed during plowing activities and while traveling onsite. Also, water will be used to minimize dust during activities such as grading and grubbing, any gathered soil will be

stabilized, any loading for soil will minimize the drop distance, and soil transport will use water or soil covering to control dust.

The Mahi Pono farm team follows Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion and, thus, runoff associated with their current farming activities. As Mahi Pono incrementally increases the amount of farmed acreage over time and crops are planted (particularly the permanent orchard crops), ground disturbance will again be limited, as appropriate and consistent with farming BMPs.

Comment 32: *Under the DEIS Section 3 – Alternatives, Subsection 3.3 - No Action (page 3-6), Line 6, reads: However, under the 1938 agreement and a related calculation involving isohyet analysis of rainfall patterns, it is understood that approximately 30% of the water in the License Area streams is derived from the privately-owned lands. Therefore, the EMI Aqueduct system could continue to divert approximately 30% of the water available from the Collection Area, plus...” (emphasis ours) The 1938 agreement, Section VIII, paragraph (4), by and between the Territory of Hawaii and East Maui Irrigation Company, Limited dated March 18, 1938, reads as follows:*

Long term average water yield” shall be the arithmetical average annual water yield which would have been diverted from any given drainage area under consideration had the aqueduct system, at the time of the determination, been in existence during the entire period in which water records are available for such area, and shall be determined jointly by the Territory’s and the Company’s hydrographers based on all available applicable water measurements and long term rainfall records;

The DEIS statement “that approximately 30% of the water in the License Area streams is derived from the privately-owned lands” is a significant water resource baseline metric. As such, the variables utilized to determine the “30%” are important to understand and verify. They need to be provide in this DEIS.

Response 32: A copy of the 1938 Agreement has been provided within the Final EIS as Appendix R. The 30% figure was agreed to between the BLNR and EMI at the end of 1987, to represent the amount of water originating from private (vs. State) lands in the 50,000-acre Collection Area, and was based on estimates of the average annual total yields from the streams in License Area. Prior to that time, the USGS provided a table in which USGS estimated, for each of the four license areas, the percentages of water estimated to have arisen on State land versus private land. This was explained in the testimony and exhibits submitted to CWRM throughout the contested case hearing on the IIFS petitions. Copies of relevant documents on this subject have been appended to the Final EIS as Appendices R-1, R-2, R-3, R-4, and R-5, and are further described in Section 3.3 of the Final EIS as shown on pages 3-24 to 3-25.

Comment 33: *The ‘related calculation involving isohyet analysis of rainfall patterns’ referred to in Subsection 3.3 should be made available for public review and comment in this DEIS. This calculation should include the yield calculations as defined in the 1938 agreement: “...the arithmetical average annual water yield which would have been diverted from any given drainage area under consideration...”*

Response 33: Please see Response #32 above for an explanation of the calculations and related background information.

Comment 34: *This EIS needs to make available for public review and comment a detailed parcel listing & associated map(s) of the License Area’s ‘privately owned lands’ from which the 30% right to the stream water flow referred to in Subsection 3.3 is derived.*

Response 34: Figure 1-1 of the Draft EIS outlines in red the 50,000 acre water Collection Area and depicts in green that portion of the water Collection Area that is owned by the State (noted as the "License Area"), and depicts in yellow those lands that are partially owned by A&B and/or Mahi Pono. Figure 1-2 provides the TMK parcel numbers for the License Area (and these parcels numbers are also reflected in Table 1-1 and in the summary at page i), as these are the State properties under consideration through the Proposed Action. No more detailed parcel listings are required under HRS Chapter 343.

Comment 35: *This EIS should explicitly document the private land owner’s source of rights, if any, to divert License Area stream flow for private purposes, in light of the adoption of the State Water Code and the mandated protection of the Public Trust.*

Response 35: As discussed in Response #29 above, and as shown on pages 3-24 to 3-25, the 1938 Agreement clearly recognizes that EMI did not need a license from the Territory (now the State) to divert and convey in the EMI Aqueduct System water derived from privately owned watersheds within the water Collection Area. For purposes of the No Action (i.e., no Water Lease) alternative, it is reasonable to assume that, in the absence of a Water Lease, EMI will, *at best*, be able to continue to divert the approximately 30% of water that is estimated to represent the average annual amount that originates on private lands within the 50,000-acre Collection Area as outlined by Appendix R-5 added to the Final EIS as described in Response #32 above.

A detailed legal analysis of the 1938 Agreement is beyond the scope of assessing environmental impacts within this EIS. As discussed in Response #12 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the State-owned Nāhiku, Ke‘anae, Honomanū, and Huelo lands (License Area) for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including

A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

The No Action alternative assessed in Section 3.3 EIS assumes that if no Water Lease were issued, the EMI Aqueduct System could continue to divert approximately 30% of the water available from the Collection Area, plus approximately 4.37 mgd from the privately owned lands between Honopou Stream and Māliko Gulch. That is because the rights under the 1938 Agreement are independent of the Proposed Action under consideration in this EIS.

Regarding your comment about the mandated protection of the Public Trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

Comment 36: *The EIS should state what volume percentage of the asserted 'privately owned lands' water rights are defined and documented as "appurtenant water rights", as well as the volume of water yield ascribed to this water right.*

Response 36: Please see Responses #29, 32, and 35 above, which explains the private landowner's rights to divert water from the Collection Area. A detailed analysis of the volume percentage of water that might be covered by any appurtenant rights is beyond the scope of assessing environmental impacts within this EIS. As discussed in Response #12 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 37: *The EIS should state what percentage of these private lands hold water rights only to the usufruct (riparian right) in each of the Lease Area Streams, as well as the volume of water yield ascribed to this particular water right.*

Response 37: Please see Responses #29, 32, and 35 above, which explains the private landowner's rights to divert water from the Collection Area. A detailed analysis of the volume percentage of water that might be covered by riparian rights is beyond the scope of assessing

environmental impacts within this EIS. As discussed in Response #12 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 38: *The EIS should examine and disclose the relative local financial impact of a foreign-owned (California) company, in comparison to the relative local financial impact of granting the lease to either a Hawaii based company, a Maui Water Authority, or a local nonprofit organization.*

Response 38: Under the Proposed Action, Mahi Pono will introduce new agricultural activity to the State of Hawaiʻi, which will benefit the State by increasing food production, employment, payroll, profits for farm tenants and companies supplying goods and services, and tax revenues to the State and County of Maui as described in Sections 4.7.3 and 4.7.4 of the Draft EIS as well as Appendix H (Economic and Fiscal Impact Study) and Appendix I (Agricultural and Related Economic Impacts). While profits from Mahi Pono's farming activities, when they exist, will be distributed to its investors, including but not limited to PSP, a Canadian pension fund, most of the economic benefits will remain in Hawaiʻi. Please note that farming activity typically requires significant upfront investment, with much later returns. The capital for that investment is provided by Mahi Pono's investors. Hence, the financial impact of a foreign-owned company is taken into account when assessing the Proposed Action.

Regarding your comment that this analysis should be compared with the financial impact of granting the Water Lease to a Hawaiʻi based company, a Maui water authority, or local nonprofit, please note that Section 3.1.2 of the Draft EIS contemplates alternative ownership of the EMI Aqueduct System which has been supplemented based on the County's TIG Report as shown on pages 3-19 to 3-20. As discussed in both the Draft EIS and the Final EIS, this alternative continues to appear speculative and not consistent with the objectives of the Proposed Action.

However, please note that the alternatives that were fully analyzed are those that were deemed reasonable to achieve the objectives of the Proposed Action, as per HAR § 11-200-17(f). The EMI Aqueduct System is owned by EMI and is not for sale or lease. The EMI Aqueduct System runs through both EMI-owned land and State-owned land. Through a water lease process, the BLNR does not have legal authority to require EMI to allow others to enter upon its lands or use the EMI Aqueduct System, and it would be impossible to operate the EMI Aqueduct System without access to the system in its entirety as more accurately described by the 1938 Agreement discussed in Responses #29, 32, and 35 above. The EMI Aqueduct System is owned by EMI, however, the EIS acknowledges that the some of the lands underlying the EMI Aqueduct System

are owned by the State. Pursuant to the 1938 Agreement, the Territory of Hawai'i (now the State) granted perpetual easements to EMI for the placement of the EMI Aqueduct System. Therefore, it is unreasonable to assess the comparative impacts of alternatives that seem highly speculative if not outright impossible, such as granting the Water Lease to a "Maui Water Authority or a local nonprofit organization."

Comment 39: *The EIS should describe the expected fair-market cost of water to the County that would be provided via the Wailoa Ditch/Tunnel. It should also describe the potential impacts to the Upcountry domestic water users if the cost of the small annual percentage of Upcountry water (about 26% annually) that is supplied by the lease area were to rise significantly. Similarly, the EIS should evaluate the impact on Upcountry farmers if this cost were to rise significantly.*

Response 39: There are many factors which could affect the cost of water delivered to the County of Maui. The cost of water to the County of Maui will depend, in part, on the amount of the lease payment for the Water Lease, which will be established by the BLNR. An appraisal to determine the fair market value of the Water Lease will be conducted prior to issuance of the Water Lease. Our expectation is that the DLNR, on behalf of the BLNR, will commission, or approve the commissioning of, the appraisal. The cost of water to the County of Maui also depends on the operational costs of running the EMI Aqueduct System, including all costs of complying with applicable regulations and laws.

However, as discussed in 4.7.3 of the Draft EIS, under the Proposed Action (where the maximum amount of water is limited by the CWRM D&O and therefore below historical averages), the rate MDWS currently pays to EMI (\$0.06 per kgal) will increase because EMI's per unit operating cost will increase as a result of fixed costs being spread out over a lower volume of water diverted and possible higher lease payments to the State compared to historic payments. While it is anticipated that the delivery costs to the County of Maui will increase, the exact amount of the increase cannot be known until the Water Lease is finalized. However, the estimate analyzed in the Draft EIS assumed a year 2030 water service fee rate of \$0.08 per kgal. This figure was calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, the MDWS would pay an estimated \$214,600 per year to EMI. However, please note that this discussion in Section 4.7.3 of the Final EIS has been updated to take into account the latest equivalent per unit cost under the latest revocable permit as shown on pages 4-277 and 4-283.

The Draft EIS did address potential impacts to MDWS customers should the cost of water delivery through the EMI Aqueduct System to the MDWS rise significantly. County of Maui water service rates vary by class of users (i.e., residential, commercial, agricultural, etc.), but average approximately \$4 per kgal. Inasmuch as the same water rates are charged across the nine water systems in the County there are many factors that determine the water service rate.

Due to the fact that water rates are not dependent on the service area a customer is located in, increases associated with increased water delivery costs from the EMI Aqueduct System and from new water source development for Upcountry Maui would affect MDWS ratepayers countywide, including domestic and agricultural users in Upcountry Maui. Moreover, as discussed in Section 4.7.3 of the Draft EIS an analysis conducted by Brown and Caldwell determined that the lifecycle cost of developing new water sources for Upcountry Maui customers would be \$34 per kgal, which far exceeds the current average water service rate of \$4 per kgal. Specifically, in Section 4.7.3 of the Draft EIS, it is stated:

Under the Brown and Caldwell analysis, the life-cycle unit cost of developing and operating wells is \$34 per kgal. It is noted that the life-cycle unit cost to develop new water for Upcountry Maui customers is high. In comparison, a similar analysis conducted for the Central Maui Water System showed a unit cost of less than \$10 per kgal, or less than one third the cost of Upcountry Maui water development (Brown and Caldwell, 2014). The total life-cycle cost for 7.95 mgd of new wells is \$1.2 billion. The life-cycle cost is expressed as the net present value of all the costs incurred over 25 years, including capital, operating, and maintenance costs.

Moreover, as discussed in Appendix I, from an agricultural perspective, should water costs significantly rise for Upcountry Maui water users, farming in Upcountry Maui would significantly decrease as many farms would relocate to Central Maui given the overall better agronomic conditions, cheaper rents, and cheaper water.

Comment 40: *The DEIS states that 7.1 million gallons per day of Upcountry Maui's water comes from the East Maui irrigation aqueduct system. This is VERY misleading, since only about 26 percent on an annual basis (depending on the year) is coming from the lease areas that are being analyzed in the EIS document. The rest is coming from other Mahi Pono lands, which are outside the proposed lease area, and are not the subject of this EIS. This statement needs to be corrected based on actual numbers based on CWRM water usage reports.*

Response 40: We respectfully disagree with your comment that this is misleading.

Approximately an average of 7.1 mgd is conveyed to MDWS at Kamole-Weir WTP and to the KAP from the EMI Aqueduct System via the Wailoa Ditch as discussed in Responses #5 to #13 above describing Section 2.1.3 and Section 2.1.3.1 of the EIS. This is approximately more than half ($\approx 54\%$) of the total surface water (13 mgd) delivered to the Upcountry Maui Water System.

Moreover, it is important to note that the other two surface water sources for MDWS to convey to the Upcountry Maui Water System are situated on private land owned by EMI, and MDWS'

right to access this source on a long-term basis is contingent upon the issuance of the Water Lease as discussed in Responses #5 to #13 above.

In total, the delivery by the EMI Aqueduct System, and the two other sources situated on EMI land, average 13 mgd or all of the total surface water delivered to MDWS.

Comment 41: *Impacts to Hawaiian Homelands Water Supply. §11-200-16 HAR Content requirements: The environmental impact statement shall contain an explanation of the environmental consequences of the proposed action. The contents shall fully declare the environmental implications of the proposed action and shall discuss all relevant and feasible consequences of the action. In order that the public can be fully informed and that the agency can make a sound decision based upon the full range of responsible opinion on environmental effects, a statement shall include responsible opposing views, if any, on significant environmental issues raised by the proposal.*

The current DEIS contains no specific information regarding the water reservation amounts from the East Maui lease area needed by DHHL. This information is now available and was publicly offered by DHHL staff at the Oct 9, 2019 BLNR meeting. These specific legally protected water reservations should be INCLUDED in the DEIS, and Mahi Pono water use plans adjusted accordingly to reflect this amount, in order for the public and agency comment process to be based upon accurate information. The DEIS also assumes in the Executive Summary that Mahi Pono can utilize the East Maui Water until the time that DHHL needs its reservation.

Response 41: Specific information regarding the Department of Hawaiian Home Lands' (DHHL) future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd as shown on pages 2-4 to 2-7. As explained in on pages 2-4 to 2-7, the DHHL water reservation process involves several steps before a reservation amount is formally identified. The first step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following adoption of the Beneficiary Consultation Report and an authorization to the Chairman to seek a reservation of water, CWRM could act on a reservation request related to a proposed lease.

As explained in Section 2.1.1 of the Draft EIS, DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B/EMI, Mahi Pono, the Department of Land and Natural Resources' (DLNR) Land Division, and DHHL staff and consultants. The results of the Beneficiary Consultation were presented to the HHC on May 30, 2019, as agenda item G-2. The motion passed by the HHC to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation request was approved by the HHC related to the EMI Aqueduct System for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

While Mahi Pono's current farm plan assumes the full use of the water that can be diverted from East Maui streams after compliance with the CWRM D&O, Mahi Pono will be obligated to reduce elements of its farm plan, and thus the availability of crop, to accommodate the permanent reduction in available water resulting from DHHL's allocation. The Reduced Water Volume alternative described in Chapter 3 of the EIS provides an assessment of the impacts of less water being made available for the Proposed Action, including Maui Pono farm plan in the Central Maui agricultural fields. Specifically, consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture.

You are correct that Section 2.1.1 of the Draft EIS stated, with respect to the DHHL reservation, that "*Until that reservation is physically claimed, however, it will be available for use by the lessee.*" That statement has been clarified in the Final EIS as shown on pages 2-4 to 2-7, as it is uncertain whether the DHHL reservation amount would be available to the lessee until such time as it is needed by DHHL. Such temporary uses of the DHHL reservation water are not addressed under HRS § 171-58. We further acknowledge that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessor and the DHHL would be necessary to allow any temporary use of water reserved for DHHL.

Please note that as discussed in Section 2.1.2 of the Draft EIS, under the Proposed Action, at full buildout of the Mahi Pono farm plan, it is estimated that approximately 87.95 mgd will be diverted from the License Area and an additional 4.37 mgd in between Honopou Stream and Māliko Gulch to support uses described in the EIS. However, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

Comment 42: *The Mahi Pono Farm Plan figures presented in appendix I estimate that 68 mgd of East Maui stream water will be available for Mahi Pono crops after 22.7 percent system losses, and 7.1 mgd for the Maui County DWS system. No water is allotted for DHHL in the Mahi Pono Farm Plan calculations.*

Response 42: As noted in Response #41 above, the Draft EIS included a "sliding scale" analysis of the impacts of the proposed Water Lease being issued but permitting water diversions in an amount less than what is allowed under the CWRM D&O in Section 3.2.1 of the Draft EIS. The sliding scale quantified effects based upon each 1 mgd reduction in water, and therefore provides the analytical framework for assessing the impacts of the Water Lease less the DHHL reservation amount. We also note that the Draft EIS was clear in recognizing that the water available to the lessee would be reduced to take into account the DHHL reservation. Specifically, Section 3.4.13 states:

For each 1 mgd less of surface water made available to the Central Maui fields, there is a related reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture, a reduction in direct sales on Maui of about \$1.7 million per year, a reduction in direct-and indirect sales on Maui and O'ahu of about \$3.3 million per year, about 8.5 fewer direct jobs on Maui and about 12 fewer direct-and-indirect jobs on Maui and O'ahu, and a reduction in State revenues of about \$50,000 per year.

Regarding your comment the 22.7 percent system losses, please note that this does not occur in the EMI Aqueduct System but rather in the Central Maui Field Irrigation System, beyond Kamole-Weir (the point at which water is conveyed to MDWS). This clarification has been made throughout the Final EIS as shown on pages 2-11, 2-27, 3-12, and 4-76.

Comment 43: *A discussion of whether it is legal for A&B/Mahi Pono to assume that the DHHL “water reservation” can be utilized by Mahi Pono until it is “needed by DHHL” should also be included in the DEIS. It is our understanding that the Waiola o Molokai vs DHHL case dealt with a similar situation, and the DHHL prevailed.*

Response 43: The issue raised in your comment above was addressed by the Supreme Court of Hawai‘i in *In Re Wai‘ola O Moloka‘i*, 103 Hawai‘i 401, 83 P. 3d 664 (2004), but the facts are very different from the current situation considered in this EIS. That case dealt with a DHHL reservation in an aquifer in a designated groundwater management area. DHHL contended that the reservation was an “existing legal use” entitled to priority over the requested use of ground water use permit applicants. The Supreme Court disagreed, stating that while DHHL’s “reservation” was a public trust purpose that was entitled to protection, that it did not constitute an “existing legal use.” More importantly, in the related subsequent case of *In Re Kukui (Molokai), Inc.*, 116 Hawai‘i 481, 174 P3d. 320 (2007), the Supreme Court ruled that CWRM, was “by no means, categorically precluded from approving uses which may compromise DHHL’s reservation, so long as the Commission’s decision is ‘made with a level of openness, diligence, and foresight commensurate with the high priority these rights command under the laws of our state.’” *Id.* at 116 Hawai‘i 491, 174 P.3d 330.

As discussed in Response #41 above, the EIS has been clarified to indicate that it is unknown whether the DHHL reservation amount can be used by others until such time as DHHL has a need for the water. We further note that we are not aware of any statutory restriction that would prevent the use of the DHHL reservation and point out that the use of the reserved water may be addressed through the CWRM reservation process or BLNR lease process.

Comment 44: *There is no indication in the DEIS how the Mahi Pono Farm Plan will be adjusted to accommodate the 11.5 mgd of East Maui Water that DHHL is reserving. The EIS should plainly discuss this, as well as whether such adjustment would be based upon a need for more water over the first few years of planting, and less water when crops are established, using regenerative agricultural methods, as was envisioned in the 2018 CWRM Decision and Order:*

“115. The estimated water requirements will change not only because some potential partners and lessees are expected to rotate multiple crops that could potentially have different crop coefficients but also because water requirements could change significantly through the use of regenerative agricultural methods.”

Response 44: As mentioned above in Response #41, the Draft EIS was clear in recognizing that the water available to the lessee would be reduced to take into account the DHHL reservation and as discussed in Section 2.1.4 of the Draft EIS that the Mahi Pono farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, which includes the DHHL water reservation. Moreover, as noted above in Response #41, the sliding scale quantified effects based upon each 1 mgd reduction in water, and therefore provides the analytical framework for assessing the impacts of the Water Lease less the DHHL reservation amount.

Regarding your comment about the water requirements of the proposed crops in the Mahi Pono farm plan, water requirements were based on crop coefficients. Specifically, Table 2-1, which has been revised in the Final EIS as Table 2-2 as shown on page 2-29 shows the water requirements of the proposed crops.

It should be noted that the water need for agriculture will change over time, but that change is based on so many unknown factors (soil conditions, crop spacing, etc.) that it would be speculative to predict the reduction in water over time. This is true even taking into account the regenerative agricultural practices that Mahi Pono will implement, such as the widespread use of compost and weed barriers. It is noted that if the crops require less water over time due to the implementation of these regenerative agricultural practices, then Mahi Pono intends to plant additional crops in areas that are currently planned to be unirrigated pasture due to the lack of enough water to irrigate all 30,000 acres of land. Hence, under the Proposed Action, at full build-out, all of the maximum allowable water available for diversions would continue to be diverted.

Comment 45: *If Mahi Pono Water demand is expected to decrease over the years, as suggested by the CWRM 2018 review, a timetable for restoration of non-IIFS streams in the Huelo Lease area should also be discussed in the EIS.*

Response 45: The CWRM D&O was issued in June 2018 and included the A&B diversified agriculture plan. Mahi Pono did not purchase the Central Maui agricultural fields from A&B until December 2018, which was after the issuance of the CWRM D&O. The Mahi Pono farm plan is not anticipated to have a decrease in water demand over the years, though at full build-out, it will require significantly less water than utilized when sugarcane was cultivated on these same lands. So while there is a total decrease in water demand over historical sugar operations, as with any new and growing farm operation, the water demand of the Mahi Pono farm plan is expected to increase over the years until full build-out. Moreover, as discussed in Response #44, if more water were to become available in the future, Mahi Pono intends to plant additional crops in areas that are currently planned to be unirrigated pasture due to the lack of enough water to irrigate all 30,000 acres of land.

Comment 46: *Lack of Accurate Information re. the Viability of the Mahi Pono Farm Plan. The EIS should acknowledge that Mahi Pono has no track record of successful farming under Maui conditions.*

Response 46: The Mahi Pono team has significant experience cultivating diverse crops and managing cattle operations on more than 100,000 acres on the continental U.S. Also, the company has established market channels, and substantial financial resources. In its first 18 months of existence, Mahi Pono has hired over 200 workers from Maui, most of whom have farm experience on the island. It is acknowledged that Mahi Pono is new to farming in Hawai'i. However, they come with significant farming credentials that bode well for a diversified agricultural undertaking of the size contemplated for the Central Maui agricultural fields. If Mahi Pono is successful, Central Maui will be able to remain in cultivated agricultural open space, and be put into use in a manner consistent with numerous State and County land use plans and designations.

Comment 47: *A&B's SEC filings inform their shareholders of the risk that plans for diversified farming on their Maui lands may not work out, even given the Company's long history of farming. A&B's 2015 SEC filing states:*

"The Company is currently evaluating several categories of replacement agricultural activities in the transition to the diversified model, including but not limited to energy crops, agroforestry, grass finished livestock operations, diversified food crops/agricultural park, and orchard crops. There is no assurance that the Company's replacement agricultural activities will be economically feasible or improve the Agribusiness segment's operating results."

The EIS needs to provide the same disclaimer, and should not predict the entire success of Mahi Pono farming operations based on how much East Maui water is sent to Central Maui.

Response 47: A&B's SEC filings are not within the scope of the EIS, nor does HRS Chapter 343 require such a disclaimer about the financial feasibility of a particular undertaking. As discussed in Response #12 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

It seems entirely evident that the Mahi Pono farm plan will require water, and the more reliable access to water that can be provided to the Central Maui agricultural fields, the greater the ability for Mahi Pono (or any farmer) to be responsive to the ever-changing agricultural market

demands while also being sensitive to the existing local farming community. However, the EIS provides two versions of the Mahi Pono farm plan. One version anticipates farming under a Water Lease that authorizes diversions in the amount consistent with the CWRM D&O. The other version contemplates the farm plan in the event that there is no Water Lease. Please see Chapters 2 and 3 of the EIS. As such, the EIS does not "predicate the entire success of Mahi Pono farming operations on how much east Maui water is sent to Central Maui" as stated in your comment.

Please also note as discussed in Response #46 above that, while success can never be predicted for any business or organization, Mahi Pono is well positioned to take on the challenge of putting Central Maui back into sustainable agriculture.

Comment 48: *The EIS needs to provide accurate information about the benefits of Central Maui farming. The numbers provided for proposed Mahi Pono profits and past performances of HC&C sugar do not seem logical:*

(Executive Summary, page v) "Mahi Pono farm plan is projected to generate more than 338 pounds per year of crops, generating \$155.9 million per year in annual food sales and \$329.5 million per year in combined direct and indirect sales." This would mean each pound of crop brought a return of \$461,242. The EIS needs to describe what kind of crop would bring this type of return, or correct what appears to be an obvious error in the calculation.

Response 48: The production figure in the Executive Summary of the Draft EIS should read 338 million pounds per year, not 338 pounds. This was a typo and has been corrected in the Final EIS, including the Executive Summary as shown on page xii.

However, please note that Section 4.7.3 and Section 4.7.4 of the Draft EIS correctly describes accurate information regarding the benefits of the Mahi Pono farm plan. At Section 4.7.3:

At full operations, the Mahi Pono farm plan will cause a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops. Annual sales are expected to reach \$155.9 million. The pastures would support a cattle herd of about 7,300 cow-and-calf animal units, produce over 4,300 calves per year, and generate revenues of about \$4.8 million per year. The solar farm would generate about 82,125 mW of electricity per year, with revenues of about \$8.2 million per year. Combined farm and energy revenues would reach \$168.9 million per year in direct sales (far exceeding the 2006 revenues from sugar production of \$101 million, and the \$116 million average for the 2008 to 2013 period).

And at Section 4.7.4:

At full development, the Mahi Pono farm plan would result in a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops.

Impacts related to agricultural economics are discussed in detail in Section 4.7.4 of the EIS based on findings in Appendix I. Please refer to Section 4.7.4 and Appendix I to see discussions regarding the numerous benefits anticipated as a result of the Proposed Action. In summary, at full build-out, the Mahi Pono farm plan is anticipated to produce a significant amount of crops for both local consumption and export generating significant beneficial economic and fiscal impacts, providing numerous direct and indirect jobs, State and County tax revenues, etc.

Comment 49: *Table 6 in Appendix I lists “recent sugar” payroll of \$68,000,000 a year. HC&S had 675 workers when they announced that sugar would shut down in 2016. Did those workers earn an average of \$100,740 a year (\$68 mil divided by 675)? The EIS needs to provide a factual basis for this claim, and all claims, made in the document.*

Response 49: As described in Section 4.7.4 of the Draft EIS and shown in Table 5 (not Table 6) of Appendix I, the employment figure for Recent Sugar (Years 2008 to 2013) was 620 direct jobs earning \$34.3 million per year, or an average of \$55,295 per job. The \$68 million payroll is for both direct and indirect jobs.

The category of indirect payroll covers fringe benefits such as medical and dental plan premiums, long-term disability and group life insurance premiums, contributions made to retirement plans, vacation payments, post-retirement expenses, and payroll taxes; i.e., things paid for by the company for the benefit of the employee. It should also be noted that only 15-20% of the employees on payroll were salaried staff including agronomists, chemists, engineers, and accountants. Most of the other employees worked significant overtime at 1.5 and 2 times the published pay rates. Section 4.7.3.4 of the Final EIS has been revised to clarify the components of indirect payroll. See page 4-284 of the Final EIS. The payroll figures were obtained from A&B as noted in the list of references to Appendix I.

Comment 50: *The potential “recent sugar profits” presented in Table 6 of Appendix I also needs additional information. A&B’s SEC filings (10K reports) show a very different range of “profits” from 2009 to 2015 – the most recent era of sugar growing. In only 4 of those 7 years did the sugar operations show a profit (2010-2013.) The other three years showed sizable losses. The DEIS says that all these years (2008-2013) had poor crop yields due to low rainfall, but 2014 and 2015 also showed poor returns. The DEIS needs to discuss this evidence that water availability is not the only factor that determines crop success in Central Maui. Only one year*

(2011) had a profit of \$22 mil. The average of the 4 profitable years was \$14.9 mil. The figures in the EIS should reflect accurate amounts, not cherry pick one promising year.

Response 50: The scenario “Recent Sugar” covers the years 2008 to 2013, and the profits are derived from both direct sales and indirect sales related just to HC&S (Maui sugar operations). The numbers in A&B’s 10-K reflect not only the Maui sugar profits, but also the company’s total agribusiness operations combined, including Kauai Coffee, KT&S, A&B Fleet Services, and A&B’s renewable energy projects, which were much broader than just HC&S. Therefore, the numbers are not comparable. The figures used in the EIS were not “cherry-picked” but rather chosen to reflect just Maui sugar operations, as is relevant for this EIS. Moreover, Appendix I of the Draft EIS acknowledged that “This period is not typical of sugar operations in that rainfall was below normal, water returned to East Maui streams was large enough to adversely affect sugarcane operations, and HC&S struggled to achieve profitable operations.” Mahi Pono’s plan for diversified agriculture in Central Maui is entirely different from HC&S sugarcane farming on those lands, and as stated in the Draft EIS, the Mahi Pono farm plan is a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e. orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community.

Comment 51: *A&B’s 2015 10-K statement (filed with the Securities & Exchange Commission) acknowledges that the four state lease areas supplied “approximately 58 percent of the irrigation water used by HC&S “and “A&B also holds rights to an irrigation system in West Maui, which provided approximately 15 percent of the irrigation water used by HC&S over the last ten years.” This would indicate that 27 % of irrigation water came from A&B wells.*

Response 51: Water from the West Maui irrigation system is beyond the scope of the EIS. That water does not contribute to the irrigation of the Central Maui agricultural fields. The EIS looks at the water diverted from East Maui streams through the EMI Aqueduct System. The EMI Aqueduct System does not combine water with the West Maui irrigation system as they are completely separate systems. Moreover, the source of water for the West Maui irrigation system comes from privately owned lands and is not from State-owned lands. Hence, the West Maui water is not included in this analysis.

Regarding the use of well water, Draft EIS Section 2.1.4 (Central Maui Field System) explains:

In addition to the surface water imported from the EMI Aqueduct System to the Central Maui field irrigation system, the irrigation infrastructure includes fifteen brackish water wells that can supplement surface water to approximately 17,200 acres of the plantation at the lower elevations (CWRM D&O, FOF 738). These brackish wells extract groundwater from the subsurface aquifers lying beneath the agricultural lands, and which are cyclically dependent on recharge derived

from the irrigation of the overlying lands by water from the EMI Aqueduct System. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water. Groundwater, however, can be delivered to 7,000 acres at higher elevations via a shared pipeline that served as a penstock line for a hydroelectric unit (CWRM D&O, FOF 739).

Draft EIS Figure 2-5 (Central Maui Infrastructure Map) identifies the wells in the Central Maui agricultural fields. However, please note that Section 2.1.4 has been revised in the Final EIS to more accurately describe the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono, and clarifies that only 10 of the 15 wells are on Mahi Pono lands and thus available for use by Mahi Pono, as shown in pages 2-24 to 2-25 and pages 3-3 to 3-4 of the Final EIS.

The reference to 15 brackish wells was derived from the CWRM D&O, FOF 738, as that was the number of brackish wells that A&B utilized during its sugar cane operations. However, one of the 15 wells referred to, State Well No. 5128-002, does not serve the Central Maui agricultural fields and four of the other brackish wells are on lands that are not owned by Mahi Pono. As such, Mahi Pono has access to only 10 such wells. Draft EIS Figure 2-5 has been revised, as shown on page 2-24, to more accurately depict the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono to support its farm plan for the Central Maui agricultural fields.

Comment 52: *The EIS needs to include a list and map of the A&B/Mahi Pono wells available to help irrigate the Mahi Pono fields and the latest chloride tests and pumping abilities of each of those wells. The map should also depict the historical and prospective areas that can be irrigated using well water.*

Response 52: Please see Response #51 and on page 2-24 referred to therein regarding a figure depicting the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono to support its farm plan for the Central Maui agricultural fields.

In response to your request for chloride numbers for the Mahi Pono wells, please see the table below, which has been added to Section 4.2.2 of the Final EIS as shown on page 4-75.

State Well No.	TMK Number	Installed Pump Capacity	Typical Range of Chlorides (MG/L) from	CWRM Delineated Aquifer
----------------	------------	-------------------------	--	-------------------------

		(MGD)	2003 through 2014 ¹	System
4825-001	(2) 3-8-004:001	20.448	225 to 350	Pā'ia
5226-002	(2) 3-8-006:001	24.048	350 to 550	Kahului
5224-002	(2) 3-8-003:004	15.120	350 to 550	Pā'ia
5323-001	(2) 3-8-001:006	20.016	No data	Pā'ia
5424-001	(2) 3-8-001:007	5.760	400 to 700	Pā'ia
5522-001	(2) 2-5-005:021	8.640	350 to 525	Pā'ia
5422-001	(2) 2-5-005:054	10.080	350 to 525	Pā'ia
5422-002	(2) 2-5-005:020	11.664	325 to 475	Pā'ia
5321-001	(2) 2-5-005:019	30.240	400 to 1600	Pā'ia
5520-001	(2) 2-7-004:032	10.080	900 to 1600	Ha'ikū

Please note that the salinity levels fluctuate and therefore a range was provided.

Regarding your comment that a map should depict the historical and prospective areas that can be irrigated using well water, the available brackish groundwater will be used similar to how it was in the past with regards to how the groundwater is applied as discussed in Section 2.1.4:

...brackish water wells that can supplement surface water to approximately 17,200 acres of the plantation at the lower elevations (CWRM D&O, FOF 738). These brackish wells extract groundwater from the subsurface aquifers lying beneath the agricultural lands, and which are cyclically dependent on recharge derived from the irrigation of the overlying lands by water from the EMI Aqueduct System. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water. Groundwater, however, can be delivered to 7,000 acres at higher elevations via a shared pipeline that served as a penstock line for a hydroelectric unit (CWRM D&O, FOF 739). This pump station was designed and built to be an emergency water source for the high-elevation fields in the event of extreme drought.

¹ There is limited salinity data prior to 2003 and after December 2014, surface water for irrigation use rapidly declined as A&B ramped down operations prior to closing in 2016.

10238-04

Letter to Mr. Albert Perez

Page 40 of 118

September 3, 2021

Please note that a figure has been produced to correspond with the above text in Section 2.1.4 of the Final EIS as shown on page 2-26.

Comment 53: *The EIS states that Mahi Pono's farm plan will use less water than the HC&S sugar operations, and provides elaborate tables in Appendix I. The Mahi Pono Farm Plan is one plan, which includes around 34,000 acres irrigated by both East Maui and West Maui stream waters. The EIS content rules do not allow for segmentation of separate parts of the same project. The 4,000 acres of fields irrigated by West Maui Water should be included in the overall analysis of how much water is needed from which source to have a viable Mahi Pono Farm Plan. The EIS needs to clearly describe the overall Mahi Pono Farm Plan, and indicate what amounts and proportions of water for the farm plan will come from East Maui streams, West Maui streams and Mahi Pono wells.*

Response 53: It is incorrect to say that the Mahi Pono farm plan is one plan that is irrigated by both East Maui water (through the EMI Aqueduct System) and West Maui stream water. The Central Maui agricultural fields owned by Mahi Pono and repeatedly identified in the Draft EIS are comprised of approximately 30,000 acres of land and can be irrigated by water from the EMI Aqueduct System. The Mahi Pono farm plan, which is described in numerous places in the Draft EIS, including Table 2-1 (Mahi Pono Farm Plan) provides a plan for diversified agriculture over approximately 30,000 acres in Central Maui. As noted above in Response #44 Table 2-1 of the Draft EIS also indicates what water is expected to come from surface water through the EMI Aqueduct System and what amounts are expected to come from groundwater.

We respectfully disagree with your view that the EIS, which fully assesses the impacts of the proposed Water Lease, the water from which would be used for irrigation purposes in Central Maui, domestic and irrigation purposes in Upcountry Maui, is somehow taking a segmented approach to environmental review. The Proposed Action is not a part of a larger action and there is no improper segmentation. Segmentation occurs when an applicant proposes more than one "action" that triggers the environmental review requirements under HRS § 343-5. If only one action is proposed, there cannot be segmentation. Here, there is only one "action" triggering Chapter 343 review -- the proposed Water Lease. There is no "action" being proposed with respect to the 4,000 acres in West Maui, and the 4,000 acres are part of an entirely separate farming operation, and that farming operation is not irrigated by the EMI Aqueduct System and is not dependent upon the Water Lease. Further, the 30,000 acres of former sugarcane fields that are being converted to diversified agriculture under Mahi Pono's farm plan will not receive any diverted stream water from West Maui, and the 4,000 acres in West Maui will not receive any diverted stream water from East Maui. The West Maui fields are a stand-alone agricultural operation with clear independent utility and are outside of the scope of this EIS for the Water Lease.

Comment 54: *Public Trails: The draft EIS is incomplete because it does not include an inventory of roads and trails in the Ko'olau Forest Reserve. HRS 264 (Public Highways and Trails) protects public right-of-way on roads and trails owned by the state. When the Ko'olau*

forest reserve was created, all roads and trails in the forest reserve became protected rights-of-way. The draft EIS needs to be extended to show the protected roads and trails in the Ko'olau Forest Reserve.

Response 54: The Draft EIS included suitable and adequate regional, location and site maps such as Flood Insurance Rate Maps, Floodway Boundary Maps, or United States Geological Survey topographic maps. See Draft EIS Figures 4-28 (East Maui Flood Insurance Rate Map) and 4-2 (USGS East Maui Topography Map), as well as numerous other figures and maps. Requirements, if any, under HRS Chapter 264 (Highways) are outside of the scope of an assessment of environmental impacts under HRS Chapter 343. With regard to the historic trails and roads that are within the License Area, Section 4.5 of the Final EIS as well as Appendix E (Archaeological Literature Review and Field Inspection) have been revised to include the current inventory of roads and trails in the License Area as shown on pages 4-147 to 4-149. CSH completed a geographic analysis of trails and roads that appear within the License Area as depicted on maps between 1869 and 1992 and available to the public domain. The majority of roads and trails within the License Area are associated with access to the EMI Aqueduct System and these road and “ditch trails” are likely contemporary with the construction of the EMI Aqueduct System.

Figure 4-39 has been added to the Final EIS to correspond with the above text (Figure 48 in Appendix E).

Furthermore, the various public recreational facilities, hiking trails, and hunting areas in the License Area, including access points, are identified in Section 4.8 of the EIS and Figures 4-37 and 4-38 of the Draft EIS (Figure 4-40 and 4-41 in the Final EIS). However, please note that Section 4.8 of the Final EIS has been updated to include more recreational facilities and an accurate discussion regarding access into the License Area as it relates to recreational activities as shown on pages 4-305 to 4-309.

Comment 55: *HRS 171-35 (Lease provisions) requires leases to protect rights-of-way and access to other public lands. The draft EIS needs to be extended to show how the proposed water lease protects rights-of-way and access to other public lands. The Hawaii Supreme Court has ruled (1908 19 H. 168) that the lease of public land cannot affect a public right-of-way existing across it.*

Response 55: HRS § 171-35 does not require a lessee to protect rights of way and access to other public lands. To the extent that HRS § 171-35 (Lease provisions; generally) applies to a water lease, it gives the BLNR discretion on whether and how to address reservations of rights of way and access to other public lands. The section of the law you cited provides as follows:

Every lease issued by the board of land and natural resources shall contain:

1. *The specific use or uses to which the land is to be employed;*
2. *The improvements required; provided that a minimum reasonable time be allowed for the completion of the improvements;*
3. *Restrictions against alienation as set forth in § 171-36;*
4. *The rent, as established by the board or at public auction, which shall be payable not more than one year in advance, in monthly, quarterly, semiannual, or annual payments;*
5. *Where applicable, adequate protection of forests, watershed areas, game management areas, wildlife sanctuaries, and public hunting areas, reservation of rights-of-way and access to other public lands, public hunting areas, game management areas, or public beaches, and prevention of nuisance and waste; and*
6. *Such other terms and conditions as the board deems advisable to more nearly effectuate the purposes of the state constitution and of this chapter.*

The issue in the case you cited from the Supreme Court of the *Territory of Hawai‘i, Robello v. Maui Cnty.*, 19 Haw. 168 (1908) was whether the easement of the public in an existing highway was extinguished by a lease to a private party when a new road was planned at some time in the future. The Court held that the lessee took his lease with full knowledge of the existing highway due to the reference on the map and actual knowledge of the existence of the road and was therefore not allowed to erect fences blocking the old road. The Court further held that no injunction should have been granted restraining the County from removing lessee's fences to keep the public road open. This case is not applicable to the proposed Water Lease.

A new condition included in the 2020 and 2021 water revocable permits required the removal of the Hanawā NAR from the revocable permit area and calls for A&B to continue discussions with DOFAW to identify additional forest reserve lands to be removed from the License Area. The Hanawā NAR consists of approximately 7,500 acres and is further discussed in Section 1.3.1 of the Final EIS as shown on page 1-2. It should be noted that no portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the revocable permit area will result in additional public access because the NAR rules restrict public access. However, this may not be true for other areas that DOFAW may want the BLNR to withdraw from the License Area going forward.

Comment 56: *The draft EIS is incomplete because it does not include an inventory and history of roads and trails on East Maui Irrigation land. HRS 264 (Public Highways and Trails) requires that historic roads and trails are protected rights-of way. The draft EIS needs to be extended to show which historic roads and trail are protected.*

Response 56: As noted above in Response #54, Section 4.5 of the Final EIS, as well as Appendix E (Archaeological Literature Review and Field Inspection), have been revised to include the current inventory of roads and trails in the License Area as shown pages 4-147 to 4-149. CSH completed a geographic analysis of trails and roads that appear within the License Area as depicted on maps between 1869 and 1992 and available to the public domain. The majority of roads and trails within the License Area are associated with access to the EMI Aqueduct System and these road and “ditch trails” are likely contemporary with the construction of the EMI Aqueduct System.

