Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Regarding your comment that climate change has changed the situation for instream users and uses, please note that climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will

bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Hence, climate change was used to assess the various alternatives presented in Chapter 3. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown on the pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Comment 6: *The EIS needs to discuss restoring the 13 streams in the Honopou to Kailua area where many people farm and gather. The EIS only says that all of the water will be diverted 60% of the time. The EIS needs to discuss the impacts of continuing those diversions.*

Response 6: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-63 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 7: *The EIS should include a full archeological inventory survey since there are unrecorded archeological sites in the lease area that could be affected by resumed diversions.*

Response 7: Please note that an Archeological Inventory is not required for the Proposed Action. Correspondence from SHPD dated January 27, 2017 and October 6, 2017 are appended to Draft EIS Appendix E (Archaeological Literature Review and Field Inspection), confirming SHPD's position regarding an Archeological Inventory Survey. Issuance of the Water Lease is not anticipated to affect any historic property, aviation artifacts, or burial site.

As discussed in Draft EIS Section 4.5 (Historic and Archaeological Resources) the Proposed Action does not involve any new construction or significant ground disturbance within undisturbed areas within the License Area. The Proposed Action continues the use of the EMI Aqueduct System for the transport of surface water, and allows the lessee or its permittees, to

maintain and repair existing access roads and trails long-used as part of the EMI Aqueduct System. As discussed in the Section 2.1.2 of the Final EIS as shown on page 2-7 enclosed, under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System. Moreover, this was explained to SHPD as discussed in the Archaeological Literature Review and Field Inspection provided as Appendix E of the EIS (“Additional information regarding the proposed Water Lease was provided to the SHPD including the understanding that the proposed Water Lease will not involve any significant ground disturbance within undisturbed areas.”)

Comment 8: *The EIS needs to include information on the true potential of farming in the East Maui and Upcountry areas. The diversion of Kuiaha stream, for example, will severely impact our Haiku Aina Permaculture Initiative. We personally know of dozens of small farm that are cultivating hundreds of acres in the Haiku and Upcountry areas. These areas benefit from a five streams while EMI system diverts over 50 streams between Nahiku and Maliko Gulch.*

Response 8: Please note that the Draft EIS did include information about the potential of farming in East Maui. Specifically, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed

some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Regarding farming in Upcountry Maui, the EMI Aqueduct System supplies water to the MDWS which then delivers a portion of it to Upcountry Maui farmers. The agricultural impacts of possible changes in this supply are addressed in Section 4.7.4 of the EIS and Appendix I, “East Maui Water Lease: Agricultural and Related Economic Impacts”.

For Upcountry Maui farms that are irrigated with water diverted from nearby streams (including Kuiaha Stream), the proposed State Water Lease will not affect (1) water flow of these streams, (2) existing or future water diversions of these streams, or (3) existing or potential farming operations that use diverted water from these streams. The reason for the lack of impacts is that the License Area does not include any Upcountry Maui streams; the License Area is east of Honopou Stream, while Upcountry Maui is west of this stream.

Note, however, that EMI/Mahi Pono have rights to divert water from streams located between Honopou Stream and Maliko Gulch. For all alternatives, an average of about 4.37 mgd will be diverted from these streams to irrigate Central Maui crops.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC’s website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin Draft EIS

From the desk of Mary McClung Law
November 6, 2019
Comments on Alexander and Baldwin's Draft Environmental Impact Statement

Earl Matsukawa
Waterleaseeis@wilsonokamoto.com

Attn: Mr. Matsukawa et al,

Please accept my comments and concerns in opposition to Alexander and Baldwin's proposal to further divert stream water from East and West Maui streams. I have been a resident and concerned citizen practicing natural farming in Kipahulu since 1999, including successfully dryland farming (non irrigated crops, based on rainfall) bananas with my husband Corey Law (who grew up flood irrigation farming in Central Valley Calif). Protecting the integrity of Maui's aquifer and restoration of Maui ecosystems should be top priorities to local and state government officials, businesses, agriculture enterprises, residents and visitors alike, because without it, we all will suffer greatly.

According to the USGS publication on estimating groundwater of Maui as of August 16, 2019, "Demand for freshwater on the island of Maui is expected to increase by 45% between 2015 and 2035. Wetter and drier climate scenarios impact the availability of the groundwater to meet this demand...estimates of groundwater recharge are needed." <https://pubs.er.usgs.gov/publication/sir20195064>

This publication was written in partnership with the County of Maui Water Supply and others. This points out inadequate information available to even consider a 30 year lease. Any lease must be for less water than has been taken in the past, and on a year to year basis. This option has to be seriously included in your draft EIS.

Restoring ecosystems can play a part in replenishing the aquifer. And the aquifer is an invisible and somewhat mysterious force that all residents and visitors, present and future depend on. We cannot afford to make mistakes going forward that put our freshwater lens at risk. We already know that the water tables have been dropping to below half of what it was since it was first being measured.

I have several relevant points I am petitioning to be included in your analysis which are either missing or lacking in discussion, consideration and data in the Draft EIS.

~ UH scientists have concluded that Hawaiian islands will continue to experience less and less tradewinds and rainfall due to climate change. We are already noticing a drop in rainfall and less tradewinds. The draft EIS needs to use the most up to date predictive climate science when considering future rainfall. <https://www.hpr2.org/post/planet808-examining-climate-change-islands#stream/0>

~ Due to this uncertain future of rainfall, we would be prudent to mitigate the great risk of compromising our freshwater lens by safeguarding Maui's future water supply and aquifer as much as possible. Any lease should be for a short period of time, smaller amount of water, and have requirements of proof of good management practices in good in order to be considered for renewal. The Draft EIS should include these public good options.

~ Streambeds are the most effective place for water to filter down into the Earth, replenishing the aquifer as they have for millennium. When a stream is dry, no water is filtering down in this way. The draft EIS needs to address this impact on our precious island aquifer.

~ As freshwater streams flow into the ocean, there is an increase of fish and diversity at the stream mouth. This benefits fishermen as well as serving the greater pelagic fish populations with ample nutrition. This impact needs to be taken into account. No water should be taken from East or West Maui streams until Mauna to Makai flow is reestablished. This is becoming general knowledge.

~ The original lease agreement was written as allowing diversion only AFTER the land and the people have their share. Yet A & B continued to increase the size, substantiality, and number of the flumes to the point of running several streams completely

dry for numerous decades, and in the Draft EIS, it is stated that their damaged streams should be a new baseline for any future agreement. This shows a lack of regard on the part of A and B for following any restrictions the state might place on a future water lease. How will records be made available to the public to prove responsible management of the EMI and stream systems.

~ Corporations have as their top legal priority to make the shareholders as much money as they can. Legally they cannot have a different top priority, such as the public good, even when managing a commons. This alone should make it clear that any water flowing out of Maui streams needs to be managed by the state, not a private interest business. The draft EIS needs to include a serious option for state management.

~ As we saw when the streams were not flowing, they get hugely overgrown with thick brush, invasive species and bramble. That makes it impossible for people including cultural practitioners to travel via the waterways, which is supposed to be a right protected by state law. This impact was not and needs to be addressed in the Draft EIS, and is part of why the streams need to continue to flow 24/7.

~ There is a local freshwater fish which actually climbs waterfalls several hundred feet high in order to return home and breed. The Hawaiian Goby fish have suction cup feet and are considered of special importance to the scientific as well as the Hawaiian communities. They are present in several East Maui streams, and could be reestablished wherever they have died out due to A and B draining the streams over the last 130 years. These need to be included in the Draft EIS.