Comment 57: *HRS 115 (Public Access to Coastal and Inland Recreational Areas) requires public rights of way to be provided at reasonable intervals to inland recreational areas. Many parts of the Ko'olau Forest Reserve are land-locked by East Maui Irrigation property. The draft EIS needs to be extended to show public rights-of- way across EMI property to the Ko'olau Forest Reserve.*

Response 57: We acknowledge your comment regarding HRS Chapter 115, but we do not view this statute as applicable to the environmental review required under HRS Chapter 343. HRS § 115-2 (Acquisition of lands for public rights-of-way and public transit corridors) provides “*When the provisions of section 46-6.5 are not applicable, the various counties shall purchase land for public rights-of-way to the shorelines, the sea, and inland recreational areas, and for public transit corridors where topography is such that safe transit does not exist.*” The County of Maui has not purchased a public right-of-way from the State or from EMI. Moreover, the provisions of HRS § 46-6.5 are not applicable. That section of the law applies when there is a subdivision into six or more lots, parcels, units, or interests. No subdivision is contemplated in connection with the proposed Water Lease. In any event, public access within portions of the License Area has been provided, as discussed in Section 4.8 of the Draft EIS, and it is expected either that public access will continue if the scope of the License Area remains the same, or, if the License Area is reduced, that public access within the former License Area lands will be dictated by a State agency. However, please note that Section 4.8 of the Final EIS, as noted in Response #54, has been revised as shown on pages 4-305 to 4-309 to include more recreational facilities and an accurate discussion regarding access into the License Area as it relates to recreational activities.

Comment 58: *The Division of Forestry and Wildlife, in their December 19, 2016 letter, included in the draft EIS, says, “Thus the Division recommends that the areas to be conveyed for a water license be done so through a land agreement that is limited to the infrastructure required for maintenance and conveyance of water, and that any terms of any agreement established for the delivery of water ensure unrestricted public access to the reserves and any state owned roads and trails.” The DEIS needs to address the positive impacts of implementing this recommendation as part of a considered Alternative action.*

Response 58: Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that

could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access to areas that are not within the License Area. Please also see Response #55 regarding the revised License Area under the most recent revocable permits and projections related to the geographical extent of the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding impacts to the areas that would allow for more public access. Moreover, impacts of the Modified Lease Area alternative are discussed in Section 3.4 of the EIS (Comparative Evaluation of Reasonable Alternatives) against different environmental resource categories.

Comment 59: *Stream and Ocean Assessment (appendix B)*

Appendix B and the DEIS conclude that East Maui stream flows don't affect conditions for marine life in East Maui, and that East Maui has the wrong ocean conditions to have substantial fish populations. Appendix B offers these conclusions even though it includes no survey of ocean fish, and measures water chemistry at only 7 of the 36 streams in the lease area.

Response 59: Your comment about Appendix B stating that the East Maui has the wrong ocean conditions to have substantial fish populations is unclear. Nowhere is this stated in Appendix B or the Draft EIS. Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean

in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams

determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83.

Comment 60: *Kumupono Assoc. study of East Maui: "Wai o ke Ola – He Wahi Mo'olelo no Maui Hikina" was prepared for A&B /EMI in 2001, and provides much historic and contemporary discussion of the robust presence of marine life along east Maui coasts and longtime dependence of East Maui communities on the sea for food supplies. The connection of fresh water stream flows to algae that feeds marine life is well established.*

The conclusions of Appendix B are erroneously used throughout the DEIS to justify the "lack of impacts" from EMI's proposed Alternative 1: diverting all the East Maui streams to the extent permitted by the 2018 CWRM D&O. The EIS needs to acknowledge that an increase of diversion from present levels will impact ocean fisheries, describe those impacts, and propose mitigations.

Response 60: Regarding your comment about the Kumupono Assoc. study of East Maui, please note that this resource was used in the Archaeological Literature Review and Field Inspection (LRFI) (Appendix E) and the Cultural Impact Assessment (Appendix F), both of which were conducted in support of the EIS.

We respectfully disagree with your comment that the conclusion of Appendix B is erroneously used throughout the Draft EIS. As stated in Response #59 above, the collected data presented in Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, because the nutrient concentrations in the ocean do not change substantially

due to stream diversions as proposed under the Water Lease, there is no pathway for fishing to be negatively impacted. This analysis means that impacts to ocean fish are negligible.

Moreover, please note that both the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) and the HSHEP model (Appendix A) involved field work in East Maui whereas the Kumupono Assoc. study of East Maui did not. The Kumupono study is more comparable to the CIA (Appendix F), involving interviews of East Maui residents and their recollections and perceptions. The CIA also notes that several commenters to the Draft EIS stated that they have observed an increase in fish returning to the nearshore coastal environments since the cessation of sugarcane operations in 2016. The CIA (CIA Section 7.5.2) has been updated to include information in the analysis of cultural impacts, specifically in the analysis of impacts to freshwater ecosystems, as summarized in Section 4.6 of the EIS, see pages 4-245 to 4-247 of the Final EIS.

Moreover, as noted within the CIA, the preferred method of fishing was open ocean fishing for the people who lived along the coast of East Maui based on background research conducted by Cultural Surveys Hawai'i (CSH) (*Ka 'Oihana Lawai'a: Hawaiian Fishing Tradition* by Daniel Kahā'ulelio (2006)). Land Commission Awards analyzed by CSH also indicate that claims were made for fresh water and off-shore fisheries.

Comment 61: *Flora and Fauna Review (Appendix C). This brief (4 days supposedly covering 33,000 acres on the ground and 1 day in the air) drive-by review of flora and fauna is entirely inadequate to inform decision makers of the impacts of the proposed action.*

Response 61: Regarding your comment about the length of time to conduct physical surveys related to the flora and fauna resources, ground and aerial surveys were conducted in 2017 and 2018 by SWCA to field-verify vegetation types and species found during previous surveying and mapping efforts. It was determined that the HIGAP vegetation data layer produced by Gon et al. (2006) was highly representative of the vegetation found in the "Study Area." Please note that the SWCA report, provided as EIS Appendix C, defined the "Study Area" as the collective License Area and the 30,000 acres of agricultural land that it referred to as the "Service Area." The HIGAP mapping data was used to estimate species distributions and potential impacts for the entire 33,000-acre License Area. Threatened and endangered species were categorized by each species' potential to occur in each vegetation type based on habitat needs. Methods have been further clarified in Appendix C, as summarized in Section 4.4 of the Final EIS as shown on page 4-113.

Comment 62: *In addition, the following deficiencies in the DEIS need to be corrected: None of the endangered damselfly populations seen by DAR surveys in 2005-06 were seen. Are they no longer found in the 33,000 acre area, or were they just missed by the superficial review?*

Response 62: Regarding your comment that none of the endangered damselfly populations seen by DAR surveys, please note as discussed in Section 4.4.2 of the Draft EIS:

*Twelve invertebrates were observed during the surveys, consisting of the Blackburn's damselfly (*Megalagrion blackburni*), Hawaiian upland damselfly (*Megalagrion hawaiiense*), citrus swallowtail butterfly (*Papilio xuthus*), Monarch butterfly (*Danaus plexippus*), housefly (*Musca domestica*), smaller lantana butterfly (*Strymon bazochii*), mud dauber (*Sceliphron caementarium*), wandering glider (*Pantala flavescens*), green darner (*Anax junius*), *Aedes* mosquito (*Aedes* sp.), walking stick (*Sipyloidea sipyilus*), and witch moth (*Ascalapha odorata*). All these invertebrates are common in East Maui.*

While the endangered damselfly species were not observed, damselfly species were observed during the survey conducted by SWCA. Moreover, it is acknowledged that other species of damselfly are known to, or may, occur within the License Area as indicated by Table 4-5 of the Draft EIS. However, please note that Table 4-5 of the Draft EIS (Table 4-10 in the Final EIS) has been revised to include the Blackburn's sphinx moth, which the United States Fish and Wildlife Service (USFWS) indicated may occur in the License Area. Moreover, during the field work conducted by Trutta in connection with the preparation of the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model, pictures of damselfly were captured and are included in Appendix A.

Comment 63: *No plant list was included in the survey report.*

Response 63: We respectfully disagree with your comment that the survey report included as Appendix C of the Draft EIS did not include a plant list. Please note that Table 4 of Appendix C includes a list of endangered or threatened plant species with critical habitat in the License Area. This table has been added to Section 4.4.1 of the Final EIS as shown on pages 4-114 to 4-117.

Please note that for the purposes of the report included as Appendix C to the EIS was not to inventory the entire License Area but rather verify an existing description HIGAP remained valid. The results determined that the HIGAP vegetation data layer was highly representative of what is present in the License Area. The HIGAP vegetation layer describes 19 vegetation cover types within the License Area which are described in detail in Table B-1 of Appendix C in the Draft EIS.

Comment 64: *The Survey does not refer to baseline data available from the extensive 1985 mapping of the East & West Wailuaiki stream basin area that was done as part of a Proposed Hydroelectric plant EIS (Kepler, 1985)*

Response 64: Regarding your comment about the 1985 EIS regarding East and West Wailuāiki streams, please note that this was reviewed by SWCA in response to this comment and no changes were required to the report included in Appendix C to the EIS or to the EIS text.

Comment 65: *The Flora and Fauna survey also included the 30,000 acres of potential farm lands (referred to as the “use area”) in the 5 day visit and did a poor job of describing impacts there.*

Response 65: Appendix C (Terrestrial Flora and Fauna Technical Report) of the EIS that was prepared by SWCA also included a survey of the approximately 30,000 acres of agricultural land in Central Maui that SWCA referred to as the "Service Area" (not the "use area" as you stated in your comment).

We respectfully disagree with your comment that the Terrestrial Flora and Fauna Technical Report did a poor job describing impacts in the Central Maui agricultural fields as it relates to the Proposed Action. The fields have been in agricultural use for over a century and under the Proposed Action would remain under agricultural use.

Comment 66: *It was not clear if the gulches in the “use area” were surveyed - they often serve as habitat areas.*

Response 66: The SWCA report clearly stated that area they designated as the "Service Area" included approximately 36,000 acres, consisting of approximately 30,000 acres of agricultural land, and approximately 6,000 acres in roads, gulches, and patches of uncultivated land. Please note that SWCA updated the description of the “Service Area,” which includes gulches, in Section 5.1.3.3 of Appendix C as follows: *"The gulches in the Service Area are composed of mostly non-native and/or invasive species. Along with the surrounding area, the gulches have been heavily impacted by prior and current land uses, such as residential and agricultural developments."*

Comment 67: *No acoustical survey for native bats was done at either survey location.*

Response 67: Regarding your comment that no acoustic survey was done to detect native bats, it was not within the scope of the EIS to conduct an acoustical study in Central Maui. It is known that the Hawaiian hoary bat occurs within this region. As noted in Section 4.4.2 of the EIS and in Appendix C, mitigation to address the potential of impacts to Hawaiian hoary bat include:

If felling of standing trees occurs during the bat breeding season, direct impacts could occur to juvenile bats that are too small to fly but too large to be carried by a parent. To minimize this impact, no trees taller than 15 feet (4.6 m) should be trimmed or removed between June 1 and September 15.

and

The use of barbless top-strand wire is recommended for all fence construction to avoid entanglement of Hawaiian hoary bat.

Moreover, please note that the above mitigation measures are also consistent with what the USFWS provided in their Draft EIS comment letter regarding the Hawaiian hoary bat.

Comment 68: *In section 5.2.3, the survey reported that no reptiles or amphibians were detected, but hikers regularly encounter a very small frog at Hanawi stream near the Wailoa ditch.*

Response 68: You are correct that the Terrestrial Flora and Fauna Technical Report provided as Appendix C noted that no reptiles or amphibians were detected during the ground surveys conducted. Moreover, it is noted that there are not any amphibians or terrestrial reptiles that are native to Hawai'i. Hence, any amphibians or terrestrial reptiles within the License Area are considered invasive species. However, please note that Trutta Environmental Solutions did observe amphibians during their stream surveys which is noted and discussed in Appendix A of the EIS. Specifically, the amphibian species observed as described in Appendix A were all introduced species. Wrinkled frogs were observed on Hanawī Stream as stated in the "Biotic Surveys" section of Appendix A.

Comment 69: *In section 6.1.1 of Appendix C the consultants conclude that under the proposed action (30-year lease) "Vegetation would remain substantially the same" in the state Lease Area. Given that Citizens have watched invasive species such as melastomes, Job's tears, gingers, African Tulip and other pests spread substantially through the Lease Area over the past 30 years of access hikes, while the density and variety of native species diminish, the EIS needs to change this conclusion, acknowledge this impact, and provide adequate mitigation. The EIS needs to address what types of mitigation would be needed to make sure that a 30-year lease would not result in the disappearance of most native species in the 1,000 to 2,000 ft elevations in the Lease Area.*

Response 69: Please note that under the Proposed Action, no vegetation removal in the License Area is anticipated except occasionally during routine maintenance and repair activities of the EMI Aqueduct System. Moreover, instream flow throughout the License Area is expected to increase and diverted water will be significantly less than what was historically diverted from the License Area during sugarcane operations. Hence, vegetation is expected to remain substantially the same and no direct impacts to flora or fauna are expected as discussed in Section 4.4.1 and Section 4.4.2 of the Draft EIS.

We respectfully disagree with your comment that the EIS does not address mitigation measures to prevent the disappearance of native species in the 1,000 to 2,000 foot elevations. The elevation

of the highest ditch that is part of the EMI Aqueduct System, the Koolau Ditch, is approximately 1,400 feet, not 2,000 feet and the EIS addresses mitigation measures that are applicable to the License Area. Appendix C and in Section 4.4.1 of the Draft EIS provide that endangered or threatened species and critical habitats exist in higher elevations of the License Area. As a mitigation measure, Section 4.4.1 of the Draft EIS states:

To avoid the introduction or transport of new invasive plant species into more pristine portions of the License Area during EMI Aqueduct System maintenance activities, all equipment and vehicles arriving from outside the License Area should be washed and inspected prior to any maintenance activities on cliff sides, near waterfalls, and in other native species-dominated areas in the License Area. Such washing and inspecting should be done at a designated location.

However, please note that the Section 4.4.1 of the Final EIS has been updated to include related mitigation measures based on comments received on the Draft EIS, as shown on pages 4-121 to 4-124.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Comment 70: *The EIS should have far more detailed information, and provide evidence before declaring that a 30-year extension of the current management style will result in "no impacts."*

Response 70: As discussed in Response #69 above, no vegetation removal is anticipated except occasionally during routine maintenance and repair activities of the EMI Aqueduct System. Moreover, regarding "management style," stream flow throughout the License Area is expected

to increase and diversions will be significantly less than what was historically diverted from the License Area during sugarcane operations. Hence, vegetation is expected to remain substantially the same and no direct impacts to flora or fauna are expected as discussed in Section 4.4.1 and Section 4.4.2 of the Draft EIS.

Comment 71: *The East Maui Watershed Partnership includes the Lease area lands on their maps, but only actively manages of East Maui lands above 3,000' elevation, which is above the Lease Area. The EIS needs to make this fact clear.*

Response 71: The lands under the jurisdiction of the East Maui Watershed Partnership span over 100,000 acres which includes the entire License Area. The License Area is actively managed by the multiple agencies and organizations, including EMWP, Maui Invasive Species Committee (MISC), DLNR, etc., in partnership with EMI.

Regarding your comment that EMI does not actively manage lands below 3,000 feet is not true. EMI continues to work with MISC by reporting sighting of invasive weeds and coordinating access in these areas, which are well below the 3,000' level. EMI personnel also monitor the License Area for signs of feral ungulates.

Comment 72: *The public waters diverted by the EMI systems are the product of two factors: a) natural rainfall, and b) the watershed lands that receive the rainfall and discharge it into springs and streams. The quantity and quality of future stream flows will depend upon the health of the surrounding watershed lands. The EIS needs to examine the impact of each Alternative on these flows.*

Response 72: We acknowledge your comments regarding the source of the public waters. Please note that the HSHEP model in Appendix A estimates streamflow at all diversion locations based on watershed and rainfall characteristics. Regarding your comment that the quantity and quality of future stream flows depend upon the health of the surrounding watershed lands, please note as discussed in Response #69 above, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans.

Regarding your comment that the EIS needs to examine the impact of each alternative on these flows, please note that the Draft EIS does analyze each reasonable alternative on stream flow in Section 3.4.3 and Section 4.2.1 of the Draft EIS. The combination of the lower and upper bounds used for the HSHEP model in Appendix A, provide the range at which we would expect changes to the diversions to fall within and provides a way to comparatively discuss different flow restoration scenarios as by definition the changes must fall somewhere between 100% diversion and 0% diversion.

Two scenarios presented in Appendix A of the Draft EIS, the Proposed Action compliant with the CWRM D&O (Trutta Environmental Solutions' 2018 IIFS scenario) and No Action

Alternative (30% remaining flow diversion) are examples of how different flow restoration scenarios result in different amounts of habitat restored. The HSHEP model is used to quantify these differences based on flow restoration changes at specific diversions.

As discussed in Section 3.4.3 of the Draft EIS, the HSHEP model requires specific diversion conditions at each diversion. Applying the model to the Reduced Water Volume alternative would require information regarding where stream flows are proposed to be increased over the Proposed Action and the amounts. Given such information, the HSHEP model is able to readily calculate the number of remaining Habitat Units (HU) in any given scenario. The appendices contained within the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report (Appendix A of the EIS) provides the necessary data to form a scenario that the HSHEP model can use to analyze and quantify the changes that occur. Hence, the HSHEP model and the appendices within the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report provides data that can assist decision makers understand how impacts could change across different diversions scenarios.

Comment 73: *In section 6. of Appendix C, the consultants conclude that the proposed action will have no Impacts- because “no habitat removal or loss is proposed...” The EIS ignores the well documented fact that dewatered streams over time lead to the decimation of native ecosystems and flora and fauna. The EIS proposes no mitigations to improve watershed health other than some mechanisms to prevent introduction of more invasive species on equipment or supplies.*

Response 73: The applicable language from Section 6 of the Terrestrial Flora and Fauna Technical Report (Appendix C) states, "*Since there is no habitat removal or loss proposed, impacts are not quantified but are described in qualitative terms.*" Regarding your comment that dewatered streams over time lead to the decimation of native ecosystems, please see Response #15 above regarding cumulative impacts.

Appendix C of the Draft EIS specifically addresses the flora and fauna considerations of the Proposed Action and alternatives. To minimize the impacts to flora and fauna in the License Area, Section 7 of Appendix C identifies several avoidance and minimization measures, including measures to avoid the introduction of additional invasive species to the License Area, which is harmful to the watershed and to native flora which are also reflected in Section 4.4 of the EIS. Moreover, regarding your comment that the EIS does not propose any mitigation measures for watershed health, Section 2.1 of the Draft EIS acknowledges the requirement for watershed management under HRS § 171-58(e).

It is recognized that Hawai‘i’s fresh water originates from the forest, which capture and absorb hundreds of inches of rain each year, allowing for slow infiltration and replenishment of our

aquifers and streams. Based upon this understanding, the legislature added sub-section (e) to HRS § 171-58, requiring the incorporation of a watershed management plan into all water lease agreements to help protect freshwater resources (surface and groundwater). In addition to sustaining ground and surface water supplies, healthy forests reduce erosion by holding soil in place, improve water quality, and provide habitat for unique and endangered plants and animals. Focusing on watershed management plans that target mauka protection actions (fencing, removal of hooved animals from important watershed forests, invasive weed control, etc.) that benefit native forests is essential if water lessees are going to have a reliable long-term supply of fresh water.

Comment 74: *The Appendix C survey provides no guidance for any restoration activities in the Lease Area, which is widely done in other EIS documents that are involved with projects, like this one, that will, by law, trigger future management plans.*

Response 74: As discussed in Response #12 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B’s former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included throughout Chapter 4 of the EIS. The impacts of the alternatives to the Proposed Action are discussed in Chapter 3 of the EIS.

Moreover, regarding your comment about restoration activities, as discussed in Response #69 above, the lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans and will be required to jointly develop a watershed management plan with the DLNR. One of the goals of a watershed management plan is to identify priority outcomes essential to maintain and *restore* biological integrity to the maximum extent practicable which include but is not limited to:

1. Removal and control of non-native hooved animals (pigs, goats, deer, sheep, cattle) from important watershed forests.
2. Removal or containment of damaging invasive plants and animals that threaten important watershed forests.
3. Monitoring and controlling other forest threats including fires, predators, and plant diseases.
4. Restoring and out-planting native species in important watershed areas and buffer zones.

5. Communication, outreach and community education to build capacity for citizen-based watershed protection.

Additionally, Appendix C provides detailed avoidance and mitigation measures to minimize impacts of the Proposed Action to flora and fauna which are summarized in Sections 4.4.1 and 4.4.2 of the Draft EIS. Moreover, the discussion of these avoidance and mitigation measures has been expanded on as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131.

Comment 75: *Appendix C and the DEIS make the erroneous assumption that 140 years of EMI use and management has had no impact on the substantial loss of native flora and fauna on public lands in the Lease Area. This assumption needs to be corrected to reflect known studies that prove otherwise.*

Response 75: We respectfully disagree with your comment that the Draft EIS and Appendix C assume that there has been no impacts to native flora and fauna in the License Area. As discussed above in in Response #15 above, we acknowledge that an EIS must consider cumulative impacts, which means "the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions." HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision-making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease. However, please note that streams in East Maui have been diverted for over a century and it is not scientifically possible to fully document impacts that first took place more than a century ago as pre-diversion data does not exist.

Section 4.4 of the EIS specifically addresses the impacts of the Proposed Action to flora and fauna resources within the License Area, including a discussion of the cumulative impacts. Appendix C (Terrestrial Flora and Fauna Technical Report) of the EIS that was prepared by SWCA included a survey of approximately 33,000 acres of land in East Maui referred to in the SWCA report as the License Area and approximately 30,000 acres of agricultural land in Central Maui that it referred to as the Service Area. These areas were collectively referred to as the Study Area throughout the SWCA report. This report is summarized in Section 4.4 of the EIS, which has been supplemented with a discussion on potential impacts on a watershed by watershed basis, using data produced by the HSHEP model and HIGAP data provided by the State, along with surveys conducted within the region as shown on pages 4-121 to 4-124.

In summary, the Proposed Action is not anticipated to have any significant impacts on the terrestrial flora and faunal resources. Section 6.3 of Appendix C in the Final EIS states that, "The

increased water flows in the streams would likely have very little impact on terrestrial flora and fauna.” Hence, this statement refers to all existing flora and fauna within the License Area and is not limited to only native species. As discussed in Section 5.1.2.1 of Appendix C in the Draft EIS, the majority (60%) of the License Area is already composed of “Open / Closed ‘Ōhi‘a Forest,” which mainly constitutes the higher elevation areas where water is not diverted as shown by Figure A-2 of Appendix C. Moreover, the immediate area surrounding the EMI Aqueduct System tends to be composed of “alien forest” which consist of non-native species.

Hence, as explained above, it is anticipated under the “Reduced Water Volume” alternative, an increase in water flow would likely have little impact on native land-based flora and fauna in the areas where more stream flow would be restored as they are removed from the direct stream environment, if there were no Water Lease (lower elevations that are made up of “alien forest”). However, as noted in Section 6.3 of Appendix C in the Final EIS, the impacts would vary on a stream-by-stream basis.

Comment 76: *Section 6.2 of Appendix C concludes that the No Action alternative (no lease awarded) would mean that it would likely not be viable for EMI to maintain the ditch system. The EIS needs to include supporting information for this conclusion. It also needs to further explore the beneficial impacts of the No Action alternative on native stream life, offshore fisheries, cultural use, recreational use, and aesthetic use. The EIS needs to discuss and analyze the possibility of others such as County or State maintaining portions of ditch system for a much-reduced level of diversion. The idea is simple dismissed as “too speculative” at this time, although the Maui Board of Water Supply has issued a report after investigating the topic.*

Response 76: Appendix C did not make the conclusion you stated. Appendix C merely recognized that under a No Water Lease alternative, if the scenario was sufficient for EMI to continue operation and maintenance of the EMI Aqueduct System, then the activities would have impacts comparable to the Proposed Action. Appendix C also recognized that if it were determined that operation of the EMI Aqueduct System was not viable because no Water Lease was issued, and EMI abandoned the system, human noise and activity along the EMI Aqueduct System would be reduced from current levels to none, and the system itself could go into disrepair and become overgrown, which could reduce or reverse current levels of habitat fragmentation. Incidentally, similar analyses were provided in the LRFI (Appendix E), which noted that if the No Action alternative includes the continued maintenance and repair of the existing EMI Aqueduct System regardless of the issuance of the subject Water Lease, then the No Action alternative will not include partial or total destruction or alteration of historic properties, detrimental alteration of the surrounding environment, detrimental visual, spatial, noise or atmospheric impingement, increasing access with chance of resulting damage, nor neglect resulting in deterioration or destruction. But if the No Action alternative does not include continued maintenance and repair of the existing EMI Aqueduct System, then the No Action alternative has the potential to pose an impact to historic properties. Moreover, Chapter 3 of the

EIS includes a variation of the Mahi Pono farm plan that would be pursued in the event no Water Lease was issued. We cannot find any definitive statement in the EIS saying that EMI would stop operating and maintaining the EMI Aqueduct System if the Water Lease is not issued.

Nevertheless, it should be noted that the EMI Aqueduct System is designed to operate with large amounts of diversion water flowing through it. Less water flowing through the EMI Aqueduct System equates to more maintenance and repair activities. Moreover, Mahi Pono may not generate enough revenue to maintain a large diversified agricultural operation and maintain and operate the EMI Aqueduct System with the limited amount of water as contemplated under the No Action scenario.

Regarding your comment that the EIS needs to further explore the beneficial impacts of the No Action alternative on native stream life, offshore fisheries, cultural use, recreational use, and aesthetic use, please note that this is discussed in Section 3.4 of the EIS. Moreover, a table of the comparative benefits and impacts has been added to summarize all the benefits and impacts from the Proposed Action and reasonable alternatives as shown on pages 3-49 to 3-80.

Regarding your comment that the EIS needs to provide a discussion or analysis of others maintaining or operating the EMI Aqueduct System, this is discussed in Section 3.1.2 of the Draft EIS, as follows:

During public scoping for the DEIS in 2016 and 2017, it was suggested that the EMI Aqueduct System should be brought under new ownership, without the further involvement of A&B and EMI, and potentially under public ownership. Ownership of the EMI Aqueduct System changed in January 2019 to include Mahi Pono, which intends to pursue diversified agriculture in Central Maui. Consideration of another change in ownership is too speculative at this point to warrant analysis. A change in the ownership of the EMI Aqueduct System will not enhance environmental quality or avoid, reduce, or minimize all or even some adverse environmental effects, costs, or risks of the Proposed Action. As discussed elsewhere in this DEIS, EMI has been operating the EMI Aqueduct System since the start of construction in the 1870s. Few have the knowledge to operate and maintain this unique and complex system, consisting of approximately 388 separate intakes, 24 miles of ditches, and 50 miles of tunnels, as well as numerous small dams, intakes, pipes, 13 inverted siphons and flumes. Furthermore, the EMI Aqueduct System is not for sale, and forced acquisition of the system is projected to be prohibitively expensive, resulting in substantial costs to the public. For these reasons, this alternative is viewed as a highly speculative and unreasonable alternative, and one that would not meet the objectives of the Proposed Action. Therefore, it was dismissed from further review.

Hence, it was deemed to be speculative as the EMI Aqueduct System is not for sale, there had not been a cost appraisal of the system, and few have the skills or knowledge to operate the extensive and complex EMI Aqueduct System.

We are aware of the County Board of Water Supply (BWS) Temporary Investigative Group (TIG) Report, which was published after the Draft EIS, on the potential acquisition of the EMI Aqueduct System by the County, speaks directly to the “ownership change” alternative referenced in your comment. To provide further context, on July 19, 2019, the Maui County BWS formed the TIG to explore options for ensuring public access to water, including the feasibility of purchasing and maintaining the EMI Aqueduct System.

Based upon information available in relation to findings and conclusions of the TIG report, it is our assessment that the County’s potential acquisition of the EMI Aqueduct System remains speculative. Furthermore, much of the institutional knowledge needed to properly operate the EMI Aqueduct System would be lost under any change in ownership scenario. This could reduce the efficacy of the system, the new owner may not have the expertise needed to properly maintain it, and possibly lead to additional and unforeseen environmental impacts. Moreover, a change in ownership would presumably directly contradict the objectives of the Proposed Action as outlined within the EIS. It is noted that the TIG report’s proposal for water rates for the Central Maui agricultural fields is nearly ten times that of what is being charged to the Agricultural Park and Upcountry agricultural users, thus rendering the economic viability of agriculture on the Central Maui fields unfeasible.

For purposes of assessment in this EIS, it is assumed that an alternative owner of the EMI Aqueduct System would be required to meet goals of the Proposed Action as described in this EIS, including meeting the Proposed Action’s stated objective to support an economically feasible, sustainable diversified agricultural operation across the Central Maui agricultural fields.

For the reasons discussed above, the County’s acquisition of the EMI Aqueduct System, and the County’s pursuit of a water lease from the BLNR are viewed as speculative and an unreasonable alternatives. However, the existence and findings of the TIG Report has been acknowledged in Section 3.1.2 of the Final EIS, as shown on pages 3-19 to 3-20. A copy of the TIG Report has been included in the Final EIS as Appendix P.

Comment 77: *EIS needs to discuss the implications of the fact that EMI controls the 4 levels of ditch system west of the lease area, which are connected to the East Maui ditch system, but not affected by the lease decision.*

Response 77: It is correct that there are four levels of EMI Aqueduct System located west of the License Area. Figure 2-2 (EMI Aqueduct System) shows the ditches that are located on private

lands west of the License Area. It is noted in Section 2.1.2 of the Draft EIS that the EMI Aqueduct System is estimated to divert an additional 4.37 mgd in this area. Access to this water is also assumed under the No Lease alternative, i.e., the EIS recognizes that water diversions from this area will not be affected by decisions on the proposed Water Lease.

Comment 78: *Section 6.3 concludes that the Reduced Water alternative (alternative 2) would result in more ditch maintenance required and “more human activity in area and greater chance of potential for negative impacts.” This section also concludes (with no proof offered) that “increased water flows in the stream would likely have very little impact on native land-based flora and fauna” and that “Impacts on aquatic fauna (damselflies, etc.) would vary by stream.” The EIS offers no proof that either of these conclusions is true, yet they are offered as a rationale to decision makers to support the Alternative 1 lease.*

Response 78: To clarify, Section 6.3 of Appendix C in the Final EIS states that, “*The increased water flows in the streams would likely have very little impact on terrestrial flora and fauna.*” Hence, this statement refers to all existing flora and fauna within the License Area and is not limited to native species. As discussed in Section 5.1.2.1 of Appendix C in the Draft EIS, the majority (60%) of the License Area is already composed of “Open / Closed ‘Ōhi‘a Forest,” which mainly constitutes the higher elevation areas where water is not diverted as shown by Figure A-2. Moreover, the area surrounding the EMI Aqueduct System tends to be composed of “alien forest” which consist of non-native species. Hence, it is anticipated under the “Reduced Water Volume” alternative, which would involve more human activity, that an increase in water flow would likely have little impact on native land-based flora and fauna in the areas where more stream flow would be restored. However, as noted in Section 6.3 of Appendix C in the Final EIS, the impacts would vary on a stream-by-stream basis. Please note that Appendix C has been updated to discuss how the Proposed Action would potentially impact the flora and fauna within the License Area on a watershed-by-watershed basis, using data produced by the HSHEP model and HIGAP data provided by the State, along with surveys conducted within the region. The updates are reflected on Section 4.4 of the Final EIS. See pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS.

Regarding aquatic fauna, and specifically damselflies as raised in your comment, under the Reduced Water Volume alternative, the HSHEP model (Appendix A) conducted an analysis of impacts to damselflies, which concluded that return to natural flow conditions should improve damselfly habitat. However, the restoration of baseflow will likely also improve habitat conditions for a number of introduced predator and competitor species of the native damselflies and thus may not in itself increase damselfly populations. Hence, under the Reduced Water Volume alternative, the more water returned to natural flow conditions, the more of an increase in damselfly habitat. This has been added to Section 3.4.3 of the Final EIS as shown on page 3.27.

Comment 79: *Appendix C refers to a future Management Plan for the Lease area that will be done by the State of Hawaii for the lease lands as part of any future lease agreement. The lease requirements found in HRS 171-58 specify that A&B/Mahi Pono need to jointly prepare a management plan with the State:*

“(e) any new lease of water rights shall contain a covenant that requires the lessee and the department of land and natural resources to jointly develop and implement a watershed management plan. The board shall not approve any new lease of water rights without the foregoing covenant or a watershed management plan.”

Appendix C - “Assessment of Terrestrial Flora and Fauna” makes absolutely no reference to any need for restoration or management of the public lands in its analyses or recommendations. The DEIS clearly quantify the impacts of a long term lease, and must evaluate and mitigate those impacts.

Response 79: As discussed in Response #12, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for uses described in the EIS. The environmental impacts of the potential Water Lease are included throughout Chapter 4 of the EIS.

Moreover, as discussed in Response #69 above, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans.

However, Appendix C does provide detailed avoidance and mitigation measures for actions within the East Maui License Area, which are summarized in Sections 4.4.1 and 4.4.2 of the Draft EIS. These avoidance and mitigation measures have been expanded on as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131.

Comment 80: *Section 6.5 discusses Alternative ownership/ Management of the ditch system and lease area- and concludes that such management “would have effects identical to those described in the “proposed Action” on Terrestrial Flora-Fauna. The DEIS needs to include analysis of increased investment in watershed management that could come with a new “ownership” model.*

Response 80: It is unknown whether any increase in investment in watershed management would come as the result of new ownership of the EMI Aqueduct System (which is not for sale in any event). However, as discussed in Response #29 above, alternative ownership of the EMI Aqueduct System is purely speculative and furthermore, because such a scenario is speculative, it is unclear whether or how it could achieve the objectives of the Proposed Action. The

alternatives analysis within the EIS is provided consistent with the requirements under HAR § 11-200-17(f).

Comment 81: *Section 6.6 dismisses the Greater Public Access alternative (smaller lease area) and concludes that greater access would impact flora and introduce more alien species and impact habitat of native birds. The DEIS needs to analyze the beneficial impacts of increased access that results in greater restoration/management activities in the watershed lands, as has been the case in various areas on Maui that manage public access.*

Response 81: Section 6.6 of the SWCA report (Appendix C) did not dismiss any particular alternative. The purpose of the technical reports is, in part, to identify potential impacts and where appropriate mitigation measures. However, any alternative or variation of an alternative that would increase public access to the License Area would have the potential to increase impacts to flora and fauna species that are present in the License Area. Increased access into the License Area would presumably allow for hiking, hunting, gathering, and other recreational and/or cultural activities to take place. An increase in these activities would result in increased vegetation trampling, which, depending on degree of access and use of the area, may have a significant impact on existing flora. In addition, the potential for weed, rapid 'ōhi'a death, and little fire ant introduction and invasion would increase. Weeds, by definition, can outcompete most flora for space and nutrient resources. Weed invasions, if they were to occur, would decrease the quality and quantity of habitat available for native plant species, which in turn may decrease the quality of critical habitat for the Maui parrotbill and crested honeycreeper. The presence of vehicles and humans for various activities in the License Area could disrupt the normal behavior of wildlife and temporarily displace individuals from roadside habitat. Human noise and activity would increase due to an increase in access, which would have a negative impact on wildlife.

Increasing the area open to public use would increase the potential for these impacts to flora and fauna to take place and potentially increase the intensity of the impacts throughout the License Area. Should the License Area be modified for greater public access, the intensity of these impacts would be greater if the public is allowed in the eastern portion of the License Area. The analysis in Appendix C demonstrates that native and unique flora and fauna species are more likely to occur in the eastern portion of the License Area. Allowing public access to the western portion of the License Area may have a lesser negative impact on biological resources. Hence, under this alternative, it is recommended that the Water Lease lessee work with the respective State agency to design an appropriate boundary that protects the integrity and safety the EMI Aqueduct System and staff, as well as minimize public access to the eastern portions of the License Area. This has been added to Section 6.6 of Appendix C and summarized in Section 3.2.2.2 of the Final EIS as shown on pages 3-21 to 3-24.

Section 1.3.1 and 3.2.2.2 of the Final EIS has been updated to acknowledge that under the water revocable permits (RPs) issued for 2020 and approved for 2021, the Hanawā Natural Area Reserve (NAR) was removed the License Area under the reevocable permits as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place.

Comment 82: *Section 7 offers Avoidance & Minimization measures such as:*

- *Biological monitor during maintenance in waterfall /cliffside areas*
- *Wash and inspect equipment before maintenance*
- *inspect any materials used for maintenance*
- *monitor ESA damselflies- work with USFWS*
- *training for onsite staff to recognize endangered species*
- *sensitivity to i'iwi nests during tree trimming*
- *use of barbless strand for top wire of fences to avoid bat injuries*

While these would be a step forward from current conditions, there is no accountability for these practices actually being employed. Take the example of fencing mentioned. Thousands of acres of Mahi Pono land have recently been fenced, some of which has stands of trees that could serve as potential endangered bat habitat. All of the fencing observed has barbed wire on its top strand, which is detrimental to bat survival. Will all this be changed only if the lease is granted?

Response 82: You are correct that Section 7 of Appendix C (Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease) provides the above avoidance and minimization measures. As discussed in Response #69 above, these avoidance and minimization measures have been expanded on as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131.

In response to your concern about accountability, it is anticipated that any Water Lease issued by BLNR will include conditions imposed upon the lessee. In this case, it is anticipated that mitigation measures presented in the EIS will inform the BLNR as to what conditions it may wish to impose upon the Water Lease lessee. Should the Water Lease be awarded such that Mahi Pono can proceed with its desired farm plan, Mahi Pono would comply with any applicable Water Lease terms, including removal of barbed wire, if required. Mahi Pono installed the barbed wire strand as a deterrent to deer, which, if unchecked, could destroy crops. Even if no Water Lease is granted, Mahi Pono has indicated that it will work with the State Division of Fish

and Wildlife (DOFAW) and the Department of Agriculture to determine whether the existing fences are a danger to the Hawaiian hoary bats and if so, whether an effective alternative can be implemented to deter deer from entering on to the farm land.

Comment 83: *Historic Resources Assessment (Appendix E). DEIS consultants have misrepresented East Maui Lease conditions to SHPD, after SHPD initially requested an AIS be done. The Action was described as “involving no ground altering activities” in order to be exempted for performing any ground based Archaeological Inventory Survey.*

Response 83: We respectfully disagree with your comment that the Draft EIS consultants misrepresented the Proposed Action to the Department of Land and Natural Resource, State Historic Preservation Division (SHPD). Correspondence from SHPD dated January 27, 2017 and October 6, 2017 are appended to Draft EIS Appendix E (Archaeological Literature Review and Field Inspection), confirming SHPD's position on this issue. Issuance of the Water Lease is not anticipated to affect any historic property, aviation artifacts, or burial site.

As discussed in Draft EIS Section 4.5 (Historic and Archaeological Resources) the Proposed Action does not involve any new construction or significant ground disturbance within undisturbed areas within the License Area. The Proposed Action continues the use of the EMI Aqueduct System for the transport of surface water, and allows the lessee or its permittees, to maintain and repair existing access roads and trails long-used as part of the EMI Aqueduct System. As discussed in the Section 2.1.2 of the Final EIS as shown on page 2-7, under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System. Moreover, this was explained to SHPD as discussed in the Archaeological Literature Review and Field Inspection provided as Appendix E of the EIS (“Additional information regarding the proposed Water Lease was provided to the SHPD including the understanding that the proposed Water Lease will not involve any significant ground disturbance within undisturbed areas.”)

Comment 84: *The 3-day field visit of 21 intakes on the EMI system cannot be held up as any proof that historic sites are not present either on state or EMI lands. The Fig 47 map in Appendix E indicates that 8 of those intakes were located on EMI land. Mahi Pono has informed the public that if they secure 30-year leases they plan to invest \$2 mil in ditch repairs. Other repairs and maintenance are needed on roads and ditch trails. A number of intakes on fully restored streams still need to have construction work undertaken. All of this ground altering construction activity has the potential to affect cultural and/or historic sites. These are all secondary impacts of the 30 Year Lease being granted. SHPD should be fully informed of the*

secondary impacts and proposed activities in an area with no previous Archaeological review, and a full AIS should be completed.

Response 84: Please note that the EIS does not state that historic sites are not present within the License Area. In fact, the EIS acknowledges that historic sites may be present in the License Area, and a Historical Structure Assessment was prepared for the EMI Aqueduct System itself. See Appendix D to the EIS. Moreover, as explained in Response #83, SHPD was fully informed of the actions related to the proposed Water Lease and SHPD determined that no Archaeological Inventory Survey (AIS) was warranted.

The archaeological literature review and field inspection (LRFI) prepared by CSH included an analysis of the natural and built environment of the License Area, a comprehensive review of traditional and historic background information of the region, a review of previous archaeological studies and findings in the region, and a field inspection of the License Area focused on inspecting the areas nearest to the EMI Aqueduct System infrastructure and access roads. Based on the research and analysis conducted for the LRFI, neither the Water Lease, nor the alternatives, is expected to have impacts archaeological historic properties within the License Area because none of these actions include significant related ground disturbance. If, through future implementation of the Proposed Action or the alternatives, ground disturbance subject to County, State, and/or Federal permits is required, then CSH recommends consultation with the SHPD to determine historic preservation requirements. The LRFI also provides cultural resource management recommendations based on the extensive research and analysis conducted during the study. For example, CSH recommends that any persons who are required to enter the License Area as part of the Proposed Action or alternatives be made aware of the potential for discovery of undocumented surface historic properties such as walls, trails, terraces, mounds, and/or caves. These structures should be avoided, protected, and reported to the SHPD. The SHPD will determine if additional mitigation is required. This recommendation is in line with recommendations that were made for the Waikamoi Preserve during a cultural-historical study of East Maui (Maly and Maly 2006).

Please note that the Applicant makes no representation regarding Mahi Pono investments in repairs to the EMI Aqueduct System, and your comment does not identify where in the EIS such information was provided, therefore no further response can be given. As discussed in Section 4.7.3 of the Draft EIS, future operational costs for the EMI Aqueduct System are anticipated to be \$1.8 million annually, similar to average costs experienced during the recent sugar operations period (2008-2013) with the only variation being the amount of the Water Lease payments owed to the State.

As discussed in Section 2.1.2 of the Final EIS, under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and

flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment.

Comment 85: *EMI maintenance activities associated with the leases will take place both on State and EMI land, and both should be included in a full AIS as part of the EIS process.*

Response 85: You are correct that EMI maintenance activities will potentially take place on both State and EMI land. However, regarding your comment that both should be include in a full AIS as part of the EIS process, as discussed in Response #83 above and in Section 4.5 of the Draft EIS, the Proposed Action does not involve any new construction or significant ground disturbance in East Maui. The Proposed Action continues the use of the EMI Aqueduct System for the transport of surface water, and allows the lessee or its permittees, to maintain and repair existing access roads and trails long-used as part of the EMI Aqueduct System. Moreover, as mentioned in Response #83 above, under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment. Moreover, as more fully described in Response #89 below, there is no requirement under HRS Chapter 343 that an EIS include an AIS. Moreover, as discussed in Response #83 above, SHPD clearly determined that no AIS should be prepared for this Water Lease.

Comment 86: *The EIS needs to include ground surveys of the roads and trails found in the lease area, which are also historic properties. Many stone paved trails are found in the East Maui Lease area, but these are not mapped or referred to in Appendix E.*

Response 86: As noted above in Response #54, Section 4.5 of the Final EIS, as well as Appendix E (Archaeological Literature Review and Field Inspection) have been revised to include the current inventory of roads and trails in the License Area as shown on pages 4-147 to 4-149. CSH completed a geographic analysis of trails and roads that appear on maps of the License Area. This analysis is limited to trails and roads that were depicted on maps between 1869 and 1992 and available to the public domain. This analysis is also limited to only the roads or trails that extend within the License Area. Hence, if the stone paved trails that you refer to in Comment #86 above were not depicted on the available map documentation, they are not known to CSH or WOC. Moreover, in your interview with CSH following publication of the Draft EIS, you did not specify any locations of these alleged unmapped trails.

Comment 87: *The Proposed action will involve, as secondary impacts, extensive mechanical clearing of these same roads, as well as EMI ditches and intake areas. It will also include the agreed upon modification of intakes to restored streams in the Lease Area ordered by CWRM.*

Response 87: Please note that the Proposed Action does not entail "extensive mechanical clearing" of roads or other modifications as you suggest. The Proposed Action involves the

continued use of the EMI Aqueduct System, including the roads and trails that have been used as part of the EMI Aqueduct System, which has been in operation for over one hundred years. As discussed in Response #83 above, under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment. Any alteration or other work to the actual stream diversions to comply with the CWRM D&O would occur regardless of the issuance or non-issuance of the Water Lease.

Regarding your comment about modification of intakes to restored streams in the License Area, that work is being done to comply with the CWRM D&O. That work is required irrespective of the issuance of the proposed Water Lease and is not within the scope of the Proposed Action. However we note that EMI is working with the CWRM to make the necessary modifications to meet the IIFS of the 2018 CWRM D&O.

Comment 88: *The EIS cannot meet the HAR 11-200-16 content requirements “ to discuss all relevant and feasible consequences of the action” if it ignores the fact that these secondary impacts will occur as part of the granting of a 30-year lease to access state lands and maintain EMI ditch system and trails.*

Response 88: Secondary impacts are analyzed within Section 4.17 of the EIS. We acknowledge that HAR § 11-200-16 requires the Draft EIS to “*fully declare the environmental implications of the proposed action and [to] discuss all relevant and feasible consequences of the action.*” The EMI Aqueduct System has been in place for well over one hundred years and the Proposed Action does not entail any expansion of the EMI Aqueduct System or the construction of any new roads to access the EMI Aqueduct System. The Draft EIS looked at impacts not only within the geographical area of the Water Lease (i.e. within East Maui), but also considered impacts in Central Maui and in Upcountry Maui in compliance with HAR § 11-200-16 and other relevant provisions of HAR Title 11, Chapter 200. Consistent with the requirement to assess secondary impacts, the EIS describes the anticipated water use and related activities at full implementation of the Mahi Pono farm plan, which was presented as Mahi Pono's 2030 vision. As explained in Section 2.1.5., it is estimated that 10 years will be required for Mahi Pono and lessees to remove volunteer sugarcane and weeds from the approximate 30,000 acres, amend soils, install field improvements, build warehouses and other structures, and plant crops.

Comment 89: *Whether these actions occur on state lease land or on EMI lands, our State Historic preservation laws would require an Archaeological field survey, to determine the presence or absence of historic properties, if the agency was aware of the true nature of the implications of the 30-year lease. None of these sites have been recorded: Patsy’s Minks family (Takemoto’s) lived in the Waihinepe’e area and the same area included the legendary pohaku that gave the valley its name when it sheltered an escaping Ali’i wahine. This pohaku is near an EMI access road. The historic review also ignores historic sites located in Mahi Pono fields, like*

the Papanene Heiau in the Spreckelsville area and the cultural practice associated with the site. A&B operates a construction dumping ground adjacent to the heiau remains. No archaeological work has been done on the site. These are just a few examples of why the EIS is not complete, and cannot be found to have discussed and mitigated all impacts, without the addition of an AIS.

Response 89: It is unclear what is meant by your reference to an “Archaeological field survey.” We assume you meant an Archaeological Inventory Survey (AIS). However, there is no requirement under HRS Chapter 343 that an EIS include an AIS. Kaleikini v. Yoshioka, 128 Hawai‘i 53, 283 P.3d 60 (2012) (holding that, with respect to the EIS done for the Honolulu rail project, “although the final EIS did not include an AIS, it was nonetheless sufficient to enable the decision-maker to consider fully the environmental factors involved” and upholding the acceptance of the EIS.). The Draft EIS, as required under HRS Chapter 343, includes extensive information about archaeological, historic, and cultural resources, including the following three technical studies: Historical Structure Assessment, Archaeological Literature Review and Field Inspection, and Cultural Impact Assessment. Moreover, as discussed above, the Proposed Action, including maintenance and repair of the EMI Aqueduct System, does not involve ground disturbing activity except in the Central Maui agricultural fields which have been continuously disturbed through historical agricultural uses for over 100 years.

Moreover, SHPD has been well informed about this EIS and the proposed Water Lease. A Chapter 6E-7 and 6E-42 historic preservation review letter dated 25 January 2017 (Log No. 2017.00026; Doc. No. 1701GC08) sent from the SHPD to the DLNR Land Division requested that, pursuant to HAR §13-284-5(b)(5)(A and C), an AIS and an architectural inventory survey, be prepared prior to issuance of the Water Lease, and that the AIS be preceded by archaeological inventory survey plan. Thereafter, additional information regarding the Water Lease was provided to the SHPD including the understanding that the proposed Water Lease will not involve any significant ground disturbance and that the potential impact of flooding from abandoning certain diversion will not be greater than periodic naturally occurring events. A subsequent Chapter 6E-8 historic preservation review letter (Log No. 2017.00026; Doc. No. 1706MBF11) sent from the SHPD to the DLNR Land Division updated the previous correspondence to no longer request the completion of an AIS plan or AIS for the License Area in conjunction with the proposed Water Lease because the Water Lease does not entail ground disturbing activities (other than what has taken place as part of routine maintenance).

Regarding your comment about the legendary pōhaku, CSH archaeologist Angela Yates, B.S. completed a pedestrian inspection of the Wahinepe‘e area on February 16, 2020 in an effort to locate the legendary pōhaku in Wahinepe‘e in response to this particular comment. However, this legendary pōhaku could not be located. The field inspection began with a pedestrian/vehicular inspection on the grounds of the Garden of Eden Arboretum, followed by a pedestrian inspection of areas along Wahinepe‘e Forest Reserve Road. These are the areas that correspond with former house lots and trails that may have been associated with the pohaku.

During the field inspection, the property owner and other employees of the Garden of Eden Arboretum discussed the property and had no knowledge of a legendary pohaku in the area. While the legendary pohaku at Wahinepe'e was not located during the field inspection, the inspection did identify potential historic properties located outside (makai) of the License Area. These potential historic properties are located approximately 400 meters or more downslope from the nearest irrigation ditch and outside of any active stream channel. These potential historic properties will not be impacted by the Proposed Action.

Regarding your comment about the Papanene Heiau, CSH determined that the most likely location for Papanene Heiau is in Spreckelsville, approximately 14.7 km (9.13 miles) west of the most western extent of the current project area. However, as noted within Section 4.5 of the Final EIS, the Papanene Heiau has been determined to be destroyed.

The archaeological inventory survey for the Paia Bypass was conducted to identify historic properties. The cultural impact assessment for the Paia Bypass was prepared to identify cultural practices but has not been finalized. The draft CIA for the Paia Bypass project identified "fishing practices, hula practices, Japanese Buddhist O-bon season traditions, as well as a variety of religious practices" as on-going cultural practices within the Paia Bypass project area. The Paia Bypass project area does not overlap with the License Area.

The archaeological inventory for the Paia Bypass also did not identify Papanene Heiau. The study noted the same information as provided in the Walker (1931) survey, that the heiau was noted.

Section 4.5 of the Final EIS has been revised to include the above discussion, as shown on pages 4-154 to 4-155.

Comment 90: *Due to lack of management of heavily diverted dry stream beds over the years, storm surges have uprooted large trees along stream banks and carried them downstream, where they put historic kalo lo'i, house platforms and other structures at risk. None of these historic properties have been surveyed or recorded in the lease area, except by volunteers. After 140 years of diversions, it is time for EMI to undertake a proper historical survey. The EIS needs to include this information, analyze potential impacts, and propose appropriate mitigation.*

Response 90: Regarding your comment about a perceived lack of management, EMI staff continually perform repair and maintenance activities the EMI Aqueduct System as necessary. As discussed in the Section 2.1.2 of the Final EIS as shown on page 2-7 under the Proposed Action, "maintenance and repair" involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment.

Regarding your comment about the historic properties and structures being at risk due to storm surge and dry stream beds, EMI is not aware of any such concerns over at least the past 20 years. Moreover, Appendix E (the LRFI) has been updated to include discussions regarding climate change impacts to historic properties and structures as summarized in Section 4.3.1 (see pages 4-89 to 4-91 of the Final EIS).

Regarding your comment that it is time for EMI to undertake a proper historical survey, please see Reseponse #83 and Response #84 regarding SHPD's requirements with respect to historic review related to the Proposed Action and the scope of the LRFI. We also note that the LRFI has been supplemented with additional information provided in response to comments on the Draft EIS, as summarized on pages 4-135 to 4-139 of the Final EIS.

Comment 91: *Unintended destruction of Hawaiian historic sites also impacts native Hawaiian cultural practice, which the EIS should also discuss and mitigate by directly involving East Maui communities in historic site preservation activities. Aha Moku Council representatives also refer to historic sites in the state or EMI lands surrounding the EMI ditch system, and Aha Moku representatives for Hamakuapoko and Ko'olau moku should be part of the AIS fieldwork process*

Response 91: The scope of the Proposed Action does not involve the destruction of any historic sites. The CIA includes outreach to members of the Aha Moku Council as listed in Table 12 of the CIA (among other groups and organizations). Of the recognized members of the Aha Moku Council who participated in the CIA, Mr. Nakanelua provided a discussion of Pākanaloha Heiau. The location and description of Pākanaloha Heiau is addressed in the LRFI in Section 2.4 (Walker Site 84). The heiau is located outside of the License Area, on Ke'anae Peninsula.

No other recognized members of the Aha Moku Council provided information on specific historic properties during consultation for the CIA.

As discussed in Response #89 above, there is no requirement under HRS Chapter 343 that an EIS include an AIS. *Kaleikini v. Yoshioka*, 128 Hawai'i 53, 283 P.3d 60 (2012) (holding that, with respect to the EIS done for the Honolulu rail project, "although the final EIS did not include an AIS, it was nonetheless sufficient to enable the decision-maker to consider fully the environmental factors involved" and upholding the acceptance of the EIS.). The Draft EIS, as required under HRS Chapter 343, includes extensive information about archaeological, historic, and cultural resources, including the following three technical studies: Historical Structure Assessment, Archaeological Literature Review and Field Inspection, and Cultural Impact Assessment. Moreover, as discussed above, the Proposed Action, including maintenance and repair of the EMI Aqueduct System, does not involve any significant ground disturbing activity except in the Central Maui agricultural fields which have been continuously disturbed through historical agricultural uses for over 100 years.

Comment 92: *Cultural Impact Assessment (appendix F). The EIS does not fully acknowledge the impact that past and proposed reduced stream flows have had on the native stream life and*

marine life that is so directly connect with the ability of Native Hawaiians to engage in traditional cultural practice of fishing and gathering in East Maui.

Response 92: The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued to EMI for the License Area in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55.

Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water. . . .*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all constitutionally protected traditional and customary rights.

We believe that the Draft EIS adequately discusses the impacts of the Proposed Action both in terms of the effects on habitat and on traditional and customary Native Hawaiian practices. Specifically, in terms of habitat, Appendix A and Section 4.2.1 of the Draft EIS presented the HSHEP model was used to quantify the impacts of flow restoration on native stream animal habitat to determine an appropriate balance between instream and offstream water uses. Impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B of the EIS. Impacts to terrestrial flora and fauna, including threatened and endangered species, are analyzed in Section 4.4 and Appendix C of the EIS. As it relates to traditional and customary, please note that CSH provides a detailed and comprehensive report accounting the history of East Maui. This report is included in Appendix E and summarized in Section 4.5 of the EIS. The EIS includes an assessment of effects on the cultural practices through the CIA provided as Appendix F.

The information provided satisfies EIS content requirements. This information will also inform BLNR in the future, when it is deliberating on the issuance and terms of the Water Lease. Under the Public Trust Doctrine, BLNR will have to balance competing considerations before making a decision on the Water Lease. The balancing that BLNR is required to perform under the Public Trust Doctrine was described at length by the Hawai‘i Supreme Court in *In Re Water Use Permit Applications*, 94 Hawai‘i 97, 9 P. 3d 409 (2000) (“Waiahole I”) and summarized in Section 1.5 of the Final EIS as shown on pages 1-25 to 1-27.

With regard to the potential effects of the Proposed Action on traditional and customary practices, as discussed in the *Ka Pa‘akai* decision, we acknowledge that BLNR will be required to “to protect the reasonable exercise of customarily and traditionally exercised rights of

Hawaiians to the extent feasible.” *Ka Pa‘akai*, 94 Hawai‘i at 35, 7 P. 3d at 1072. BLNR has previously so stated in its Findings of Fact, Conclusions of Law, and Decision and Order filed on March 23, 2007 in the contested case proceeding that is still pending regarding the Proposed Action (the 2007 D&O) as follows:

Public trust principles require that adequate provision be made for the protection of *traditional and customary Hawaiian rights*, the protection and procreation of fish and wildlife, the maintenance of proper ecological balance and scenic beauty, and the preservation and enhancement of waters of the State for municipal uses, public recreation, public water supply, agriculture and navigation.

2007 D&O COL No. 6 at page 41 (citing *Waiahole I*). CWRM, in its June 20, 2018 D&O, also recited the State’s constitutional obligation to consider the impacts of stream diversions in East Maui on traditional and customary practices of Native Hawaiians at pages 242 through 245, including the Supreme Court of Hawaii’s more recent holding on this subject in *State v. Pratt*, 127 Hawai‘i 206, 277 P. 3d 300 (2012).

We believe that the Draft EIS (including Appendix F) together with the CWRM D&O, provide ample information for the BLNR to consider regarding potential impacts to traditional and customary practices, and that will enable BLNR, at the point that it is deliberating on the Water Lease, to fulfill its constitutional obligation “to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible.” *Ka Pa‘akai* at, 94 Hawai‘i at 35, 7 P. 3d at 1072.

Comment 93: *Appendix F, the Cultural Impact Assessment (CIA), concludes that as long as Stream Flow standards are met in the East Maui streams subject to the 2018 Water Commission decision, all other streams can be diverted with no impacts to traditional Hawaiian cultural practices. It also concludes that the East Maui coasts do not have reefs, and therefore do not support related marine species, even though information in Kama‘aina interviews mentions the importance of stream flows to the abundance of ocean fisheries and related cultural practices of fishing and gathering. This conclusion does not reflect generational knowledge, or marine life and stream life studies from East Maui found in the statements of numerous East Maui kama‘aina included in Appendix F.*

Response 93: Your comment that the CIA "*concludes that as long as stream flow standards are met in the East Maui streams subject to the 2018 Water Commission decision, all other streams can be diverted with no impacts to traditional Hawaiian cultural practices,*" is a misstatement of the CIA's conclusions. Rather, the CIA acknowledges that the Proposed Action may impact Native Hawaiian cultural resources and practices and provides for several recommendations to mitigate those impacts. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of

the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, as shown pages 4-158 to 4-159 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action as shown on pages 4-171 to 4-254.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the*

Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Your comment that the EIS concludes that there are no reefs and does not support related marine life is incorrect. There are no statements in the EIS or within the East Maui Irrigation Assessment of Streams and the Ocean report (Appendix B) or the other technical studies alleging this. Rather, Appendix B analyzed the interactions of the streams in the License Area with the related ocean environments and concluded that:

The effects of stream water on marine waters must be considered minor in these habitats. This result is supported by the physical processes associated with relatively small input of stream water to the vastly larger ocean environment. The prevailing conditions of extreme mixing by physical forces is the most important factor in diminishing the zone of influence of stream water in a marine setting. In all cases where it was possible to sample across the boundary where streams flowed into the ocean, there were sharp gradients reflecting the intense mixing of stream water to background ocean levels. Observation of the habitats in these transition zones indicated that they were primarily composed of sand and barren rock. Owing to continual, intense wave energy, these nearshore areas do not constitute important habitats for coral reef communities and associated marine species. Beyond the narrow transition zone, the influence of stream water is minimal owing to rapid intense mixing. These processes should not be affected by changes in stream flow related to seasonal variation of diversions.

As for the risks of impacts to fishing, the collected data presented in Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be negatively impacted. Please note that the report acknowledged that different results could occur with respect to linking stream discharge to estuarine function in other areas. But due to the harsh physical conditions of East Maui, stream flow rates do not greatly impact marine ecosystem function.

Moreover, Section 4.2.3 of the Final EIS has been updated to discuss that the HSHEP model used by Trutta to conduct an analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals included as Appendix A to the EIS, also considered estuarine reaches present in the stream segments subject to analysis as shown on pages 4-78 to 4-83. Using the HSHEP model coupled with aerial imagery available, the stream mouth areas of each stream subject to analysis were reviewed for the potential for estuary segments present. The presence of a terminal waterfall, possibility of estuary habitat, and the extent of embayment at the stream mouth were also noted. Table 4-6 of the Final EIS shows the results for all of the East Maui

streams within the License Area associated with the EMI Aqueduct System. Furthermore, the subsequent Table 4-7 of the Final EIS, shows the five streams that have any possibility of an estuarine reach. Of these five streams, three streams (Waiahue, Pi'inaau, and Honomanu) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reach, Pa'akea will have connectivity flow restoration, while 'O'opulua will have no additional flow restoration. Thus overall, the majority of estuarine habitat that exists in East Maui will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83.

Comment 94: *Hawaiian cultural users whose interviews are in the CIA agree: increased stream flows are needed to support stream and marine life in enough abundance to allow traditional gathering from both streams and ocean coastlines. The EIS does not include recent studies of marine fish populations in East Maui or recent interviews with East Maui residents. These residents inform us they have observed that the recent increase in East Maui flows due to the closure of sugar, with stream diversions reduced to 20-25 mgd, has already resulted in increased fish populations in East Maui.*

Response 94: We acknowledge your comment about kama'āina interviews that mention the importance of stream flows to the abundance of the ocean fisheries. Please note that commenters

of the EIS and CIA participants stated that they have noted both positive changes (increase in fish populations returning to the nearshore coastal environments, increase in water flow rate for taro farming) and negative changes (increased erosion causing near-shore brown water and blockages of culverts from uprooted vegetation) to the regional environment since the halting of diversion after the closing of HC&S commercial sugar operations in Central Maui in 2016. However, as noted in Response #59 above, from an ocean chemistry standpoint, the results of the study in Appendix B suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. See Appendix B, Section 5. The CIA recognizes 25 streams that were identified by community participants as having an estuary environment that may be impacted by streamflow as presented in Tables 14-16 in the CIA.

Moreover, as discussed in Response #59 above, Table 4-7 of the Final EIS shows the five streams that have any possibility of an estuarine reach based on HSHEP model as shown on pages 4-78 to 4-83. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83

The HSHEP model used in Trutta Environmental Solutions' report (Appendix A), it clearly and directly addresses the impacts of streamflow diversion on the native amphidromous stream species (including opae, 'o'opu and hīhīwai). Due to an increase in streamflow under the Proposed Action when compared to historical diversion rates, opae, 'o'opu and hīhīwai are anticipated to have an increase in HU. However, these HU will slightly decrease from current conditions as more water is gradually diverted as the Mahi Pono farm plan develops to full build-out as outlined in Section 4.2.1 of the EIS.

The CIA and EIS identify impacts to the regional environment, taro farming, and freshwater resources within the License Area based public documentation and consultation with the community as presented in Section 4.6 of the Draft EIS. Specifically, Section 4.6 of the Draft EIS states:

4. *Participant Kyle Nakanelua is concerned with the act of diverting water. He explicitly states that “when those places dry up that adversely impacts the way of life, the cultural practice if you will” and it “adversely impacts the people’s way of life that live there.”*
 - a. *To support this claim, Mr. Nakanelua states that ‘ōpae was once prevalent in the streams that flowed through their family property named Lakini. He relates that when he began to regularly clean the property his grandmother would still catch ‘ōpae. He adds that today*

there is no 'ōpae but there are prawns. When CSH asked if 'ōpae was being overpicked, he replied “no” because “we were the only one there.” He also does not think the introduction of prawns is to blame but believes “that the flow of water is impactful” and has seen the water decline since 1989.

5. *A 2014 declaration provided by Dan Clark from Ke‘anae stated he needs cool, fast running water for optimal kalo production. Due to low stream flow results, there has been an increase in disease to his kalo, which decreases production.*
6. *Jonah Jacintho states in his 2014 declaration that due to a lack of stream flow, fish populations have decreased therefore he cannot fish as much. To increase the population of ocean fish, fresh water is integral for spawning and nutrients. He also added that more water in stream beds would also increase ‘o‘opu, prawn, and hīhīwai populations.*

Section 4.6 of the EIS summarizes the findings of the CIA as follows:

Based on information gathered from the cultural and historical background, and the community consultation, significant cultural resources were identified within the License Area, as well as outside of the License Area. It should be acknowledged that although some of the impacted cultural resources exist outside of the License Area, what takes place within the License Area directly affects these cultural practices and resources. At present, there is documentation and testimony indicating traditional and customary Native Hawaiian rights are currently being exercised within the License Area. Cultural resources, practices, and beliefs were identified as currently existing within the License Area. In addition, East Maui, which includes the License Area and beyond the License Area, maintains a rich subsistence and cultural history.

Additionally, the CIA and Section 4.6 of the Final EIS have been updated to more specifically include identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action based on community consultation as shown on pages 4-239 to 4-252 . The revised CIA includes community input regarding recent changes observed as a result of stream flow changes in the recent past.

Comment 95: *The EIS needs to include studies on current fish populations, and needs to discuss how this trend of increasing fish populations that support traditional Hawaiian gathering practices can continue, rather than not mention that it is happening.*

Response 95: Regarding your comment that the EIS needs to include studies on current fish populations, as discussed in Response #59, the analysis presented in Appendix B concluded that impacts from the Proposed Action to ocean fish are negligible; therefore there is no scientifically sound reason to undertake a study of ocean fish in East Maui related to impacts from the Proposed Action. Moreover, evaluation of possible impacts on fisheries and nearshore gathering areas would require rigorous “before/after” experiments to determine changes between periods of diversion and non-diversion, with enough time during each phase for ecosystems to come to an equilibrium. As such an experimental set-up is not feasible because conclusions based on existing conditions are the most scientifically reasonable way to evaluate potential changes as presented in the East Maui Irrigation Assessment of Streams and the Ocean report (Appendix B) and summarized in Section 4.2.3 of the EIS. The survey results indicating that nearshore mixing in the study areas was of a magnitude to bring stream-derived nutrients to background marine levels should be adequate to address the concerns brought up in the comments. However, if it was possible to conduct the controlled before/after experiment it would have provided an unequivocal scientifically rigorous set of results to clarify/confirm that this is the case (e.g., changes/no changes to marine nutrient availability). The differentiation between fisheries and gathering areas is that fisheries generally occur offshore in open waters, while gathering areas are within the reach of people from the shoreline.

Regarding your comment that the EIS should discuss this trend as it relates to cultural practices, please note that Section 4.6 of the Final EIS has been updated to include comments received in response to the Draft EIS, which discusses an observed increase in fish populations, as shown on page 4-168.

Comment 96: *The EIS also needs to evaluate the Cultural impacts of rediverting the 12 streams in the Huelo lease area that were not evaluated in the CWRM IIFS proceeding. These streams have had regular flows for the past two years, allowing residents of the surrounding communities a chance to gather native stream life.*

Response 96: The Water Lease would not involve "rediverting" streams, as these 12 streams located within the Huelo portion of the License Area have continued to be diverted both before and after issuance of the CWRM D&O. We understand that the streams you are referring to are those listed in Table 1-3 of the Draft EIS as not being subject to the CWRM D&O (Kōlea, Punalu‘u, Ka‘aiea, ‘O‘opuola, Puehu, Nā‘ili‘ilihaele, Kailua, Hanahana, Hoalua, Waipi‘o, Mokupapa, and Ho‘olawa). Based upon actions taken by parties with an interest in cultural uses, the streams that were the subject of the CWRM IIFS proceedings are presumed to be the streams with the most significance to cultural practitioners because the CWRM proceedings were initiated by NHLC's May 2001 filing of 27 petitions to Amend IIFS on behalf of Na Moku, Beatrice Kepani Kekahuna, Marjorie Walleth, and Elizabeth Lehua Lapenia.

Moreover, as discussed in Section 1.3.3 of the Draft EIS, on July 23, 2001, NHLC met with CWRM staff to discuss the handling of the 27 petitions, and an agreement was reached that efforts would focus on Honopou, Hanehoi, Waiokamilo, Kualani, Pi'ina'au, Palauhulu, and Wailuānui streams, and expanded to include Puolua (these eight streams being deemed "Priority Streams"). Furthermore, also as discussed in Section 1.3.3. of the Draft EIS, in June 2010 Nā Moku filed a petition for a Contested Case for:

Petitioners' right to sufficient stream flow to support the exercise of their traditional and customary native Hawaiian rights to growing kalo and gathering in, among, and around East Maui streams and estuaries and the exercise of other rights for religious, cultural and subsistence purposes. Specifically, the rights of members to engage in such practices in, on, and near Waikamoi, Puohokamoā, Ha'ipua'ena, Punalau / Kōlea, Honomanū, West Wailuāiki, East Wailuāiki, Kopiliula and Pua'aka'a, Waiohue, Pa'akea, Kapaula, Hanawī streams from HRS § 1-1 and HRS § 7-1 and protected under HRS § 174-101.

As such, there is no indication that the streams that were not subject to the NHLC petitions have significant cultural uses or are impacted by the diversions. Nevertheless, the CIA (Appendix F), which is a regional study, has been supplemented to include an additional analysis of the impacts to cultural resources and practices related to the streams in the License Area, including those that were never the subject of the IIFS petitions. A summary of this discussion is provided in Section 4.6 of the Final EIS, as shown on pages 4-171 to 4-254. Moreover, the 12 streams referred to here *were* analyzed using the HSHEP model to assess changes in native amphidromous stream animal habitat with respect to stream diversions.

Comment 97: *Mitigation Measures. The mitigation measures proposed on page viii need to be strictly enforced; for example, it only takes one exception to introduce an invasive species. In order to make them effective, all mitigation measures must be mandatory. For example, the wording "A monitor should have familiarity with plants of the area" needs to be changed to say "A monitor shall have familiarity with plants of the area." Also, instead of "recommending" consultation with lineal and cultural descendants of the area in the event that iwi kūpuna and/or cultural finds are encountered, such consultation needs to be required. The DEIS also needs to present a detailed plan – to include funding - about how these mitigation measures will be enforced.*

Response 97: HAR § 11-200-17(m) includes in relevant part that a Draft EIS should include "where possible and appropriate, . . . specific reference to the timing of each step proposed to be taken in the mitigation process, what performance bonds, if any, may be posted, and what other provisions are proposed to assure that the mitigation measures will in fact be taken." In this case, it is appropriate to complete the EIS process with the expectation that BLNR will, within the Water Lease, identify the required mitigation measures, including any related funding.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the Board of Land and Natural Resources (BLNR) approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report prepared by the Department of Land and Natural Resources (DLNR) has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. Specifically, one of the content requirements calls for “adaptive management” which seeks (i) to establish measurable objectives, including performance metrics to measure and report the degree to which management actions have been successful in achieving goals and objectives; (ii) monitoring performance metrics to track success; and (iii) establishment of a systematic process to review results and employ adaptive management approaches to improve results where needed. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Comment 98: *The Draft EIS needs to clearly indicate how much diverted surface water, water from development tunnels, and/or water from wells will be available to meet A&B’s diversified ag needs from areas outside (east and west) of the proposed lease area. Specific information should be provided about these sources and their output to the EMI system. Currently, the DEIS only discusses East Maui Lease stream water and well water.*

Response 98: As a point of clarification, the diversified agriculture is being undertaken by Mahi Pono. A&B is not engaging and will not be engaging in agricultural activities in the Central Maui agricultural fields. Your comment regarding source of water "from areas outside (east and west) of the proposed License Area" is unclear. To the east of the License Area is the Hāna region. The EMI Aqueduct System does not extend east of Makapipi Stream. To the west of the License Area are privately owned lands and the water yield from this area has been addressed in the EIS and is accounted for with respect to available water supply to support the Mahi Pono farm plan. Figure 1-1 (EMI Aqueduct System Collection Area) of the Draft EIS depicts the area to the west of the License Area and Section 2.1.2 (East Maui/License Area) of the Draft EIS explains that the EMI Aqueduct System is estimated to divert an additional 4.37 mgd from the point that it leaves the License Area at Honopou Stream and collects water from streams on privately owned land to its last diversion at Māliko Gulch. Regarding development tunnels, please see Responses #11 and 13 above.

Comment 99: *Information contained in the main body of the DEIS and its Appendices should be fully reflected in the Executive Summary.*

Response 99: The Draft EIS Executive Summary contained the information called for under HAR § 11-200-17(b), which calls for a concise discussion of the listed elements. The Executive Summary has been refined and clarified to better discuss the body of the Final EIS and its appendices as shown on pages iii to xxiv.

Comment 100: *Maps Need More Clarity: The Fig 1-1 ditch system map does not very clearly delineate the EMI ditch systems. The colors used to indicate abandoned or active ditch sections are not very distinguishable. The dotted lines used to indicate ditch tunnel sections make the relationship of the various ditches hard to determine. Showing sections of the lease area at larger scale (zoomed in) and using contrasting colors to mark tunnel sections would facilitate public review.*

Response 100: As noted above in Response #34, the purpose of Figure 1-1 of the Draft EIS is to depict the water Collection Area. Figure 1-1 outlines in red the 50,000 acre water Collection Area and depicts in green that portion of the water Collection Area that is owned by the State. However, please note that Figure 2-1 of the Draft EIS shows the various ditches / tunnels of the EMI Aqueduct System within the License Area.

Comment 101: *The DEIS does provide several additional maps. (Fig 1-1, 1-3, 2-2, 2-2. All are more detailed, but they are still hard to understand. Fig 1-3 shows the Alexander and Baldwin (A&B) use area for diverted water but does not indicate the County of Maui Department of Water Supply (MDWS) use area that depends upon the EMI diversions. The EIS needs to provide this information.*

Response 101: We acknowledge your comment that the Draft EIS contains several detailed maps. The body of the Draft EIS, not including the consultant studies, contains some 53 maps and figures. As such, we cannot further address your generalized comment about difficulty understanding the maps. However, regarding your comment about Figure 1-3 not showing the MDWS "use area that depends upon the EMI diversions" for clarification, please note that Figure 1-3 is titled "CWRM IIFS Decision & Order Map." It is unclear what you mean by "use area for diverted water," but Figure 1-3 depicts the License Area (in four sections), the streams subject to the CWRM D&O, and the nature of those streams, as determined by CWRM (i.e., fully restored, habitat streams, connectivity streams, non-IIFS streams). Figure 1-3 is not intended to illustrate the service area for the Upcountry Maui Water System that depends on diversions from the EMI Aqueduct System. The Upcountry Maui Water System Service Area is depicted in Figure 2-3 (Upcountry Maui Water System Service Area). However, please note that Figure 2-4 has been added to Section 2.1.3.1 of the Final EIS to depict the three Upcountry Maui Water System's subsystems service areas. See page 2-15.

Comment 102: *Fig 2-3 shows the MDWS service area, but needs to show which parts can be served by the Upper and Lower Waikamoi pipelines, which parts are served by the Wailoa ditch, and which parts are served by wells.*

Response 102: As discussed above in Response #101, please note that Figure 2-4 has been added to the Final EIS to depict the three Upcountry Maui Water System's subsystems service areas. See page 2-15 of the Final EIS. The Makawao System is serviced by the Wailoa Ditch and the Kaupakalua and Ha'ikū Wells. As discussed in Section 2.1.3.1 of the Draft EIS:

The Kamole-Weir WTP serves the communities of Makawao, Pukalani, Hali'imaile, and Ha'ikū.

The Lower Kula System is serviced by the Lower Waikamoi Flume. As discussed in Section 2.1.3.1 of the Draft EIS:

The Pi'iholo WTP relies on water through the Lower Waikamoi (Kula) Flume, which diverts water from various streams in the Ha'ikū Uka Watershed (Waikamoi, Puohokamoa, Ha'ipua'ena, and Honomanū), previously owned by A&B and now owned by Mahi Pono, and serves the Lower Kula community.

The Upper Kula System is serviced by the Upper Waikamoi Flume. As discussed in Section 2.1.3.1 of the Draft EIS:

The Olinda/Upper Kula WTP relies on water from the Upper Waikamoi (Kula) Flume, which diverts water from various stream diversions in the Ha'ikū Uku Watershed (Waikamoi, Puohokamoa, and Ha'ipua'ena), and serves the Upper Kula, Ulupalakua, and Kanaio communities.

Comment 103: Fig 2-4 shows MDWS treatment plants and the upper Kula ditch, but needs to show which areas are served by these facilities.

Response 103: As discussed in Response #101, Figure 2-4 has been added to Section 2.1.3.1 of the Final EIS to depict the three Upcountry Maui Water System's subsystems service areas. See 2-15 of the Final EIS.

Comment 104: *The location of the MDWS aqueduct systems (Upper and lower Kula Pipelines) which occur almost entirely outside the lease area and are not dependent upon continued water diversion from the lease area by EMI is not illustrated at all in the DEIS; it needs to provide this information.*

Response 104: You are correct that the water sources for the Upper and Lower Kula Pipelines (or Flumes) are not dependent on water diversions from the License Area. However, as discussed above in Response #6 above, these systems are situated on private land now owned by EMI and are operated and maintained by EMI staff. The existing agreements in place that allow the MDWS to access these sources of water are contingent upon the issuance of the Water Lease.

Comment 105: *The DEIS needs to show and discuss the area containing streams outside the lease area that are diverted by EMI and provided to the A&B use area regardless of the outcome of the License agreements. All of these are important parts of the information the Board of Land and Natural Resources (BLNR) needs in order to understand what the EMI system does. If these items are not included on this map, new maps should be created to clearly include this information.*

Response 105: The information you are requesting is within the Draft EIS. The Draft EIS depicts and discusses the area that is outside of the approximately 50,000 acre water Collection Area; the EMI Aqueduct System diverts water from the Collection Area and from private land to the west of the Collection Area. Figure 1-1 (EMI Aqueduct System Collection Area) depicts the water Collection Area in red. Figure 1-1 also shows the streams that are diverted between the western end of the State-owned License Area and Māliko Gulch. Section 2.1.2 (East Maui/License Area) of the Draft EIS explains that the EMI Aqueduct System is estimated to divert an additional 4.37 mgd from the point that it leaves the License Area at Honopou Stream and collects water from streams on privately owned land to its last diversion at Māliko Gulch.

Comment 106: *In chapter 4, Fig 4-15, the “Haiku” label is actually in Hamakuapoko west of Maliko Gulch. Haiku is located east of Maliko Gulch.*

Response 106: Please note that Figure 4-15 of the Draft EIS shows the Land Study Bureau soils designations in Central Maui and that the “Haiku” label has been corrected to be east of Māliko Gulch.

Comment 107: *In Appendix E, fig 47, the field inspections map has the label “Ho‘olawa” where the stream and community of Honopou is located. It has the label “Haiku” where the Honopou stream intake on New Haiku ditch may be located. These labels create confusion, and need to be corrected.*

Response 107: The label “Ho‘olawa” and “Haiku” were incorrectly used and have been removed, as it was not the purpose of this figure to label communities. The intention of Figure 47 in Appendix E of the Draft EIS is to depict the names of the sluice gates of the EMI Aqueduct System. Figure 47 in Appendix E of the Draft EIS has been revised as Figure 53 in Appendix E of the Final EIS. See Appendix E enclosed in the Final EIS.

Comment 108: *The DEIS states that, “Settlements along Hāna Highway from west to east, toward Hāna, include Huelo and Kailua makai of the Huelo License Area, Ke‘anae and Wailua makai of the Ke‘anae License Area and Nāhiku makai of the Nāhiku License Area.” Many communities in the lease area have no public water systems, and the DEIS needs to specifically discuss mitigation plans to restore sufficient flows to Puniawa, Ho‘olawa, Mokupapa, Honokalā, Waipio, East Waipio, Waipio iki and Hanawana streams to provide domestic water to the hundreds of families who live in these communities. Their streams are not part of the 2001 IIFS*

petition for the East Maui Lease areas, yet the continued diverted conditions of their streams impacts their daily lives and their rights to have sufficient water for their domestic needs.

Response 108: Your comment regarding the settlements along Hāna Highway is unclear. However, please note that the statement, “*Settlements along Hāna Highway from west to east, toward Hāna, include Huelo and Kailua makai of the Huelo License Area, Ke‘anae and Wailua makai of the Ke‘anae License Area and Nāhiku makai of the Nāhiku License Area.*” is not included in the Draft EIS. It appears that this statement was in the EISPN.

Regarding your comment about many communities in the "lease area" (i.e., License Area), please note that there are not communities within the License Area. However, there are East Maui communities located below the License Area. We acknowledge your comment that many communities do not have public water system. However, please note that this is under the purview of the MDWS, not EMI.

Regarding your comment about mitigation plans to restore sufficient flows to the streams mentioned in Comment #108 above, please note that the EMI Aqueduct System has historically diverted all of those streams except for Honokalā Stream. However, Puniawa is considered a tributary to Honopou Stream, which is ordered to be fully restored under the CWRM D&O. Hence, it will not be diverted. We acknowledge that the Draft EIS does not specifically talk about how to *restore* the non-petitioned streams, which includes the streams you mentioned above in Comment #110. Under the Proposed Action, the proposed Water Lease requests to divert the maximum amount of water from the License Area after compliance with the CWRM D&O. Please note that these streams were included as part of the overall analysis of the EIS and associated technical studies. Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The HSHEP model in Appendix A and summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species.

Regarding the East Maui streams in the License Area, the EIS presents four scenarios using the HSHEP model. The diversion amounts were determined in advance and modeled for those specific scenarios. Due to common sense technical challenges to the HSHEP model, not all scenarios were presented or analyzed. To provide context, there are approximately 388 individual diversions in the EMI Aqueduct System. Potentially any of these diversions could: (1) have different levels of water restoration mandated at the diversion location; (2) could have engineering changes to increase fish passage and decrease larval entrainment; and/or (3) have the sequence of water restoration or engineering changes include numerous different scenarios with for example, 50% water return on diversion 1, an engineering change on diversion 2, a 60 % water return and an engineering change on diversion 3, and so on. This could result in many different scenarios - too many for meaningful review, and each potential adjustment would not alter the overall findings as presented in the Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP Model). To be more specific on the

number of potential iterative scenarios, there is a formula for the number of permutations = n^r . So, in a stream with 3 diversions, if we wanted to present different flow restoration levels, 0 to 100% in 10% intervals, we get 11^3 which equals 1,331 different scenarios. If a single engineering adjustment is added (2 options of no change and new design), the result is 22^3 , which equals 10,648 scenarios.

For example, there are 10 diversions on Nā'ili'ilihale Stream, which is one of the non-IIFS streams. Applying different flow restoration levels 0 to 100 in 10% intervals, as discussed above, there are approximately 25,937,424,601 scenarios. Twenty-five billion scenarios are far too many to reasonably understand or consider for management actions. Also note that no engineering changes to those diversions to increase fish passage or decrease larval entrainment were considered in the example. Thus, the number of permutations involved in considering all options for the 300+ diversions in the East Maui streams precludes a systematic optimization of all possible scenarios.

In other words, the difficulty lies in the complexity and the number of possibilities created by those questions regarding the restoration of the non-petitioned streams while attempting to determine the answers to best balance the offstream uses related to the Proposed Action. Therefore, while questions regarding restoration of the non-IIFS streams are valid, the questions need to be constrained to a smaller subset of possibilities to make optimization testing possible. With that caveat stated, some general guiding concepts can be concluded to minimize impacts to the non-petitioned streams from stream diversions.