~ There are native birds that likely have been impacted also. Not only the forest birds who would not have year round access to freshwater when the streams are dried up, but also coastal birds that evolved to depend on the ecosystem being in tact. Birds and other fauna, esp native Hawaiian ones need to be seriously surveyed comparing in tact streams vs the EMI damaged ones. Restoration of the mountain to ocean flow would clearly help restore damaged ecosystems due to the last 130 years of taking more than was originally intended by the agreement. This sustained flow to the ocean needs to be part of the Draft EIS.

~ Modern soil science is realizing how the microbiology in the soil affects the robustness of the surrounding forest tree and plant communities. The microbiology cannot live where the soil is dried out. This issue is also not addressed, but needs to be.

~ Diagrams showing specifically where Nahiku water comes from and how much need to be included in the Draft EIS. Records show that underground tunnels naturally feed the Nahiku intake pipe and there is no shutoff. So the claim that Nahiku would be at risk of losing their water if the proposal from A and B stream flow is not accepted seems to be a scare tactic, and if so, another strike against them for irresponsibly “yelling fire in a crowded theater” only for their gain.

~ Upcountry water also needs specific details. Again, contrary to statements made in the Draft EIS, records show that Upcountry is served water via the County pipes. Only in times of drought have they gotten some water via EMI. These records and numbers need to be included for consideration of alternatives to EMI water for Upcountry.

~ Also regarding Upcountry water, several well projects have already been taken on, and oughtn't be so readily dismissed as an option. Upcountry wells and other options need to be included in the Draft EIS.

~ Kula Ag Park was promised to become 300 acres, yet the Draft only mentions 80. Why the discrepancy? Please include information about this in the draft EIS and include 300 acres in an alternative proposal. We have youth on Maui learning to farm who cannot afford land. The Ag Park would provide an affordable option for them as well as more seasoned farmers who just need access to more land because they are so successful.

~ Acreage in East Maui suitable for growing taro or truck crops is grossly underestimated in potential productivity and number of acres. There are many hidden loi in the forests alongside streams which can be restored to growing taro and other indigenous crops. The local model for this is the Kipahulu Ohana who has been partnering with the National Park and restored many stream fed indigenous loi and crops in previously overgrown loi alongside Oheo Gulch. According to a UH Manoa report released 2-26-2019, titled “Indigenous Agriculture has the Potential to Contribute to Food Needs Under Climate Change”, there is the potential for restoring 250,000 acres of traditional agroecosystems, producing more than 1 million metric tons annually. They advise, “plans to meet food self sufficiency goals must consider how climate change will affect agricultural viability”. See AAAS and Eureka Alert

~ There is not adequate explanation of why the same amount of water to “responsibly” farm the proposed 15,000 acres is exactly the same as A&B took to farm 30,000. It should be less than half, based on a responsible choice to conserve water, and choose less thirsty crops. Detailed explanation rather than broad sweeping statements about quantities needed should be included as well as earnest actions in dryland farming crop choices.

~ Trails should be included, whether for the public or for responsible educational and conservation groups to manage. These are not private lands, these are huge swaths of public land and the public should have reasonable access. Several groups such as Na Hele On Trails, Sierra Club, and more would be good at providing oversight as well as potential service trips. This option needs to be included in the Draft EIS.

~ Every Maui tour brochure for the Hana Hwy shows picturesque taro loi in Keanae and waterfalls galore. Yet the taro is a fraction of what it could be because so many people have had to move away after the water was no longer flowing well. And same goes for the awesomeness of the waterfalls. Impacts on tourism of running streams dry do not seem to be explored substantially.

~ Crop choices are a concern. Responsible sustainable farming that you claim to be supportive of is farming based on rainfall and soil types. Your choices of citrus, cattle are not low water use. Whereas growing market demand would point to planting such crops as coconuts, dates and others. Getting creative, surely with your sales resources, you could create a brand for Maui Plumeria, Best lei in the Islands, perfumes etc for instance. And other drought tolerant crops. Think how your boulevards could be lined with fragrant varietal and historic plumeria, everyone driving by would have to have one! Your plumeria tours would pay more than the farming. Neem trees could be grown for their fertilizer potential and double benefit the surrounding area by increasing permeability and it is cooler in the shade. It is also a medicinal plant, known in Kenya as marobaini meaning forty, because it has 40 different medicinal uses. It is also well recognized in India and beginning to be researched in the West. Draft EIS needs to include responsible and innovative crop choices such as these.

~ There is a gaping hole when it comes to identifying soil types and arable quality across the land in question. The Draft EIS needs to spell out via maps and charts which and how many acres of land are poor arable lands, etc. This information should be available to you because soil types on Maui were well studied and documented, and would be a first step in any good farm plan.

~ County Plan guidelines state a goal of 5 mgd of reclaimed water to be used. No mention is found, it is currently missing from your review and needs to be addressed.

~ Management part of the plan should have some details in the Draft EIS. Any other person applying for a state lease has to show in detail how they plan to manage it and improve the land. Usually includes restoring native species.

~ Consider taking a page from Ulupalakua Ranch and work with Art Medieros and Auwahi to not only restore native forests, but increase soil permeability, and perhaps even rainfall in these areas. Their work has been scientifically studied and documented to prove increase in soil permeability in adjacent land due to dryland forest restoration. See these two important documents:

<https://static1.squarespace.com/static/573a2a872fe131b2351c0330/t/575a2ea927d4bd5d73013749/1465527980840/Perkins+et+al.-2012+Geophysical+Research+Letters.pdf>

<https://static1.squarespace.com/static/573a2a872fe131b2351c0330/t/575a2a6f27d4bd5d73012392/1465526976183/Perkins+et+al+2014+EcoHydro.pdf>

Restoring of native habitats and forest should definitely be part of the Draft EIS. Art Medieros is the most knowledgeable one to advise where and how much land should be allocated.

~ You say the water table has gotten saline, some of your wells have been compromised and gotten saline. This is a definite concern for everyone on Maui. How much could this be due to commercial fertilizer salt that has gone down into the aquifer in this area, or overuse of groundwater? Artesian springs in Wailuku have dried up. This just points to how critical it is for Maui to focus on replenishing our aquifer. We cannot afford to abandon land or wells due to irreversible damage of any more rise in salinity and compromise of the irreplaceable freshwater lens. In India, whole villages have been abandoned because of that. In California's Central Valley, the wells are all going dry, so there is a race to drill deeper and deeper wells. Then those wells go dry, and they don't stop drilling, they just dig in and drill more furiously than before. The large corporate agribusiness that moved into the area recently has kept all the well drilling rigs busy at their place while neighbors fruit trees have had to be cut down due to death by non irrigation. At this point the land is actually sinking because the aquifer has shrunk so intensely. There are innovative ways to respond. <https://www.sacbee.com/news/california/big-valley/article229148999.html>

~ There are crops that tolerate salt. Coconuts are one. An exploration of potentials for these plants should be explored. http://www.biosalinity.org/salt-tolerant_plants.htm

~ Details of well water tests should be presented in the Draft EIS and considered including dates and any specifics about presence of salts and chemicals such as 24D etc which were used by A and B.

Thank you for this opportunity to submit my comments on, observations of and concerns about this draft EIS. I would like to hear your responses, ideas and changes to the Draft EIS which include these valid and important concerns.