With respect to diversion locations and amount for non-petitioned streams:

1. Regardless of the way the water is diverted, greater percentages of total streamflow diverted generally result in lower amounts of instream habitat for native stream species. However, when diversion amounts are similar among scenarios,
 - a. Diverting comparable amounts of water at higher elevation diversions is less damaging to instream habitat for native stream species than diverting that water at lower elevation diversions.
 - b. Returning comparable amounts of water at the higher elevation diversions and allowing it to flow downstream without additional diversion will result in more instream habitat than partial water diversion at all diversions due to the compounding impact of entrainment at each diversion.

With respect to modifications of the diversion for improved passage and decrease entrainment:

2. Improvements in diversion passage result in more suitable habitat at most flow amounts.
3. At lower flow restoration amounts, modifications to improve passage result in greater gains in suitable habitat than at higher flow restoration amounts.

Please note that Section 4.2.1 of the Final EIS has been revised to include a general discussion more specific to the impacts and mitigations associated with the non-petitioned streams, and how

stream flow restoration will influence Habitat Units in the License Area as shown on pages 4-63 to 4-67. It has also been noted in Section 4.7.2 of Final EIS that many of the communities downstream of the EMI Aqueduct System adjacent to the non-petitioned streams do not have access to MDWS water and depend upon these streams to meet their domestic water use as shown on page 4-263.

It is assumed that restoration scenarios of the non-petitioned streams would fall under the Reduced Water Volume alternative. As discussed in Response #73 above, the HSHEP model requires specific diversion conditions at each diversion. Applying the model to the Reduced Water Volume alternative would require information regarding where stream flows are proposed to be increased over the Proposed Action and the amounts. Given such information, the HSHEP model is able to readily calculate the number of remaining Habitat Units (HU) in any given scenario.

Comment 109: *Section 1.1 states that the “need” for the Water Lease is due to the lack of existing adequate alternative sources of water and infrastructure to meet these demands. This section of the DEIS needs to clearly define the amount and location of A&B acreage that actually needs irrigation, the availability of additional EMI sources of stream water outside the lease area, and the availability of reclaimed water from the Wailuku-Kahului wastewater treatment plant, to provide that irrigation.*

Response 109: Citing the Draft Maui Island Water Use and Development Plan (March 2019), Section 1.1 of the Draft EIS includes a statement that "A need for the Water Lease is the lack of practicable alternative sources of water and the lack of alternative infrastructure to meet these demands." It is unclear what you mean by "A&B acreage that actually needs irrigation." As discussed throughout the Draft EIS, the Central Maui fields formerly in sugarcane production are now owned by Mahi Pono and are being used, and planned for use, for diversified agriculture. The Mahi Pono farm plan, provided in Table 2-1 of the Draft EIS lists the acreage that Mahi Pono proposes to irrigate under the Proposed Action as shown below:

Table 2-1 Mahi Pono Farm Plan							
Proposed Use	Acres	Gallon Per Acre a Day	Surface MGD	Ground water MGD	Total MGD	Annual MGD	% of Total
<i>Community Farm</i>	800	3,392	1.87	0.83	2.70	987	3.28%
<i>Orchards (citrus, mac nuts, beverage crops)</i>	12,850	5,089	53.39	12.04	65.43	23,883	79.48%
<i>Tropical Fruits</i>	600	4,999	2.07	0.87	2.94	1,073	3.57%
<i>Row and Annual Crops</i>	1,200	3,392	3.14	0.95	4.09	1,491	4.96%
<i>Energy Crops</i>	500	3,392	1.18	0.53	1.70	622	2.07%
<i>Pasture, irrigated</i>	4,700	1,161	4.20	1.25	5.46	1,992	6.63%
<i>Pasture, unirrigated</i>	9,100	0	0	0	0.00	0	0.00%

<i>Green Energy</i>	250	0	0	0	0.00	0	0.00%
TOTAL	30,000	2,744	65.86	16.47	82.33	30,047.77	100.00%

Hence, under the Proposed Action, approximately 9,100 acres would be unirrigated. Moreover, Consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture.

Table 3-1 of the Draft EIS provides the Mahi Pono farm plan in the event that no Water Lease is issued as shown below:

<i>Proposed Use</i>	<i>Acres</i>	<i>GPAD</i>	<i>Surface MGD</i>	<i>Groundwater MGD</i>	<i>Total MGD</i>	<i>Annual MGD</i>	<i>% of Total</i>
<i>Community Farm</i>	300	3,392	0.70	0.26	0.97	353	3.25%
<i>Orchards (citrus, mac nuts, beverage crops)</i>	4,180	5,089	17.36	3.39	20.75	7,574	69.77%
<i>Tropical Fruits</i>	200	4,999	0.69	0.26	0.95	349	3.21%
<i>Row and Annual Crops</i>	400	3,392	1.15	0.82	1.98	722	6.65%
<i>Energy Crops</i>	200	3,392	0.47	0.20	0.68	248	2.28%
<i>Pasture, irrigated</i>	3,800	1,161	3.40	1.01	4.41	1,610	14.83%
<i>Pasture, unirrigated</i>	20,670	0	0	0	0.00	0	0.00%
<i>Green Energy</i>	250	0	0	0	0.00	0	0.00%
TOTAL	30,000	991	23.79	5.95	29.74	10,855.16	100.00%

Hence, under the No Action alternative, approximately 20,670 acres would be unirrigated. However, food crop production and beneficial economic impacts would be significantly less than the Proposed Action as discussed in Section 3.4.13 of the Draft EIS.

Section 2.1.2 of the Draft EIS, as well as other sections of the Draft EIS, discuss the approximately 4.37 mgd that is collected by the EMI Aqueduct System after it leaves the License Area.

The availability of the use of reclaimed water from the Wailuku-Kahului Wastewater Reuse Facility (WWRF) is discussed in Draft EIS Section 3.1.1.2 (Reclaimed Water), which provides an analysis of the feasibility of the use of reclaimed water from the Wailuku-Kahului WWRF to irrigate the Central Maui fields. As discussed, the recycled water alternative using existing R-2 water from the Kahului WWRF could be considered an alternative as supplemental source. However, R-2 water has limited useability on crops. County of Maui Department of Environmental Management (DEM) does not intend to send this R-2 water to the Central Maui agricultural fields. Further consideration of this alternative has been included in Chapter 3 of the FEIS, which has also been supplemented with a discussion about the potential new reuse/effluent disposal facility in Central Maui to be located south-west of the Kahului WWRF that is being considered by the County Department of Environmental Management. See pages 3-9 to 3-11 of the Final EIS.

Comment 110: *It also needs to note that a portion (roughly half) of the water in the Upcountry MDWS system comes from diversions outside the proposed lease area, or from fresh water wells, and is not dependent on the EMI system.*

Response 110: As discussed above in Response #6, Draft EIS Section 2.1.3.1 (Upcountry Maui Water System) states that the MDWS Upcountry Maui Water System relies on three surface water sources, which accounts for approximately 80-90 percent (13 mgd) of water delivered through the Upcountry Maui Water System (CWRM D&O, FOF 799), but that only one of the three surface water sources is delivered directly by the EMI Aqueduct System, through the Wailoa Ditch. That same section of the Draft EIS explains that "*approximately 10-20 percent of water delivered through the Upcountry Maui Water System comes from a series of basal aquifer wells: the Ha'iku Well, Po'okela Well, and the two Kaupakalua wells.*" That section of the Draft EIS also stated that a total of 4.9 mgd of water was delivered from these wells. However, that language requires clarification, and correction as recent input from the MDWS indicates there is only one Kaupakalua well, and has been restated as follows: "*These three wells have a total production capacity of about 3.4 mgd of water.*" CWRM D&O, FOF 811. Applicable edits have been made to Section 2.1.3.1 of the Final EIS to reflect this clarification.

Comment 111: *The DEIS also needs to discuss the new Upcountry wells being planned by the MDWS and DHHL as potential "alternative sources". None of this is made very clear by maps or text in the DEIS, and this needs to be corrected.*

Response 111: We are currently not aware of any wells being planned in Upcountry Maui nor are there any permits on file for new wells by MDWS for the Upcountry Area. Moreover, MDWS has indicated that it has no current or anticipated expansion or improvement plans for the MDWS system within the EIS areas based on additional consultation after the publication of the Draft EIS. The letter dated July 24, 2020 from MDWS indicating this has been added to the Final EIS as Appendix P. We are also unaware of any wells being planned in Upcountry Maui by DHHL.

Comment 112: *The DEIS needs to discuss the current “Memorandum of Understanding” (MOU) executed between EMI and MDWS. It should also refer to the section of the MOU where both A&B and DWS agree to work on plans to restore stream flows if agricultural needs change (which they already have!!)*

Response 112: The language you refer to above was in an amendment to the MOU that was not consummated and is not in effect. The current agreement in place states that "A&B and EMI acknowledge and agree that, in performing their obligations under this Agreement they shall observe and comply with their obligations under the [JUNE 2018 CWRM D&O] IIFS."

Comment 113: *The DEIS should specify those plans for stream restoration that have been discussed by A&B and DWS.*

Response 113: There have not been any discussions between A&B and MDWS regarding stream restoration. Please see Response # 112, explaining that the amendment to the MOU you referred to was never consummated and is not in effect.

Comment 114: *The DEIS should have an accurate list of streams that are diverted by the Wailoa-Ko'olau Ditch: East & West Wailua Iki, and East & West Wailua Nui, Waipio, Hoalua, Ho'olawa, Na'ili'ili haele, Kailua, Waiohue, Kopili'ula, Wahinepe'e, Waiokamilo, Puakea, Puaka'a and Palauhulu.*

Response 114: Section 2.1.3.1 of the Draft EIS notes that the Kamole-Weir WTP receives surface water from the Wailoa Ditch, which, in turn receives water from diversions of various streams extending as far east as Makapipi Stream at the eastern border of the License Area through the Koolau Ditch. The streams that have historically been diverted by the Wailoa / Koolau Ditches are Honopou, Hanehoi, Puolua, Alo, Waikamoi, Puohokamoa, Ha'ipua'ena, Kōlea, Punalau, Honomanū, Nua'ailua, Pi'ina'au, Paluhulu, East and West Wailuānui, East and West Wailuāiki, Kopili'ula, Pua'aka'a, Waiohue, Pa'akea, Waia'aka, Kapā'ula, Hanawī, and Makapipi streams. However, as noted in Section 1.3.4 of the Draft EIS, some of these streams are no longer diverted per the CWRM D&O, such as Hanehoi, Puolua (partial-not completely), Pi'ina'au, Palauhulu, East and West Wailuānui, West Wailuāiki, Waiohue, and Makapipi streams.

Comment 115: *The Alternative's section of the DEIS needs to discuss crops and growing methodologies that will use significantly less water than the maximum amount allowed by the IIFS. The Maui Tomorrow Foundation's report, "Mālama 'Āina: A Conversation About Maui's Farming Future," provides information on these proven methods.*

Response 115: Under the Proposed Action, as discussed in Response #111 above, there are approximately 9,100 acres planned to be unirrigated with the current Mahi Pono farm plan, even with the full allocation of the water. As discussed in Response #45 above, Mahi Pono intends to plant additional crops in areas that are currently planned to be unirrigated pasture due to the lack of enough water to irrigate all 30,000 acres of land should water demands of the planned crops reduce.

Comment 116: *HC&S historically used their brackish wells for up to 40% of their water needs up to 2002. They are part of a reliable system. Despite this, A&B also reported being short of water 10 months out of the year, even though they had unrestricted access to all of the water they could divert from East Maui, and 25 mgd from Na Wai Eha and their system of 15 wells. This needs to be discussed in the EIS.*

Response 116: The information you recite in Comment #116 is addressed in Section 2.1.4 of the Draft EIS which explains that the Central Maui Field Irrigation System has brackish groundwater wells that can supplement surface water to approximately 17,200 acres of the Central Maui agricultural fields at the lower elevations. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water as noted in Response #51. During sugarcane operations, the combined pumping capacity of A&B's 15 brackish water wells was 228 mgd of brackish water, but the true instantaneous pumping capacity of the wells – the most that can be pumped over 3 to 5 days – was 115 mgd during sugar cultivation, after which sump levels started to decline. From 1986 to 2013, A&B pumped an average of 71 mgd from the brackish water wells; during the 2008-to-2013 period, these wells delivered about 70 mgd of brackish groundwater to the lower-elevation fields. This was a suitable source of water for sugarcane during droughts because sugarcane can tolerate periodic use of water with higher salinity levels. However, please note that Section 2.1.4 of the Final EIS regarding the description of the brackish groundwater wells that serve the Central Maui Field Irrigation System has been revised to accurately reflect the number of wells that can serve Mahi Pono, as not all were a part of the sale transaction between Mahi Pono and A&B as shown on page 2-25 of the Final EIS.

Moreover, with respect to the Mahi Pono farm plan, because of salinity and the salt tolerance of diversified agricultural crops, which are less salt-tolerant than sugarcane, the use of brackish water on the lower fields is assumed to be limited to about 30% of the water applied. Combining the upper and lower fields, the overall water split across all 30,000 acres would be approximately 80% surface water and 20% brackish groundwater water. If insufficient water is available from the EMI Aqueduct System, then crop farming will have to be reduced no matter how much

brackish water was available. Thus, we disagree with your statement that the brackish wells are part of a 'reliable system'. Additionally, the sustainable yield of the underlying aquifers as well as the quality of water are uncertain in light of the fact that significantly less recharge from imported East Maui waters will occur. Historically, the sustainable pumping capacity of these wells was highly dependent on irrigation recharge and the positive benefits to the underlying aquifers.

Comment 117: *The Lowrie, New Hamakua, Manuel Luis, and Center Ditches intercept and divert dozens of streams. A complete chart of all the ditches and diversion points inside and outside of the lease area should be provided in the EIS.*

Response 117: You are correct that the ditches mentioned in your comment above divert several streams. Regarding your request a chart of all the ditches and diversions inside and outside the License Area, Section 2.1.2 of the Draft EIS describes and depicts the ditches of the EMI Aqueduct System within and outside the License Area. Specifically, Section 2.1.2 of the Draft EIS states:

The EMI Aqueduct System spans the State-owned License Area which includes four areas in East Maui, known as the Nāhiku, Ke 'anae, Honomanū, and Huelo. The EMI Aqueduct System consists of approximately 388 separate intakes, 24 miles of ditches, and 50 miles of tunnels, as well as numerous small dams, intakes, pipes, 13 inverted siphons and flumes. The EMI Aqueduct System collects surface stream water from approximately 50,000 acres of land (Collection Area), of which approximately 33,000 acres are owned by the State of Hawai'i (License Area), and the remaining approximately 17,000 acres are privately owned by EMI and Mahi Pono.

The EMI Aqueduct System starts at Makapipi Stream, in the Nāhiku portion of the License Area, with the Koolau Ditch. The Koolau Ditch traverses westward across the Ke 'anae License Area and into the Honomanū License Area where it crosses paths with the Spreckles Ditch. This is where streams had multiple diversions at different levels to supply water to the EMI Aqueduct System. Separating higher elevation ditches allows them to maintain the very slight slope necessary to convey flows by gravity over long distances to irrigate higher elevation fields. This avoids the cost of energy required to pump water up from ditches delivering water at lower elevations. As the system continues westward, the Koolau Ditch transitions at the boundary between the Honomanū and Huelo portions of the License Area to the Wailoa Ditch. Makai of the Koolau/Wailoa Ditch, are the Manuel Luis and the Center Ditch. At Waikamoi Stream, the New Hamakua Ditch begins, running parallel to the Wailoa Ditch, but at a lower elevation.

The Spreckles Ditch terminates its mauka segment at Waikamoi Stream, and begins its makai segment at Ka'aiea Stream, until it converges with the Lowrie Ditch at Nā'ili'ilihale Stream. Makai of Lowrie Ditch is the Haiku Ditch. At Honopou Stream, the water collected within the License Area by the EMI Aqueduct System exits the License Area. Crossing this western boundary of the License Area in descending elevation are the Wailoa Ditch, the New Hāmākua Ditch, the Lowrie Ditch, and the Haiku Ditch. West of Honopou Stream, the EMI Aqueduct System traverses land that was largely owned by A&B and is now largely owned by Mahi Pono. Additional flows from streams located on this land are diverted by the EMI Aqueduct System until it crosses Maliko Gulch beyond which there are no stream diversions. Crossing Maliko Gulch in descending elevation are the Wailoa Ditch, Kauhikoa Ditch, Lowrie Ditch, and the Haiku Ditch. Figure 2-1 depicts the EMI Aqueduct System in East Maui identifying the system's ditches, and major stream diversions within and outside the License Area. Figure 2-2 depicts the major ditches that transport water to the agricultural fields in Central Maui.

Regarding all diversion points, as discussed throughout the EIS, it is estimated that there are approximately 388 intakes that span over 50,000 acres. Hence, as discussed in Section 1.3.1 of the Draft EIS, the related graphic depicts the major diversions associated with the EMI Aqueduct System. Specifically, Section 1.3.1 of the Draft EIS states:

Figure 1-1 illustrates the EMI Aqueduct System overlaid on the Department of Land and Natural Resources (DLNR) Division of Aquatic Resources (DAR) geographic information system (GIS) data obtained from the State Office of Planning's GIS download portal. An electronic drawing of the EMI Aqueduct System was georeferenced by Akinaka & Associates, Ltd. (Akinaka) to depict major diversions on East Maui streams shown on a United States Geological Survey (USGS) base layer map obtained from ESRI. Due to the complexity of the EMI Aqueduct System and the level of detail shown on the map, not all of the minor diversions could be associated with a stream or tributary.

Comment 118: *The County's upper and lower Kula pipelines traverse EMI lands, and are serviced by intakes on the upper reaches of several streams that flow through the East Maui lease area. The intakes, mostly above the East Maui lease area, are maintained by EMI, which charges the county for "water delivery" that arrives at the DWS reservoirs through the Kula pipelines. It is important that the DEIS clearly explains the workings of this system.*

Response 118: The information you are seeking is in Section 2.1.3.1 of the Draft EIS, which describes the MDWS Upcountry Maui Water System in detail, as well as in Responses #5 to #13.

Comment 119: *The DEIS should discuss the alternative of the system being managed as a public irrigation district, being managed by a partnership of agencies and stakeholders, and*

other possible management scenarios. Maui DWS also referred to a need to have the DEIS discuss these options in their comments.

Response 119: The Draft EIS considered alternative ownership / management of the EMI Aqueduct System as discussed in Response #38 above describing that Section 3.1.2 of the Draft EIS contemplates alternative ownership of the EMI Aqueduct System. Also as discussed above, that section of the EIS has been further modified based on the County's TIG Report which was prepared after publication of the Draft EIS as shown on pages 3-19 to 3-20. However, please note that the alternatives that were fully analyzed are those that were deemed reasonable as per HAR § 11-200-17(f). The EMI Aqueduct System is owned by EMI and is not for sale or lease. The EMI Aqueduct System runs through both EMI-owned land and State-owned land. Through a water lease process, the BLNR does not have legal authority to require EMI to allow others to enter upon its lands or use the EMI Aqueduct System, and it would be impossible to operate the EMI Aqueduct System without access to the system in its entirety. As discussed in Response #29 above, the EMI Aqueduct System is owned by EMI, however, the EIS acknowledges that some of the lands underlying the EMI Aqueduct System are owned by the State. Pursuant to the 1938 Agreement, the Territory of Hawai'i (now the State) granted perpetual easements to EMI for the placement of the EMI Aqueduct System. Therefore, it is unreasonable to assess the comparative impacts of alternatives that seem highly speculative if not outright impossible, such as the EMI Aqueduct System being managed by a public irrigation district, partnership of agencies, or otherwise. Hence, to assess alternative ownership at this point is too speculative and unreasonable.

Moreover, as discussed in Response #76 above, on July 19, 2019, the Maui County Board of Water Supply formed the subject TIG to explore options for ensuring public access to water, including the feasibility of purchasing and maintaining the EMI Aqueduct System.

Comment 120: *The DEIS should also discuss the option of individual lease areas being awarded to the residents of the area who depend upon the streams. Dismissal of this alternative as "speculation" and as offering "no environmental benefit" does not meet the required EIS content standard that requires a realistic examination of alternatives.*

Response 120: The EIS was prepared to analyze the impacts of the proposed Water Lease consistent with the objectives and purpose of the proposed Water Lease as described in Sections 1.1 and 1.2 of the EIS, including the use of the EMI Aqueduct System. The scenario you describe is entirely outside of the purpose and need for the Proposed Action and is therefore not a realistic or reasonable alternative for the purposes of this EIS.

Comment 121: *The transition of other plantation ditches to irrigation districts has already happened to several Hawaii systems, and this alternative needs to be examined just as thoroughly as the evaluation of the alternative of Mahi Pono getting 88 mgd of East Maui water is examined.*

Response 121: Please see Response # 120 above. Such a scenario is not consistent with the stated objectives (see HAR § 11-200-17(f)) of the Proposed Action. See EIS Section 1.2, which provides:

In general, the objectives of the issuance of the Proposed Action (Water Lease) are:

- *Preserve and maintain the EMI Aqueduct System, including its access roads*
- *Continue to meet domestic and agricultural water demands in Upcountry Maui*
- *Continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses)*
- *Continue to serve community water demands in Nāhiku*

Comment 122: *The alternatives section needs to discuss a variety of updated fee schedules and a funding structure that creates enough revenue to actually actively manage the lease lands for watershed productivity.*

Response 122: It is expected that a budget for management of the License Area lands for watershed productivity will be part of fulfilling the watershed management plan requirement under HRS § 171-58. There are many existing mauka watershed plans, including those implemented by the State's Division of Forestry and Wildlife (DOFAW) and groups like the Watershed Partnerships. As discussed in Section 2.1 of the Draft EIS, A&B was a founding member of the East Maui Watershed Partnership (EMWP), which was the first watershed partnership in the State of Hawai'i and which served as a model for other watershed partnerships throughout the State. In reviewing existing watershed management plans in general, however, DLNR has recently determined that some of the existing watershed plans are not always directly correlated to the water lease area and some plans are old and outdated. In certain places, new threats to watershed health are not addressed in existing watershed plans. Additionally, DLNR determined that estimated budgets in such existing plans may not reflect the current cost of management if the plan is over 5 years old. As such, DLNR will work with proposed water lessees to determine if any existing plan meets the minimum content requirements and sufficiently addresses the protection of watershed forests and fresh water resources in the License Area. If it does not, DLNR will work with the lessee to determine the specific actions needed and jointly develop a new plan or update the existing plan as noted in Response #71 above. It should be noted that the existence of a watershed management plan does not absolve a water lessees' duty to help with the implementation of management actions. A lessee must provide DLNR proof that it is already contributing to the protection of the watershed, and membership in a Watershed Partnership may not fulfill the requirement of implementation.

DLNR and a water lessee will jointly develop a watershed management plan that cites existing management plans, meets the minimum content requirements, and outlines what reasonable management practices are needed for the water lease area and the current estimated costs associated with implementation. The new plan will be specific to the watershed(s) associated with the lease (the sources that feed the lease area) and management will be based on current estimated costs. One of the required elements of a watershed management plan is a budget, which entails a) an estimate of costs and categories of expenditures needed; and b) potential sources of funding for implementing the actions. See pages 2-2 to 2-4 of the Final EIS.

Comment 123: *The DEIS should clearly explain that no one else has bid on these East Maui leases, and A&B/EMI have had a defacto monopoly on their use.*

Response 123: Section 1.3.2 of the Draft EIS provides a history of the EMI Aqueduct System from the 1870s forward. That is followed by Section 1.3.3, which states that since 1876, A&B, or its predecessors and affiliates, have been issued from the Kingdom, the Territory and then the State of Hawai‘i, various leases, agreements, licenses, and permits that authorized the development, diversion, transportation and use of government-owned water from streams in East Maui within approximately 33,000 acres owned by the Territory/State.

Comment 124: *Appendix B states that the amount of water flowing in streams has no impact on terrestrial flora and fauna. Appendix F says that cultural impacts are addressed by the 2018 CWRM decision. The DEIS needs to discuss how industrialization and dewatering of streams has left lasting and continuing impacts on the watersheds and the community members who dwell there, and who are trying to perpetuate native Hawaiian cultural practices despite artificially fluctuating water levels. The EIS should acknowledge those impacts and propose mitigation that will achieve the following:*

- a) restore watershed health and productivity in lease areas*
- b) restore native stream life and viable stream flows for traditional agriculture, including in the Ha‘ikū and Huelo communities.*
- c) restore soil health and productivity, and adopt other regenerative practices such as windbreaks and Keyline contouring to reduce water demand in central Maui.*

Response 124: Regarding your comment that Appendix B states that the amount of water flowing in streams has no impact on terrestrial flora and fauna, please note that Appendix B (East Maui Irrigation Assessment of Streams and the Ocean), analyzes the nearshore coastal environment and the amount of land-based nutrients delivered from stream into the ocean. We believe you meant to refer to Appendix C (Terrestrial Flora and Fauna Technical Report). However, nowhere in Appendix C is it stated that the amount of water flowing in streams has no impact on terrestrial flora and fauna. Rather, Appendix C concludes that under the Proposed Action, there would not be significant change to terrestrial flora and fauna that already currently exists. It is expected that the vegetation cover types would remain substantially the same as discussed in Section 4.4 of the Draft EIS. Moreover, mitigation and avoidance measures are

discussed in Section 4.4 of the Draft EIS to prevent further change / introduction of invasive species into the License Area.

Regarding your comment that Appendix F (Cultural Impact Assessment) says that cultural impacts are addressed by the CWRM D&O, please note that this is not stated in Appendix F. Rather it is stated in Appendix F and Section 4.6 that, "...*the CWRM D&O has the potential to reduce or eliminate this cultural impact.*" Moreover, the discussion of cultural resources and impacts has been expanded in Section 4.6 of the Final EIS with respect to East Maui to take into account additional outreach that was undertaken in connection with comments submitted in response to the Draft EIS. The CIA found that the CWRM D&O did in fact reduce many cultural impacts, specifically those related to taro farming. See pages 4-242 to 4-244 of the Final EIs.

Regarding your comment that the Draft EIS should discuss how industrialization and dewatering streams has left lasting and continuing impacts on the watersheds, please note as noted in Response #15 above, we acknowledge that an EIS must consider cumulative impacts, which means "the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions." HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision-making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease. However, please note that streams in East Maui have been diverted for over a century and it is not scientifically possible to fully document impacts that first took place more than a century ago as pre-diversion data does not exist. Moreover, we acknowledge that cultural practices and subsistence lifestyles that are unique to East Maui communities have a direct relationship with the health and abundance of native stream and estuarine habitats, as well as the region's overall environmental integrity.

Regarding your suggestion that the EIS include mitigation measures to restore watershed health and productivity in the License Area, please note as discussed in Response #23 above, the lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. It is recognized that Hawai'i's fresh water originates from the forest, which capture and absorb hundreds of inches of rain each year, allowing for slow infiltration and replenishment of our aquifers and streams. Based upon this understanding, the legislature added sub-section (e) to HRS § 171-58, requiring the incorporation of a watershed management plan into all water lease agreements to help protect fresh water resources (surface and ground water). In addition to sustaining ground and surface water supplies, healthy forests reduce erosion by holding soil in place, improve water quality, and provide habitat for unique and endangered plants and animals. Focusing on watershed management plans that target mauka protection actions (fencing, removal of hooved animals from important watershed forests, invasive weed control, etc.) that benefit native forests is essential if water lessees are going to have a reliable long-term supply of fresh water. As discussed in Section 2.1 of the Draft EIS, HRS § 171-58 requires the BLNR to jointly develop and implement a watershed management plan with the

lessee of any water lease. A&B was a founding member of the East Maui Watershed Partnership. Under the Proposed Action, it is anticipated that the Water Lease lessee will continue to pursue watershed management activities either through an existing watershed management plan or a newly developed watershed management plan or some combination of both. The existing EMWP Management Plan was prepared in July 2009 and amended in July 2018, attached to the EIS as Appendix O. The EMWP Management Plan describes the watershed resources such as water, cultural / physical resources, native flora and fauna, and recreational resources. The EMWP Management Plan identifies the watershed threats and management objectives for the East Maui Watershed.

Regarding your suggestion that the EIS include mitigation measures to restore native stream life and stream flows for traditional agricultural practices, as discussed in Response #18 above, the CWRM D&O addressed the needs for kalo farming for the vast majority of streams that are diverted and proposed for diversion under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS, including within the Huelo area. It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation.

However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches as noted in Appendix I and Section 4.7.4 of the Final EIS.

Taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Regarding your suggestion that the EIS include mitigation to restore soil health in Central Maui through the use of windbreaks, keyline contouring, and other measures, as discussed in Section 4.1.2 of the Draft EIS:

Under the Proposed Action, the agricultural fields in Central Maui will be converted to a diversified agricultural farming operation by Mahi Pono. The soils in Central Maui have already been disturbed from over a century of sugarcane cultivation in the region. Mahi Pono's diversified agricultural operation will include soil preparation to remove the remnants of sugarcane and other vegetation from the fields as needed. These preparations include the application of effective micronutrients, plastic removal, pH adjustments, and the application of organic matter. Soils will be gathered and replaced or moved into other field locations, as needed, and activities such as soil amendment will follow in preparation for planting.

Moreover, the Mahi Pono farm team follows Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies

Comment 125: *The DEIS must discuss the relative benefits of regenerative agricultural methods in future plans for the irrigated former sugar lands. Examples would be: rotational grazing; extensive cover cropping; contour plowing and water collection swales (see MTF "Mālama `Āina report referenced earlier). The DEIS cannot conclude that "sustainability" will be achieved by using the same outmoded methods that lead to past chronic water shortages and lost soil health.*

Response 125: The Mahi Pono farm team follows Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies. Once crops are planted (particularly the permanent orchard crops), ground disturbance will be a limited, resulting in a further reduction of dust and erosion, thus reducing runoff. In addition, the Water Lease terms and conditions will require farm tenants to follow BMPs. These practices may include, but are not limited to, rotational grazing, use of cover crops, contour plowing, and use of swales. Also, please note that sugarcane farming methods are not applicable to those used for diversified agriculture. Moreover, as noted in Response #1 above that Mahi Pono plans to invest over \$20 million to increase the efficiency of its on-farm irrigation system in Central Maui (i.e., the distribution system from the Kamole-Weir to the agricultural fields). Mahi Pono's irrigation engineering team is also designing a high-efficiency irrigation system. The new irrigation system will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycle and re-use all water used in Mahi Pono's processing plants; and (3) integrate various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to Section 2.1.4 of the Final EIS as shown page 2-25.

Comment 126: *The current set of Alternatives examined in the DEIS is extremely lacking. Dismissal of alternatives was done without factual information. The discussion of Alternatives*

must provide sufficient information for the reader to gain a good understanding of why particular alternatives are rejected. HAR 11-200-16 requires that:

“The draft EIS shall describe in a separate and distinct section alternatives which could attain the objectives of the action, regardless of cost, in sufficient detail to explain why they were rejected. The section shall include a rigorous exploration and objective evaluation of the environmental impacts of all such alternative actions. Particular attention shall be given to alternatives that might enhance environmental quality or avoid, reduce, or minimize some or all of the adverse environmental effects, costs, and risks.”

Unfortunately, none of the 3 Alternatives considered; or the 3 Alternatives dismissed, were explored with enough rigor or objectivity to meet this standard of evaluation.

Response 126: We respectfully disagree with your opinion that the alternatives analysis is lacking. The relevant section of the law is HAR § 11-200-17(f), as cited in Chapter 3 (Alternatives) of the Draft EIS. HAR §11-200-17(f) requires an analysis of alternatives to the Proposed Action "*which could attain the objectives of the action.*" The objectives of the Proposed Action, as stated in Section 1.2 of the Draft EIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku. Importantly, HAR § 11-200-17(f) requires a comparative evaluation of the environmental benefits, costs, and risks of the Proposed Action and each reasonable alternative. As noted in Response #15 above, Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued.

Chapter 3 of the Draft EIS also identified other alternatives that could meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects, and therefore those alternatives were discussed, but ultimately not assessed to the same degree as (a) through (d). Nevertheless, in response to comments submitted on the Draft EIS, a further exploration of those alternatives was undertaken and is provided within Chapter 3. Additionally, Chapter 3 acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible.

Chapter 3 of the Draft EIS includes a comparative evaluation of the environmental "benefits, costs, and risks" of the Proposed Water Lease and "each reasonable alternative" i.e. (a) through (d) across a spectrum of environmental factors, such as Soils, Surface Waters and Aquatic Environment, Groundwater, Coastal Waters, Drainage, Natural Hazards, Flora, Fauna, and Invertebrates, Historic Resources, Cultural Resources and Practices Social Characteristics, Economic and Fiscal Resources, Agricultural and Related Economic Resources Recreational Resources, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Water Systems, and Public Services and Facilities. However, please note that Section 3.5 of the Final EIS includes a comparative table of the various alternatives and the associated impacts of each alternative as shown on pages 3-49 to 3-80.

Comment 127: *The DEIS needs to disclose impacts of continued large scale diversions in the event of climate change, and provide strategies for the EMI system to respond to changes in rainfall patterns. There also needs to be a discussion of funding needed to increase resiliency and increase the capacity of the East Maui watersheds to store and release surface and ground water that will continue to supply the EMI system during changing weather events. The continued mass dewatering of streams will have impacts if rainfall patterns change; the impact of this must also be discussed.*

Response 127: Climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of

this EIS as shown on pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Your comment regarding about the EMI Aqueduct System responding to changes in rainfall patterns is unclear. However, please note that the EMI Aqueduct System must meet the respective IIFS of the License Area streams prior to diverting any surface water through the EMI Aqueduct System.

Regarding your comment about funding needed to increase resiliency, as discussed in Response #69, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses a budget with potential sources of funding for implementing the actions of the watershed management plan which must also have adaptive management.

Comment 128: *The DEIS needs to discuss impacts of proposed large-scale diversions on aesthetic resources. Examples include the dry and diminished appearance of streams, pools and waterfalls enjoyed by the public during hiking and nature study and by local residents in areas like Ho‘olawa, Hanawana, Mokuapapa and Waipio.*

Response 128: Please note that potential impacts of the Proposed Action to visual resources are discussed in Section 4.9 of the Draft EIS. Regarding the East Maui region, Section 4.9 concludes that, “[n]o significant impacts on visual resources in the region are anticipated because no new construction or land alteration is planned for the License Area.” However, Section 4.9 also acknowledges that “in the short-term, measuring from the current time, where diversions are lower due to the lack of agricultural activity in Central Maui, against the time when Mahi Pono's diversified agriculture needs begin to use the maximum amount of water permitted, there will be a decrease in stream flows and waterfalls that can be viewed along Hāna Highway.” Section 4.9 further explains that the “expected decrease from the current baseline must be considered in a historical context as well: the impacts to such visual resources under the Proposed Action will be far less than the impacts over the years of sugarcane operations when vastly more water was diverted from East Maui than is planned under the Proposed Action.” However, please note that Section 4.9 of the Final EIS has been expanded to further discuss scenic vistas, cascading waterfalls, and stream flow as shown on pages 4-311 to 4-312.

Moreover, Section 3.4.15 of the Draft EIS Section 3.4.15 analyzes the potential for the alternatives to the Proposed Action to impact visual resources in East Maui, Upcountry Maui and Central Maui. With respect to East Maui and Upcountry Maui, Section 3.4.15 reaches conclusions substantially similar to those of the Proposed Action. With respect to Central Maui, Section 3.4.15 concludes that there may be adverse impacts to visual resources in Central Maui under the No Action alternative, the Reduced Water alternative and the Alternative Lease Duration alternative to the extent that those alternatives may limit the extent to which Mahi Pono can implement its farm plan. Limitations on the implementation of the farm plan would result in less open green space in Central Maui.

Regarding the specific areas mentioned above in Comment #128 (Ho‘olawa, Hanawana, Mokuapapa and Waipi‘o), please note that there is expected to be no change from existing conditions in terms of visual resources as these streams through these areas are expected to be diverted as they have been in past under the Proposed Action.

Comment 129: *Current EMI use of the lease area limits public use and enjoyment of public lands, as noted in comments from DLNR lands division and Na Ala Hele. The proposed lease area also includes streams that are part of recreation use at such facilities as the Garden of Eden arboretum, Twin Falls Community and Camp Ke‘anae. Recreational use of many streams in the lease area, especially in local neighborhoods such as Hanawana, Hoolawa, Mokuapapa, Honokala, Honopou and Huelo is already significantly impacted under the former lease conditions. The proposed diversions will continue those impacts and need to be discussed in the EIS.*

Response 129: The discussion in Section 4.8 has been expanded in the Final EIS to include the Garden of Eden Arboretum and the YMCA Camp Ke‘anae as shown on pages 4-305 to 4-309.

Twin Falls was discussed in the Draft EIS in Section 4.8 stating:

“Twin Falls is partially within the License Area. The upper falls are within the License Area but the area that is frequently visited is outside the License Area. It is noted that participants in the SIA noted that the Twin Falls trails and other area trails are subject to overgrown landscaping and flash flood conditions.”

A discussion regarding the streams mentioned in Comment #129 has been added to in Section 4.8 (Recreational Uses and Park Facilities) of the Final EIS as shown on pages 4-305 to 4-309.

Moreover, in focus groups and interviews conducted for the SIA, community access and use of the overall watershed area were raised by participants. In response to Draft EIS comments, the SIA has been revised to include Section 5.3.1.3, Community Use and Access to Water Collection Area which is reflected in Section 4.8 as shown on pages 4-305 to 4-309. This section identifies Nā Ala Hele trails in the Collection Area, reported community use of this area, including hiking

and hunting, summarizes community interest in accessing this area to observe the EMI Aqueduct System, and outlines the process for obtaining access to the License Area.

Comment 130: *The DEIS needs to discuss removal of decades worth of debris and waste from ditch system maintenance that has been left to clutter the natural features of the lease area.*

Response 130: Regarding your comment above, please note that EMI has established standard operating procedures to address the cleanup of trash and debris during the course of its activities. EMI has in place a practice of removing any equipment and excess materials it brings into the License Area to perform work on the EMI Aqueduct System as soon as the job(s) is completed. In addition, employees look out for unnecessary debris in the field during routine maintenance tasks and when unused items are observed from previous field work, EMI has conducted specific identification and removal operations. Of note, smaller portions of the EMI Aqueduct System have been misinterpreted by some to be unused ‘debris’ when in fact they do serve an operating function.

Comment 131: *If stream water is used for central Maui development, there will be a cumulative impact on public facilities and services that must be considered. A&B has “provided” stream water allotments to Maui County in the past to secure additional water meters for developments on A&B’s own former agricultural lands (such as Haiku Hill, Haiku Makai). The full range of potential development impacts resulting from this type of water allotment should be discussed.*

Response 131: The only development within Central Maui contemplated in connection with the proposed Water Lease is the continued re-development and re-establishment of agriculture on approximately 30,000 acres of agricultural fields that used to be in sugarcane and are now planned and being used for diversified agriculture. The proposed Water Lease does not entail the development of residential subdivisions (like Haiku Hill or Haiku Makai) in the Central Maui agricultural fields. It is expected that the Water Lease will authorize specific character of use for the leased water and any use that is outside of that authorization would not be permitted.

Comment 132: *The EIS needs to discuss the potential for and cumulative effects of A&B and/or Mahi Pono having access to millions of gallons of water to use for development if Ag operations fail to be profitable.*

Response 132: Such a discussion is beyond the scope of the EIS. The only development within Central Maui contemplated in connection with the proposed Water Lease is the continued re-development and re-establishment of agriculture on approximately 30,000 acres of agricultural fields that used to be in sugarcane and are now planned and being used for diversified agriculture. It is expected that the Water Lease will authorize specific character of use for the leased water and any use that is outside of that authorization would not be permitted. Please also see Responses #30 and #131.

Comment 133: *The DEIS needs to provide information on every stream in the lease area, including the amount of water that is diverted or planned to be diverted, from each section of each stream, from each stream as a whole, from each license area, and from all licensed areas as a whole.*

Response 133: EMI has gauges located in several locations across the License Area. These gauges measure the flow in the ditches only. It is not feasible to measure flow in the streams, as there are limited areas that contain the necessary control points to accurately measure streamflow. Similarly, it is not feasible to provide total diversion amounts by a particular portion of the proposed License Area, i.e. diversions amounts only from Huelo, diversion amounts only from Nahiku, etc. The USGS used to have gauges at each of the License Area boundaries. Those gauges were not on individual streams, they were in the ditches at each license area boundary. However, due to USGS cost cutting, several of those gauges were removed. It is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gages to wash away. EMI has never conducted stream gauging as that lays within the expertise the CWRM and the USGS. As noted in the CWRM D&O, the measurements EMI take are at Honopou Stream and Maliko Gulch, however, for the purpose of measuring the aggregate flow from entire License Area, the Honopou Stream measurement reading was used.

As discussed in Draft EIS Section 2.1.2 (East Maui/License Area) and 2.1.4 (Central Maui Field System), the long-term average delivery of water by the EMI Aqueduct System up until 1986 had been approximately 165 mgd (prior to any use of water by the MDWS or HC&S on the agricultural fields). This measurement was taken at Māliko Gulch. As discussed in Section 2.1.2 of the Draft EIS, the amount of water that could be diverted from the License Area under the Proposed Action is approximately 87.95 mgd.

Comment 134: *Aquifers from Nahiku to Ke'anae are believed to be fully saturated, with no separated levels between the Kula and Honomanū basalt layers. (Gingerich, 1998). This implication and the deep connection between surface and ground water in a "saturated" aquifer needs to be discussed in the EIS. It should also acknowledge that diversions over the last century have had significant impacts on the aquifers and watershed health, which continue to progress; the DEIS needs to discuss the impact associated with cause a resumption of diversions.*

Response 134: Regarding your comment on the connection between surface and groundwater in a saturated aquifer, please note that an aquifer is generally considered as an area which is saturated with water. Any part of the saturated zone that is underground is considered groundwater. When the saturated zone breaks the surface, that is where streams and surface water occur. Surface water and groundwater can occur within the same aquifer.