Sincerely yours,

Mary McClung Law

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Mary McClung:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments and concerns in opposition to Alexander and Baldwin’s proposal to further divert stream water from East and West Maui streams. I have been a resident and concerned citizen practicing natural farming in Kīpahulu since 1999, including successfully dryland farming (non irrigated crops, based on rainfall) bananas with my husband Corey Law (who grew up flood irrigation farming in Central Valley Calif). Protecting the integrity of Maui’s aquifer and restoration of Maui ecosystems should be top priorities to local and state government officials, businesses, agriculture enterprises, residents and visitors alike, because without it, we all will suffer greatly.*

Response 1: We acknowledge your comments and concerns in opposition of the Proposed Action, and that in your view protecting the integrity of Maui's aquifer and the restoration of ecosystems should be a top priority for the State. It is also understood that you are commenting as a concerned citizen who practices farming in Kīpahulu. Please note that the Proposed Action does not affect Kīpahulu, which is beyond the eastern terminus/end of the EMI Aqueduct

System. The Proposed Action impacts a portion of East Maui, Upcountry Maui, and Central Maui as described in Chapter 4 of the EIS.

Regarding your comment about Maui's aquifer and restoration of Maui's ecosystems, as discussed in Chapter 5 of the EIS, the Proposed Action is supportive of a number of the State's priorities including growing diversified agriculture, increasing local food production, and managing access to State lands which prevents the spread of invasive species thus preserving ecosystems. Additionally, the Proposed Action would contribute to recharge of the Central Maui aquifers as discussed in EIS Section 2.1.4 and Section 4.2.2. Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the water lessee and DLNR to jointly develop and implement a watershed management plan. On October 11, 2019, after the publication of the Draft EIS on September 23, 2019, the BLNR approved the minimum content requirements for a watershed management plan. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. A copy of the BLNR-approved DLNR report is enclosed as Appendix O-1. The BLNR delegated authority to the DLNR staff to jointly develop watershed management plans with water lessees to ensure that the watershed management plan aligns with the goals of watershed protection to maintain watershed function and water yield and to restore or maintain a certain level of biological integrity that is the foundation of a healthy watershed.

Comment 2: *According to the USGS publication on estimating groundwater of Maui as of August 16, 2019, "Demand for freshwater on the island of Maui is expected to increase by 45% between 2015 and 2035. Wetter and drier climate scenarios impact the availability of the groundwater to meet this demand...estimates of groundwater recharge are needed." <https://pubs.er.usgs.gov/publication/sir20195064>*

This publication was written in partnership with the County of Maui Water Supply and others. This points out inadequate information available to even consider a 30 year lease. Any lease must be for less water than has been taken in the past, and on a year to year basis. This option has to be seriously included in your draft EIS.

Response 2: Regarding your comment that the Water Lease must be for less water than has been taken in the past, that is exactly what is being proposed under the Proposed Action. Specifically, Section 2.1.2 of the Draft EIS states:

However, the amount of water that may be diverted should the Water Lease be issued is substantially less than the amount that was diverted during normal sugar production. For example, in 2006 it is estimated that the EMI Aqueduct System delivered approximately 156.69 mgd at Maliko Gulch, whereas under the CWRM D&O, it is estimated that the delivery at Maliko Gulch will be approximately 92.32 mgd (Akinaka, 2019).

The median flow required by the CWRM D&O provides an estimated available median flow at Honopou Stream of 87.95 mgd, where the EMI Aqueduct System leaves the License Area. Beyond the License Area, the diverted streams only provide supplemental ditch flow when License Area diversions are low. The amount that can be added is relatively low because when rainfall is high in East Maui, the ditches are fuller and there is little needed to supplement the flow. And, when rainfall is low in East Maui, the streams west of Honopou Stream have less flow in them as they are in an area that receives less rainfall than areas further east. During drier (low flow) periods, it is estimated that 4.37 mgd is available to supplement the EMI Aqueduct System between Honopou Stream and Maliko Gulch. With this added flow, the estimated median flow available beyond Maliko Gulch for use in Upcountry Maui and the Central Maui fields is estimated to be 92.32 mgd (Akinaka, 2019).

Hence, under the Proposed Action, the amount of water diverted will be significantly less than past diversion amounts during sugarcane operations.

Regarding your comment that the Water Lease should be on a year-to-year basis, please note that shorter Water Lease durations were considered within the EIS in Section 3.2.2.1 and throughout Section 3.4 of the EIS. Specifically, Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing

successful diversified agricultural operations and crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

Hence, a shorter lease term could limit the ability to successfully implement the Mahi Pono farm plan, which is inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui. However, the terms and conditions of the Water Lease are at the discretion of the BLNR.

The United States Geological Survey (USGS) report you cited in Comment #2 states that between 2015 and 2035, it is expected that the demand for potable water from the County of Maui County Department of Water Supply (MDWS) will increase 45% from 33.5 million gallons per day (mgd) to 48.5 mgd. However, the report does not go into the breakdown of aquifer use and future demand and what aquifers will be the most affected by the projected increase in demand. The USGS report only identifies certain aquifer sectors and aquifer systems that will experience either increases or decreases due to climate projections. In the scenarios presented in the USGS report, the aquifer systems in the Ko‘olau Aquifer Sector are projected to see some of the largest increases in recharge, whereas aquifer systems in the Central Aquifer Sector are projected to see decreases in recharge due to changes in rainfall patterns from future climate change trends. However, please note that under the Proposed Action, surface water is diverted from the East Maui License Area (which lies largely over the Ke‘anae, Waikamoi and Honopou aquifers in the Ko‘olau Aquifer Sector (See EIS Figure 4-17), to the Central Maui agricultural fields, which largely lie over the Pā‘ia Aquifer in the Central Aquifer Sector (See EIS Figure 4-18). As detailed in Section 4.2.2 of the EIS, the groundwater pumpage within the Ko‘olau Aquifer Sector is far below the Sustainable Yield (SY). This section of the EIS also addresses the anticipated impacts to the Central Aquifer Sector from the conveyance of East Maui surface water to Central Maui for irrigation purposes. Section 4.2.2 of the EIS has been updated to reflect your comment regarding the USGS report, as shown on page 4-71 for East Maui and page 4-76 for Central Maui.

Regarding the Central Aquifer, the cited USGS report anticipates that there will be decreases in recharge due to changes in rainfall patterns from future climate change trends. However, as discussed in Section 4.2.2 of the Draft EIS:

SY does not account for water transfers, including surface water conveyed to the Central Maui Aquifer Sector from the Ko‘olau Aquifer Sector by the EMI Aqueduct System. Such imported water for irrigation flowing past the root zone of crops enters the aquifer from which it can be pumped and reused. According to the Draft Maui Island Water Use and Development Plan (March 2019), the

“impact on ‘available’ groundwater that can be extracted from the Kahului and Pā‘ia aquifers from irrigation return flow is highly uncertain since the cessation of sugarcane cultivation in 2016” (p. 18). The plan further notes that there are no monitoring wells in the Central Aquifer Sector to gauge water level changes over time. Nevertheless a simulated scenario in a 2008 USGS study suggests that the complete removal of irrigation return recharge would decrease water levels and increase salinity in the Central Maui Aquifer Sector (Akinaka, 2019).

Hence, the Central Aquifer Sector has generally low SY numbers. However, the numbers do not take into account the recharge that occurs from system losses (i.e., water lost to seepage and evaporation, and including other water uses, such as water used for reservoirs, fire protection, dust control, and hydroelectric uses) from the Central Maui Field Irrigation System within the Central Maui agricultural fields. Some portion of this seepage would enter the Pā‘ia, and Kahului, and Ha‘ikū aquifers, and some amount of the water used for irrigation would seep past the root zone and also enter the aquifers. Little is known about the exact relationship between the irrigation return water and how much could be reused as groundwater. However, the use of East Maui surface water to irrigate the Central Maui agricultural fields has long supplemented the underlying aquifers, and a similar relationship will continue under the Proposed Action, essentially constituting a beneficial impact to the Central Maui aquifers, particularly the Pā‘ia and Kahului aquifers, albeit at a smaller scale than when sugarcane was being cultivated. Thus, under the Proposed Action, it is assumed that at full operation of the Mahi Pono farm plan, system losses within the Central Maui agricultural fields would add to the recharge of the aquifers underlying the Central Maui agricultural fields as discussed in Section 4.2.2 of the EIS regarding Central Maui groundwater, updated as shown on pages 4-74 to 4-77.

Regarding your comment that the EIS has inadequate information to consider a water lease, we believe that the EIS contains sufficient information for the Board of Land and Natural Resources (BLNR) to consider a long-term water lease.

It is also understood that notwithstanding any changes to stream flows due to climate change, the Water Lease will have to adhere to the Interim Instream Flow Standards (IIFS) set forth in the Commission on Water Resources Management Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O). Impacts to the License Area due to climate change are discussed in more detail in Section 4.3 of the EIS.

Comment 3: *Restoring ecosystems can play a part in replenishing the aquifer. And the aquifer is an invisible and somewhat mysterious force that all residents and visitors, present and future depend on. We cannot afford to make mistakes going forward that put our freshwater lens at*

risk. We already know that the water tables have been dropping to below half of what it was since it was first being measured.

Response 3: Your comments are acknowledged, however you did not specify what aquifer you are referring to. It is generally known that restoring the ecosystem can replenish the aquifer, increase recharge rates, and the amount of groundwater (Adane et. al, 2018, *Impact of grassland conversion to forest on groundwater recharge in the Nebraska Sand Hills*, Journal of Hydrology: Regional Studies, Volume 15) As discussed in Section 4.2.2 of the EIS, use of East Maui surface water is not expected to have any significant impact on reducing the amount of groundwater available within the freshwater lens underlying the License Area. In fact, as discussed in Response #2, the Ko‘olau Aquifer Sector is expected to see an increase in groundwater from recharge rates due to changes in rainfall patterns from future climate change trends as noted by the USGS report you cited in Comment #2. Thus, the Proposed Action would have even less of an impact on groundwater in East Maui as more water is anticipated to be recharged into the ground in the Ko‘olau Aquifer Sector.

In the Central Maui Aquifer Sector, it is anticipated that recharge rates and the SY will decrease due to changes in rainfall patterns which may further decrease the amount available for pumpage. Since the use of East Maui surface water to irrigate the Central Maui agricultural fields has long supplemented the underlying Central Maui aquifers, it is expected that a similar relationship will continue under the Proposed Action, essentially constituting a beneficial impact to the Central Maui aquifers, albeit at a smaller scale than when sugarcane was being cultivated.

Your comment about the water tables dropping below half of what it was since it was first measured is unclear, as you do not describe specifically where, or what measurements you are relying on. It is our understanding that water tables have not dropped as you have described in East Maui, Upcountry Maui, or Central Maui—the areas of study for this EIS. However, it can be noted that the SY for the entire island of Maui has decreased over the years. By comparing the CWRM’s 1987, 2008 and 2018 maps of SY for the island of Maui, it shows an overall decrease of 25 mgd from 452 mgd (1987) to 427 mgd (2008), then a decrease of 70 mgd from 427 mgd (2008) to 357 mgd (2018) for the entire island of Maui.

Comment 4: *I have several relevant points I am petitioning to be included in your analysis which are either missing or lacking in discussion, consideration and data in the Draft EIS.*

~ UH scientists have concluded that Hawaiian islands will continue to experience less and less tradewinds and rainfall due to climate change. We are already noticing a drop in rainfall and less tradewinds. The draft EIS needs to use the most up to date predictive climate science when

considering future rainfall. <https://www.hpr2.org/post/planet808-examining-climate-change-islands#stream/0>

Response 4: It is not clear from your comment what, if any, aspect of the brief audio clips from a radio program that you cited you believe are relevant to the EIS and therefore we cannot comment on those clips. However, we note that the EIS does include the most recent information regarding climate change within its analysis. As discussed in Section 4.3.1 of the Draft EIS:

Regular trade winds are key in driving the Hawai‘i’s hydrological cycle, generating rainfall which helps maintain Maui’s water supply. However, a recent study showed that Hawai‘i’s trade winds have decreased in frequency by approximately 30% over the past 37 years, from 291 days per year in 1973, to 210 days per year in 2009 (Garza et. al, 2012). The decrease in the trade winds could have serious implications for the Hawaiian Islands, including adversely impacting local agriculture, native ecosystems and endangered species, and the State’s limited freshwater supply.

Overall, the State of Hawai‘i is experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014)...

Climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. Such rainfall patterns increase the amount of stormwater runoff flowing through the region, including through the streams within the License Area that reach the shoreline. The expected climatic changes in precipitation patterns and streamflow will influence the quantities and concentration of stormwater runoff entering the nearshore environments and coastal waters, resulting in increased sedimentation, impacting coral reefs. However, because of the continuous wave energy in shore areas in East Maui, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species. (SE & MRC, 2019).

Hence, the EIS recognizes that the State of Hawai‘i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall. However, as noted in the USGS report cited in Comment #2 and as discussed in Response #2, East Maui could see an increase in rainfall.

Section 4.3.1 of the Final EIS has been expanded to include information from the archeological literature review and field inspection (LRFI) report (Appendix E), the Cultural Impact Assessment (CIA) report (Appendix F), and the Terrestrial Flora and Fauna Technical Report (Appendix C) prepared for this EIS as shown on pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Comment 5: *Due to this uncertain future of rainfall, we would be prudent to mitigate the great risk of compromising our freshwater lens by safeguarding Maui’s future water supply and aquifer as much as possible. Any lease should be for a short period of time, smaller amount of water, and have requirements of proof of good management practices in good in order to be considered for renewal. The Draft EIS should include these public good options.*

Response 5: Regarding your comment about a Water Lease for a shorter period of time and smaller amount of water, please refer to Response #2 above. Also, in response to your comment on the Water Lease being for a smaller amount of water, please note that Section 3.2.1 of the EIS addresses a Reduced Water Volume alternative and Section 3.3 addresses a No Action alternative, both of which are for smaller amounts of water than the Proposed Action, and a comparative evaluation of those alternatives is provided throughout Section 3.4 of the EIS. Moreover, please note that the terms and conditions of the Water Lease are at the discretion of the BLNR.

It is not clear from your comment how you view the length of the Water Lease as a matter to be dictated by climate change. As discussed in Section 4.2.2 of the EIS, the freshwater lens in East Maui (the location of the License Area where majority of water would be diverted) is not anticipated to experience adverse impacts as a result of the Proposed Action.

It is also not clear from your comment what "good management practices" you believe should be a requirement of the Water Lease. However, the EIS describes various measures to mitigate impacts within the License Area. As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area in East Maui. These impacts are related to various aspects of the natural environment. For stream habitat impacts, there will be a reduction from natural flow conditions, which can be mitigated by adjustments in diversions to minimize entrainment or increases in stream flow. For native terrestrial flora and fauna resources, as well as historic and archeological resource, there is anticipated to be impacts from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; impacts to cultural resources and practices due to access or restriction of access can be mitigated by a myriad of recommendations proposed by CSH as discussed in Section 4.6; and community concerns and perceptions as discussed in Section 4.7.2 of the EIS can be mitigated by further public outreach and consultation.

Moreover, as discussed in Response #1 above, the Water Lease lessee will be subject to all applicable requirements of HRS § 171-58 regarding watershed management plans.

In addition to recommended measures for the License Area, the EIS also describes water conservation practices planned and/or underway by Mahi Pono within the Central Maui agricultural fields. Mahi Pono expects to invest over \$20 million to increase the efficiency of its private Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to Section 2.1.4 of the Final EIS as shown on page 2-25.