Regarding your comment about the diversion's impact on aquifers and watershed health, please note that the effects of the diversions are uncertain since the diversions have been occurring for over a century and pre-diversion data does not exist. However, it can be noted that the sustainable yield (SY) for the entire island of Maui has decreased over the years, including the Ko'olau Aquifer Sector. By comparing the CWRM's 1987, 2008 and 2018 maps of SY for the island of Maui, it shows an overall decrease of 25 mgd from 452 mgd (1987) to 427 mgd (2008), then a decrease of 70 mgd from 427 mgd (2008) to 357 mgd (2018) for the entire island of Maui. Specifically, the Ko'olau Aquifer Sector, where the License Area is situated, similarly also shows a decrease in SY from 186 mgd (1987) to 175 mgd (2008) then to 152 mgd (2018).

In order to determine SY, the CWRM assesses the groundwater recharge and takes into account ground and surface water users as well as the regions' ecosystems dependency on the source. SY changes over time due to changes in climates, rates of recharge, groundwater surface water interactions, land use, etc. When presented with insufficient data, estimations are made based on SY models. As updated data becomes available, the CWRM periodically reviews and updates the SY estimates.

Hence, it can be noted that the SY for the Ko'olau Aquifer Sector has seen a decreasing trend over the years. However, there is no evidence this decrease is directly related to the EMI Aqueduct System and its diversion of stream flows since a variety of factors go into computing the SY. In fact, as indicated in Section 4.7.4 of the Draft EIS, the EMI Aqueduct System diverted less water in the period from 2008 to 2013 (referred to in the EIS as a period of Recent Sugarcane Cultivation), and even less water has been diverted from 2016 to the present. This should mean that the amount of water available for recharge of the aquifers underlying the License Area was greater during these periods. Yet the SY of the Koolau Aquifer Sector continued to decrease. Section 4.2.2 of the Final EIS has been revised to discuss the above, as shown on page 4-69.

Comment 135: *Existing and ongoing impacts to our coastal waters and fisheries need to also be discussed in the DEIS. It should also be acknowledged that East Maui diversions over the last century have had significant impacts on coastal waters and fisheries, not just on Maui, but throughout the Hawaiian Islands; the proposed lease would cause a resumption of those impacts, and those impacts need to be discussed.*

Response 135: Please note as discussed above in Response #60 that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream delivered nutrients to nearshore marine habitats. The collected data presented in Appendix B and summarized in Section 4.2.3 of the EIS suggest that the

nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, because the nutrient concentrations in the ocean do not change substantially due to stream diversions as proposed under the Water Lease, there is no pathway for fishing to be negatively impacted. Moreover, please note that it is not scientifically possible to fully document impacts that first took place more than a century ago, for East Maui and the Hawaiian Islands.

Comment 136: *Significant native plant communities are found above Puohakamoa, Waikamoi, Haipuaena. Impacts of maintenance equipment bringing in invasive species needs to be discussed and mitigated.*

Response 136: We acknowledge your comments above. Please note that Section 4.4 of the Draft EIS discussed avoidance and minimization measures to reduce to impact of the Proposed Action, which includes maintenance and repair activities. Moreover, please note that these measures have been revised and expanded upon in the Final EIS as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131. However, please note that Puohakamoa and Waikamoi streams are in the Huelo portion of the License Area and subject to the CWRM D&O, and Haipuaena stream is in the Honomanu portion of the License Area and is also subject to the CWRM D&O. Hence, it is expected that the surrounding environment will benefit from the restored flows.

Comment 137: *Impacts on endangered fauna and flora (plants and avian species) need to be discussed in the EIS, as well as impacts on existing native stream life resources and anticipated impacts on all native stream life species used for traditional practices. We concur with USFWS comments, which should be used to formulate content of the DEIS.*

Response 137: Please note that impacts to endangered flora and fauna, including plants and avian species, are discussed in Appendix C and Section 4.4. of the Draft EIS. Please note that Section 4.4.1 of the Draft EIS lists 18 plant species with designated critical habitat within the License Area. However, Section 4.4.1 of the Final EIS has been revised to include plants species with critical habitat as recognized by the USFWS as shown on pages 4-114 to 4-117. Appendix C and Section 4.4.1 of the EIS conclude that there are no anticipated adverse impacts to flora resources in East Maui from the Proposed Action. The Water Lease does not require vegetation removal except for routine maintenance purposes, therefore the amount of each vegetation cover type currently present would remain substantially the same. SWCA determined that the continued diversion of water through the EMI Aqueduct System would not have impacts on terrestrial flora species. Recommended mitigation measures associated with maintenance activities undertaken in the License Area are proposed in the Draft EIS and have been revised and expanded upon in the Final EIS as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131.

Endangered avian species with the potential to occur in the License Area are noted Section 4.4.2 and Table 4-5 of the Draft EIS. Moreover, three endemic (native) avifauna—'apapane (*Himatione sanguinea*), Hawai'i amakihi (*Chlorodrepanis cinea*), and I'iwi (*Drepanis coccinea*)

—were found during ground surveys of the License Area, one of which (the 'i'iwi), is federally listed as threatened. Due to the low level of activity that may take place in the License Area, no significant impacts to avian species are expected. It is acknowledged that the presence of vehicles and humans for maintenance activities could disrupt the normal behavior of wildlife and temporarily displace individuals from roadside habitat, but such activities are expected to be very infrequent and therefore any disruption to wildlife would have limited effect. Nevertheless, proposed mitigation measures are provided in Section 4.4.2 of the Draft EIS which have been revised and expanded upon in the Final EIS as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131. Moreover, please note that the discussion of avian malaria has also been added to Section 4.4.2 of the Final EIS as shown on pages 4-126 to 4-131.

Regarding impacts to native stream life used for traditional practices, the CIA included in Appendix F and summarized in Section 4.6 of the EIS identified impacts to the regional environment, taro farming, and freshwater ecosystems based on consultation with the community. Please note as discussed in Section 4.6 of the Draft EIS, several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water, although those concerns were expressed prior to the issuance of the CWRM D&O. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo 'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; *Neritina graposa*), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as 'o'opu) or continue to grow in the ocean. Specifically, Section 4.6 states:

4. *Jonah Jacintho states in his 2014 declaration that due to a lack of stream flow, fish populations have decreased therefore he cannot fish as much. To increase the population of ocean fish, fresh water is integral for spawning and nutrients. He also added that more water in stream beds would also increase 'o'opu, prawn, and hīhīwai populations.*
5. *In Lezley Jacintho's 2014 declaration, she states that due to lack of stream flows, her kalo production has declined due to root rot and other diseases. She adds that stream flow output is also important in the spawning of different species of fish. The lack of stream flow affects her gathering rights as a Native Hawaiian and her 'ohana (family). Native species such as 'o'opu needs fresh water to travel back upstream, which compromises their reproduction. Fish, hīhīwai, 'ōpae, and 'o'opu populations are also scarce and many families cannot gather these resources causing them to move away. Another concern Ms. Jacintho voiced is stagnate water, which causes leptospirosis and other bacteria...*

10. In Earl Smith, Sr.'s 2014 declaration, he states that he recalls gathering 'ōpae, hīhīwai, and 'o'opu from Hanawī, Makapīpī, and One'o Streams. He can only find these species in Hanawī Stream. Near the coast, he would fish for moi (threadfish; *Polydactylus sexfilis*), aholehole (Hawaiian flagtail; *Kuhlia sandvicensis*), manini (reef surgeonfish; *Acanthurus triostegus*), and enenuē (chub; *Kyphosus bigibbus*) but has noticed a depletion of fish. He attributes this to a lack of stream flow that empties in the ocean.
11. In Edward Wendt's 2014 declaration, he states that he gathers and fishes in the streams to provide a protein source for his family, neighbors, and kūpuna (elders) who may be unable to gather for themselves. He also enjoys teaching traditional fishing practices and values to students. However, due to the lack of adequate stream flow, Mr. Wendt is unable to teach students how to mālama (to take care of) streams, fish, and gather. The diminished stream flow has negatively impacted the muliwai, fisheries, and his lo'i kalo. Invasive species such as the apple snail and African tulip tree have infringed his lo'i kalo.

Relating to the impacts mitigations presented in Section 4.6 of the Draft EIS:

*Impact: Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; *Neritina graposa*), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision.*

CSH Recommendation: It is recommended that a biologist or similar qualified professional provide an assessment of the impacts of water diversion to

indigenous freshwater species ('ōpae, 'o'opu, and hīhīwai) within the License Area. The application of the CWRM D&O has the potential to reduce or eliminate this cultural impact. Nine of the streams mentioned by community participants where this impact is identified have been fully restored in accordance with the CWRM D&O. These include Honopou (Puniawa Tributary), Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Makapipi, Waiohue, Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), and West Wailuāiki Streams.

Trutta and SWCA prepared reports in support of the DEIS assessing the impacts of the Proposed Action, particularly impacts on indigenous freshwater species, and terrestrial flora and fauna. The impacts of the Proposed Action to freshwater species are discussed in Section 4.2.1 and the impacts to terrestrial flora and fauna are discussed in Sections 4.4.1 and 4.4.2. Moreover, the two reports are appended to the DEIS (See Appendix A and Appendix C).

Please note that the CIA, has been further updated based upon comments received during the public comment period on the Draft EIS. The applicable revisions to the CIA are summarized in Section 4.6 of the Final EIS, as shown on pages 4-239 to 4-252.

Moreover, please note that the HSHEP model included the report in Appendix A which is summarized in Section 4.2.1 of the EIS found that under the Proposed Action the habitat for species such as 'ōpae, 'o'opu, and hīhīwai would increase from what was available under historic diversion rates.

Comment 138: *Previous and ongoing impacts to archaeological resources such as lo'i, 'auwai and house sites in the lease areas need to be fully documented. The EIS needs to discuss the fact that these types of impacts can be expected to continue if the proposed lease is granted.*

Response 138: As discussed in Response #84, in consultation with SHPD, an archaeological LRFI report was prepared to determine the likelihood that historic properties (any building, structure, object, district, area, or site over 50 years old) may be affected by the proposed Water Lease and, based on findings, consider cultural resource management recommendations. The LRFI included an analysis of the natural and built environment of the License Area, a comprehensive review of traditional and historic background information of the region, a review of previous archaeological studies and findings in the region, and a field inspection of the License Area focused on inspecting the areas nearest to the EMI Aqueduct System infrastructure and access roads.

Appendix E (the LRFI report) of the Draft EIS recites that the Māhele records for the East Maui region contain claims for terrestrial agricultural features such as lo'i (irrigated kalo terraces), pākanu (garden, planting enclosure), 'auwai (artificial irrigation canals, used to feed lo'i), kula

(fields, open pasture), pali (cliff, precipice, or steep hill suitable for cultivation of select plants), kīhāpai (small cultivated patch or orchard), mo‘o (ridge for similar purpose as pali), and pō‘alima (small agricultural patches tended in traditional times solely for chiefly tribute), and also notes that there are kuleanas claimed for their naturally occurring vegetation and the right of tenants to collect these resources, such as ‘ie (aerial roots of the ‘ie‘ie vine, used in plaiting, basketry, and wicker weaving), olonā (shrub with fibrous bark used in fishnets, baskets, and to construct tī leaf raincoats and capes), wauke (paper mulberry used in making tapa cloth), hala (pandanus tree) and wildy occurring kalo (taro) and sweet potato. The LRFI also discusses a May 1995 multidisciplinary cultural landscape study of Ke‘anae and Wailuanui that located certain habitation sites in the coastal region of Ke‘anae and Wailuanui, outside of the License Area.

Specifically, regarding your comment about lo‘i, ‘auwai, and house site, the CIA has been updated with follow-up interviews in response to comments on the Draft EIS and identifies impacts to the regional environment, taro farming, and freshwater ecosystems within the License Area based consultation with the community which are summarized in Section 4.6 of the Final EIS provided by pages 4-239 to 4-252 of the Final EIS which includes your notes from your interview with CSH that an increase in water supply will allow for an increase in agricultural activity, including taro farming.

Comment 139: *Hamakuapoko has cultural sites in A&B and/or Mahi Pono agricultural fields that need to be identified and protected; Hamakualoa also has cultural sites in the lease area lands that need to have proper recording and protection. Old ditch structures such as the Spreckels Old Haiku ditch, are also deteriorating and drifting downstream in chunks. Impacts to all of these sites and structures, and impacts to the gathering and cultivation of traditional crops need to be addressed in the DEIS. This needs to include a discussion of impacts in areas where no restoration is being proposed, such as the Hanawana and Kailua areas, Waipio and Waipio Iki, Hoolawa, Honokala, Makapipi and Mokupapa.*

Response 139: Regarding your comments about Hāmākuapoko having cultural sites in the Mahi Pono agricultural fields in Central Maui, the proposed agricultural use by Mahi Pono in Central Maui will be confined to existing agricultural fields that, prior to the end of sugar production in 2016, were continuously plowed for more than a century. Additional plowing within an established agricultural plow zone will not pose a new or increased impact to historic properties any more so than past agricultural plowing.

Mahi Pono’s farm plan for the Central Maui agricultural fields includes ground disturbance in agricultural zones that have been subject to the same type and extent of ground disturbance for more than a century. Hence, any cultural sites that may have once existed in the Central Maui agricultural fields have been destroyed. However, the LRFI recommends consultation with the SHPD in the event that agricultural use in Central Maui is proposed for areas outside of established agricultural zones or for projects that would involve ground disturbance beneath the agricultural plow zone.

Regarding your comment that Hāmākualoa has cultural site in the License Area that need to have proper recording and protection, please note as discussed in pages 4-154 to 4-155, agricultural activities will not take place outside the existing agricultural fields or plow zone. Moreover, we note that in your interview with CSH, which took place after publication of the Draft EIS, you did not identify any of these site that you refer to in this comment letter.

Your comments that chunks of the old ditch system are deteriorating and drifting downstream are acknowledged. However, it is unclear specifically what portion of the EMI Aqueduct System you are referring to, as the old ditches are many miles in length. EMI staff continually perform repair and maintenance activities for the EMI Aqueduct System and are unaware of the specific instance you reference.

Regarding your comments about impacts to sites and structures, gathering and cultivation of traditional crops, CSH contacted you for additional consultation on the Papanene Heiau in Central Maui. Additional information regarding this heiau has been included in the updated LRFI and is discussed in Section 4.5 of the Final EIS. See pages 4-154 to 4-155.

The CIA was summarized in Section 4.6 of the Draft EIS:

Based on information gathered from the cultural and historical background, and the community consultation, significant cultural resources were identified within the License Area, as well as outside of the License Area. It should be acknowledged that although some of the impacted cultural resources exist outside of the License Area, what takes place within the License Area directly affects these cultural practices and resources. At present, there is documentation and testimony indicating traditional and customary Native Hawaiian rights are currently being exercised within the License Area. Cultural resources, practices, and beliefs were identified as currently existing within the License Area. In addition, East Maui, which includes the License Area and beyond the License Area, maintains a rich subsistence and cultural history.

However, the CIA has been updated pursuant to post-Draft EIS consultation, as reflected in Section 4.6 of the Final EIS, including discussion regarding impacts to the regional environment, taro farming, freshwater ecosystem and cultural sites as well as recommendations to mitigate those potential impacts based on other consultant studies and community consultation as shown on pages 4-239 to 4-252.

Regarding your comment that the EIS needs to include a discussion of impacts in the area where no restoration is being proposed, such as the Hanawana and Kailua areas, Waipio and Waipio Iki, Hoolawa, Honokala, Makapipi and Mokupapa please note that Table 4-13 to 4-15 has been added to Section 4.6 of the Final EIS as shown on pages 4-171 to 4-239 which identifies cultural

practices on a stream-by-stream basis in response to comments fielded during the Draft EIS by CSH.

Comment 140: *The DEIS needs to use Kepa Maly's East Maui study as part of the Cultural Impact Assessment.*

Response 140: Your comment lacks specificity on which Maly study you are referring to. However, the following resources were consulted in conjunction with the preparation of the Archaeological Literature Review and Field Inspection (Appendix E) and the Cultural Impact Assessment (Appendix F):

Maly, Kepā, and Onaona Maly

2001 *Volume I Wai o ke Ola: He Wahi Mo'olelo no Maui Hikina: A Collection of Native Traditions and Historical Accounts of the Lands of Hāmākua Poko, Hāmākua Loa and Ko'olau, Maui Hikina (East Maui), Island of Maui*. Kumu Pono Associates, Hilo, Hawai'i.

2006 *He Mo'olelo No Maui Hikina - Kalialinui I Uka A Me Nā 'Āina O Lalo: A Cultural Historical Study of East Maui - The Uplands of Kalialinui, and the Lands that Lie Below, Island of Maui "The Waikamoi Preserve"*. Kumu Pono Associates, Hilo, Hawai'i.

Comment 141: *Cumulative Socio-Economic impacts of A&B controlling use of such a large amount of water for 30 years, as proposed, must also be discussed in the EIS.*

Response 141: The socio-economic impacts of the Proposed Action are addressed at length in Section 4.7 of the Draft EIS, and in further detail in Appendices G through I (Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report). Draft EIS Section 4.7 has subsections addressing impacts to populations and impacts (Section 4.7.1), impacts to social characteristics (Section 4.7.2), impacts to the economy and other fiscal considerations (4.7.3), and impacts to the agricultural economy. (4.7.4). The potential socio-economic impacts of the alternatives to the Proposed Action considered by the Draft EIS are analyzed in Section 3.4.11 (Social Characteristics), 3.4.12 (Economic and Fiscal Resources), and 3.4.13 (Agricultural and Related Economic Resources). The Draft EIS thoroughly addressed cumulative socio-economic impacts in Section 4.17. That discussion has been further supplemented by updates in the Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report as shown on pages 4-331 to 4-336.

Comment 142: *The EIS needs to discuss abandonment of ditch structures on permanently restored streams and what happens to diverted water on streams while they await "permanent restoration."*

Response 142: Upon making the voluntary commitment to permanently restore the stream flows in the “taro streams”, EMI returned approximately 90-95% of the natural flow of the streams— all that could be done by adjusting (opening or closing) the diversion gates. The final 5-10% to achieve complete restoration requires modifications to diversions, essentially construction projects, thus triggering various permitting processes that continue to be pursued.

Potential impacts from the abandonment of structures and equipment as it relates to native stream habitat was assessed and discussed in Appendix A, the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report.

The work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows.

The CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. CWRM ordered in relevant part (see CWRM D&O at p. 269):

- I. It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.*
- J. This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process*
- K. The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.*

CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

However, please note that generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best. The presence of cement or wood near or partially within the stream channel is not inherently bad for stream animals.

Conversely, meeting the instream flow standard at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the water flowing into the diversion and back to the stream from another location in the diversion ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

The two primary conditions where diversion structures could impact native stream species are structures where diversion and ditch water still comingle or structures that create a barrier to upstream migration. A diversion structure could also impact native stream animals as they move upstream if it creates an unnatural barrier. If no wetted pathway exists, upstream passage will be stopped.

Altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns.

In summary, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts.

The above is discussed in more detail in Section 4.2.1 of the Final EIS as shown on pages 4-61 to 4-62 and on pages 4-63 to 4-67 of the Final EIS.

Comment 143: *It also needs to discuss the effect of diversion design and its impact on native streamlife migration, as well as the impacts/benefits of permanently removing all ditch structures on the permanently restored streams.*

Response 143: Diversions come in many different shapes and designs, as discussed in the Historic Structure Assessment provided as Appendix D of the Draft EIS. CWRM will be looking at how specific diversions should be modified in the course of overseeing the implementation of its CWRM D&O, as the treatment of diversion structures is a matter that was addressed by

CWRM in the D&O for the Interim Instream Flow Standards (IIFS) proceedings on the East Maui streams. CWRM ordered in relevant part:

- i. It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.
- j. This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process.
- k. The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.

See CWRM D&O at p. 269.

Please note that the diversions closer to the stream mouth have more impact than those farther from the stream mouth, some designs can entrain larvae or block passage more than other designs, and the amount of water passing is also important when quantifying impacts. The *Assessment of the Environmental Impact of Stream Diversions on 33 East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model* (May 27, 2019) prepared by Trutta Environmental Solutions, Inc. addresses all of these factors on a diversion by diversion basis. Hence, in summary, addressing the impacts of diversion design will need to be done on a case-by-case basis with the CWRM. However, please note that Section 4.2.1 of the Final EIS has been updated to include the above and discuss diversion impacts and mitigations measures in more detail as shown on pages 4-63 to 4-67.

Regarding your comment about the impacts/benefits of permanently removing all ditch structures on the permanently restored streams, please note as discussed in Response #142 that complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts.

Comment 144: *In addition, there needs to be a discussion in the EIS of who controls the diversion structures, how any allowable streamflow amounts will be enforced, and the relationship that public access to the leased areas has on the likelihood of streamflow violations being reported.*

Response 144: Diversions structures are controlled by the EMI staff that operate the EMI Aqueduct System.

Regarding streamflow enforcement, the current East Maui water revocable permits specify that quarterly reports to the BLNR are required. These reports are mandated to include a statement of compliance with the IIFS and identify the total amount of water being diverted from License Area measured at Honopou. It is expected, and the EIS takes into account, that compliance with the IIFS requirements under the CWRM D&O will also be required under the Proposed Action. In compliance with the CWRM D&O streamflow requirements, EMI has adjusted certain movable portions of gates to ensure that streamflow below the gates complies with the IIFS requirements. Compliance with the CWRM D&O IIFS requirements is always subject to CWRM staff verification.

Regarding public access, it is recognized that the License Area could be smaller for the proposed Water Lease than the 33,000 acres of State-land that has historically been the subject of the water lease and/or revocable permits for East Maui surface water. BLNR, under the terms of the revocable permits in effect as of January 1, 2020, removed the Hanawi Natural Area Reserve, consisting of approximately 7,500 acres, from the land area encumbered by the revocable permits which has been reflected in the various figures depicting the License Area in the Final EIS. DLNR-DOFAW has expressed a desire to further reduce the License Area by removing portions of the Ko'olau Forest Reserve that are not managed by A&B/EMI or that A&B/EMI does not need to operate, maintain and repair the EMI Aqueduct System. It is assumed that the management of public access to those lands would fall on a State Agency as discussed in Section 3.2.2.2 of the Draft EIS. However, due to concerns about public safety, including safety from risks from stream flooding and risks related to the EMI Aqueduct System, it is not anticipated that DLNR would authorize unfettered public access to the EMI Aqueduct System, and therefore it is not anticipated that members of the public would be in a position to report "streamflow violations." Section Section 3.2.2.2 has been expanded in the Final EIS to further take into account a modified License Area. See pages 3-21 to 3-24 of the Final EIS.

Comment 145: *Some DWS Kula Pipelines intakes appear to divert streams in the lease area. The intake for the Nahiku DWS supply is in the lease area. Community water systems for Huelo, Honopou, Ho'olawa, and Waipio residents are in the lease area. What happens there in the lease area affects many potable water users; this should be discussed in EIS.*

Response 145: The presence of MDWS "Kula pipelines" is recognized in the Draft EIS. Figure 2-4 depicts the Upcountry Maui Water System and shows MDWS infrastructure, such as the Upper and Lower Waikamoi Flumes, Olinda Water Treatment Plant, and Kula Pipeline, but none of these improvements are within the License Area. The Upper and Lower Waikamoi Flumes

sourced and situated in the Ha'ikū Uka Watershed on privately owned land as discussed within Respones #6 and is not within the License Area.

Regarding your comment about the intake for the Nāhiku MDWS System, please note that this intake is not located within the License Area, it is on land owned by EMI. However, for more details regarding this system, please see Response #14 above.

Your comment regarding community water systems for Huelo, Honopou, Ho'olawa, and Waipi'o that you state are in the License Area is acknowledged. However, are unaware of any water systems within the License Area other than the EMI Aqueduct System.

The EIS recognizes that the Water Lease has the potential to affect many potable water users, as discussed in Appendix H and Appendix I of the EIS which are reflected in Chapter 3 and Chapter 4 of the EIS. Under the Proposed Action, potable water users would not experience any significant impacts. However, under the No Action alternative, or the Reduced Water Volume alternative, MDWS potable water users may experience significant increases in water costs or some users may even be left without a reliable source of potable water.

Comment 146: *The DEIS needs to include a discussion of impacts of utilizing water for any uses other than agriculture that are anticipated over the 30-year term of the proposed lease.*

Response 146: We respectfully disagree. An analysis of uses of diverted water in manners inconsistent with the proposed uses identified in the Draft EIS is beyond the scope of the EIS. The EIS was prepared to analyze the impacts of the Proposed Action and if the Proposed Action is approved (i.e. if the Water Lease is issued), that water would be used for agriculture and other uses discussed in the EIS. Presumably, any significant change to the use of the water authorized under a Water Lease issued based upon this EIS would require an additional or separate environmental analysis.

Comment 147: *The DEIS needs to provide details of plans to restore stream courses and watersheds in the lease area where diversions are being permanently abandoned and removed, as well as any positive and/or negative impacts of such restoration.*

Response 147: As noted in Response #143 above the potential impacts from the abandonment of structures and equipment as it relates to native stream habitat was assessed and discussed in Appendix A of the EIS. Moreover, the Proposed Action itself does not include any abandonment of diversion structures, except to the extent that the Proposed Action will be implemented in the context of the requirements of the CWRM D&O, which is separate and independent from the proposed Water Lease. The CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. CWRM ordered in relevant part (see CWRM D&O at p. 269):

- I. It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.*
- J. This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process*
- K. The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.*

CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the IIFS requirements under the CWRM D&O.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.² Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

² Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

November 07, 2019

Aloha Gentlemen;

We would like to go on record as advocating for Alexander and Baldwin and Mahi Pono to obtain a water lease for a duration which will allow Mahi Pono to implement their farm plan.

This water lease will hopefully allow water diversion from East Maui in accordance with availability and previously agreed upon in stream flow standards. The duration we believe should be for at least 5 years to allow 'Bonafide performance' on Mahi Pono Farm Plan, with renewal options based upon performance.

We are a teen work skills training program since 1993, and have been allowed by Alexander & Baldwin (and now Mahi Pono), to draw up to 50,000 gallons daily for our 4 acre student operated organic garden, of which there is a photo attached. We actually draw about 5,000 gpd from the EMI Haiku Ditch for our garden. To our knowledge, EMI also allows taro farmers to also draw water from their ditches too.

Thank you, Mahalo, for this opportunity to testify on behalf of proposed water lease.

Sincerely,

Brian McCafferty

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Brian McCafferty:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200, Section 18. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *We would like to go on record as advocating for Alexander and Baldwin and Mahi Pono to obtain a water lease for a duration which will allow Mahi Pono to implement their farm plan.*

Response 1: We acknowledge that you as a representative of the organization, Teens On Call, are supportive and advocate for the Proposed Action that would enable the Applicant to divert water and support the Mahi Pono farm plan.

Comment 2: *This water lease will hopefully allow water diversion from East Maui in accordance with availability and previously agreed upon in stream flow standards. The duration we believe should be for at least 5 years to allow ‘Bonafide performance’ on Mahi Pono Farm Plan, with renewal options based on performance.*

Response 2: Please note that the Proposed Action, as discussed in Section 2.1 is the issuance of a long-term Water Lease (30 years) that would allow for the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for uses described in the EIS in compliance with the IIFS set by the CWRM D&O in June 2018. Specifically, as discussed in Section 2.1 of the Draft EIS:

Independent of the Proposed Action, on June 20, 2018, the CWRM issued its D&O setting IIFS for numerous streams and tributaries of streams in the License Area, which includes water originating and flowing from both State and privately owned lands within East Maui. The CWRM D&O establishes a quantity of water that must remain in each stream at specified locations. The CWRM D&O ordered full stream restoration for 10 streams and partial flow restoration on 12 additional streams (Please refer to Section 1.3.4). Therefore, the maximum amount of water that can be awarded through the Water Lease is what is available for diversion after the CWRM D&O is implemented. This is the premise of the Proposed Action.

With regards to your comment about the duration being five years, Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability." The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation.

As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Comment 3: *We are a teen work skills training program since 1993, and have been allowed by Alexander & Baldwin (and now Mahi Pono), to draw up to 50,000 gallons daily for our 4 acre student operated organic garden, of which there is a photo attached. We actually draw about 5,000 gpd from the EMI Haiku Ditch for our garden. To our knowledge, EMI also allows taro farmers to also draw water from their ditches too.*

Response 3: We acknowledge that Teens On Call is a teen work skills training program that have been allowed to draw up to 50,000 gallons (of which 5,000 comes from the Haiku Ditch) daily from A&B and now Mahi Pono for the organization's four acre student operated organic garden. Please note however, EMI does not allow kalo farmers to draw water from the EMI Aqueduct System directly.

Comment 4: *Thank you, Mahalo, for this opportunity to testify on behalf of proposed water lease.*

Response 4: We appreciate your interest and participation in this environmental review process.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

RE: Comments on the East Maui Water Leases Draft EIS

Dear Mr. Matsukawa,

Thank you for the opportunity to submit these comments on behalf of the Ha'iku Community Association. The Ha'iku Community Association (HCA) serves to educate and inform the citizens of the North Shore area of Maui, Hawaii about issues and activities of concern to our community. As we stated in our earlier request, we believe this DEIS should not have been issued missing key information like DHHL water needs and how they will be met. Nevertheless, we are submitting our comments on the content that is available in the DEIS.

Our members include residents of the area between Kailua Town and Maliko Gulch on the island of Maui. (96708 zip code.) Our members who live in the traditional communities of Ha'iku, Pauwela, Kui'aha, Kaupakalua, Ulumalu, Pe'ahi, Honopou, Ho'olawa, Mokupapa, Honokala, Waipio, Huelo, Puolua, Hanawana and Kailua, are directly affected by the EMI diversions of streams in their neighborhoods. Our members living between Honopou Stream and Kailua Stream are directly downstream of the proposed Huelo section of the state lease area being discussed in the Draft EIS and are greatly affected by decisions being made by EMI /A&B and Mahi Pono regarding water diverted from the various streams; maintenance of the various ditch systems, and management of the diversions, stream channels and watershed areas.

Our comments reflect the areas of the DEIS where needed information has been omitted or information provided is incorrect or does not meet the intent of our Hawaii environmental review process that is clearly stated in 11-200-16 HAR:

§11-200-16 HAR Content requirements. The environmental impact statement shall contain an explanation of the environmental consequences of the proposed action. The contents shall fully declare the environmental implications of the proposed action and shall discuss all relevant and feasible consequences of the action. In order that the public can be fully informed and that the agency can make a sound decision based upon the full range of responsible opinion on environmental effects, a statement shall include responsible opposing views, if any, on significant environmental issues raised by the proposal.

- While the EIS needs to “fully declare the environmental implications of the proposed action,” instead it often relies on unsupported assumptions that the proposed action will have no impacts, and the few impacts it might present can be mitigated, with no real adjustment in the amount of water diverted, the length of the lease or the modification of the diversion systems.

HCA Members and supporters will be directly impacted by the preferred Alternative 1

The DEIS preferred Alternative 1: a 30 year lease for 33,000 acres of state land and a continuation of the EMI diversion practices of the past 140 years, will have substantial impacts on our members and supporters who live in Ha'iku and East Maui. This information is not included in the DEIS.

The DEIS concludes that there ARE NO IMPACTS of Alternative 1.

HCA believes the the EIS needs to discuss impacts to:

- Upcountry residents, businesses, farmers and Hawaiian cultural users in the Ha'iku area;
- the protected rights of DHHL beneficiaries Upcountry, East Maui and Central Maui;
- the health and safety of East Maui residents, businesses, farmers and Hawaiian cultural users;
- native stream life and ecosystems and to archaeological sites, marine species and traditional native Hawaiian cultural practices.

The DEIS also concludes, without much supporting information, that diverting less East Maui stream water; having greater public access to public lands, having a shorter lease period or having no lease would have many impacts and the loss of many benefits to Upcountry and central Maui residents and businesses.

The DEIS relies on incomplete or selective information to reach this conclusion.

Our members and supporters have come to public hearings, submitted comments on the EISPN and filed declarations as part of the Water Commission's Instream Flow Standards contested case. The DEIS has evidence of these concerns on the effects of continued diversions on streams not covered by the IIFS decision. These concerns are found in Appendix F (Cultural Impact Assessment) AND APPENDICES K, L & M (Scoping meeting transcripts) but the EIS concludes that the proposed continuation of the diversions will have no impacts on traditional and customary uses or native Hawaiian cultural users in East Maui, Upcountry or Central Maui, as long as the IIFS standards are met.

Because the DEIS does not include required information, but relies on a selective set of data, it fails to "fully declare the environmental implications of the proposed action."

MPACTS TO DHHL LANDS AND BENEFICIARIES

- The current DEIS contains no specific information regarding the water reservation amounts from the East Maui lease area needed by DHHL. **This information is now available and was publicly offered by DHHL staff at the Oct 9, 2019 BLNR meeting.** These specific legally protected water reservations should be INCLUDED in the DEIS, and Mahi Pono water use plans adjusted accordingly to reflect this amount, in order for the public and agency comment process to be based upon accurate information. A discussion of whether it is legal for A&B /Mahi Pono to assume that the DHHL "water reservation" can be utilized by Mahi Pono until it

is “needed by DHHL” should also be included in the DEIS. It is our understanding that the Waiola o Molokai vs DHHL case dealt with a similar situation, and the DHHL prevailed.

IMPACTS TO RESIDENTS & TRADITIONAL HAWAIIAN USERS OF HUELO LEASE AREA

The DEIS needs to fully declare the environmental implications of the proposed Alternative 1:

- **On the twelve streams in the Huelo lease area that have never undergone evaluation or study for amended IIFS.** Hundreds of families live along these streams directly below the state lease lands and have no public source of drinking or irrigation water. They depend upon the streams. Only 3 of 17 streams in the Huelo lease area were fully restored under the 2018 CWRM decision. These three streams can not satisfy all the water needs of the entire region of over 1000 residents. Two streams (Waikamoi and Puohokamoa) stream are supposed to have partial restoration, but with no compliance or monitoring schedule in place for East Maui, that Commission order, may or may not ever be implemented.
- **On the impacts of lack of stream channel and diversion structure management on the health and safety of downstream residents in the Huelo Lease area.** The EIS needs to include information and implementation strategies for a storm water management plan for EMI diversion structures and the watershed lease lands above populated communities like Honopou, Ho’olawa and Huelo. Currently the lack of maintenance or modification of EMI diversion structures and the stream channels allow storm waters to accumulate to dangerous levels, erode stream banks and uproot trees, and carry massive debris loads downstream posing extreme hazards and cutting off access. These conditions have already impacted older culverts, bridges and other essential infrastructure, putting community members at risk.
- **On impacts of continued steam diversions on Hawaiian traditional use and small farmers in the Huelo lease area.** Alternative 1 falsely assumes that all East Maui stream water not “needed” to meet the Water Commission’s 2018 Instream Flow standards can be transported to Central Maui with no impacts to the unmet needs of downstream farm owners and traditional Hawaiian water users in the Huelo Lease area ,and so it has not provided any information on this required topic. The continued dewatering of the majority of streams in the Huelo lease area has impacted and continues to impact Hawaiian families who traditionally gathered from these streams and wish to pass on this knowledge to future generations. It has also impacted the many small commercial and subsistence farms in the lands below Huelo lease area.

IMPACTS TO RESIDENTS AND TRADITIONAL HAWAIIAN USERS OF E. MAUI LEASE AREA

The DEIS needs to fully declare the environmental implications of the proposed Alternative 1:

- **On impacts to traditional fishing practices including ocean fisheries in the entire East Maui area.** The DEIS Marine Study (Appendix B) examined water chemistry, tidal action and sea level rise impacts of 7 East Maui streams over a 5 day period in January 2018 and a 5 day period in July 2018. Based on this brief survey, which collected no data on the presence or absence of fish in the ocean or ocean estuaries where streams meet the ocean, the EIS concluded:
 - “Owing to continual, intense wave energy, these nearshore do not constitute important habitats for coral reef communities and associated marine species.”
 - The DEIS and the Cultural Impact Assessment went on to conclude, that in spite of substantial generational knowledge about the importance of stream flows to marine fisheries gathered in the Declarations of East Maui residents during the 2014-15 Water commission contested case, the presence or absence of freshwater stream flows into the ocean would have no impact on marine life or on Hawaiian cultural practices associated with traditional fishing or gathering of ocean marine life.
 - The EIS needs to acknowledge that traditional Hawaiian knowledge of East Maui coastal areas, based on longtime observation, connects freshwater stream flows with expanded muliwai (estuaries) that act as nurseries for marine fish species as well as expanded offshore fisheries due to the food source provided by native O’opu fry that travel to the ocean to mature. With limited stream flows, both those parts of the ecological cycle are extremely limited or not present, which impacts marine life populations. The EIS did not “fully declare the environmental implications” of the proposed Alternative 1 because it examined only a narrow group of data, assumed that fish only live in reef environments, and ignored other substantial information. provided by Hawaiian residents of East Maui.
- **On impacts to expanded farming and food production in the Entire East Maui Lease area if the majority of stream water that would naturally be available in East Maui communities is transported to the dry plains of Central Maui.** The EIS needs to acknowledge that East Maui has far more than 35 acres that are and could be utilized for potential Commercial truck farms, and far more than 44 acres that can be used for wetland kalo, if sufficient water were available to get through the dryer months. These figures were based on data from a handful of streams involved in the CWRM IIFS contested case. The EIS needs to provide data from ALL of East Maui, including the Huelo Lease area where most streams had no IIFS review.
- HAR 11-200-16 (f) requires :
 - The draft EIS shall describe in a separate and distinct section alternatives which could attain the objectives of the action, regardless of cost, in sufficient detail to explain why they were rejected. The section shall include a rigorous exploration and objective evaluation of the environmental impacts of all such alternative actions. Particular attention shall be given to alternatives that might enhance environmental quality or avoid, reduce, or minimize some or all of the adverse environmental effects, costs, and risks

- Alternative 2: the “Reduced Water Alternative” needs to include “rigorous exploration and objective evaluation” of an Alternative Plan. This Alternative Plan needs to discuss how to provide for sufficient stream water to remain in Ho’olawa, Waipio, Mokuapapa, Hanawana and Kailua streams that serve the communities in the Huelo Lease areas, and also provide for native streamlife and Traditional Cultural use in all the Huelo Lease area streams. This plan would specify appropriate soil preparation, crops and crop acreages in the Mahi Pono planting area that would support Alternative 2, and allow farming in Central Maui with a reduced water demand from East Maui.

IMPACTS TO HA’IKU AND UPCOUNTRY FARMERS AND TRADITIONAL HAWAIIAN USERS

The DEIS needs to fully declare the environmental implications of the proposed Alternative 1 outside the East Maui Lease Area in the Upcountry area :

- **On Hawaiian families in Ha’iku-Pe’ahi who wish to grow kalo on family lands located along streams outside the East Maui lease area.**
- **On small family farms in Ha’iku-Pe’ahi region that need abundant, reliable, affordable water for orchards and commercial and subsistence food crops.**
- **On local Ha’iku-Pe’ahi area fishers and native Hawaiian Traditional Cultural gatherers and users.**
- The DEIS assumes that the diversions of the East Maui Lease area streams and all the remaining streams between Honopou stream and Maliko Gulch has no impact on anyone who lives, farms, fishes or gathers in the 16 sq miles area of fertile Ha’iku-Pe’ahi lands and Ha’iku-Pe’ahi coastlines that had legendary fisheries.
- This assumption is made by the DEIS, ignoring the public testimony calling for restored streams in the Ha’iku area, and seeking to present only information that paints a favorable picture of the Mahi Pono farm plan’s large water needs. The DEIS assumes from 89 mgd to 92 mgd of East Maui stream water is needed to irrigate 16,000 acres of orchards and crops and 5,000 acres of grazing land in Central Maui for the Mahi Pono Farm Plan. If 89 mgd was used that would average 4,248 gal./acre/day, similar what sugar cane demanded.
- The needs of others who live and farm along the diverted streams in Ha’iku-Pe’ahi are simply ignored. Many Ha’iku-Pe’ahi area residents have no access to the County’s upcountry water system and need to use stream water to irrigate if they wish to farm. The Ha’iku-Pe’ahi families who do have access to County water **do not depend on the EMI ditch system as Ha’iku is served by County well water.**
- These Ha’iku-Pe’ahi residents get only impacts, and no benefits if large amounts of East Maui stream water are diverted by A&B. Ha’iku area customers with no County water service depend upon numerous private wells and some small springs.

- The assumption in the DEIS that all Upcountry residents would benefit if EMI/A&B/Mahi Pono diverts as much water as legally allowed from East Maui and the streams beyond the lease area, does not really apply to the 10,000 plus residents who live and farm in the Ha'iku-Pe'ahi area. The DEIS does not refer to this fact or make it clear.
- The EIS needs to fully declare the environmental implications of the proposed Alternative 1 and the Farm Plan it supports on the 10,000 plus existing residents, farmers, and native Hawaiian Cultural users in the Ha'iku area- between Honopou and Maliko streams. These local residents share their need for flowing streams to support their farms at HCA meetings.
- Since 2016, many Ha'iku-Pe'ahi streams had their diversion gates open because HC&S ceased sugar production and residents were able to use stream waters. Alternative 1 makes no provisions for Ha'iku-Pe'ahi farmers or Hawaiian families who hope to continue to use stream water to grow food.
- Alternative Mahi Pono farm plans that share the stream waters with Ha'iku-Pe'ahi residents need to be discussed in the EIS.

Mahalo for considering our community comments. We wish to remain a consulted party.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Maile Davis:

Thank you for comments dated October 25, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am writing to you on behalf of the Ha‘iku Community Association regarding our comments on the East Maui Water Leases Draft EIS. Our Board of Directors voted to submit comments on the DEIS, and we have heard from a number of other citizens in our community who also wish to submit comments, since they are directly affected by the East Maui Water Lease actions described in the DEIS.*

Response 1: We acknowledge that the Ha‘ikū Community Association is submitting comments to the subject Draft EIS, whom has also heard from numerous citizens who also wish to submit comments. Please note that we received over 400 comments during the public comment period on the subject Draft EIS.