Mahi Pono has also implemented several water saving strategies for the Central Maui agricultural fields and continues to evaluate additional methods. Mahi Pono water saving strategies include the following:

- Planting windbreaks in the fields.
- Incorporating significant uses of weed mat along plant lines, which will reduce evapotranspiration and erosion.
- Mowing rather than plowing inter-rows to preserve organic matter and keep cover to prevent soil erosion.

- Operating within the terms of a Conservation Plan from NRCS, which includes swales and diversions for erosion protection,
- Practicing rotational grazing of livestock,
- Planting permanent tree crops that will develop canopies that will assist with soil moisture retention and reduce evapotranspiration.

Comment 6: ~ *Streambeds are the most effective place for water to filter down into the Earth, replenishing the aquifer as they have for millennium. When a stream is dry, no water is filtering down in this way. The draft EIS needs to address this impact on our precious island aquifer.*

Response 6: The EIS does address impacts to groundwater aquifers. Please refer to Responses #2 and #3 above. Furthermore, the IIFS established under the CWRM D&O requires full restoration of 10 streams within the License Area, and partial restoration for biological reasons to several other streams within the License Area. You did not identify any streambed that you believe will be dry under the Proposed Action, therefore we cannot respond with any greater specificity. You also did not specify which Maui aquifer you are referring to. However, as explained in Response #2, groundwater levels in East Maui are expected to be greater than historic levels due to increased recharge from stream restoration actions under the CWRM D&O. In addition, the Ko‘olau Aquifer Sector is expected to see an increase in groundwater from recharge rates due to changes in rainfall patterns from future climate change trends. Thus, the Proposed Action would have even less of an impact on groundwater as more water is anticipated to be recharged into the ground.

Comment 7: ~ *As freshwater streams flow into the ocean, there is an increase of fish and diversity at the stream mouth. This benefits fishermen as well as serving the greater pelagic fish populations with ample nutrition. This impact needs to be taken into account. No water should be taken from East or West Maui streams until Mauna to Makai flow is reestablished. This is becoming general knowledge.*

Response 7: Your comments in response to the Proposed Action are acknowledged. For clarification, the Proposed Action does not involve any diversions from West Maui streams. The EMI Aqueduct System diverts water exclusively from East Maui.

It is generally known that flow from mountain to ocean can provide environmental benefits. In the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A), the HSHEP Model was used to quantify the impacts of flow restoration on native stream animal habitat which provides data that can assist decision makers to understand how impacts could change across different diversions scenarios. The mauka-to-makai connection is

integral to the design of the HSHEP model in estimating the impacts of stream diversions on native species habitat. Impacts to stream habitats and native amphidromous stream species are analyzed in Section 4.2.1 and Appendix A of the EIS. Under the Proposed Action, habitat units (HU) are expected to increase compared to historical diversion rates during sugarcane operations. However, as stated in Section 4.2.1 of the EIS, habitat units would decrease by approximately 36.1% when compared to a theoretical natural flow scenario, where no water was diverted from the License Area (theoretical because even under the No Water Lease scenario, the EMI Aqueduct System would continue to divert 30% of the water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS requirements). Please note that the report in Appendix A has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats which is also reflected in Section 4.2.1 of the Final EIS, as shown on pages 4-56 to 4-67.

Regarding the impacts to coastal waters and nearshore environments, these are analyzed in Section 4.2.3 and Appendix B (East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry) of the EIS. The survey conducted for that assessment provided data to indicate that stream-delivered nutrients do not extend to pelagic areas (pelagic is defined as "open ocean"). The study suggests that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, because the nutrient concentrations in the ocean do not change substantially due to stream diversions as proposed under the Water Lease, there is no pathway for fishing to be negatively impacted. This analysis means that impacts to ocean fish from the Proposed Action are negligible.

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may

have a small estuarine reaches, Pa‘akea will have connectivity flow restoration, while ‘O‘opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi‘ina‘au Stream) have estuarine reaches, four of which were noted by Trutta’s HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR’s methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi‘ina‘au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa‘akea) have connectivity flow restoration ordered. Pa‘akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83 of the Final EIS.

Regarding your comment about an increase in fish and diversity, unfortunately there is no actual scientific data relative to the interplay between diversions by the EMI Aqueduct System and fish populations. However, some who commented on the Draft EIS and/or participated in the CIA, stated that they have noted an increase in fish populations returning to the nearshore coastal environments since the cessation of , since the halting of diversion after the closing of HC&S commercial sugar operations in Central Maui in late 2016. This information has been added to Section 4.6 of the Final EIS as shown on page 4-168.

Comment 8: ~ *The original lease agreement was written as allowing diversion only AFTER the land and the people have their share. Yet A & B continued to increase the size, substantiality,*

and number of the flumes to the point of running several streams completely dry for numerous decades, and in the Draft EIS, it is stated that their damaged streams should be a new baseline for any future agreement. This shows a lack of regard on the part of A and B for following any restrictions the state might place on a future water lease. How will records be made available to the public to prove responsible management of the EMI and stream systems.

Response 8: It is unclear what you mean by the "original lease agreement." The Kingdom of Hawai'i granted the first license in 1876 to A&B and its partners to develop what became the EMI Aqueduct System and divert water from East Maui, as discussed in Section 1.3.2 of the Draft EIS. A&B entered into subsequent agreements with the Kingdom of Hawai'i, then the Territory of Hawai'i, and the State of Hawai'i permitting diversions of the East Maui surface water, and it is understood that A&B complied and operated within the terms of those previous agreements.

We respectfully disagree with your comment that the Draft EIS states "damaged streams" should be a new baseline for any future lease agreement. First, HAR § 11-200-17(g) requires that an EIS describe the environmental setting "as it exists before commencement of the action." Second, there appears to be a misunderstanding regarding the use of the upper and lower boundaries applied to the HSHEP model for the assessment of impacts to the native amphidromous stream species. The application of the HSHEP model uses the two boundaries for assessment: the "Full Diversion Condition" (the lower boundary) and the "Natural Condition" (the upper boundary). The combination of the lower and upper bounds provides the range at which we would expect changes to the diversions to fall within and provides a way to comparatively discuss different flow restoration scenarios as, by definition, the changes must fall somewhere between 100% diversion and 0% diversion. The two scenarios presented, the Proposed Action compliant with the CWRM D&O (Trutta's 2018 IIFS scenario) and No Action alternative (30% remaining flow diversion), are examples of how different flow restoration scenarios result in different amounts of habitat units. The HSHEP model is used to quantify these differences based on flow restoration changes at diversions. The HSHEP follows a logical approach and systematically addresses on-the-ground conditions.

Regarding your comment asking how records will be made public, reports submitted to State agencies are considered public records that may be requested pursuant to the Uniform Information Practices Act, HRS Chapter 92F. Reporting to State agencies is required under the water Revocable Permits and under the CWRM D&O, and similar reporting requirements may be required under the Water Lease. As discussed in Sections 4.2.1 and 4.6 of the EIS, the CWRM D&O requires EMI to report on changes in stream diversions and ditch settings as irrigation requirements increase. EMI also maintains a system of optical encoders with float tape

and data loggers within the EMI Aqueduct System. The information obtained is reported to CWRM on a monthly basis.