Comment 2: *We have heard concerns that the present DEIS is missing key information that should be included, in order for the public to provide informed feedback to the DEIS.*

*The current DEIS contains no specific information regarding the water reservation amounts from the East Maui lease area needed by DHHL. **This information is now available and was publicly offered by DHHL staff at the Oct 9, 2019 BLNR meeting.** These specific legally protected water reservations should be INCLUDED in the DEIS, and Mahi Pono water use plans adjusted accordingly to reflect this amount, in order for the public and agency comment process to be based upon accurate information. A discussion of whether it is legal for A&B /Mahi Pono to assume that the DHHL “water reservation” can be utilized by Mahi Pono until it is “needed by DHHL” should also be included in the DEIS. It is our understanding that the Waiola o Molokai vs DHHL case dealt with a similar situation, and the DHHL prevailed.*

Response 2: We respectfully disagree with your comment that the Draft EIS contains no information regarding the water reservation amounts for the Department of Hawaiian Home Lands (DHHL). Specific information regarding the DHHL’s future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL’s Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd as shown on pages 2-4 to 2-7. As explained in on pages 2-4 to 2-7, the DHHL water reservation process involves several steps before a reservation amount is formally identified. The first step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following

adoption of the Beneficiary Consultation Report and an authorization to the Chairman to seek a reservation of water, CWRM could act on a reservation request related to a proposed lease.

As explained in Section 2.1.1 of the Draft EIS, DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B/EMI, Mahi Pono, the Department of Land and Natural Resources' (DLNR) Land Division, and DHHL staff and consultants. The results of the Beneficiary Consultation were presented to the HHC on May 30, 2019, as agenda item G-2. The motion passed by the HHC to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation request was approved by the HHC related to the EMI Aqueduct System for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

While Mahi Pono's current farm plan assumes the full use of the water that can be diverted from East Maui streams after compliance with the CWRM D&O, Mahi Pono will be obligated to reduce elements of its farm plan, and thus the availability of crop, to accommodate the permanent reduction in available water resulting from DHHL's allocation. The Reduced Water Volume alternative described in Chapter 3 of the EIS provides an assessment of the impacts of less water being made available for the Proposed Action, including Maui Pono farm plan in the Central Maui agricultural fields. Specifically, consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture.

Please note that Section 2.1.1 of the Draft EIS stated, with respect to the DHHL reservation, that "*Until that reservation is physically claimed, however, it will be available for use by the lessee.*" That statement has been clarified in the Final EIS as shown on pages 2-4 to 2-7, as it is uncertain whether the DHHL reservation amount would be available to the lessee until such time as it is needed by DHHL. Such temporary uses of the DHHL reservation water are not addressed under HRS § 171-58. We further acknowledge that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease

lessor and the DHHL would be necessary to allow any temporary use of water reserved for DHHL.

Please note that as discussed in Section 2.1.2 of the Draft EIS, under the Proposed Action, at full buildout of the Mahi Pono farm plan, it is estimated that approximately 87.95 mgd will be diverted from the License Area and an additional 4.37 mgd in between Honopou Stream and Māliko Gulch to support uses described in the EIS. However, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at an

Comment 3: *The current DEIS also assumes that 10 years will be required to “remove sugar cane and weeds” for the 15,975 acres proposed for future Mahi Pono crops, and therefore a shorter term lease will not be possible. Since that section was written, thousands of acres of Mahi Pono Land was burned, effectively removing cane and weeds: 5,300 acres of Mahi Pono farmland burned below Pukalani (Aug 1, 2019) and 9,200 acres of Mahi Pono and state land burned in Central Maui (July 2019). This status information should be included in the DEIS for public comment as regards the factors influencing the length of water lease agreements.*

Response 3: You are correct that as explained in Section 2.1.5 of the Draft EIS, it is estimated that 10 years will be required for Mahi Pono and lessees to remove volunteer sugarcane and weeds from the approximate 30,000 acres, amend soils, install field improvements, build warehouses and other structures, and plant crops. However, please note that this is not for 15,975 acres.

Since the publication of the Draft EIS, please note that Section 2.1.4 of the Final EIS has been revised to reflect Mahi Pono's current and near-term expected water use as shown on pages 2-30 and 2-32, which details average water being diverted from East Maui streams through the EMI Aqueduct System and how that water will be used. It important to note that as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet the needs of the approved water uses, including the MDWS and of Mahi Pono's agricultural operations in Central Maui.

Regarding your comment about a shorter lease term, Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully

analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Comment 4: *That being said, we respectfully request that A&B, Inc/ EMI withdraw the present document and resubmit that document with such key information updated. The process of reading and offering substantial comments on such a large document is quite overwhelming and it is important that those willing to commit to such a process be given more adequate time, and be provided with the full range of information available.*

Response 4: We respectfully disagree with our comment. As noted in the responses above, the information you claimed was missing was in fact within the Draft EIS, and has been updated accordingly. Regarding your comment about being given adequate time to review such a large document, please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai'i Revised Statutes (HRS) § 343-5. There is no

10238-04
Letter to Mr. Maile Davis
Page 6 of 6
September 3, 2021

statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

RE: East Maui Water Lease Draft-EIS Proposed Lease (Water Lease) for Nāhiku, Ke'ānae, Honomanu, Huelo License Area

Please accept our comments on the subject DEIS

Hui o Nā Wai 'Ehā is a Native Hawaiian non-profit organization that was established in 2003 and has a membership of over 500 which include kuleana kalo and diversified farmers, engaged Maui community members, water resource management advocates and instream users. The mission of Hui o Nā Wai 'Ehā is to advocate for the restoration and stewardship of mauka to makai streamflow in Waikapū, Wailuku, Waiehu and Waihe'e Streams (Nā Wai 'Ehā), to protect cultural and natural resources related to traditional and customary practices of Native Hawaiian kalo farmers and to engage the Maui community in water resources management education and outreach programs.

Hui o Nā Wai 'Ehā Board of Directors and members deeply care about ka wai a Kāne as it relates to both surface and ground water. Water is a public trust resource and one of if not the most important natural and cultural resources on earth. Native Hawaiians have a close affinity with the waters of Kāne and have the utmost respect for its use. We are very concerned about this proposed lease of public water because of its ability to allow corporations such as A&B and Mahi Pono to continue causing negative impacts to watersheds, streams, native aquatic species, traditional and customary rights of Native Hawaiian kalo farmers, nearshore fisheries-estuaries, and groundwater aquifers via their plantation era diversion and water delivery systems. Hui o Nā Wai 'Ehā values agriculture, especially that of traditional agricultural systems and understand the importance of food security. The former leased areas which are being proposed to be leased again by A&B/Mahi Pono through this EIS process were some of the most abundant and fertile agricultural lands utilized by Native Hawaiians historically. The development of plantation era systems over 150 years ago destroyed Native Hawaiian

(808) 430-4534 · Huionawai4@gmail.com · www.huionawaieha.org ·  

The Mission of Hui o Nā Wai 'Ehā is to advocate for the restoration and stewardship of mauka to makai streamflow in Waikapū, Wailuku, Waiehu, Waihe'e Streams (Nā Wai 'Ehā), to protect cultural and natural resources related to traditional and customary practices of Native Hawaiian kalo farmers and to engage the Maui community in water resource management education and outreach programs.

lifestyles, traditions and system by which Native Hawaiians self-managed watersheds and vast agricultural complexes. Generations were lost amongst the lack of opportunities to continue a self-sufficient way of life and community-based agricultur. Luckily however, a lot of the cultural landscapes in these East Maui areas are still present and a new generation of Native Hawaiians and others are biting at the bit to return to these lands to cultivate food and manage mauka to makai watersheds again, like the way our ancestors once did. None of this can happen, due to the fact that corporations such as A&B and Mahi Pono want to continue to divert millions of gallons of water from this region to lands that are marginal or just above average for agricultural use.

Hui o Nā Wai 'Ehā has a close affinity with Native Hawaiian community members from Maliko to Wailuanui and all the ahupua'a and valleys in between. We understand exactly what they are going through because we are fighting for the same things they are as it relates to the waters of our four great streams, Waikapū, Wailuku, Waiehu and Waihe'e. Stream diversions and ditch systems have negatively impacted our moku since 1862 and still do so today. Nā Wai 'Ehā was the largest contiguous kalo growing region in Hawai'i and the moku of Hāmākuapoko, Hāmākualoa, and Ko'olau where these A&B-Mahi Pono proposed leases take places was equally abundant and is worth every bit of effort to protect in perpetuity, especially as it relates to water resources.

Hui o Nā Wai 'Ehā understands that there were some stream/river diversions that were "given up", whereby stream flows were restored in a few of the 100+ East Maui Streams, especially in taro farming communities such as Wailuanui and Ke'anae. What is not necessarily being done is the removal of these diversion and ditch systems to ensure the watershed and/or streams return back to their natural state and without control of corporations such as A&B-Mahi Pono. According to the DEIS, East Maui only has 44 acres for potential kalo cultivation and that the 10 streams restored in 2018 as part of the East Maui Water Rights Contested Case gives East Maui people all the water they need. This is farthest from the truth and unacceptable. That statement does not address the dozen plus other areas in which lo'i kalo was cultivated. There is very little to no discussion about this in the DEIS and is something that needs to be addressed. The EIS needs to address how the lack of removal of actual concrete and steel diversion structures impact native habitat and species. Opening gates and returning "full" stream flow to 10 East Maui Streams and returning only partial flow to 7 other streams does not suffice when man-made structures are still in place. The EIS needs to address how the lack of partial to no removal of these structures have on the overall health of the stream, native aquatic species and traditional agricultural systems below them.

The DEIS also assumes that most of the East Maui streams "baseline condition" is the previously diverted state when sugar farming was in full swing. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities. There are a vast number of taro farming communities and ahupua'a that are equal in value to places like Ke'anae-Wailuanui and have the potential for Native Hawaiian lineal descendants to return to their ancestral lands and cultivate them for their communities and the overall food security of Maui; i.e. Honomanu, Nāhiku, Honopou, Halehaku, Pe'ahi, Huelo, Ho'olawa, Makapipi,

Hui o Nā Wai 'Ehā, 213 West Waikō Road, Wailuku, Maui, Hawaii 96793

The Mission of Hui o Nā Wai 'Ehā is to advocate for the restoration and stewardship of mauka to makai streamflow in Waikapū, Wailuku, Waiehu, Waihe'e Streams (Nā Wai 'Ehā), to protect cultural and natural resources related to traditional and customary practices of Native Hawaiian kalo farmers and to engage the Maui community in water resource management education and outreach programs.

Maliko, etc..). The EIS needs to discuss methods of restoring the 13 streams in the Honopou to Kailua area, where many Native Hawaiians and long-standing community members live and struggle to farm due to the lack of streamflow as well as gathering because of plantation era diversions and irrigation systems. All that is described in the DEIS is that it estimated that all of the water will be diverted from the streams 60% of the time. The EIS needs to discuss the impacts of continuing those diversions, which has decimated 85% of native stream habitat and negatively impacted thousands of local residents. The EIS needs to address this head on and allow for an option whereby streams are no longer diverted and the promotion of a restored East Maui ecosystems, watershed and self-sufficient communities in these areas described above.

The EIS should include discussion of a plan and funding to manage the invasive species in the license area. Invasive plants and animals are hurting the health and the function of the watershed lands and as well as Native Hawaiian farmers in the lower reaches of these valleys. This includes the fact that diversions promote stagnant pools along streambeds and increases in breeding grounds for mosquitos that carry Dengue fever and other viruses that affect both residents and native aviary species.

Continuing mass water diversion from East Maui will greatly have an impact on native aquatic species and native insects. The current state which allows for mass diversions in East Maui also severely impacts lo'i kalo farmers both struggling to farm and those trying to return to their ancestral lands to farm. The DEIS assumes that there is only a small fraction of water being diverted and that there is no impact on kalo growers (both current and future) native stream life, near-shore and off-shore fisheries and recreational/aesthetic values which is simply not true at all. The EIS needs to address the impacts on the above discussion along with potential future impacts by not having streams restored. The EIS needs to address and evaluate environmental impacts on streams based on what they were like pre-diversions.

Mahi Pono plans to use the total amount of East Maui Stream water available, including any "water reservation" held by the Department of Hawaiian Homelands (which has requested East Maui stream water for its projects). This is unacceptable and the EIS needs to show how this issue is being addressed for the future needs of Native Hawaiian for both housing and agriculture.

The DEIS does not include any detailed summary of how stream flows will be measured and monitored above and below diversions and within the ditch systems by a non-bias third party (I.e. community members in conjunction with CWRM/USGS). There are now Interim Instream Flow Standards in effect for 10+ East Maui Streams and there are currently no monitoring systems in place to ensure that the law is being followed and that diverters are complying with them. One of the major things plaguing Nā Wai 'Ehā is the fact that corporations like Wailuku Water Co. and Mahi Pono similar to that of East Maui still have control of these diversion systems, capture 100% of the streamflows and release what is "required by law" below via the IIFS rulings. This poses major issues in terms of their ability to comply, follow the law and allowance for access to these areas for transparency. In addition, plantation era systems continue to allow for dry stream beds in-between diversions and IIFS points. This negatively impacts native

aquatic species habitat and their ability to migrate upstream. The DEIS does not include any detailed discussions on how these issues will be addressed in East Maui. Furthermore, there is a need for collective engagement between CWRM, community members, kuleana kalo farmers, State and A&B-Mahi Pono which never seems to happen let alone the fact that this was not addressed in the DEIS as an important factor in addressing connectivity, compliance and enforcement issues. These points need to be strongly considered in the Final EIS.

Hui o Nā Wai 'Ehā thanks you for this opportunity to address the DEIS and humbly asks that you include this important information and address these points in the Final EIS. Mahalo nui loa! Ola I ka wai!

Me ke aloha,

Hui o Nā Wai 'Ehā Board of Directors

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Board of Directors of Hui o Nā Wai ‘Ehā:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Hui o Nā Wai ‘Ehā is a Native Hawaiian non-profit organization that was established in 2003 and has a membership of over 500 which include kuleana kalo and diversified farmers, engaged Maui community members, water resource management advocates and instream users. The mission of Hui o Nā Wai ‘Ehā is to advocate for the restoration and stewardship of mauka to makai streamflow in Waikapū, Wailuku, Waiehu and Waihe’e Streams (Nā Wai ‘Ehā), to protect cultural and natural resources related to traditional and customary practices of Native Hawaiian kalo farmers and to engage the Maui community in water resources management education and outreach programs.*

Response 1: We acknowledge that the Hui o Nā Wai ‘Ehā is a Native Hawaiian non-profit organization, with over 500 members which includes kuleana kalo and diversified farmers, Maui community members, water resource management advocates, and instream users, whose mission is to advocate for the restoration and stewardship of mauka to makai streamflow of in Waikapū, Wailuku, Waiehu, and Waihe’e streams, to protect cultural and natural resources related to traditional and customary practices of Native Hawaiian kalo farmers and to engage the Maui

community in water resources management education and outreach programs. Please note that the subject Water Lease does not involve Waikapū, Wailuku, Waiehu, and Waihe'e streams.

Comment 2: *Hui o Nā Wai 'Ehā Board of Directors and members deeply care about ka wai a Kāne as it relates to both surface and ground water. Water is a public trust resource and one of if not the most important natural and cultural resources on earth. Native Hawaiians have a close affinity with the waters of Kāne and have the utmost respect for its use. We are very concerned about this proposed lease of public water because of its ability to allow corporations such as A&B and Mahi Pono to continue causing negative impacts to watersheds, streams, native aquatic species, traditional and customary rights of Native Hawaiian kalo farmers, nearshore fisheries-estuaries, and groundwater aquifers via their plantation era diversion and water delivery systems.*

Response 2: We acknowledge your comments and understand that the Hui o Nā Wai 'Ehā Board of Directors and members deeply care about water resources as it relates to both surface and groundwater. Regarding your comment about water being a public trust, we acknowledge that the Proposed Action (the issuance of a 30-year Water Lease by the Board of Land and Natural Resources (BLNR)), requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai'i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. The dual roles of the BLNR and its sister agency, the Commission on Water Resource Management (CWRM), as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action as shown on pages 1-25 to 1-27.

Regarding your comment about negative impact to watersheds, as discussed in the EIS, Hawai'i Revised Statutes (HRS) § 171-58(e) requires a watershed management plan in connection with a water lease. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy

of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically address identifying priority outcomes essential to maintain or restore biological integrity of the watershed. The goals of watershed management plans are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

Regarding impacts about streams and native aquatic species, this is discussed further in subsequent Responses #5 and #8 below. Please refer to those for more detail.

Regarding impacts to traditional and customary rights of Native Hawaiian kalo farmers, this is discussed in further detail in Response #6 below.

Regarding your comment about impacts to nearshore fisheries-estuaries, this is discussed further in subsequent Response #13 below.

Regarding impacts to groundwater aquifers, it is unclear to as what groundwater aquifers you are referring to. Please note that under the Proposed Action, surface water is diverted from the East Maui License Area (which lies largely over the Ke'ānae, Waikamoi and Honopou aquifers in the Ko'olau Aquifer Sector (See EIS Figure 4-17), to the Central Maui agricultural fields, which largely lie over the Pā'ia Aquifer in the Central Aquifer Sector (See EIS Figure 4-18)). As detailed in Section 4.2.2 of the EIS, the groundwater pumpage within the Ko'olau Aquifer Sector is far below the Sustainable Yield (SY). This section addresses impacts to the Ko'olau Aquifer Sector in East Maui as well as the anticipated impacts to the Central Aquifer Sector from the conveyance of East Maui surface water to Central Maui for irrigation purposes. Note that Section 4.2.2 of the Final EIS has been updated to reflect a USGS report published in 2019 as shown on page 4-71 for East Maui and page 4-76 for Central Maui.

Comment 3: *Hui o Nā Wai 'Ehā values agriculture, especially that of traditional agricultural systems and understand the importance of food security. The former leased areas which are being proposed to be leased again by A&B/Mahi Pono through this EIS process were some of the most abundant and fertile agricultural lands utilized by Native Hawaiians historically. The development of plantation era systems over 150 years ago destroyed Native Hawaiian lifestyles, traditions and system by which Native Hawaiians self-managed watersheds and vast agricultural complexes. Generations were lost amongst the lack of opportunities to continue a self-sufficient way of life and community-based agriculture. Luckily however, a lot of the cultural landscapes in these East Maui areas are still present and a new generation of Native Hawaiians and others are*

biting at the bit to return to these lands to cultivate food and manage mauka to makai watersheds again, like the way our ancestors once did. None of this can happen, due to the fact that corporations such as A&B and Mahi Pono want to continue to divert millions of gallons of water from this region to lands that are marginal or just above average for agricultural use.

Response 3: Regarding your comment about East Maui being some of the most abundant and fertile agricultural lands utilized by Native Hawaiians historically, the Archaeological Literature Review and Field Inspection (LRFI) prepared by Cultural Surveys Hawai'i (CSH) included an analysis of the natural and built environment of the License Area, a comprehensive review of traditional and historic background information of the East Maui region, and is included as Appendix E in the EIS and summarized in Section 4.5 of the EIS. The LRFI and Section 4.5 of the EIS have been updated to include a supplemental discussion regarding historical agricultural land use in East Maui as shown on pages 4-143 to 4-147.

For the analysis conducted in Appendix I of the EIS (East Maui Water Lease: Agricultural and Related Economic Impacts report prepared by Plasch Econ Pacific LLC), taro farms in East Maui (from Honopou to Nāhiku), including use of water from streams not subject to the Findings of Fact, Conclusions of Law, and Decision and Order in Case CCH-MA13-01 dated June 20, 2017 issued by CWRM (the "CWRM D&O"), are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). This estimate is updated from the Draft EIS, where the analysis was based upon known landowners who have about 45 acres in East Maui that are suitable for growing taro. It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā, and would rely primarily on the taro streams ordered for full restoration under the CWRM D&O. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. This acreage is assumed for the Proposed Action and all associated alternatives since nearly all potential new taro cultivation is assumed to draw water from fully restored taro streams which will have the same flows under all alternatives. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O "*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*" (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on the pages 4-288 to 4-293. As discussed in Section 4.7.4 of the EIS, at its peak, taro production in Hawai'i was thought to cover

approximately 20,000 acres. By 1900, taro production Hawai'i decreased to about 1,280 acres, and by 1966, only 400 acres were farmed. As of 2015, land in crops were estimated at about 340 acres. According to the Agricultural Land Use Maps (ALUM), the East Maui communities had about 105.5 gross acres in taro in 1980, including about 96.3 acres in Ke'anae and Wailua, and 9.3 acres in Hūelo. By 2015, the acreage in taro had fallen to about 34.2 acres in taro, and only about 30 gross acres in taro by the end of 2017.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Regarding your comments, *“development of plantation era systems over 150 years ago destroyed Native Hawaiian lifestyles, traditions and system by which Native Hawaiians self-managed watersheds and vast agricultural complexes,”* note that Section 4.5 of the EIS and Appendix E provide a detailed and comprehensive report accounting the history of East Maui as it relates to historical and archaeological resources and provides background on traditional and customary practices that occurred within the region, as further discussed in Section 4.6 of the EIS and Appendices E (LRFI) and F (Cultural Impact Assessment (CIA)). Moreover, Section 4.7.4 of the Final EIS has been updated to include a discussion related to the decline of farming in East Maui as it relates to taro cultivation as shown on pages 4-288 to 4-293.

Regarding your comments, *“a lot of the cultural landscapes in these East Maui areas are still present and a new generation of Native Hawaiians and others are biting at the bit to return to these lands to cultivate food and manage mauka to makai watersheds again, like the way our ancestors once did”* note that Section 4.6 of the EIS and Appendix F (CIA) identify impacts to the regional environment, taro farming, and freshwater resources within the License Area based public documentation and consultation with the community. Moreover Section 4.7.2 and Appendix G (Social Impact Assessment) of the EIS documents the history of the East Maui region in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono.

We respectfully disagree with your comment that the agricultural lands in Central Maui are marginal or just above average for agricultural use. As summarized in Section 4.7.4 of the Draft EIS and Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts):

Central Maui has some of the best agricultural conditions in the State for farming, including a large area in a compact configuration, high-quality soils, high solar radiation, a location near markets and shipping terminals, and potentially ample water at low delivery costs (assuming a new Water Lease with a reasonable use fee), and for lessees rents that will be comparatively low.

The basis for this finding is given in Subsection 5 and Figures 4 through 12 of Appendix I of the Draft EIS.

Moreover, as discussed in Section 5 of Appendix I and Section 4.7.4 of the Draft EIS, the overwhelming majority of the Central Maui agricultural fields (approximately 80%) are rated by the UH Land Study Bureau (LSB) as having the highest Overall Productivity Rating of "A" (on a scale of "A" to "E" with "E" being the lowest soil rating), and a little over 11% has a "B" rating. In other words, about 27,567 acres (90.9%) are high-quality lands rated A or B. The Agricultural Lands of Importance to the State of Hawai'i (ALISH) Classification System, was developed and compiled in 1977 by the State Department of Agriculture with assistance from the U.S. Department of Agriculture - Natural Resources Conservation Service (NRCS), and the College of Tropical Agriculture, University of Hawai'i. Approximately 25,669 acres of the Central Maui agricultural fields are classified under the ALISH system as "Prime", which means "agricultural land which is land that is best suited for the production of crops because of its ability to sustain high yields with relatively little input and with the least damage to the environment." Also, as discussed in Section 5.1.4 of the EIS and Section 5 of Appendix I, approximately 22,000 of the 30,000 acres of agricultural fields in Central Maui are designated as Important Agricultural Lands (IAL). Under Article XI, Section 3, of the Constitution of Hawai'i, the State is required to conserve and protect agricultural lands, promote diversified agriculture, increase agricultural self-sufficiency and assure the availability of agriculturally suitable lands. HRS Chapter, 205, § 205-41 through § 205-52, provides for the designation of IAL. As stated in HRS Chapter 205: "*The objective for the identification of important agricultural lands is to identify and plan for the maintenance of a strategic agricultural land resource base that can support a diversity of agricultural activities and opportunities that expand agricultural income and job opportunities and increase agricultural self-sufficiency for current and future generations.*" IAL designation facilitates the long-term dedication of lands for future agricultural use so long as there is a sufficient supply of water to allow for profitable farming. As such, the Central Maui agricultural fields are highly suitable for agricultural production and uses and are not considered "marginal" as you suggest.

Comment 4: *Hui o Nā Wai 'Ehā has a close affinity with Native Hawaiian community members from Maliko to Wailuanui and all the ahupua'a and valleys in between. We understand exactly*

what they are going through because we are fighting for the same things they are as it relates to the waters of our four great streams, Waikapū, Wailuku, Waiehu and Waihe'e. Stream diversions and ditch systems have negatively impacted our moku since 1862 and still do so today. Nā Wai 'Ehā was the largest contiguous kalo growing region in Hawai'i and the moku of Hāmākuapoko, Hāmākualoa, and Ko'olau where these A&B-Mahi Pono proposed leases take places was equally abundant and is worth every bit of effort to protect in perpetuity, especially as it relates to water resources.

Response 4: Regarding your comment about the moku of Hāmākuapoko, Hāmākualoa, and Ko'olau being equally abundant as the Nā Wai 'Ehā with regard to taro growing, please see Response #3 above. It is acknowledged that East Maui historically had an abundance of agriculture activity, including taro cultivation. However, please note that the majority of these lands for taro cultivation, historically and potential, occur outside of the License Area, which is the land subject to the proposed Water Lease. The LRFI and Section 4.5 of the EIS have been updated to include a supplemental discussion regarding historical agricultural land use in East Maui as shown on pages 4-143 to 4-147.

Regarding your comment about protecting these lands in perpetuity, especially as it relates to water resources, it is unclear what is specifically meant. We are unsure if you are referring to the taro lands below the License Area, or the License Area itself, which consists solely of state-owned lands. Regarding the lands outside of the License Area, these are mainly privately owned lands. The Water Lease will not give the lessee any authority over or to use lands outside of the License area. From a water resource perspective, as you emphasize and as noted in Response #3 above, all of the streams in the License Area that historically supported taro cultivation in the moku of Hāmākuapoko, Hāmākualoa, and Ko'olau will be fully restored, with all natural flow water available for taro cultivation and other uses.

As discussed in Section 5.1 of the EIS, the License Area consists of lands owned by the State of Hawai'i and are designated within the State Land Use Conservation District. The intent of the Conservation District is to preserve such lands and valuable resources through appropriate management and use, which is administered by the BLNR.

Moreover, as discussed in Section 2.1 of the Draft EIS and in Response #2 above and #11 below, the water lessee will be subject to all applicable requirements under HRS § 171-58, which articulates terms for the disposition of a water lease, including the development and implementation of a watershed management plan. See pages 2-2 to 2-4 providing the updated Final EIS text regarding the content requirements for a watershed management plan.

Also please note that A&B was a founding member of the East Maui Watershed Partnership (EMWP). The existing EMWP Management Plan was prepared in July 2009 and amended in July 2018, has been attached as Appendix O to the Final EIS. The EMWP Management Plan describes the watershed resources such as water, cultural / physical resources, native flora and fauna, and recreational resources. The EMWP Management Plan identifies the watershed threats and management objectives for the East Maui Watershed. Under the Proposed Action, it is anticipated that EMI and/or Mahi Pono will continue to pursue watershed management activities.

Comment 5: *Hui o Nā Wai 'Ehā understands that there were some stream/river diversions that were “given up”, whereby stream flows were restored in a few of the 100+ East Maui Streams, especially in taro farming communities such as Wailuanui and Ke‘anae. What is not necessarily being done is the removal of these diversion and ditch systems to ensure the watershed and/or streams return back to their natural state and without control of corporations such as A&B-Mahi Pono.*

Response 5: Contrary to your statement that there are "100+" streams, the total number of streams/tributaries within the License Area is 36 total streams (which includes their tributaries) as indicated by Table 1-3 in the Final EIS. However, please note that the Draft EIS identified 37 streams within the License Area as it includes Puakea Stream. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is subject to the CWRM D&O as a “connectivity stream.” Of these 36 total streams, only 25 are proposed to be diverted under the Proposed Action as a number of the streams were fully restored under the CWRM D&O.

Regarding your comment about removal of diversions and ditch system structures to ensure the watershed and / or stream return back to their natural state, it is also acknowledged that the subject EIS does not propose the removal or modification of any diversion structures as part of the Water Lease. The work related to diversion modifications required for compliance with the Interim Instream Flow Standards (IIFS) under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows.

The CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. CWRM ordered in relevant part (see CWRM D&O at p. 269):

- i. *It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.*
- j. *This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process*
- k. *The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.*

As discussed in Section 1.3.4 of the EIS, CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

Comment 6: *According to the DEIS, East Maui only has 44 acres for potential kalo cultivation and that the 10 streams restored in 2018 as part of the East Maui Water Rights Contested Case gives East Maui people all the water they need. This is farthest from the truth and unacceptable. That statement does not address the dozen plus other areas in which lo'i kalo was cultivated. There is very little to no discussion about this in the DEIS and is something that needs to be addressed.*

Response 6: Please note as discussed in Response #3 above, for the analysis conducted in Appendix I to the EIS (East Maui Water Lease: Agricultural and Related Economic Impacts report), taro farms in East Maui (from Honopou to Nāhiku), including use of water from streams not subject to the CWRM D&O, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā, and would rely primarily on the taro streams ordered for full restoration under the CWRM D&O. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. This acreage is assumed for the Proposed Action and all associated alternatives since nearly all potential new taro cultivation is assumed to draw water

from fully restored taro streams which will have the same flows under all alternatives. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on the pages 4-288 to 4-293. As discussed in Section 4.7.4 of the EIS, at its peak, taro production in Hawai‘i was thought to cover approximately 20,000 acres. By 1900, taro production Hawai‘i decreased to about 1,280 acres, and by 1966, only 400 acres were farmed. As of 2015, land in crops were estimated at about 340 acres. According to the Agricultural Land Use Maps (ALUM), the East Maui communities had about 105.5 gross acres in taro in 1980, including about 96.3 acres in Ke‘anae and Wailua, and 9.3 acres in Hūelo. By 2015, the acreage in taro had fallen to about 34.2 acres in taro, and only about 30 gross acres in taro by the end of 2017.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 7: *The EIS needs to address how the lack of removal of actual concrete and steel diversion structures impact native habitat and species. Opening gates and returning “full” stream flow to 10 East Maui Streams and returning only partial flow to 7 other streams does not suffice when man-made structures are still in place. The EIS needs to address how the lack of partial to no removal of these structures have on the overall health of the stream, native aquatic species and traditional agricultural systems below them.*

Response 7: Please note that generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best. The presence of cement or wood near or partially within the stream channel is not inherently bad for stream animals. Conversely, meeting the instream flow standard at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the

water flowing into the diversion and back to the stream from another location in the diversion ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

The two primary conditions where diversion structures could impact native stream species are structures where diversion and ditch water still comingle or structures that create a barrier to upstream migration. A diversion structure could also impact native stream animals as they move upstream if it creates an unnatural barrier. If no wetted pathway exists, upstream passage will be stopped.

Altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns.

In summary, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate adverse impacts while taking total impacts caused into consideration. The physical act of removing diversion structures could generate adverse impacts to the surrounding environment in certain circumstances that would not occur if the structures were left in place. The above is discussed in more detail in Section 4.2.1 of the Final EIS as shown on pages 4-63 to 4-67.

Please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model does not address traditional agricultural systems. However, as discussed above in Response #5 above, the CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. Moreover, as discussed in Response #3 above, the CWRM ordered that streams subject to the D&O that are used for taro growing or for community and non-municipal domestic uses cease all diversions and have full stream flow restored.

Comment 8: *The DEIS also assumes that most of the East Maui streams “baseline condition” is the previously diverted state when sugar farming was in full swing. This avoids discussing the*

option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

Response 8: The HSHEP model, which was used for the assessment of impacts to the native amphidromous stream species and is included in Appendix A and summarized in Section 4.2.1 of the EIS, does in fact analyze the no diversion scenario (termed the Natural Condition). The upper boundary (the Natural Condition) provides context to the maximum number of habitat units (HU) available for native species. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat for native stream species. This is a coherent position as it provides context to the best conditions possible for native species.

The HSHEP analysis similarly assessed the lower boundary of conditions, by modeling the impact of full diversion of the streams in the License Area. The lower boundary (the "Full Diversion Condition") reflects the maximum impact or maximum amount of habitat lost due to diversions. The use of the Full Diversion Condition as the lower boundary estimates the amount of available habitat under a scenario where the EMI Aqueduct System would divert its maximum capacity from the East Maui streams in the License Area. However, please note that none of the Proposed Action or any of the alternatives discussed in the EIS seek to increase diversion amounts over the maximum amount of water allowed to be diverted under the CWRM D&O, which is far less than the amount of water diverted at the peak of sugarcane production. The modeled assumption under the full diversion scenario is 100% diversion of "base or normal low" streamflow at all diversions within the EMI Aqueduct System. Thus, all habitat, entrainment, and barrier impacts were set to their maximum (greatest negative impact on species habitat) at all diversions. We acknowledge that the Full Diversion Condition resulted in more than half of all stream habitat being eliminated from the East Maui Streams as stated in Section 4.2.1 of the Final EIS.

The use of the Full Diversion Condition is also a historically coherent position as it reflects the conditions that were existing in East Maui streams for much of the past hundred years. Not considering diversion conditions under sugarcane agriculture seems disingenuous as it does not provide any context to a very well-known historical condition.

The combination of the lower and upper bounds provide the range at which we would expect changes to the diversions to fall within and provides a way to comparatively discuss different flow restoration scenarios as by definition the changes must fall somewhere between 100% diversion and 0% diversion.

The HSHEP model also reviewed a diversion scenario that was in compliance with the IIFS set forth under the CWRM D&O (i.e. the Proposed Action), and a "no action" alternative where 30% of the flow remaining (after compliance with the IIFS under the CWRM D&O) in the License Area streams is diverted as discussed in Section 3.3 of the EIS.

The two scenarios presented, "2018 IIFS (Proposed Action)" and "No Action Alternative (30% remaining flow diversion)" are examples of how different flow restoration scenarios result in different amounts of HU restored, within the lower and upper bounds. The HSHEP model is used to quantify these differences based on flow restoration changes at diversions. The HSHEP follows a logical approach and systematically addresses on-the-ground conditions.

Hence, the EIS does provide an analysis of the impacts of "no diverted streams" on the availability of instream HU. However, that scenario is not one of the alternatives described in Chapter 3 of the EIS. Instead, as required by law, the EIS provides an analysis of the No Action alternative, i.e., a scenario where no Water Lease is issued. There, it is understood that approximately 30% of the water available from the License Area could still be diverted independent of the issuance of the Water Lease, as discussed in Section 3.3 of the EIS. Under this assumption, it is understood that the No Action alternative would result in more surface flow in the streams within the License Area, and therefore lesser associated impacts on instream HU than under the Proposed Action.

Comment 9: *There are a vast number of taro farming communities and ahupua'a that are equal in value to places like Ke'anae-Wailuanui and have the potential for Native Hawaiian lineal descendants to return to their ancestral lands and cultivate them for their communities and the overall food security of Maui; i.e. Honomanu, Nāhiku, Honopou, Halehaku, Pe'ahi, Huelo, Ho'olawa, Makapipi, Maliko, etc..).*

Response 9: Please note that it is unclear where these communities are as they do not show up within the Census Designated Place (CDP) database. However, it is assumed that some of these are communities that are situated along the streams that possess this name or communities below the regions of the License Area.

Please note as it relates to Honomanū, all streams within the Honomanū portion of the License Area have been restored either as "biological streams" or "connectivity streams." See EIS Section 1.3.4. Particularly, Honomanū Stream, itself has been ordered to be restored as a "biological stream" as discussed in Section 1.3.4 of the Draft EIS.

All streams within the Nāhiku portion of the License Area have been ordered to be restored as “community streams” or “connectivity streams.” *Id.* Particularly, Makapipi Stream has been ordered to be fully restored as the community of Nāhiku below Hāna Highway depend upon this stream for taro cultivation.

Honopou Stream has been ordered to be fully restored by the CWRM D&O.

Halehaku Stream is a stream that is located outside the License Area and runs through privately owned land, thus it is not affected by the proposed Water Lease. It is unclear where the community of Pe‘ahi is, however, it is also assumed that the Pe‘ahi community is located in the area of the same name, which is outside of the License Area. The Huelo portion of the License Area saw restoration across the sector, with three streams fully restored (including Huelo stream), as well as restoration of a “biological stream” and one “connectivity stream.” See CWRM D&O at 268-69.

Ho‘olawa Stream was not subject to the CWRM D&O and thus did not receive a restoration status. This is one of the streams within the Huelo portion of the License Area.

Māliko Stream is located outside the License Area and runs through privately owned land, thus is not a subject of the proposed Water Lease.

As it relates to taro farming, please refer to Responses #3 and #6 above, as well as pages 4-288 to 4-293 of the Final EIS. All or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop) is assumed for the Proposed Action and all associated alternatives since nearly all potential new taro cultivation is assumed to draw water from fully restored taro streams which will have the same flows under all alternatives.

Moreover, the Cultural Impact Assessment (CIA) (Appendix F) prepared by CSH for the EIS has identified cultural impacts to taro farming as a result of the Proposed Action in Section 4.6 of the EIS as discussed in Response #3 above. Please note that the CIA was a regional study that was not limited to only the streams that were addressed by the CWRM D&O but, covered the entire License Area.

Comment 10: *The EIS needs to discuss methods of restoring the 13 streams in the Honopou to Kailua area, where many Native Hawaiians and long-standing community members live and*

struggle to farm due to the lack of streamflow as well as gathering because of plantation era diversions and irrigation systems. All that is described in the DEIS is that it estimated that all of the water will be diverted from the streams 60% of the time. The EIS needs to discuss the impacts of continuing those diversions, which has decimated 85% of native stream habitat and negatively impacted thousands of local residents. The EIS needs to address this head on and allow for an option whereby streams are no longer diverted and the promotion of a restored East Maui ecosystems, watershed and self-sufficient communities in these areas described above.

Response 10: Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since the publication of the Draft EIS that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. Since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which was subject to the CWRM D&O as a "connectivity stream."

Regarding your comment that the EIS needs to discuss methods of restoring the non-petitioned streams in the Honopou to Kailua area, we acknowledge that the EIS does not specifically talk about how to *restore* the non-petitioned streams. These streams are anticipated to be diverted as they have been. Please note that these streams were included as part of the overall analysis of the EIS and associated technical studies. Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The HSHEP model in Appendix A and summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. Taken in isolation, for the non-petitioned streams, it is estimated that under the Proposed Action there is approximately an 88.2% reduction from the Natural Flow Condition scenario for these 12 streams. However, from a regional perspective (looking at all streams in the License Area), the License Area will see an overall increase in HU from historical diversion rates. Under the Proposed Action, the License Area will see an overall 13.8% increase in available HU when compared to historical diversions under sugarcane operations. Under the Proposed Action, the number of HU within the entire License Area is decreased by an estimated 36.1% from a theoretical Natural Condition (i.e., a condition where no streams are diverted). This is considered theoretical because even under the No Water Lease scenario, the EMI Aqueduct System would continue to divert 30% of the water available at the Honopou Stream boundary after compliance with the IIFS established under the CWRM D&O. However, under the Proposed Action, the number of HU is increased by approximately 27.4% in comparison to the Full Diversion condition that existed when the diverted water was used for sugar cultivation. This information is further detailed in Section 4.2.1 of the Final EIS, which has been revised as shown pages 4-56 to 4-67. HU, as defined by the HSHEP report (Appendix A), as relative measures of stream habitat where each unit length of stream is multiplied by the Habitat

Suitability Indices for the particular species. It is important to recognize that the accumulation of HU for amphidromous species is additive, meaning that a single unit of stream may have total HU in excess of the stream area quantified. In other words, if HU for multiple non-competitive species in a given area are added together, the combined HU could be greater than the area. This is important when considering the total HU for all eight amphidromous species in a stream as the total HU for all eight species may be greater than the total stream area.

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 million gallons per day (mgd) will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams and will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Regarding your comment that those diversions will decimate 85% of native stream life habitat along the non-petitioned streams, note that the portion of the HSHEP report (Appendix A) that your comment refers to is limited in applicability to the non-petitioned streams only; it does not apply to all streams in the License Area. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams. Further, in that the non-petitioned streams currently have a 'status quo' IIFS, the Water Lease would not result in a "reduction" of 85% of HU for those streams. Rather, the Proposed Action, i.e., proposed Water Lease, represents a continuation of the level of diversion on these streams that historically occurred for many years. Your comment refers specifically to two scenarios -- the Natural Condition scenario and the Full Diversion Condition scenario -- considered under the HSHEP model, but which are scenarios that are not proposed in the EIS as the Proposed Action or alternatives. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams. Therefore, it would have been misleading to, as you suggested, to breakout the impacts to the non-petitioned streams in Section 4.2.1 of the EIS, as it applies to the Proposed Action.

Comment 11: *The EIS should include discussion of a plan and funding to manage the invasive species in the license area. Invasive plants and animals are hurting the health and the function of the watershed lands and as well as Native Hawaiian farmers in the lower reaches of these valleys. This includes the fact that diversions promote stagnant pools along streambeds and increases in breeding grounds for mosquitos that carry Dengue fever and other viruses that affect both residents and native aviary species.*

Response 11: Regarding your comment about a plan and funding to manage the invasive species in the License Area, it is presumed that this would fall under a watershed management plan as discussed in Response #2 above. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. As discussed in the EIS, HRS § 171-58(e) requires that any new lease of water rights "shall contain a covenant that requires the lessee and the department of land and natural resources to jointly develop and implement a watershed management plan. The board shall not approve any new lease of water rights without the foregoing covenant or a watershed management plan." In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable Watershed Management Plan. See pages 2-2 to 2-4 of the Final EIS.

Note that the minimum content requirements under the category of "Goals" address invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Regarding your comment about diversions creating stagnant pools for mosquito breeding, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat. Thus, an increase in habitat was predicted to occur at diverted flows.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. Second, Hawaiian streams are naturally flashy (i.e., they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta) regarding controlling introduced poeciliid fishes (e.g., guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. Unfortunately, this did not occur with increased streamflow. The

introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed.

While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. Anecdotal observations made by Trutta staff members, support the continued presence of Culex mosquitoes under a wide range of stream flows as they reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i. Please note that Section 4.2.1 of the Final EIS has been updated to include the above discussions related to the Culex mosquito as shown on pages 4-58 to 4-61.

Regarding your comment about Dengue Fever, it is our understanding that there has been only one outbreak of Dengue Fever on the island of Maui which was in 2001 as noted in the CWRM D&O. Please note that according to the State Department of Health that Dengue Fever is not endemic to the State of Hawai'i and is relatively uncommon. Most cases that have occurred throughout the State have been contracted from exposure outside the State and being brought in either by residents or visitors.

Comment 12: *Continuing mass water diversion from East Maui will greatly have an impact on native aquatic species and native insects.*

Response 12: As discussed in Response #8 above, the HSHEP model in Appendix A and summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown on pages 4-61 to 4-62. The above excerpt and the updated text on pages 4-61 to 4-62 present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of HU, as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See on pages 4-56 to 4-67 of the Final EIS.

Comment 13: *The current state which allows for mass diversions in East Maui also severely impacts lo'i kalo farmers both struggling to farm and those trying to return to their ancestral lands to farm. The DEIS assumes that there is only a small fraction of water being diverted and that there is no impact on kalo growers (both current and future) native stream life, near-shore and off-shore fisheries and recreational/aesthetic values which is simply not true at all. The EIS needs to address the impacts on the above discussion along with potential future impacts by not having streams restored. The EIS needs to address and evaluate environmental impacts on streams based on what they were like pre-diversions.*

Response 13: Please note that the East Maui streams are not currently being diverted on a large scale. Section 2.1.4 of the Final EIS has been revised to discuss current water usage as shown on pages 2-30 and 2-32. As of October 2020, an average of 23.3 mgd was being diverted from the License Area streams through the EMI Aqueduct System. Moreover, even at full implementation of the Mahi Pono farm plan, diversion will be less than half of what it was while sugar production was on-going in Central Maui as discussed in Section 2.1.2 of the EIS.

With regards to impacts of taro farmers, please see Response #3 and Response #6 above. For the analysis conducted in Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts), taro farms in East Maui (from Honopou to Nāhiku), including use of water from streams not subject to the CWRM D&O, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā,

and would rely primarily on the taro streams ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. This acreage is assumed for the Proposed Action and all associated alternatives since nearly all potential new taro cultivation is assumed to draw water from fully restored taro streams which will have the same flows under all alternatives.

With regards to impacts to native stream life, please see Responses #8, 10, and 12 above, explaining that it is anticipated that a negative impact will result from the Proposed Action which would result in approximately a 36.1% reduction in instream HU as compared to the theoretical Natural Condition (i.e., no diversions) modeled in the HSHEP, as explained in Response #10 above. However, the Proposed Action is expected to result in an increase of 13.8% in HU over the Full Diversion Condition (comparable to diversions during historical sugar operations). See EIS Section 4.2.1.

With regards to nearshore fisheries and off-shore fisheries, the collected data presented in Appendix B (East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry) and summarized in Section 4.2.3 of the EIS suggest that the broad scope of nutrient delivery conveyed from the streams to the ocean is limited. This is due to the intense mixing process that occurs when strong ocean currents – common in the nearshore ocean environments in East Maui – which quickly disperse a relatively small amount of fresh water into an exponentially larger ocean. Consequently, if nutrient concentrations in the ocean are not subject to substantial change, there is no meaningful vehicle for fishing to be negatively impacted by streamflow.

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams

(Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83.

Regarding your comment that *“The EIS needs to address and evaluate environmental impacts on streams based on what they were like pre-diversions,”* note that it is not scientifically possible to fully document impacts that first took place more than a century ago as pre-diversion data does not exist. However, as discussed in Response #8 above, Section 4.2.1 of the EIS and the HSHEP model (Appendix A to the EIS) analyzes a no diversion scenario (termed the Natural Condition). The upper boundary (the Natural Condition) provides context to the maximum number of HU

available for native species. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat for native stream species.

Comment 14: *Mahi Pono plans to use the total amount of East Maui Stream water available, including any “water reservation” held by the Department of Hawaiian Homelands (which has requested East Maui stream water for its projects). This is unacceptable and the EIS needs to show how this issue is being addressed for the future needs of Native Hawaiian for both housing and agriculture.*

Response 14: Your statement is incorrect. The Applicant fully acknowledges that, should the Water Lease be issued, the Department of Hawaiian Homelands (DHHL) has rights to reserve water for use on its homestead lands. Specific information regarding the DHHL's future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd as shown on pages 2-4 to 2-7. As explained on pages 2-4 to 2-7 of the Final EIS, the DHHL water reservation process involves several steps before a reservation amount is formally identified. The first step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following adoption of the Beneficiary Consultation Report and an authorization to the Chairman to seek a reservation of water, CWRM could act on a reservation request related to a proposed lease.

As explained in Section 2.1.1 of the Draft EIS, DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B/EMI, Mahi Pono, the Department of Land and Natural Resources' (DLNR) Land Division, and DHHL staff and consultants. The results of the Beneficiary Consultation were presented to the HHC on May 30, 2019, as agenda item G-2. The motion passed by the HHC to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation request was approved by the HHC related to the EMI Aqueduct System for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

While Mahi Pono's current farm plan assumes the full use of the water that can be diverted from East Maui streams after compliance with the CWRM D&O, Mahi Pono will be obligated to reduce elements of its farm plan, and thus the availability of crop, to accommodate the permanent reduction in available water resulting from DHHL's allocation. The Reduced Water Volume alternative described in Chapter 3 of the EIS provides an assessment of the impacts of less water being made available for the Proposed Action, including Maui Pono farm plan in the Central Maui agricultural fields. Specifically, consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture.

Note that Section 2.1.1 of the Draft EIS stated, with respect to the DHHL reservation, that "*Until that reservation is physically claimed, however, it will be available for use by the lessee.*" That statement has been clarified in the Final EIS as shown on pages 2-4 to 2-7, as it is uncertain whether the DHHL reservation amount would be available to the lessee until such time as it is needed by DHHL. Such temporary uses of the DHHL reservation water are not addressed under HRS § 171-58. We further acknowledge that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessor and the DHHL would be necessary to allow any temporary use of water reserved for DHHL.

Please note that as discussed in Section 2.1.2 of the Draft EIS, under the Proposed Action, at full buildout of the Mahi Pono farm plan, it is estimated that approximately 87.95 mgd will be diverted from the License Area and an additional 4.37 mgd in between Honopou Stream and Māliko Gulch to support uses described in the EIS. However, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

Comment 15: *The DEIS does not include any detailed summary of how stream flows will be measured and monitored above and below diversions and within the ditch systems by a non-bias third party (I.e. community members in conjunction with CWRM/USGS). There are now Interim Instream Flow Standards in effect for 10+ East Maui Streams and there are currently no monitoring systems in place to ensure that the law is being followed and that diverters are complying with them.*

Response 15: There are IIFS for all streams Statewide. The CWRM D&O served to amend the IIFS for 22 streams in East Maui. The IIFS are being met for all East Maui streams, as diversions of East Maui streams in the License Area are currently low, and most of the water remains in the streams, undiverted. Note that that as of October 2020, an average of 23.3 mgd was being diverted from License Area streams through the EMI Aqueduct System.

Regarding systems in place to ensure the law is being followed with respect to water diversions, under the revocable permits annual reports, and now quarterly reports, are submitted by EMI to the BLNR. Since the CWRM D&O was issued, however, EMI has been working closely with the CWRM staff on the implementation of the ordered IIFS. The IIFS are being met for all License Area streams.

Regarding your comment about stream measurements above and below diversions, it is not practically feasible to install gauging to achieve what you suggest. Nor is it necessary to ensure IIFS compliance. Note that EMI has 12 gauging stations located in several ditch locations across the License Area to monitor and manage East Maui ditch deliveries. These gauges measure the flow in the ditches only, using a system that includes optical encoders with float tape and data loggers. It is not feasible to measure flow in the streams, as there are limited areas that contain the necessary control points to accurately measure streamflow. EMI's 12 gauging stations include seven gauges that were formerly operated and maintained by the USGS to calculate the total amount of water diverted from each of the four sections of the License Area. Those gauges were also in the ditches, not on individual streams. Due to USGS cost cutting, in 1986 EMI took over the responsibility of operation and maintenance of those seven former USGS gauges. At that

time, the state began assessing a flat rental fee rather than one based on the specific amount of water collected in each license area. EMI contracts with the USGS to conduct quarterly discharge measurements to verify the accuracy of the gauges at the Honopou boundary of the License Area, which measure the total water withdrawn from the Collection Area.

It is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gauges to wash away. As noted in the CWRM D&O, Finding of Fact (FOF) 50, EMI takes measurements at the boundary of each section of the License Area and at its gauging station at Māliko Gulch. However, for the purpose of measuring the aggregate flow from entire License Area, the measurements taken at the Honopou boundary were used.

Comment 16: *One of the major things plaguing Nā Wai 'Ehā is the fact that corporations like Wailuku Water Co. and Mahi Pono similar to that of East Maui still have control of these diversion systems, capture 100% of the stream flows and release what is “required by law” below via the IIFS rulings. This poses major issues in terms of their ability to comply, follow the law and allowance for access to these areas for transparency.*

Response 16: We respectfully disagree with your comment. Even when sugar was in full production in Central Maui, it was estimated that the EMI Aqueduct System diverted only 15% of the total rainfall in the East Maui watershed. In addition, the Proposed Action will be compliant with the CWRM D&O that ordered significant restoration for several of the East Maui streams within the License Area as discussed throughout the Draft EIS. Water can only be diverted after the IIFS are met. Moreover, these compliance requirements must be satisfied irrespective of whether the Water Lease is issued.

Regarding your comment about transparency, EMI's use of surface water is regulated closely by the CWRM and the BLNR through the revocable permits for the water and will be under the proposed Water Lease, amongst other government agencies. The Proposed Water Lease is very much in the eye of regulators, with significant reporting and permitting requirements at the State and County level, as discussed in Response #15 above. Please note that the EIS process is a model of transparency. Furthermore, as discussed in Section 2.1 of the EIS, the Water Lease will be awarded through a public auction process.

Comment 17: *In addition, plantation era systems continue to allow for dry stream beds in-between diversions and IIFS points. This negatively impacts native aquatic species habitat and*

their ability to migrate upstream. The DEIS does not include any detailed discussions on how these issues will be addressed in East Maui.

Response 17: Please note that under the Proposed Action, significantly less water will be diverted from East Maui streams in the License Area compared to how streams were diverted historically during sugarcane operations. Specifically, as discussed in Section 2.1.2:

The EMI Aqueduct System was designed and is intended to be operated to capture and convey a major portion of the base flow from streams in the License Area to supply the former sugarcane operations in Central Maui. The EMI Aqueduct System is not designed to capture and convey short periods of high streamflow known as freshets that occur when it rains heavily in the upslope areas of the watershed. Such larger flows quickly overtop or bypass the diversions and remain in the streams. The system will only divert up to the capacity of the ditches to convey slow moving water along the very slight slopes of the ditches. Up until 1986, when the first return of water was made to the East Maui streams, the long-term average delivery by the EMI Aqueduct System was 165 mgd (CWRM D&O, FOF 519) before any use of the water by the MDWS or HC&S. In 2001, the CWRM began the process toward its D&O for several East Maui streams that further changed the amount of water available for delivery to Upcountry Maui and to the Central Maui agricultural fields. Based on these changes to the system, a more recent history of flow deliveries from the EMI Aqueduct System was computed from 1987 to 2006 (20 year time period). When analyzing the delivery data at Honopou Stream and Maliko Gulch, the median (Q50) flow at these areas for this time period was 135.58 mgd at Honopou Stream and 146.64 mgd at Maliko Gulch (Akinaka, 2019).

Compliance with the June 2018 CWRM D&O requires modifications to many of the stream diversion works that are part of the EMI Aqueduct System. Streams requiring partial restoration of flow have required adjustments to their diversions. Full stream flow restoration has required closure of the stream diversions. These compliance requirements must be met irrespective of whether the Water Lease is issued. East Maui, specifically the License Area, has already been affected by increased stream flows resulting from less offstream diversions due to the closure of sugar operations in December 2016. Currently, the EMI Aqueduct System is only diverting approximately 20 mgd. As a result, very little surface stream water is currently being diverted relative to what would be allowed should the Water Lease be awarded per the Proposed Action. However,

the amount of water that may be diverted should the Water Lease be issued is substantially less than the amount that was diverted during normal sugar production. For example, in 2006 it is estimated that the EMI Aqueduct System delivered approximately 156.69 mgd at Maliko Gulch, whereas under the CWRM D&O, it is estimated that the delivery at Maliko Gulch will be approximately 92.32 mgd (Akinaka, 2019).

The median flow required by the CWRM D&O provides an estimated available median flow at Honopou Stream of 87.95 mgd, where the EMI Aqueduct System leaves the License Area. Beyond the License Area, the diverted streams only provide supplemental ditch flow when License Area diversions are low. The amount that can be added is relatively low because when rainfall is high in East Maui, the ditches are fuller and there is little needed to supplement the flow. And, when rainfall is low in East Maui, the streams west of Honopou Stream have less flow in them as they are in an area that receives less rainfall than areas further east. During drier (low flow) periods, it is estimated that 4.37 mgd is available to supplement the EMI Aqueduct System between Honopou Stream and Maliko Gulch. With this added flow, the estimated median flow available beyond Maliko Gulch for use in Upcountry Maui and the Central Maui fields is estimated to be 92.32 mgd (Akinaka, 2019).

As discussed in Response #16 above, water can only be diverted from the License Area streams after the IIFS are met. All compliance requirements must be satisfied irrespective of whether the Water Lease is issued.

Regarding your comment about impacts to native aquatic species that need to migrate upstream, this is included in the HSHEP model (Appendix A to the EIS) summarized in Section 4.2.1 of the Draft EIS. As discussed in Response #7 above, the two primary conditions where diversion structures could impact native stream species are structures where diversion and ditch water still comingle or structures that create a barrier to upstream migration. A diversion structure could also impact native stream animals as they move upstream if it creates an unnatural barrier. If no wetted pathway exists, upstream passage will be stopped. Moreover, as discussed in Response #10 above, under the Proposed Action there is expected to be an approximate 36.1% reduction in potential HU from the theoretical Natural Flow Condition (i.e. no diversions), which include the native aquatic species, within the License Area.

Regarding your comment that the Draft EIS, “*does not include any detailed discussions on how these issues will be addressed in East Maui*” note that mitigation measures are described in Section 4.2.1 of the Draft EIS, which states:

Even with stream flow restoration and creation of wetted pathways to the ocean, entrainment of larvae at the diversions remains an issue and contributes to the loss of HU. Additional HU may be gained for the native stream species by decreasing entrainment at the diversion locations. Any action or modification of the diversion to decrease entrainment would increase the total restored HU without any additional water released to the stream.

Hence, making modifications to diversions so that entrainment is eliminated or reduced, can increase the number of HU, as well as improve connectivity within the stream for aquatic species. As discussed in Response #10 above, however, there are numerous reasons why there could be HU available, but no presence or a lesser presence of stream life. Please note that the impacts and mitigation measures discussed in Section 4.2.1 of the Final have been expanded on as shown on pages 4-63 to 4-67.

Comment 18: *Furthermore, there is a need for collective engagement between CWRM, community members, kuleana kalo farmers, State and A&B-Mahi Pono which never seems to happen let alone the fact that this was not addressed in the DEIS as an important factor in addressing connectivity, compliance and enforcement issues. These points need to be strongly considered in the Final EIS.*

Response 18: Regarding your comment about collective engagement, the Social Impact Assessment (SIA), as well as Section 4.7.2 of the EIS recommends the establishment of a “Core Working Group” comprised of geographic communities, environmental, agriculture, and business interests, and public agencies. The group would serve as a forum for exchanging ideas and collaborative efforts, as well as provide feedback and suggestions to Mahi Pono. Each member of the Core Working Group would be expected to reach out to their own networks to extend the discussion beyond the Core Working Group. While there would likely be strong differences in perspectives and opinions, the Core Working Group would need to find ways to establish core principles, common ground and manageable solutions. However, the terms of the Water Lease are at the discretion of the BLNR.

Additionally, Section 4.6 and Appendix F (CIA) of the EIS recommend that any future amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices and beliefs be fully vetted with the potentially affected community by engaging

relevant stakeholders in discussion in order to keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

Should the BLNR make this a requirement as a part of the Water Lease conditions, the applicant will comply with all conditions of the Water Lease.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Re: DEIS for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanū, and Huelo License Areas

From: Jeffrey Parker

President, Tropical Orchid Farm, Inc

Huelo, Maui

P.O. Box 170

Haiku, HI, 96708

Dear Mr. Hirokawa and Mr. Matsukawa,

Thank you for the opportunity to comment on the DEIS.

Thank you for all your hard work and making the very useful information available to the public.

I do have concerns about several issues covered in the DEIS. I am a farmer, operating a successful farm in the study area of Huelo, using water from a stream in the study area, since 1976. I am a Member of Maui County Farm Bureau.

I. The EIS needs to examine in depth, other Alternatives, such as Alternative Lease Duration (3.2.2) Analysis of Project Alternatives 2-4 is woefully inadequate.

A. 3.2.2.1 Alternative Lease Duration. There are many other stream users that might be harmed by tying up the water and locking-in uses for the proposed 30 year period. Factors such as the threat of rapid climate change have changed the situation for instream users and uses. While the DEIS has an excellent discussion of climate change (4.3.1), it is not considered as a factor in reviewing the Alternative Actions.

1. My farm gets all of the water needed for its operation from a stream which is not one of the streams receiving restored flows under CWRM D&O. The stream running through my property is 100% diverted ¼ mile above my property at the Lowrie Ditch, and then diverted 100% again at the lower boundary of the property, at the New Haiku Ditch. The water flowing between the diversions is from seeps. While there has always been enough seepage to sustain us, there have been some dry periods lately where we were truly frightened. It is a new world now with Climate Change, and events around the World have shown that anything is now possible. Should our stream stop flowing between the diversions, I will need to ask that water be released from the Lowrie diversion. Because of the rapidly-changing climate situation, I believe that control of stream flows should not be locked-in for 30 years.

II. EIS should not unquestioningly rely on Mahi Pono's unproven plan or Mahi Pono's unsubstantiated data. Mahi Pono is an unproven idea. While their stated goals are attractive, they have no farming experience in Hawaii. It is clear that their proposals are experimental. As just one small example, their press release for the first plots to be available (those plots at the lowest elevation near the Puunene Mill) mentioned that one

(Page 2)

(cont.) crop will be potatoes. Farmers up in Kula, who grow potatoes, are laughing at this proposal and insist that potatoes will not be successful down at that elevation. In any case, there is no proof that any of the crops mentioned can succeed in that harsh, depleted environment. So, in actuality most of these crops are being floated as trial balloons. There is quite a lot of water available to Mahi Pono right now, at a minimum the water from the privately-owned A&B watershed lands, plus brackish, plus Na Wai Eha water. (Incidentally, even though not a part of the 30-year lease proposal, the DEIS should include analysis of, and factor in, the Na Wai Eha water that is used to irrigate 4000 acres in the Central Valley) Sugar is one of the thirstiest known crops, other crops should require far less water.

Additionally, there is unlikely to be enough entrepreneurs wanting to take advantage of the lease plots to be offered by Mahi Pono. From my view as an aging farmer, the biggest obstacles to expanding diversified ag I see, are: lack of interest in farming, lack of interest in hard physical labor, low pay and benefits, high cost of materials, exposure to and cost of chemicals, the need to dedicate one's entire life, etc. Since Mahi Pono is a speculative venture, with no track record, and because there is adequate water for them right now, I think it is misguided to rely on the MT venture as a prime justification for returning to the 30-year lease.

I question the conclusion that "a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment" because as I said, there actually is plenty of water available for Mahi Pono to get started, and it makes complete sense to require them to prove their venture before taking the very serious action of returning to the former 30-year lease, IF the MP venture is to be used as a prime justification. "A short-term lease would derail development of the Mahi Pono farm plan because of the risk of not being able to farm for a long enough period to recover their planned investment" (2.1.5) However, Mahi Pono was well-aware of the current year-to-year water lease when they made the decision to buy the land.

A. Farm Plan Table 2-1. EIS should cite the sources for the information, i.e., the amount of water needed for the proposed crops. How were these numbers arrived at? If no sources other than MP can be cited, then the acreage, crops and water requirements appear to be purely speculative. For comparison, applicants bidding for diversified ag State Lease Lands, must submit very detailed farm and business plans, with detailed substantiation of numbers. Those applications are then reviewed by a committee made up of a banker, a Dept. of Ag official, and DLNR officials. Why would information used to decide these momentous water leases not be subjected to the same rigor as for a small State lease?

1. Formerly, pasture lands leased to cattlemen were unirrigated. But under MP farm plan, 4700 acres will be irrigated, using, according to their numbers, 5.46 MGD or 6.63% of the total. Will other cattlemen be able to lease irrigated pasture from MP, or is the irrigated pasture planned for MP's own use?

III. EIS needs to study whether the super-low cost of water provided to Mahi Pono will unfairly disadvantage other ranchers and farmers outside of Mahi Pono. For example, a rancher wishing to irrigate a pasture will pay \$1.10 per 1000 gallons, whereas Mahi Pono will pay below \$.06 per 1000 gallons. This would cause independent ranchers raising high-quality

(Page 3)

(cont.) beef to be unable to compete. This same concern applies to all farming outside of Mahi Pono where farmers are paying the \$1.10 ag rate.

IV. (4.7.4 EIS should stress that several East Maui farms, such as my own, are dependent on the 13 streams not included in the CWRM D&O. DEIS states “In the past, farmers in East Maui have reported that surface-water diversions to supply water to Central Maui left insufficient water in the streams for them to take full advantage of the agricultural potential in East Maui. However, in light of the CWRM D&O, ample stream water should now be available”. Clearly, this statement does not cover uses and users on the 13 streams not included in the CWRM D&O.

V. EIS should detail how Mahi Pono will be included in the Watershed Management Plan, since they are not the Lessee. (2.2) “Under the Proposed Action, it is anticipated that EMI and/or Mahi Pono will continue to pursue watershed management activities”. This is important to me as a farmer and a subject-area stream user battling invasive species constantly. There is no question that not nearly enough has been done on this front, under the present WMP.

VI. EIS should examine closer whether the idea that there are no further impacts because the streams have already been diverted for over a hundred years is the best policy for the future of the watershed. Should a different standard be used, one that supports restoration of watershed health?

VII. EIS should re-examine section on Irretrievable and Irreversible Commitment of Resources. (Executive Summary xi.)

“The issuance of the Water Lease will not result in the irreversible use of the water resource because the Water Lease will be for a term, and not perpetual”. The EIS should back this claim up with opinions from legal and planning subject-matter-experts. For example, if water uses continue to grow and become increasingly dependent on these diversions, does that not defacto convey rights to those uses, so that in reality the resources will be irretrievable and irreversible?

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Jeffrey Parker:

Thank you for comments dated November 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Thank you for the opportunity to comment on the DEIS. Thank you for all your hard work and making the very useful information available to the public. I do have concerns about several issues covered in the DEIS. I am a farmer, operating a successful farm in the study area of Huelo, using water from a stream in the study area, since 1976. I am a Member of Maui County Farm Bureau.*

Response 1: We acknowledge that you have concerns over several issues presented in the subject Draft EIS and you are a farmer in the Huelo region using water from a stream that is within the License Area. We also note that you are a member of the Maui County Farm Bureau.

Comment 2: *The EIS needs to examine in depth, other Alternatives, such as Alternative Lease Duration (3.2.2) Analysis of Project Alternatives 2-4 is woefully inadequate.*

A. 3.2.2.1 Alternative Lease Duration. There are many other stream users that might be harmed by tying up the water and locking-in uses for the proposed 30 year period. Factors such as the threat of rapid climate change have changed the situation for instream users and uses. While the DEIS has an excellent discussion of climate change (4.3.1), it is not considered as a factor in reviewing the Alternative Actions.

Response 2: Your comment about many other stream users that may be harmed is unclear as you do not specify what stream users would be impacts (i.e., recreational users, cultural practitioners, taro farmers, etc.). However, please note that with respect to the Draft EIS, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the Proposed Action relating to the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts to known existing and reasonably foreseeable future users, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts. As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area. These impacts are related to stream habitat, as there will be a reduction from natural flow conditions which can be mitigated by adjustments in diversions to minimize entrainment; terrestrial flora and fauna resources, as well as historic and archeological resources, from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; cultural resources and practices which can be mitigated by a myriad of recommendations proposed by Cultural Surveys Hawai'i; and socio-economic characteristics which can be mitigated by further public outreach and consultation.

Regarding your comment that climate change has changed the situation for instream users and uses, as you acknowledge climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream

base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action as well as the alternatives to the Proposed Action specific to the three geographic areas discussed in the Draft EIS as addressed in Section 3.4.7 (Natural Hazards), which discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Hence, climate change was used to assess the various alternatives presented in Chapter 3. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the Archaeological Literature Review and Field Inspection (LRFI) (Appendix E), Cultural Impact Assessment (CIA) (Appendix F), and the Terrestrial Flora and Fauna Technical Report (Appendix C) conducted in conjunction of this EIS as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Please note that the Alternative Lease Duration alternative was considered but ultimately dismissed as Section 3.2.2.1 of the Draft EIS explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless described in Section 3.2.2.1 and fully analyzed across the spectrum of environmental criteria in Section 3.4 of the EIS. In addition, a summary table comparing the various alternatives, as well as the No Action alternative, has been added as Table 3-2 to Section of the Final EIS as pages 3-49 to 3-80. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be

hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan. A lease term shorter than 30 years could limit the ability of Mahi Pono or one of its farming lessees to establish diversified agriculture in Central Maui. The infrastructure and land management necessary to support a diversified agriculture farm plan is different from what was necessary for sugar cane, and thus requires significant infrastructure improvements and land preparation. Given the considerable time and expense it takes to develop a diversified farm plan such as the one Mahi Pono is proposing, a shorter-term water lease would likely result in a reduced range of crops, and the reduced cultivation of designated Important Agricultural Lands (IAL) in Central Maui. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

Comment 3: *My farm gets all of the water needed for its operation from a stream which is not one of the streams receiving restored flows under CWRM D&O. The stream running through my property is 100% diverted ¼ mile above my property at the Lowrie Ditch, and then diverted 100% again at the lower boundary of the property, at the New Haiku Ditch. The water flowing between the diversions is from seeps. While there has always been enough seepage to sustain us, there have been some dry periods lately where we were truly frightened. It is a new world now with Climate Change, and events around the World have shown that anything is now possible. Should our stream stop flowing between the diversions, I will need to ask that water be released from the Lowrie diversion. Because of the rapidly-changing climate situation, I believe that control of stream flows should not be locked-in for 30 years.*

Response 3: We acknowledge your comments and understand that the stream that your farm operates on in the Huelo region is not subject to the Commission on Water Resource Management's (CWRM) Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O). However, you do not provide specificity to which stream this is, thus we cannot provide a specific response. We acknowledge that the

CWRM did not amend the existing Interim Instream Flow Standards (IIFS) for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu‘u, Ka‘aiea, ‘O‘opuola, Puehu, Nāili‘ilihaele, Kailua, Hanahana, Hoalua, Waipi‘o, Mokupapa and Ho‘olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration status); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe‘e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area.

With regards to your comment about a water lease term of 30 years being too long, please refer to Response #2 above which discusses the reasons why a 30-year lease term is necessary and being requested under the Proposed Action.

With regards to your comment about climate change, as discussed in Response #2 above, climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai‘i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Hence, climate change was used to assess the various alternatives presented in Chapter 3. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

Moreover, as discussed in Section 2.1.2 of the Draft EIS, under the Proposed Action, at full buildout of the Mahi Pono farm plan, it is estimated that approximately 87.95 mgd will be diverted from the License Area and an additional 4.37 mgd in between Honopou Stream and Māliko Gulch to support uses described in the EIS. However, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

Comment 4: *EIS should not unquestioningly rely on Mahi Pono's unproven plan or Mahi Pono's unsubstantiated data. Mahi Pono is an unproven idea.*

While their stated goals are attractive, they have no farming experience in Hawaii. It is clear that their proposals are experimental.

Response 4: Your comment about Mahi Pono's farm plan being an unproven idea is unclear. However, please note that Mahi Pono has been farming the Central Maui agricultural fields since they purchased A&B's former sugarcane land in December 2018 and has been expanding its agricultural operations since then. It is acknowledged that Mahi Pono is a new entity that has been recently formed with the goal of operating a large diversified agriculture farm in Hawai'i. However, in its first 18 months of existence, Mahi Pono has hired over 200 workers from Maui, most of whom have farm experience on the island. In addition, Mahi Pono's management has significant experience cultivating diverse crops on more than 100,000 acres on the continental U.S. Also, the company has established market channels, and substantial financial resources. The Mahi Pono farm plan is discussed not only in the Executive Summary, but in detail in Section 2.1.4. and Section 4.7.4, as well as Appendix I. Water requirements for 2030 (i.e., when full build out of the farm plan is expected) are discussed in Subsection 9.a of Appendix I, with details provided in Table 3, Section 3.a of Appendix I. This table includes average daily per-acre water requirements by crop. Production figures are discussed in Subsection 10.a, with details provided in Table 4, Section 4.a of Appendix I.

The Mahi Pono farm plan will evolve over time based on a number of factors, including the available supply of surface water, experience which will be gained on crops that grow well in Central Maui, crops that are profitable, the size of the market for profitable crops, etc.

Comment 5: *As just one small example, their press release for the first plots to be available (those plots at the lowest elevation near the Puunene Mill) mentioned that one crop will be potatoes. Farmers up in Kula, who grow potatoes, are laughing at this proposal and insist that potatoes will not be successful down at that elevation. In any case, there is no proof that any of*

the crops mentioned can succeed in that harsh, depleted environment. So, in actuality most of these crops are being floated as trial balloons.

Response 5: The crops in the Mahi Pono farm plan were chosen with the goal of increasing Hawai'i's food independence while also meeting criteria for commercial viability and potential. Many crops can be grown in Hawai'i, but relatively few can be grown at a scale and cost that compete with low-cost volume producers on the mainland, Mexico and elsewhere. For many crops, the Hawai'i market is too small for economies of scale, and shipping costs and delivery times are a disadvantage for exports. The Mahi Pono farm plan is a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community.

With regards to your comment about Central Maui being a harsh, depleted environment, as summarized in Section 4.7.4 of the Draft EIS and Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts):

Central Maui has some of the best agricultural conditions in the State for farming, including a large area in a compact configuration, high-quality soils, high solar radiation, a location near markets and shipping terminals, and potentially ample water at low delivery costs (assuming a new Water Lease with a reasonable use fee), and for lessees rents that will be comparatively low.

The basis for this finding is given in Subsection 5 of Appendix I of the Draft EIS, along with Figures 4 to 12 in Appendix I of the Draft EIS.

Moreover, as discussed in Section 5 of Appendix I and Section 4.7.4 of the Draft EIS, the overwhelming majority of the Central Maui agricultural fields (approximately 80%) are rated by the UH Land Study Bureau (LSB) as having the highest Overall Productivity Rating of "A" (on a scale of "A" to "E" with "E" being the lowest soil rating), and a little over 11% has a "B" rating. In other words, about 27,567 acres (90.9%) are high-quality lands rated A or B. The Agricultural Lands of Importance to the State of Hawai'i (ALISH) Classification System, developed and compiled in 1977 by the State Department of Agriculture with assistance from the U.S. Department of Agriculture - Natural Resources Conservation Service (NRCS), and the College of Tropical Agriculture, University of Hawai'i. Approximately 25,669 acres of the Central Maui agricultural fields are classified under the ALISH system as "Prime", which means "agricultural land which is land that is best suited for the production of crops because of its ability to sustain high yields with relatively little input and with the least damage to the environment." Also, as discussed in Section 5.1.4 of the EIS and Section 5 of Appendix I, approximately 22,000 of the 30,000 acres of

agricultural fields in Central Maui are designated as IAL. Under Article XI, Section 3, of the Constitution of Hawai‘i, the State is required to conserve and protect agricultural lands, promote diversified agriculture, increase agricultural self-sufficiency and assure the availability of agriculturally suitable lands. HRS Chapter 205, § 205-41 through § 205-52, provides for the designation of IAL. As stated in HRS Chapter 205: “*The objective for the identification of important agricultural lands is to identify and plan for the maintenance of a strategic agricultural land resource base that can support a diversity of agricultural activities and opportunities that expand agricultural income and job opportunities and increase agricultural self-sufficiency for current and future generations.*” IAL designation facilitates the long-term dedication of lands for future agricultural use so long as there is a sufficient supply of water to allow for profitable farming. Hence, Central Maui offers some of the best agricultural land in the State.

Comment 6: *There is quite a lot of water available to Mahi Pono right now, at a minimum the water from the privately-owned A&B watershed lands, plus brackish, plus Na Wai Eha water. (Incidentally, even though not a part of the 30-year lease proposal, the DEIS should include analysis of, and factor in, the Na Wai Eha water that is used to irrigate 4000 acres in the Central Valley) Sugar is one of the thirstiest known crops, other crops should require far less water.*

Response 6: With regards to your comment about utilizing water from Nā Wai ‘Ehā, please note this water is from the West Maui irrigation system. Water from the West Maui irrigation system is beyond the scope of the EIS. That water does not contribute to the irrigation of the Central Maui agricultural fields. The EIS looks at the water diverted from East Maui streams through the EMI Aqueduct System, a portion of which water is delivered to the Central Maui agricultural fields. The EMI Aqueduct System does not comingle water with the West Maui irrigation system as they are completely separate systems. Moreover, the source of water for the West Maui irrigation system comes from privately owned lands and is not from State-owned lands. Hence, the West Maui water is not included in this analysis.

Regarding your comment that there is a lot of water available to Mahi Pono right now, please note that Section 2.1.4 of the Final EIS has been revised to reflect Mahi Pono’s current and near-term expected water use, which details average water being diverted from East Maui streams through the EMI Aqueduct System and how that water will be used. As discussed on pages 2-30 and 2-32 of Section 2.1.4, based on the planned estimates, Mahi Pono projected that its total water needs from the East Maui watershed/streams over the course of 2021 would be approximately 32.3 mgd. The 2021 revocable permits cap water withdrawals from the License Area at 45 mgd on an annual average basis. However, in order to implement the full buildout of the Mahi Pono farm plan, it is estimated that approximately 87.95 mgd of surface water is needed from the License Area. The EMI Aqueduct System is estimated to divert an additional 4.37 mgd of surface water from the point that it leaves the License Area at Honopou Stream and

collects water from streams on privately owned land to its last diversion at Māliko Gulch. Thus, under the Proposed Action, an estimated total of approximately 92.32 mgd could be conveyed to supply the MDWS for users in Upcountry Maui and the agricultural fields in Central Maui as discussed in Section 2.1.2 of the Final EIS. Hence the amount of surface water available to Mahi Pono currently is approximately less than half of what is needed to implement the full buildout of the Mahi Pono farm plan.

With regards to A&B's privately owned watershed land, as discussed in Section 3.3 of the Draft EIS, under the 1938 Agreement and a related calculation involving isohyet analysis of rainfall patterns, it is understood that approximately 30% of the water in the License Area streams is derived from the privately-owned lands. Therefore, under the No Action alternative, the EMI Aqueduct system could continue to divert approximately 30% of the water available from the License Area plus approximately 4.37 mgd from the privately owned lands between Honopou Stream and Māliko Gulch. This amount is estimated to be approximately 30.76 mgd.

With regards to brackish water, Draft EIS Section 2.1.4 (Central Maui Field System) explains:

In addition to the surface water imported from the EMI Aqueduct System to the Central Maui field irrigation system, the irrigation infrastructure includes fifteen brackish water wells that can supplement surface water to approximately 17,200 acres of the plantation at the lower elevations (CWRM D&O, FOF 738). These brackish wells extract groundwater from the subsurface aquifers lying beneath the agricultural lands, and which are cyclically dependent on recharge derived from the irrigation of the overlying lands by water from the EMI Aqueduct System. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water. Groundwater, however, can be delivered to 7,000 acres at higher elevations via a shared pipeline that served as a penstock line for a hydroelectric unit (CWRM D&O, FOF 739).

Draft EIS Figure 2-5 (Central Maui Infrastructure Map) identifies the wells in the Central Maui agricultural fields. However, please note that Section 2.1.4 has been revised in the Final EIS to more accurately describe the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono and clarifies that only 10 of the 15 wells are on Mahi Pono lands and thus available for use by Mahi Pono.

The reference to 15 brackish wells was derived from the CWRM D&O, FOF 738, as that was the number of brackish wells that A&B utilized during its sugar cane operations. However, one of the 15 wells referred to, State Well No. 5128-002, does not serve the Central Maui agricultural fields and four of the other brackish wells are on lands that are not owned by Mahi Pono. As such, Mahi Pono has access to only 10 such wells. Draft EIS Figure 2-5 has been revised to more

accurately depict the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono to support its farm plan for the Central Maui agricultural fields.

During sugarcane operations, the combined pumping capacity of A&B's 15 brackish water wells was 228 mgd of brackish water, but the true instantaneous pumping capacity of the wells – the most that can be pumped over 3 to 5 days – was 115 mgd during sugar cultivation, after which sump levels started to decline. From 1986 to 2013, A&B pumped an average of 71 mgd from the brackish water wells; during the 2008-to-2013 period, these wells delivered about 70 mgd of brackish groundwater to the lower-elevation fields. This was a suitable source of water for sugarcane during droughts because sugarcane can tolerate periodic use of water with higher salinity levels.

With respect to the Mahi Pono farm plan, because of the salinity of the water from the brackish wells and the salt tolerance of diversified agricultural crops, which are less salt-tolerant than sugarcane, the use of brackish water on the lower fields is assumed to be limited to about 30% of the water applied. Combining the upper and lower fields, the overall water split across all 30,000 acres would be approximately 80% surface water and 20% brackish groundwater water. If insufficient water is available from the EMI Aqueduct System, then crop farming will have to be reduced no matter how much brackish water is available. Thus, we disagree with your statement that the brackish wells provide 'a lot of water'. Additionally, the sustainable yield of the underlying aquifers as well as the quality of water are uncertain in light of the fact that significantly less recharge of the Central Maui aquifers from imported East Maui waters will occur. Historically, the sustainable pumping capacity of these wells was highly dependent on irrigation recharge and the positive benefits to the underlying aquifers.

Comment 7: *Additionally, there is unlikely to be enough entrepreneurs wanting to take advantage of the lease plots to be offered by Mahi Pono. From my view as an aging farmer, the biggest obstacles to expanding diversified ag I see, are: lack of interest in farming, lack of interest in hard physical labor, low pay and benefits, high cost of materials, exposure to and cost of chemicals, the need to dedicate one's entire life, etc. Since Mahi Pono is a speculative venture, with no track record, and because there is adequate water for them right now, I think it is misguided to rely on the MP venture as a prime justification for returning to the 30-year lease.*

Response 7: With regards to your comment about entrepreneurs wanting to take advantage of the lease plots, please note that Mahi Pono plans to lease approximately 2,050 acres to other farmers at favorable terms, including relatively low rents (anticipated to be \$150 per acre per year for community farms) for long periods. These farmers will have access to low-cost non-potable water from the Central Maui Field Irrigation System.

At full operations of the Mahi Pono farm plan, currently estimated to occur around 2030, an estimated 790 farming and crop-processing jobs will be provided in Central Maui (direct jobs)

(about 160 more jobs than provided by HC&S sugar operations in 2006). As explained in Section 4.7.4:

The increase in employment would be gradual, with most jobs filled by former sugarcane workers, skilled workers from Maui and other islands, recent graduates of agricultural-schools and colleges, and unskilled workers who would receive on-the-job training.

Approximately an additional 227 indirect jobs on Maui will be generated by the purchase of goods and services, for a total exceeding 1,000 new jobs on Maui. Hiring workers will be spread out over a number of years as fields are planted, orchards mature, processing facilities are built, etc. Assuming 10 years to reach full operations, direct employment on Maui will increase by an average of about 80 jobs per year, while total direct and indirect jobs will increase by an average of about 100 jobs per year. The latter figure is less than 8% of the 1,270 annual job increase projected for the years 2020 to 2030 by the State for the County of Maui (DBEDT, "Population and Economic Projections for the State of Hawai'i to 2045, June 2018).

In its first 18 months of existence Mahi Pono had hired over 200 workers, all of whom were living on Maui when hired. They were attracted by the type of work, wages and benefits.

Based on past hiring, nearly all future employees are expected to come from Maui. Also, at least in the near-term, attracting workers should be easier than in the recent past because of the long-term adverse economic effects of COVID-19 on tourism and Maui's economy. It may take years to rebuild the economy, and the Mahi Pono farm plan will contribute significantly to this rebuilding.

Comment 8: *I question the conclusion that "a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment" because as I said, there actually is plenty of water available for Mahi Pono to get started, and it makes complete sense to require them to prove their venture before taking the very serious action of returning to the former 30-year lease, IF the MP venture is to be used as a prime justification.*

Response 8: As noted in Response #2 above, Section 3.2.2.1 of the Draft EIS explains that "a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability." The Alternative Lease Duration alternative is nevertheless fully analyzed across the spectrum of environmental criteria in Section 3.4 of the EIS. In addition, a summary table comparing the various alternatives, as well as the No Action alternative, has been added as Table 3-2 to Section 3.5 of the Final EIS as pages 3-49 to 3-80. The Agricultural and Related Economic Impacts report provided as Appendix I to the

Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water. Furthermore, as discussed in Response #2, a lease term shorter than 30 years could limit the ability of Mahi Pono or one of its farming lessees to establish diversified agriculture in Central Maui as the infrastructure and land management necessary to support a diversified agriculture farm plan is different from what was necessary for sugar cane, and thus requires significant infrastructure improvements and land preparation.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Regarding your comment that Mahi Pono already has plenty of water to get its farm plan started, please refer to Response #6. Moreover, Mahi Pono has been implementing a portion of its farm plan with water that has been available to Mahi Pono under yearly revocable permits as explained in Response #6 above and discussed in Section 2.1.4 of the EIS, based on the planned estimates, Mahi Pono projected that its total water needs from the East Maui watershed/streams over the course of 2021 would be approximately 32.3 mgd. The 2021 revocable permits cap water withdrawals from the License Area at 45 mgd on an annual average basis. However, in order to implement the full buildout of the Mahi Pono farm plan, it is estimated that

approximately 87.95 mgd of surface water is needed from the License Area. The EMI Aqueduct System is estimated to divert an additional 4.37 mgd of surface water from the point that it leaves the License Area at Honopou Stream and collects water from streams on privately owned land to its last diversion at Māliko Gulch. Thus, under the Proposed Action, an estimated total of approximately 92.32 mgd could be conveyed to supply the MDWS for users in Upcountry Maui and the agricultural fields in Central Maui as discussed in Section 2.1.2 of the Final EIS. Hence the amount of surface water available to Mahi Pono currently is approximately less than half of what is needed to implement the full buildout of the Mahi Pono farm plan.