Comment 9: ~ *Corporations have as their top legal priority to make the shareholders as much money as they can. Legally they cannot have a different top priority, such as the public good, even when managing a commons. This alone should make it clear that any water flowing out of Maui streams needs to be managed by the state, not a private interest business. The draft EIS needs to include a serious option for state management.*

Response 9: Your comment suggests a fundamental misunderstanding of the facts. The proposed Water Lease, if issued, will be issued by the BLNR, a State agency. As such, the BLNR will have the opportunity and the obligation to assess the request for a Water Lease through all appropriate considerations, including the Public Trust Doctrine, and establish the terms by which it is willing to issue the Water Lease.

Under the Public Trust Doctrine, BLNR will have to balance competing considerations before making a decision on the Water Lease. The balancing that BLNR is required to perform under the Public Trust Doctrine was described at length by the Hawai'i Supreme Court in *In Re Water Use Permit Applications*, 94 Hawai'i 97, 9 P. 3d 409 (2000) (Waiahole I) and summarized in Section 1.5 of the Final EIS as shown on pages 1-25 to 1-27.

Contrary to your comment, please note that Section 3.1.2 of the Draft EIS considered alternative ownership of the EMI Aqueduct System. However, a change in ownership is too speculative at this point to warrant further analysis beyond what is already in the EIS. Moreover, there is no information provided regarding this speculative alternative to suggest that it would enhance environmental quality or avoid, reduce, or minimize all or even some of the adverse environmental effects, costs, or risks of the Proposed Action. Please note that Section 3.1.2 of the Final EIS has been supplemented to acknowledge the County of Maui, Board of Water Supply Temporary Investigative Group (TIG) Report dated October 17, 2019 that was made available after the publication of the Draft EIS, as shown on pages 3-19 to 3-20. Moreover, a copy of the TIG Report is provided as Appendix Q to the Final EIS. However, as discussed in both the Draft EIS and the Final EIS, this alternative continues to appear speculative and not consistent with the objectives of the Proposed Action.

Regarding your comment about profits being the top priority of corporations, we note that companies can also be rated by their attention to and investment in social issues such as environmental protection, diversity and inclusion, treatment of employees, etc. as well as their financial performance.

Comment 10: ~ *As we saw when the streams were not flowing, they get hugely overgrown with thick brush, invasive species and bramble. That makes it impossible for people including cultural practitioners to travel via the waterways, which is supposed to be a right protected by state law. This impact was not and needs to be addressed in the Draft EIS, and is part of why the streams need to continue to flow 24/7.*

Response 10: Regarding your comment about streams when there is no flow and become overgrown with vegetation, this is generally acknowledged and understood that negative impacts occur on species habitat and passage. As stated in EIS Section 4.2.1, it is possible for streams to be dewatered if diversions were permitted to take all flow under low flow conditions. Under full diversion conditions (which is far in excess of what is proposed for the Water Lease), the number of stream habitat units available is reduced by approximately 49.9% from the theoretical full natural flow condition, where no water is diverted from the License Area. However, the Proposed Action proposes diversion amounts significantly less than the full diversion scenario.

With regard to the potential effects of the Proposed Action on traditional and customary practices, as discussed in the Hawai'i Supreme Court decision, *Ka Pa 'akai O Ka 'Āina v. Land Use Commission*, 94 Hawai'i 31 7 P. 3d 1068 (2000), it is acknowledged that BLNR will be required to "to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible." *Ka Pa 'akai*, 94 Hawai'i at 35, 7 P. 3d at 1072. BLNR has previously so stated in its Findings of Fact, Conclusions of Law, and Decision and Order filed on March 23, 2007 in the contested case proceeding that is still pending regarding the Proposed Action (the 2007 D&O) as follows:

Public trust principles require that adequate provision be made for the protection of ***traditional and customary Hawaiian rights***, the protection and procreation of fish and wildlife, the maintenance of proper ecological balance and scenic beauty, and the preservation and enhancement of waters of the State for municipal uses, public recreation, public water supply, agriculture and navigation.

2007 D&O COL No. 6 at page 41 (emphasis added).

The State's constitutional obligation to consider the impacts of stream diversions in East Maui on traditional and customary practices of Native Hawaiians is also addressed at pages 242 through 245 of the CWRM D&O, including the Supreme Court of Hawai'i's more recent holding on this subject in *State v. Pratt*, 127 Hawai'i 206, 277 P. 3d 300 (2012). The CIA assessed the impacts, alternatives, and measures to mitigate impacts of the proposed Water Lease on the cultural resources, practices and beliefs identified through this process. The assessment includes discussion of potential impacts on the following: 1) regional environment; 2) taro farming; 3) freshwater ecosystems; 4) cultural sites; 5) access by cultural practitioners; and 6) climate

change. CSH then developed recommendations for mitigation based upon CSH's expertise, research and input received during the CIA consultation process, and based upon other technical studies that have been prepared for the EIS. Section 4.6 of the Final EIS has been supplemented with a more detailed discussion of the matters above. See pages 4-239 to 4-252 of the Final EIS.

As discussed in Section 4.6 of the Final EIS, public access to the License Area is currently limited to permitted access by hunting groups and hiking clubs. Should the Water Lease be issued, CSH recommended that public access for practitioners be via a similar process to what is used for hiking groups. EMI has confirmed that no individual that has approached EMI regarding access for cultural purposes has ever been denied access. See pages 4-239 to 4-252 of the Final EIS.

Comment 11: ~ *There is a local freshwater fish which actually climbs waterfalls several hundred feet high in order to return home and breed. The Hawaiian Goby fish have suction cup feet and are considered of special importance to the scientific as well as the Hawaiian communities. They are present in several East Maui streams, and could be reestablished wherever they have died out due to A and B draining the streams over the last 130 years. These need to be included in the Draft EIS.*

Response 11: Please note that the Hawaiian Goby fish was included in the HSHEP model included in the report attached as Appendix A to the EIS, which is also summarized in Section 4.2.1 of the EIS. Specifically, the HSHEP model developed habitat suitability indices for the following species: O'opu nākea (*Awaous stamenius*); 'O'opu alamo'o (*Lentipes concolor*) (the Hawaiian Goby fish); 'O'opu naniha (*Stenogobius hawaiiensis*); 'O'opu nōpili (*Sicyopterus stimpsoni*); 'O'opu akupa (*Eliotris sandwicensis*). For specific HU change for the Hawaiian Goby fish, please refer to Appendix 3 of Appendix A of the Final EIS. Under the Proposed Action, overall HU are expected to increase regionally compared to historical diversion rates during sugarcane operations. However, as stated in Section 4.2.1 of the EIS, habitat units would decrease by 36.1% when compared to a zero diversions scenario. It is important to recognize that the accumulation of HU for amphidromous species is additive, meaning that a single unit of stream may have a total HU in excess of the stream area quantified. In other words, if HU for multiple non-competitive species in a given area are added together, the combined HU could be greater than the area. This is important when considering the total HU for all eight amphidromous species in a stream as the total HU for all eight species may be greater than the total stream area.

Comment 12: ~ *There are native birds that likely have been impacted also. Not only the forest birds who would not have year round access to freshwater when the streams are dried up, but*

also coastal birds that evolved to depend on the ecosystem being intact. Birds and other fauna, esp native Hawaiian ones need to be seriously surveyed comparing intact streams vs the EMI damaged ones. Restoration of the mountain to ocean flow would clearly help restore damaged ecosystems due to the last 130 years of taking more than was originally intended by the agreement. This sustained flow to the ocean needs to be part of the Draft EIS.