Comment 9: *A short-term lease would derail development of the Mahi Pono farm plan because of the risk of not being able to farm for a long enough period to recover their planned investment” (2.1.5) However, Mahi Pono was well-aware of the current year-to-year water lease when they made the decision to buy the land.*

Response 9: As discussed in Responses #2 and #8 above, Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return the 30,000 acres of agricultural lands in Central Maui back to a sustainable diversified farming operation. Mahi Pono conducted proper due diligence and is aware of the risks when purchasing approximately 41,000 acres from A&B.

Furthermore, the State of Hawai‘i has been clear that the annual revocable permits cannot continue indefinitely. As discussed in Section 1.4 of the Draft EIS, by order dated July 8, 2016, the Board of Land and Natural Resources (BLNR) directed A&B to proceed with the preparation of an EIS in connection with a long-term water lease.

Comment 10: *Farm Plan Table 2-1.*

EIS should cite the sources for the information, i.e., the amount of water needed for the proposed crops. How were these numbers arrived at? If no sources other than MP can be cited, then the acreage, crops and water requirements appear to be purely speculative.

Response 10: The Mahi Pono farm plan was developed by agricultural and technical experts. As noted in Response #4 above, the Mahi Pono farm plan is discussed not only in the Executive Summary, but in detail in Section 2.1.4. and Section 4.7.4, as well as Appendix I (Agricultural and Related Economic Impacts) of the EIS. Water requirements for 2030 are discussed in Subsection 9.a of Appendix I, with details provided in Table 3, Section 3.a of Appendix I. This table includes average daily per-acre water requirements by crop. Production figures are discussed in Subsection 10.a, with details provided in Table 4, Section 4.a of Appendix I.

Comment 11: *For comparison, applicants bidding for diversified ag State Lease Lands, must submit very detailed farm and business plans, with detailed substantiation of numbers. Those applications are then reviewed by a committee made up of a banker, a Dept. of Ag official, and DLNR officials. Why would information used to decide these momentous water leases not be subjected to the same rigor as for a small State lease?*

Response 11: We acknowledge your comments. However, please note that that the Proposed Action is not for a State Land Lease but, rather a Water Lease. Mahi Pono's agricultural operations are taking place entirely on privately owned land and is not subject to the same requirements as agricultural operations that take place on State Land Leased areas. Moreover, please note that Chapter 2 of the EIS provides rigorous details regarding the use of the water under the Proposed Action and how it would be used. With regards to the Mahi Pono farm plan, the EIS explains that at full operation (which is anticipated by 2030), the Mahi Pono farm plan will utilize approximately 30,000 acres in Central Maui. Section 2.1.4 of the Draft EIS state:

- *That total amount of water will be delivered to approximately 30,000 acres. Of those 30,000 acres:*
 - *Approximately 15,950 acres would be used for farming, including 12,850 acres for orchard crops and 3,100 acres for other crops.*
 - *Approximately 13,800 acres would be used for pasture, of which about 4,700 acres would be irrigated.*
 - *Approximately 250 acres would be used for green energy, such as a solar farm.*

Because there is insufficient surface water to support the entire farm plan, brackish groundwater will also be used. . .

This farm plan would consist of the following:

- *Approximately 20,650 acres of irrigated farm land, including 12,850 of orchard crops, 600 acres of tropical fruit, 1,200 acres of row and annual crops, in addition to a community garden and limited non-GMO energy crops.*
- *Approximately 13,800 acres of cattle pasture, comprised of 4,700 acres of irrigated pasture, and 9,100 acres of unirrigated pasture. This should fit the proposed model of grass-finishing on irrigated pasture. The unirrigated acreage is less than 10,000 acres, which helps ensure that that the entire area devoted to unirrigated pasture will remain productive.*

However, please note that Table 2-1 of the Draft EIS (Table 2-2 of the Final EIS) that was incorporated into Section 2.1.4 has been updated with more precise water usage numbers.

Comment 12: *Formerly, pasture lands leased to cattlemen were unirrigated. But under MP farm plan, 4700 acres will be irrigated, using, according to their numbers, 5.46 MGD or 6.63% of the total. Will other cattlemen be able to lease irrigated pasture from MP, or is the irrigated pasture planned for MP's own use?*

Response 12: You are correct that as shown by Table 2-1 of the Draft EIS (Table 2-2 in the Final EIS) that approximately 4,700 acres of land is planned for irrigated pasture use which is estimated to require approximately 5.46 mgd of both surface and groundwater use. Please note that this is intended for Mahi Pono agricultural operations and will not be leased. It should be noted that Mahi Pono plans to lease approximately 2,050 acres to other farmers at favorable terms, including relatively low rents (anticipated to be \$150 per acre per year for community farms) for long periods. These farmers will have access to low-cost non-potable water from the Central Maui Field Irrigation System.

Comment 13: *EIS needs to study whether the super-low cost of water provided to Mahi Pono will unfairly disadvantage other ranchers and farmers outside of Mahi Pono.*

For example, a rancher wishing to irrigate a pasture will pay \$1.10 per 1000 gallons, whereas Mahi Pono will pay below \$.06 per 1000 gallons. This would cause independent ranchers raising high-quality beef to be unable to compete. This same concern applies to all farming outside of Mahi Pono where farmers are paying the \$1.10 ag rate.

Response 13: Please note that the Mahi Pono farm plan, as discussed in Response #5 above, is a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community.

Also note that Mahi Pono has individually met with several members of the Maui County Council. Mahi Pono has also had various meetings with community groups such as Go Maui, Maui Tomorrow, Mā'alaea Community Association, Pukalani Community Association, and the Alliance of Maui Community Associations regarding the Mahi Pono farm plan and use of water from East Maui streams, and conducted farm tours with members of the community.

Your comment about that Mahi Pono will pay \$0.06 per kgal is incorrect. Please note that as discussed in Section 4.7.3 of the Draft EIS, the rate MDWS currently pays to EMI for water is

\$0.06 per kgal. However, it is anticipated that the delivery costs to the County of Maui will increase, the exact amount of the increase cannot be known until the Water Lease is finalized. However, the estimate analyzed in the Draft EIS assumed a year 2030 water service fee rate of \$0.08 per kgal. This figure was calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, the MDWS would pay an estimated \$214,600 per year to EMI. However, please note that this discussion in Section 4.7.3 of the Final EIS has been updated to take into account the latest equivalent per unit cost under the latest revocable permit as. As it relates to how much EMI pays to divert water, as discussed in Section 4.7.3 of the Final EIS, the revocable permit rent established by the BLNR in November 2020 for calendar year 2021 was \$238,362, which represents an increase from the rent that was historically paid. Assuming 32.3 mgd is diverted under the 2021 revocable permit, the Water Lease rent rate would translate to \$0.019 per thousand gallons. This rate of \$0.019 is assumed as the basis for the future annual Water Lease payment to the DLNR. However, the actual Water Lease rental amount will be based on an appraisal conducted prior to issuance of the Water Lease which is within the purview of the BLNR as required under HRS Chapter 171. Should the Water Lease amount be higher or lower, the operational costs of the EMI Aqueduct System would be adjusted accordingly.

In the State of Hawai'i, County water systems were designed primarily to supply potable water to homes and businesses. Much of this is groundwater which is expensive to pump to higher elevations, and some is surface water which is expensive to treat for safety. Also, the water is delivered via buried water mains and pipes, and often pumped to enclosed tanks at elevations sufficient to provide adequate water pressure to users.

In contrast, most agricultural water systems were designed to supply large volumes of untreated surface water to farms, or brackish groundwater from wells having a short lift. This water is often delivered in open ditches and stored in open reservoirs.

Development and operating costs for agricultural water systems and, correspondingly, agricultural water rates are generally lower than that for County systems. As a result, farmers who use County water are at a disadvantage compared to farmers who use water from agricultural water systems. This disadvantage exists Statewide and has existed for a century or more. The Mahi Pono farm plan will have an insignificant impact on this situation.

As noted in Response #12 above, Mahi Pono plans to lease approximately 2,050 acres to other farmers at favorable terms, including relatively low rents (anticipated to be \$150 per acre per year for community) for long periods. These farmers will have access to low-cost non-potable water from the EMI Aqueduct System.

As it relates to ranchers, please note that most ranches rely on rainfall to supply water to their pastures. Except for small volumes of drinking water for the cattle, water rates are irrelevant for most ranches.

Comment 14: *4.7.4 EIS should stress that several East Maui farms, such as my own, are dependent on the 13 streams not included in the CWRM D&O.*

DEIS states “In the past, farmers in East Maui have reported that surface-water diversions to supply water to Central Maui left insufficient water in the streams for them to take full advantage of the agricultural potential in East Maui. However, in light of the CWRM D&O, ample stream water should now be available”. Clearly, this statement does not cover uses and users on the 13 streams not included in the CWRM D&O.

Response 14: We respectfully disagree with your comment that the EIS did not cover uses and users along the streams not subject to the CWRM D&O. Specifically, as discussed in Section 4.7.4 of the EIS, the East Maui farms included in the analysis took into account both taro farms and other farms that are, or could be, irrigated with water diverted from streams flowing through the License Area, including the communities between Honopou and Nāhiku, which includes Huelo. Taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water

to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS.

Comment 15: *EIS should detail how Mahi Pono will be included in the Watershed Management Plan, since they are not the Lessee. (2.2) “Under the Proposed Action, it is anticipated that EMI and/or Mahi Pono will continue to pursue watershed management activities”. This is important to me as a farmer and a subject-area stream user battling invasive species constantly. There is no question that not nearly enough has been done on this front, under the present WMP.*

Response 15: Section 1.3.1 of the EIS describes the current ownership of EMI, the proposed lessee under the Water Lease. EMI was previously a wholly owned subsidiary of A&B. As of February 2019, MP EMI, LLC became a co-owner of EMI. Mahi Pono's agricultural operations are centralized under Mahi Pono, LLC. MP EMI, LLC and Mahi Pono, LLC share the same parent company. Therefore, Mahi Pono will be involved in the watershed management plan should the Water Lease be issued to the applicant. As discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS.

With regards to your comment about the present watershed management plan, we assume that you are referring to the East Maui Watershed Partnership. The lands under the jurisdiction of the East Maui Watershed Partnership span over 100,000 acres which includes the entire License Area. The License Area is actively managed by the multiple agencies and organizations, including EMWP, Maui Invasive Species Committee (MISC), DLNR, etc., in partnership with EMI.

In reviewing existing watershed management plans in general, however, DLNR has recently determined that some of the existing watershed plans are not always directly correlated to the water lease area and some plans are old and outdated. In certain places, new threats to watershed health are not addressed in existing watershed plans. Additionally, DLNR determined that estimated budgets in such existing plans may not reflect the current cost of management if the plan is over 5 years old. As such, DLNR will work with proposed water lessees to determine if any existing plan meets the minimum content requirements and sufficiently addresses the protection of watershed forests and freshwater resources in the License Area. If it does not, DLNR will work with the lessee to determine the specific actions needed and jointly develop a new plan or update the existing plan as noted above. It should be noted that the existence of a watershed management plan does not absolve a water lessees' duty to help with the implementation of management actions. A lessee must provide DLNR proof that it is already contributing to the protection of the watershed, and membership in a Watershed Partnership may not fulfill the requirement of implementation.

Comment 16: *EIS should examine closer whether the idea that there are no further impacts because the streams have already been diverted for over a hundred years is the best policy for the future of the watershed.*

Should a different standard be used, one that supports restoration of watershed health?

Response 16: Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream

diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS.

With regards about your question about a different standard being used is unclear. However, as noted in Response #15 above, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and

plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS.

Comment 17: *EIS should re-examine section on Irretrievable and Irreversible Commitment of Resources. (Executive Summary xi.)*

The issuance of the Water Lease will not result in the irreversible use of the water resource because the Water Lease will be for a term, and not perpetual”. The EIS should back this claim up with opinions from legal and planning subject-matter-experts. For example, if water uses continue to grow and become increasingly dependent on these diversions, does that not defacto convey rights to those uses, so that in reality the resources will be irretrievable and irreversible?

Response 17: Please note as explained in Chapter 6 of the Draft EIS:

An irreversible or irretrievable commitment of resources refers to impacts on or losses to resources that cannot be recovered or reversed. Examples include permanent conversion of wetlands, the loss of cultural resources, soils, wildlife, agricultural production, or socioeconomic conditions. Irreversible is a term that describes the loss of future options for a resource. Irretrievable is a term that applies to the loss of a resource that is not renewable and cannot be recovered for future use.

Please note that water is considered to be a renewable resource to a certain extent. As further discussed in Section 6.1 of the Draft EIS:

The use of surface/stream water for domestic and agricultural purposes could be viewed as an irretrievable use of the resources, to the extent that the water has been removed from its natural course. However, the use of this surface water is part of the cycle to return the water to the environment. For example, some of the water applied to land will return to the atmosphere through evaporation and transpiration through plants while water entering the ground will eventually discharge into the ocean. Water consumed by humans and animals, will evaporate through breathing and perspiration, and wastewater effluent from cesspools, septic systems and wastewater treatment plants that discharge into the ground will eventually reach the ocean. Water in the atmosphere, including water evaporating from the ocean and land, will fall as rain, including in East Maui, completing the cycle. This is an open cycle involving the movement of water through the atmosphere, land and oceans of the earth.

As part of a global hydrologic cycle, water is generally considered a renewable resource. In any particular location and time, however, there may only be a limited

amount available, for example, to flow in streams or be diverted for other uses. To the extent that a commitment is made as to where that water goes or is used, the result is an irreversible use of that water for that period of time. The Proposed Action is a Water Lease with 30-year commitment to the proposed use of water. With careful management and responsible usage, water is a renewable resource and with that understanding the Water Lease would not involve an irretrievable commitment of the water resource.

Hence, the use of surface water is not irretrievable or irreversible.

Furthermore, to address your comments about water uses expanding, please note that should the Water Lease be issued it would be for the uses described in the EIS and for the term of the Water Lease issued. Should water uses be expanded it is assumed that subsequent environmental documentation may be warranted. Furthermore, the term of the Water Lease under the Proposed Action is for 30 years. After that term, the use of the water under the Water Lease would not be authorized (unless an extension or new lease is granted) and the water resources would presumably be available.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Young Progressives Demanding Action Comments on the Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanū, and Huelo License Areas

Aloha Mr. Earl Matsukawa & Mr. Ian Hirokawa,

My name is Jun Shin. I am the Environmental Justice Action Committee Chair for the Young Progressives Demanding Action (YPDA), an organization whose members work toward building a Hawai'i that is just, equitable, and sustainable through community organizing and issue advocacy.

YPDA offer these comments as one of the organizations who participated in the community effort to stop House Bill 1326 during the 2019 legislative session. YPDA is opposed to abuses taking place in stream diversions for private profit. At the same time, we also support the diversification of our agriculture, the local production of our food, and of our energy. These interests are not separate from one another as water is for the benefit of all people, affirmed by the Public Trust Doctrine and the Hawai'i State Constitution. Water remains a vital part of all these important policy making discussions, so while working on being both sustainable and self sufficient, we need to contend with generations of corporate greed and its effects on our native streams and the communities that need those streams.

The EIS should give an in-depth review of and discuss the benefits of shorter term lease options of less than 30 years, due to uncertainties of future rainfall and future water supplies. A 30 year

lease would be simply unaccountable to the communities that would be affected by the lease, this is not only an environmental issue, but an issue of good/accountable government. With the continual effects of climate change and the need for mitigation efforts, there needs to be a constant emphasis by our leaders and policymakers on the need for our natural resources to be protected for all people.

The EIS needs to discuss methods of restoring the 13 streams in the Honopou to Kailua area, where lots of people live and farm and gather. All that is said is that it's estimated that all of the water will be diverted from the streams 60% of the time. The EIS needs to discuss the impacts of continuing those diversions, which will decimate 85% of native stream habitat and impact thousands of local residents. For generations now, farmers, cultural practitioners, and the larger community has fought long and hard for stream restoration. Many Kūpuna have passed away before seeing their streams restored. This historical injustice cannot be allowed to continue, traditional and customary rights are protected by the Public Trust Doctrine and by extension, the Hawai'i State Constitution. This is not only for current practitioners, but for the continued access of these practices for future generations.

Young Progressives Demanding Action is asking that the Draft Environmental Impact Statement includes this important information. We appreciate the opportunity to submit comments on this Draft EIS.

E Ola I Ka Wai, Water is Life!

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jun Shin:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *YPDA offer these comments as one of the organizations who participated in the community effort to stop House Bill 1326 during the 2019 legislative session. YPDA is opposed to abuses taking place in stream diversions for private profit. At the same time, we also support the diversification of our agriculture, the local production of our food, and of our energy. These interests are not separate from one another as water is for the benefit of all people, affirmed by the Public Trust Doctrine and the Hawai‘i State Constitution. Water remains a vital part of all these important policy making discussions, so while working on being both sustainable and self-sufficient, we need to contend with generations of corporate greed and its effects on our native streams and the communities that need those streams.*

Response 1: We acknowledge your comments. Your comment regarding the abuses taking place in stream diversions is unclear. However, please note that with respect to the Draft EIS, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the Proposed Action relating to the East Maui

License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts. As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area. These impacts are related to stream habitat, as there will be a reduction from natural flow conditions which can be mitigated by adjustments in diversions to minimize entrainment; terrestrial flora and fauna resources, as well as historic and archeological resources, from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; cultural resources and practices which can be mitigated by a myriad of recommendations proposed by Cultural Surveys Hawai'i; and socio-economic characteristics which can be mitigated by further public outreach and consultation.

Regarding your comment that you support diversified agriculture and local food production, the crops in the Mahi Pono farm plan were chosen with the goal of increasing Hawai'i's food independence while also meeting criteria for commercial viability and potential. Many crops can be grown in Hawai'i, but relatively few can be grown at a scale and cost that compete with low-cost volume producers on the mainland, Mexico and elsewhere. For many crops, the Hawai'i market is too small for economies of scale, and shipping costs and delivery times are a disadvantage for exports. The Mahi Pono farm plan is a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community. With regards to the Mahi Pono farm plan, the EIS explains that at full operation (which is anticipated by 2030), the Mahi Pono farm plan will utilize approximately 30,000 acres in Central Maui. Section 2.1.4 of the Draft EIS state:

- *That total amount of water will be delivered to approximately 30,000 acres. Of those 30,000 acres:*

- *Approximately 15,950 acres would be used for farming, including 12,850 acres for orchard crops and 3,100 acres for other crops.*
- *Approximately 13,800 acres would be used for pasture, of which about 4,700 acres would be irrigated.*
- *Approximately 250 acres would be used for green energy, such as a solar farm.*

Because there is insufficient surface water to support the entire farm plan, brackish groundwater will also be used. . .

This farm plan would consist of the following:

- *Approximately 20,650 acres of irrigated farm land, including 12,850 of orchard crops, 600 acres of tropical fruit, 1,200 acres of row and annual crops, in addition to a community garden and limited non-GMO energy crops.*
- *Approximately 13,800 acres of cattle pasture, comprised of 4,700 acres of irrigated pasture, and 9,100 acres of unirrigated pasture. This should fit the proposed model of grass-finishing on irrigated pasture. The unirrigated acreage is less than 10,000 acres, which helps ensure that that the entire area devoted to unirrigated pasture will remain productive.*

However, please note that Table 2-1 of the Draft EIS (Table 2-2 of the Final EIS) that was incorporated into Section 2.1.4 has been updated with more precise water usage numbers as shown on page 2-29.

With regards to the Public Trust Doctrine, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

Comment 2: *The EIS should give an in-depth review of and discuss the benefits of shorter term lease options of less than 30 years, due to uncertainties of future rainfall and future water supplies. A 30 year lease would be simply unaccountable to the communities that would be*

affected by the lease, this is not only an environmental issue, but an issue of good/accountable government. With the continual effects of climate change and the need for mitigation efforts, there needs to be a constant emphasis by our leaders and policymakers on the need for our natural resources to be protected for all people.

Response 2: Please note that shorter Water Lease durations were considered within the EIS in Section 3.2.2.1 and throughout Section 3.4 of the EIS. Specifically, Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

Hence, a shorter lease term could limit the ability to successfully implement the Mahi Pono farm plan, which is inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui. However, the terms and conditions of the Water Lease are at the discretion of the BLNR.

With regards to your comment about the uncertainty of rainfall, in the scenarios presented in the a USGS report (2019) titled, "Estimated Groundwater Recharge from a Water-Budget Model Incorporating Selected Climate Projections, Island of Maui, Hawai'i" the aquifer systems in the Ko'olau Aquifer Sector are projected to see some of the largest increases in recharge, whereas aquifer systems in the Central Aquifer Sector are projected to see decreases in recharge due to changes in rainfall patterns from future climate change trends. However, please note that under the Proposed Action, surface water is diverted from the East Maui License Area (which lies largely over the Ke'anae, Waikamoi and Honopou aquifers in the Ko'olau Aquifer Sector (See EIS Figure 4-17), to the Central Maui agricultural fields, which largely lie over the Pā'ia Aquifer in the Central Aquifer Sector (See EIS Figure 4-18). As detailed in Section 4.2.2 of the EIS, the

groundwater pumpage within the Ko‘olau Aquifer Sector is far below the Sustainable Yield (SY). This section of the EIS also addresses the anticipated impacts to the Central Aquifer Sector from the conveyance of East Maui surface water to Central Maui for irrigation purposes. Section 4.2.2 of the EIS has been updated to reflect the USGS report, as shown on pages 4-69 to 4-71.

With regards to climate change in general, please note that climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai‘i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Hence, climate change was used to assess the various alternatives presented in Chapter 3. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown on the pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Comment 3: *The EIS needs to discuss methods of restoring the 13 streams in the Honopou to Kailua area, where lots of people live and farm and gather. All that is said is that it’s estimated that all of the water will be diverted from the streams 60% of the time. The EIS needs to discuss the impacts of continuing those diversions, which will decimate 85% of native stream habitat and impact thousands of local residents. For generations now, farmers, cultural practitioners, and the larger community has fought long and hard for stream restoration.*

Response 3: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action.

These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of

those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *Many Kūpuna have passed away before seeing their streams restored. This historical injustice cannot be allowed to continue, traditional and customary rights are protected by the Public Trust Doctrine and by extension, the Hawai‘i State Constitution. This is not only for current practitioners, but for the continued access of these practices for future generations.*

Response 4: We acknowledge your comments. As discussed in Response #1 above, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B’s 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

With regards to cultural practices and practitioners, the CIA (Appendix F) acknowledges that the Proposed Action may impact Native Hawaiian cultural resources and practices and provides for several recommendations to mitigate those impacts. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to ‘ōpae, ‘o‘opu, pūpūlo‘i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe‘e, Puohokamoa, Ha‘ipua‘ena, Honopou (Puniawa Tributary), Punala‘u (Kōlea and Ulunui Tributaries), Honomanū, Nua‘ailua, Pi‘ina‘au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili‘ula, Pa‘akea, Kapā‘ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Kualani (or Hāmau),

East Wailuāiki, West Wailuāiki, Pua‘aka‘a Tributary, and Waia‘aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo‘i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe‘e, Puohokamoa, Ha‘ipua‘ena, Punala‘u (Kōlea and Ulunui Tributaries), Honomanū, Nua‘ailua, Pi‘ina‘au, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili‘ula, Pua‘aka‘a, Pa‘akea, Waia‘aka, Kapā‘ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, on pages 4-158 to 4-159. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action as shown on page 4-239 to 4-252 of the Final EIS.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training,

inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

RE: Request for additional time to submit comments for the Draft EIS for East Maui Water Leases

Dear Mr. Tsutsui, Mr. Benjamin, Mr. Hirokawa, Mr. Matsukawa, and Ms. Case;

The Kula Community Association Board of Directors requests that our upcountry Maui community receive a 60-day extension to review the very large 2,700 page Draft EIS for the proposed East Maui water system lease. Our region has a strong interest in knowing what is in the Draft-EIS document and in understanding all of its many ramifications. Our community uses water from the East Maui system. We have two large Department of Hawaiian Homelands residential and farming communities which receive priority under state water policies, a large

farming community, the Kula Agricultural Park and its soon-to-be opened 262-acre addition, approximately 10,000 Kula residents, and about 35,000 Upcountry residents. The waters that will be coming from the lease area are of considerable importance to all of the above. Therefore, we ask that you please give us an additional 60 days to review the huge document and to make useful comments.

The Board of Land and Natural Resources required A&B and EMI to proceed with the EIS preparation in 2016. The applicant has been working on the document for about three years since they issued their EIS Prep Notice. The result of their three years of effort is a 2,700 page document that deserves to be read and analyzed by those affected. The purpose of the draft EIS review process is to provide the public and other agencies an opportunity to discover the extent to which a proposing agency or applicant has examined environmental concerns and available alternatives. Please give us the courtesy of an extension and we will provide useful feedback that should make the final EIS a better document.

Mahalo,
Gina Flammer, President

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Gina Flammer:

Thank you for comments dated October 17, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The Kula Community Association Board of directors Requests that our upcountry Maui community receive a 60-day extension to review the very large 2,700 page Draft EIS for the proposed East Maui water system lease. Our region has a strong interest in knowing what is in the Draft-EIS document and in understanding all of its many ramifications.*

Response 1: Please note that we provided an initial response letter to your public comment period extension on November 1, 2019 enclosed as Attachment #1. As you were apprised by email dated October 28, 2019, from Mr. Tom Eisen of the Office of Environmental Quality Control, there is no statutory mechanism that provides for time extensions of the comment period. Please note that we received over 400 comments during the statutory public comment period.

Comment 2: *Our community uses water from the East Maui system. We have two large Department of Hawaiian Homelands residential and farming communities which receive priority*

under state water policies, a large farming community, the Kula Agricultural Park and its soon-to-be opened 262-acre addition, approximately 10,000 Kula residents, and about 35,000 Upcountry residents. The waters that will be coming from the lease area are of considerable importance to all of the above. Therefore, we ask that you please give us additional 60 days to review the huge document and to make useful comments.

Response 2: We acknowledge your comments. Please note that Section 2.1.3.1 of the Draft EIS explains how the Upcountry Maui region receives water under the Proposed Action. Specific information regarding the Department of Hawaiian Home Lands' (DHHL) future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd as shown on pages 2-4 to 2-7 of Final EIS. As explained on shown on pages 2-4 to 2-7 of Final EIS, the DHHL water reservation process involves several steps before a reservation amount is formally identified. The first step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following adoption of the Beneficiary Consultation Report and an authorization to the Chairman to seek a reservation of water, CWRM could act on a reservation request related to a proposed lease.

As explained in Section 2.1.1 of the Draft EIS, DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B/EMI, Mahi Pono, the

Department of Land and Natural Resources' (DLNR) Land Division, and DHHL staff and consultants. The results of the Beneficiary Consultation were presented to the HHC on May 30, 2019, as agenda item G-2. The motion passed by the HHC to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation request was approved by the HHC related to the EMI Aqueduct System for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

While Mahi Pono's current farm plan assumes the full use of the water that can be diverted from East Maui streams after compliance with the CWRM D&O, Mahi Pono will be obligated to reduce elements of its farm plan, and thus the availability of crop, to accommodate the permanent reduction in available water resulting from DHHL's allocation. The Reduced Water Volume alternative described in Chapter 3 of the EIS provides an assessment of the impacts of less water being made available for the Proposed Action, including Maui Pono farm plan in the Central Maui agricultural fields. Specifically, consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture.

You are correct that Section 2.1.1 of the Draft EIS stated, with respect to the DHHL reservation, that "*Until that reservation is physically claimed, however, it will be available for use by the lessee.*" That statement has been clarified in the Final EIS as shown on pages 2-4 to 2-7, as it is uncertain whether the DHHL reservation amount would be available to the lessee until such time as it is needed by DHHL. Such temporary uses of the DHHL reservation water are not addressed under HRS § 171-58. We further acknowledge that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessor and the DHHL would be necessary to allow any temporary use of water reserved for DHHL.

Please note that as discussed in Section 2.1.2 of the Draft EIS, under the Proposed Action, at full buildout of the Mahi Pono farm plan, it is estimated that approximately 87.95 mgd will be

diverted from the License Area and an additional 4.37 mgd in between Honopou Stream and Māliko Gulch to support uses described in the EIS. However, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

Regarding Kula Agricultural Park and the 262-acre expansion, please note that the Draft EIS provided information about the amount of water used at KAP and the source of water for the KAP expansion area in a number of sections. Section 2.1.3.2 of the Draft EIS states:

Presently, water demands at KAP are served by the County, which, by contractual agreement, is able to draw up to 1.5 mgd from the end of the Hāmākua Ditch and to utilize a former plantation reservoir to serve KAP. As noted previously, the Ditch is fed directly by the EMI Aqueduct System through the Wailoa Ditch. As of late 2015, the Maui County Office of Economic Development calculated that the current use for the KAP is approximately 548,191 gpd of which 80-90 percent of delivered water is from surface water sources with the remaining portion from basal aquifer wells. Due to the current design of the County's KAP distribution system (pump system in the reservoir), 1.5 mgd must be delivered to the County in order for it to provide the needed 548,191 gpd to the KAP users.

Section 4.7.4 of the EIS notes that in 2017, of the water delivered to MDWS through the EMI Aqueduct System, "About 0.46 mgd were for crops at the KAP, however, 1.5 mgd had to be supplied by the EMI Aqueduct System to produce the 0.46 mgd used by the farmers."

Moreover, the Draft EIS explains that the water delivery agreements in place with MDWS are contingent upon issuance of the Water Lease, which include water delivery for the KAP and the KAP expansion. Section 3.3 of the Draft EIS states:

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. As a consequence, domestic and agricultural water needs in Upcountry Maui would need to be met by alternative water sources that would need to be developed by the MDWS. At this point in time, it is unknown whether sufficient groundwater resources exist in Upcountry Maui to meet these water demands. It is anticipated that the development of alternative water-source infrastructure would be prohibitively expensive, and depending upon the specific sources, or combination of sources, could result in significant direct adverse impacts to the environment.

Appendix H (Economic and Fiscal Impact Study) and Appendix I (Agricultural and Related Economic Impacts) further provide:

Under the Proposed Action, EMI will continue to supply water to the MDWS for Upcountry Maui, including for agricultural water use. It is also noted that as part of the County's purchase of the 262-acre expansion of the KAP, EMI has agreed to supply the water for the expansion. The additional water will come from water savings due to infrastructure improvements to the reservoir and pumps that serve the KAP that will reduce system losses (Plasch Econ Pacific, LLC, 2019). The actual amount of water delivered from the EMI Aqueduct System is not anticipated to increase in order to serve the 262-acre expansion.

Appendix H, Section B-2a Appendix I, Section 6b of the Draft EIS provides:

In 2018, A&B sold 262 acres to the County for the expansion of the Kula Ag Park, and agreed to supply the MDWS with 1 mgd of surface water from the EMI System to meet the needs of the expansion area, subject to the continuation of State permits or issuance of the Water Lease. The needed water allocation will result from infrastructure improvements to the reservoir and pumps that serve the Ag Park, and use existing deliveries from the EMI System more efficiently. Thus, the current level of water deliveries to the Kula Ag Park will suffice for both the existing and expanded Kula Ag Park areas.

Please note that the above information has been added to Section 2.1.3.2 of the Final EIS as shown on pages 2-20 to 2-21.

Comment 3: *The Board of Land and Natural Resources required A&B and EMI to proceed with the EIS preparation in 2016. The applicant has been working on the document for about three years since they issued their EIS Prep Notice. The result of their three years of effort is a 2,700 page document that deserves to be read and analyzed by those affected. The purpose of the draft EIS review process is to provide the public and other agencies an opportunity to discover the extent to which a proposing agency or applicant has examined environmental concerns and available alternatives. Please give us the courtesy of an extension and we will provide useful feedback that should make the final EIS a better document.*

Response 3: We acknowledge your comments. As noted in Response #1 above, we provided an initial response letter to your public comment period extension on November 1, 2019 enclosed as Attachment #1. As you were apprised by email dated October 28, 2019, from Mr. Tom Eisen of the Office of Environmental Quality Control, there is no statutory mechanism that provides for

10238-04
Letter to Ms. Gina Flammer
Page 6 of 6
September 3, 2021

time extensions of the comment period. Please note that we received over 400 comments during the statutory public comment period.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: October 17 letter requesting an extension to review DEIS for East Maui Water Lease

Aloha,

In response to your October 17, 2019 letter requesting additional time to submit comments for the subject EIS, OEQC offers the following comments:

Pursuant to HRS Chapter 343, which establishes the environmental review process in Hawai'i, there is no authority to extend the statutory 45-day public comment period on Draft EISs.

While in the past, there have been "extra-legal" decisions to extend the comment period, this has resulted in a legal cloud over both the requirement to respond to any comments submitted after the statutory 45-day deadline, as well as the legal ability for a "late-commenter" to challenge the agency's potential Acceptance determination on the Final EIS.

Accordingly, to facilitate the occasional situation where the action's proponent deems a longer comment period is appropriate, we promote the concept that the Draft EIS can be "republished" (or if the DEIS is changed in any way, then a "2nd DEIS" can be published) in *The Environmental Notice*. Such an additional publication would trigger another "legal" 45-day public comment period; any comments submitted during any of the comment periods would be considered as "timely submitted," and thus would need to be included (with a response) in the action's Final EIS. Challenge rights would be preserved.

Since OEQC publishes EISs at the behest of proponents of the action (i.e., the applicant in this case), we defer to the applicant's decision on whether to re-publish any particular EIS. Accordingly, we would suggest you take up this matter with the applicant's contact for this action.

Please feel free to contact me should you desire additional information on the environmental review process.

Sincerely,

Tom Eisen, Planner
Office of Environmental Quality Control

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū and
Huelo License Areas

Dear Ms. Flammer and Mr. Mayer:

This is in response to your October 17, 2019 letter requesting a 60-day time extension of the 45-day comment period for the subject Draft Environmental Impact Statement (EIS). The comment period for the Draft EIS will end on November 7, 2019.

As you were apprised by email dated October 28, 2019 from Mr. Tom Eisen of the Office of Environmental Quality Control, there is no statutory mechanism that provides for time extensions of the comment period. Therefore, we urge you to submit whatever comments you have within the 45-day comment period. We will, however, address and respond to comments submitted by you within a reasonable time after the end of the 45-day comment period.

Sincerely,

Earl Matsukawa, AICP

Subject: MAUI TIME MAGAZINE 10.31.2019 - Mahi Pono Is Coming For Our Water

Aloha, Everyone -

In regards to the above subject line it has taken sometime for myself to sift threw this article; due to it length. As well as, waiting for a responses from the Clinton Foundation in - NYC. However, in-part their explanation was @ one time when Hillary Clinton went into court she first visited the copy room @ her office. Then taking two boxes of copy machine paper. Placing them on a two wheel cart, and then rolling them into a Federal Court Room - But, after yesterday's round on Tammy Baldwins's Facebook page D-WI, w/ Hillary Clinton, and Tulsi Gabbard - Seems the Clinton's have slipped away to the Dominican Republic. - Sosua....

Our thought is; the general population of the Hawaiian Islands County government should put in place a permit program in place for private land holders to (commercial, and residential) for private cistern systems.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Leo Thiner-Brickey:

Thank you for comments dated November 6, 2019, and November 8, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *In regards to the above subject line it has taken sometime for myself to sift through this article; due to its length. As well as, waiting for a responses from the Clinton Foundation in - NYC. However, in-part their explanation was @ one time when Hillary Clinton went into court she first visited the copy room @ her office. Then taking two boxes of copy machine paper. Placing them on a two wheel cart, and then rolling them into a Federal Court Room - But, after yesterday's round on Tammy Baldwins's Facebook page D-WI, w/ Hillary Clinton, and Tulsi Gabbard - Seems the Clinton's have slipped away to the Dominican Republic. - Sosua... Our thought is; the general population of the Hawaiian Islands County government should put in place a permit program in place for private land holders to (commercial, and residential) for private cistern systems.*

Response 1: We acknowledge your comments. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System

10238-04
Letter to Mr. Leo Thiner-Brickey
Page 2 of 2

for the uses described in the EIS. The environmental impacts of the potential Water Lease are included throughout Chapter 4 of the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: DEIS for Lease of East Maui Streams

Dear Mr. Earl Matsukawa,

I care very deeply about the proposed lease of public trust water because I am a partner in 10.5 acres of agricultural land in Haiku. My partner and I have farmed this land for decades use the water from Kuiaha stream to raise fish on our farm. Diversion of these waters, not included in the DEIS as far as I can see, will severely impact our farm operations.

Further, my partner and i are concerned that no one is taking care of the watershed which we know has been in decline from decades of neglect.

* The EIS need to needs to discuss the option of not diverting any streams and discuss how that would benefit East Maui ecosystems and East Maui Communities.

furthermore, The EIS should included discussion of a plan and funding for a plan to manage the invasive species in the license area. These invasive species and animals are harming the health and the function of the watershed lands.

* There is not discussion of shorter term leases. As longtime residents of Haiku, we see that weather patterns are changing, there is less rainfall, longer drought periods. Future rainfall and water supply are unknown. There should be discussion of a five-year lease with renewal subject to climate change impacts and farm successes.

* The EIS needs to discuss restoring the 13 streams in the Honopou to Kailua area where many people farm and gather. The EIS only says that all of the water will be diverted 60% of the time. The EIS needs to discuss the impacts of continuing those diversions.

* The EIS should include a full archeological inventory survey since there are unrecorded archeological sites in the lease area that could be affected by resumed diversions.

* The EIS needs to include information on the true potential of farming in the East Maui and Upcountry areas. The diversion of Kuiaha stream, for example, will severely impact our Haiku Aina Permaculture Initiative. We personally know of dozens of small farm that are cultivating hundreds of acres in the Haiku and Upcountry areas. These areas benefit from a five streams while EMI system diverts over 50 streams between Nahiku and Maliko Gulch.

We are asking that the DEIS included this important information.

Thank you for this opportunity to submit comments on the Draft EIS.

Mark Sheehan

President, HAPI

Jeffrey Bronfman,

VP, HAPI

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Mark Sheehan:

Thank you for comments dated November 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I care very deeply about the proposed lease of public trust water because I am a partner in 10.5 acres of agricultural land in Haiku. My partner and I have farmed this land for decades use the water from Kuiaha stream to raise fish on our farm. Diversion of these waters, not included in the DEIS as far as I can see, will severely impact our farm operations.*

Response 1: We acknowledge your comments that you care deeply about the Proposed Action and that you are a partner in 10.5 acres of agricultural land in Ha‘ikū. We understand that you and your partner have farmed this 10.5 acres for decades from the water of Kuiaha Stream to raise fish on your farm. Please note that Kuiaha Stream is outside of the License Area and is not subject to the Water Lease application and is beyond the scope of the EIS.

Comment 2: *Further, my partner and i are concerned that no one is taking care of the watershed which we know has been in decline from decades of neglect.*

Response 2: As discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed

management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Comment 3: *The EIS needs to discuss the option of not diverting any streams and discuss how that would benefit East Maui ecosystems and East Maui Communities.*

Response 3: Please note that the EIS does present a No Action alternative however, under this alternative 30% of water could be diverted from the License Area. For purposes of the No Action (i.e., no Water Lease) alternative, it is reasonable to assume that, in the absence of a Water Lease, EMI will, *at best*, be able to continue to divert the approximately 30% of water that is estimated to represent the average annual amount that originates on private lands within the 50,000-acre Collection Area by way of the 1938 Agreement. A copy of the 1938 Agreement has been provided within the Final EIS as Appendix R. The 30% figure was agreed to between the BLNR and EMI at the end of 1987, to represent the amount of water originating from private (vs. State) lands in the 50,000-acre Collection Area, and was based on estimates of the average annual total yields from the streams in License Area. Prior to that time, the USGS provided a table in which USGS estimated, for each of the four license areas, the percentages of water estimated to have arisen on State land versus private land. This was explained in the testimony and exhibits submitted to CWRM throughout the contested case hearing on the IIFS petitions. Copies of relevant documents on this subject have been appended to the Final EIS as Appendices R-1, R-2, R-3, R-4, and R-5, and are further described in Section 3.3 of the Final EIS as shown on pages 3-24 to 3-25.

The No Action alternative assessed in Section 3.3 EIS assumes that if no Water Lease were issued, the EMI Aqueduct System could continue to divert approximately 30% of the water available from the Collection Area, plus approximately 4.37 mgd from the privately owned lands between Honopou Stream and Māliko Gulch. That is because the rights under the 1938 Agreement are independent of the Proposed Action under consideration in this EIS.

Regarding your comment that the EIS needs to further explore the beneficial impacts of the No Action alternative on the ecosystem and community of East Maui, please note that this is discussed in Section 3.4 of the EIS. Moreover, a table of the comparative benefits and impacts has been added to summarize all the benefits and impacts from the Proposed Action and reasonable alternatives as shown on pages 3-49 to 3-80.

Comment 4: *Furthermore, The EIS should include discussion of a plan and funding for a plan to manage the invasive species in the license area. These invasive species and animals are harming the health and the function of the watershed lands.*

Response 4: As discussed in Response #2 above, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Comment 5: *There is not discussion of shorter term leases. As longtime residents of Haiku, we see that weather patterns are changing, there is less rainfall, longer drought periods. Future rainfall and water supply are unknown. There should be discussion of a five-year lease with renewal subject to climate change impacts and farm successes.*

Response 5: We disagree with your comment. Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as

Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.