Response 12: Regarding your comment about the impacts on native birds, these are discussed in the report in Appendix C (Terrestrial Flora and Fauna Technical Report) of the EIS, which is summarized in Section 4.4.2 of the EIS. Specifically, Section 4.4.2 of the Draft EIS states:

*The birds observed in the License Area are species commonly found in low- to mid-elevation mesic and wet forest areas on the northern slope of Haleakalā Volcano. In all, nine bird species were documented, six of which are protected by the Migratory Bird Treaty Act (MBTA). Of these, three species—‘apapane (*Himatione sanguinea*), Hawai‘i ‘amakihi (*Chlorodrepanis virens wilsoni*), and ‘i‘iwi (*Drepanis coccinea*)—are endemic to Hawai‘i; one is a migratory shorebird and two are non-native introductions. The ‘i‘iwi is the only federally and state-listed bird that was detected during ground surveys and was identified by vocalizations. In addition to ‘i‘iwi, the federally and state-listed Maui parrotbill (*Pseudonestor xanthophrys*) and crested honeycreeper (*Palmeria dolei*) are known to occur in mesic and wet forest above approximately 3,937 feet (1,200 meters [m]).*

Regarding the impacts of the Proposed Action, Section 4.4.2 been revised in the Final EIS based on comments received on the Draft EIS to further outline the existing conditions of the License Area and more accurately reflect targeted mitigation measures based on feedback provided by the DLNR and USFWS. See pages 4-129 to 4-131 of the Final EIS. Moreover, Section 4.4.2 of the Final EIS has also been expanded to include a discussion regarding potential impacts of avian malaria as shown on pages 4-129 to 4-131.

As it relates to impacts to other fauna species within the License Area, these are also discussed within Appendix C (Terrestrial Flora and Fauna Technical Report) of the EIS, which is summarized in Section 4.4.2 of the EIS. Specifically, Section 4.4.2 of the Draft EIS states:

*Introduced mammals observed include cow (*Bos taurus*), feral pig (*Sus scrofa*), and feral cat (*Felis catus*). No other mammals were observed during the ground surveys, although rat (*Rattus spp.*), mongoose (*Herpestes javanicus*), and mouse (*Mus musculus*) could be expected to occur.*

No terrestrial reptiles or amphibians are native to Hawai'i. No terrestrial reptiles or amphibians were detected during the ground surveys...

*Twelve invertebrates were observed during the surveys, consisting of the Blackburn's damselfly (*Megalagrion blackburni*), Hawaiian upland damselfly (*Megalagrion hawaiiense*), citrus swallowtail butterfly (*Papilio xuthus*), Monarch butterfly (*Danaus plexippus*), housefly (*Musca domestica*), smaller lantana butterfly (*Strymon bazochii*), mud dauber (*Sceliphron caementarium*), wandering glider (*Pantala flavescens*), green darner (*Anax junius*), *Aedes* mosquito (*Aedes* sp.), walking stick (*Sipyloidea sipyilus*), and witch moth (*Ascalapha odorata*). All these invertebrates are common in East Maui.*

The Proposed Action is not anticipated to have a significant impact on special-status fauna species or invertebrates potentially within the License Area. Nevertheless, Section 4.4.2 provided measures to minimize any potential impacts which has been updated based on feedback provided by the DLNR and USFWS as shown on 4-129 to 4-131.

Regarding your comment about flow from mountain to ocean restoring the ecosystem, this is generally understood. As discussed in Responses #8, #10, and #11 above, the impacts of the Proposed Action fall between two of the scenarios analyzed in the HSHEP Model: the Full Diversion and Natural Condition scenarios. Hence, the Proposed Action will provide beneficial impacts regarding habitat units when compared to past diversion amounts during sugarcane operations but, will negatively impact potential habitat units when compared to a theoretical condition where no water is diverted.

Regarding your comment about A&B taking more water than what was originally intended in the agreements, as discussed in Response #8 above, it is understood that A&B complied and operated within the terms of those previous agreements.

Regarding your comment about sustained flow from the streams entering the ocean being a part of the EIS, this is discussed in Section 4.2.3 of the EIS and in Response #7 above. The survey conducted for that assessment provided data to indicate that stream-delivered nutrients do not extend to pelagic areas (pelagic is defined as "open ocean"). The study suggests that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, because the nutrient concentrations in the ocean do not change substantially due to stream diversions as proposed under the Water Lease, there is no pathway for fishing to be negatively impacted. This analysis means that impacts to ocean fish from the Proposed Action are negligible.

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui due to the steep terrain of the streams that flow from the License Area as shown on pages 4-78 to 4-83.

Comment 13: ~ *Modern soil science is realizing how the microbiology in the soil affects the robustness of the surrounding forest tree and plant communities. The microbiology cannot live where the soil is dried out. This issue is also not addressed, but needs to be.*

Response 13: It is not clear from your comment where you anticipate soils to be dried out due to issuance of the proposed Water Lease. Within the Central Maui agricultural fields, Mahi Pono does not employ any agricultural practice intended to “dry out” the soil. Mahi Pono endeavors to clear, plow fields to turn the soil, and incorporate soil amendments (i.e., compost) only in anticipation of planting. Impacts to soil are discussed in Section 4.1.2 of the EIS. Additionally, it is assumed that the microbiology of the License Area is in good condition as it is considered a pristine environment with limited human activity. Moreover, regarding your comment about the soil being dried out, some regions of East Maui receive over 300 inches of rain annually as discussed in Section 4.3.1 of the EIS. Under the Proposed Action, soil conditions are anticipated to remain the same.

Comment 14: ~ *Diagrams showing specifically where Nahiku water comes from and how much need to be included in the Draft EIS. Records show that underground tunnels naturally feed the Nahiku intake pipe and there is no shutoff. So the claim that Nahiku would be at risk of losing their water if the proposal from A and B stream flow is not accepted seems to be a scare tactic, and if so, another strike against them for irresponsibly “yelling fire in a crowded theater” only for their gain.*

Response 14: We acknowledge your comments. In response to your comment requesting diagrams specifically showing where Nāhiku water comes from, please see page 2-23, which Figure 2-6 has been added to the Final EIS. Please note, the description of the Nāhiku water service from Section 2.1.3.3 of the Draft EIS, has been revised to take into account clarifications from the MDWS after the publication of the Draft EIS, as shown on pages 2-21 to 2-22.

According to MDWS, EMI's Nāhiku Tunnel is the sole source of water for the MDWS Nāhiku Water Service Area. It is also our understanding that EMI developed and owns the Nāhiku Tunnel. Per a 1973 Memorandum of Understanding, as amended, MDWS can draw up to 20,000 gallons of water per twenty-four hour day to serve the Nahiku community. EMI continues to deliver water to the MDWS for the Nāhiku community pursuant to the agreement. However, that continued delivery is premised upon EMI's continued receipt of permits or a lease from the State BLNR.

Comment 15: ~ *Upcountry water also needs specific details. Again, contrary to statements made in the Draft EIS, records show that Upcountry is served water via the County pipes. Only in times of drought have they gotten some water via EMI. These records and numbers need to be included for consideration of alternatives to EMI water for Upcountry.*

Response 15: There appears to be a misunderstanding on where the water comes from that the County uses to supply its Upcountry Maui Water System. You are correct that Upcountry users on the MDWS system are served by County pipes, but these pipes only distribute water from the source. The main sources of water for the Upcountry Maui DWS system are surface water sources that are delivered by the EMI Aqueduct System or arise on EMI lands along with some well (ground) water. Thus water “from EMI” is consistently provided to the Maui DWS to service Upcountry Maui and in fact these surface water sources (stream water), particularly the source delivered by the EMI Aqueduct System, serve an even more important role during times of drought.

Specifically, Section 2.1.3.1 of the Draft EIS explains that the MDWS Upcountry Maui Water System relies on three surface water sources, which accounts for approximately 80-90 percent of water delivered through the Upcountry Maui Water System. One of the three surface water sources is delivered directly by the EMI Aqueduct System, through the Wailoa Ditch. Average daily use by the MDWS from the Wailoa Ditch is about 7.1 mgd. Please note that Section 2.1.3.1 has been clarified in the Final EIS to more accurately describe the Upcountry Maui Water System. See pages 2-13 to 2-20 of Final EIS.

The other two surface water sources are not supplied by the EMI Aqueduct System, but are fed by streams located on lands owned by Mahi Pono / EMI. See page 2-13 of the Final EIS.

Hence, all of the surface water delivered to the Upcountry Maui Water System is either supplied by water that originates from the License Area, which is conveyed by the EMI Aqueduct System via the Wailoa Ditch, or from private land. This surface water accounts for approximately 80-90% of all water delivered in the Upcountry Maui Water System. The remaining 10-20% of water delivered comes from a series of basal aquifer wells in Upcountry Maui.

It is assumed in the alternatives addressing reductions in water amounts authorized for diversion, the current agreements in place with MDWS would either be terminated or the amount that MDWS would receive would be less, thereby impacting the users of the MDWS Upcountry Maui Water System.

Comment 16: ~ *Also regarding Upcountry water, several well projects have already been taken on, and oughtn't to be so readily dismissed as an option. Upcountry wells and other options need to be included in the Draft EIS.*

Response 16: The Upcountry Maui Water System is solely the responsibility of the County. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'ānae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including the approximately 30,000 acres of agricultural fields in Central Maui. The EMI Aqueduct System also supplies water to the MDWS. Whether and how MDWS may wish to pursue new sources of water for the Upcountry Maui area is beyond the scope of this EIS and is too speculative for detailed analysis.

However, we are currently not aware of any wells or alternative water sources being planned in Upcountry Maui nor are there any permits on file for new wells by MDWS for the Upcountry Maui Area. Moreover, MDWS has indicated that it has no current or anticipated expansion or improvement plans for the MDWS system within the EIS areas based on additional consultation with MDWS after the publication of the Draft EIS. The letter dated July 24, 2020 from MDWS indicating this has been added to the Final EIS as Appendix P. Furthermore, as discussed in Section 2.1.3.1 of the EIS, any new well development by MDWS would be subject to fiscal and environmental barriers and the constraints of the 2003 Consent Decree between the County of Maui and the Coalition to Protect East Maui Water Resources, Hui Alanui o Makena, Sierra Club and Mark Sheehan. The costs of any new well development would also be passed on to the Upcountry Maui consumers. See Section IV.A of Appendix H (Economic and Fiscal Impact Assessment).

Comment 17: ~ *Kula Ag Park was promised to become 300 acres, yet the Draft only mentions 80. Why the discrepancy? Please include information about this in the draft EIS and include 300 acres in an alternative proposal. We have youth on Maui learning to farm who cannot afford land. The Ag Park would provide an affordable option for them as well as more seasoned farmers who just need access to more land because they are so successful.*

Response 17: Your comment that the Draft EIS only mentions an 80-acre Kula Agricultural Park (KAP) is incorrect. Draft EIS Section 2.1.3.2 explains that the KAP is managed by the County of Maui, Office of Economic Development to promote the development of diversified agriculture on the island of Maui, and that KAP consists of 31 farm lots ranging from 10 to 30 acres and totaling 445 acres. Furthermore, EIS Section 2.1.3.2 of the Final EIS has been revised to explain

that in 2018, A&B sold 262 acres to the County for the expansion of the KAP and agreed to supply the MDWS with surface water from the EMI Aqueduct System to meet the needs of the KAP expansion area, subject to the continuation of State permits or issuance of the Water Lease as shown on pages 2-20 to 2-21 (for clarification, the Draft EIS contemplated the 262-acre KAP expansion but the particular details are now provided in Section 2.1.3.1). Therefore, under the Proposed Action, it is assumed that the 262-acre KAP expansion would receive water from the EMI Aqueduct System.

Comment 18: *~ Acreage in East Maui suitable for growing taro or truck crops is grossly underestimated in potential productivity and number of acres. There are many hidden loi in the forests alongside streams which can be restored to growing taro and other indigenous crops. The local model for this is the Kipahulu Ohana who has been partnering with the National Park and restored many stream fed indigenous loi and crops in previously overgrown loi alongside Oheo Gulch. According to a UH Manoa report released 2-26-2019, titled "Indigenous Agriculture has the Potential to Contribute to Food Needs Under Climate Change", there is the potential for restoring 250,000 acres of traditional agroecosystems, producing more than 1 million metric tons annually. They advise, "plans to meet food self-sufficiency goals must consider how climate change will affect agricultural viability". See AAAS and Eureka Alert*

Response 18: Regarding your comment that the acreage in East Maui suitable for growing taro or truck crops is grossly underestimated, please note that for the analysis included in Appendix I and summarized in Section 4.7.4, taro farms in East Maui (from Honopou to Nāhiku), including use of water from streams not subject to the CWRM D&O, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. This acreage is assumed for the Proposed Action and all associated alternatives since nearly all potential new taro cultivation is assumed to draw water from fully restored taro streams which will have the same flows under all alternatives. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM

D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Regarding your comment about there being many hidden lo‘i in the forests along streams, please note that these were not included in the analysis as we are not aware of these hidden lo‘i. Moreover, your comment does not provide specificity as to where these hidden lo‘i are.

Your comment about the local model made by Kipahulu Ohana that restored many lo‘i alongside Ohea Gulch is acknowledged. However, as mentioned above, we are not aware of hidden lo‘i in East Maui.

Regarding your comment about the UH Mānoa report titled “Indigenous Agriculture has the Potential to Contribute to Food Needs Under Climate Change,” please note that this report generally speaks about the State as a whole and is not focused on East Maui. Moreover, it is our understanding based on the analysis in the Agricultural and Related Economic Impacts report (Appendix I) and as summarized in Section 4.7.4 of the EIS, that it is assumed that all or nearly all of the farming, taro and truck farming, would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams ordered for full restoration.

Comment 19: ~ *There is not adequate explanation of why the same amount of water to “responsibly” farm the proposed 15,000 acres is exactly the same as A&B took to farm 30,000. It should be less than half, based on a responsible choice to conserve water, and choose less thirsty crops. Detailed explanation rather than broad sweeping statements about quantities needed should be included as well as earnest actions in dryland farming crop choices.*

Response 19: It is unclear why you stated that Mahi Pono would farm only 15,000 acres of land. As shown on Table 2-1 of the Draft EIS, the Mahi Pono farm plan covers some 30,000 acres of land in Central Maui. At full operations, the Mahi Pono farm plan is projected to use 85.22 mgd of surface water (before Central Maui Field Irrigation System losses) to farm approximately

30,000 acres in Central Maui. This is stated in Section 2.1.2 in the EIS. In contrast, HC&S used on average 165 mgd as discussed in Section 2.1.4 of the EIS. Thus, Mahi Pono's projected water use, at full operations, is approximately half of what was used to farm sugar, consistent with your statement. Please note that Table 2-1 (Table 2-2 in the Final EIS) has been revised as shown page 2-29 of the Final EIS and shows the water requirements of the proposed crops. Moreover, as discussed in Response #5 above, Mahi Pono expects to invest over \$20 million to increase the efficiency of its Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Hence, the use of the surface water will also be more efficient under the Proposed Action compared to usage during sugarcane operations.

Regarding the choice of crops, as explained in Section 2.1.4 of the Draft EIS the Mahi Pono farm plan is a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community. Moreover, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

Comment 20: *~ Trails should be included, whether for the public or for responsible educational and conservation groups to manage. These are not private lands, these are huge swaths of public land and the public should have reasonable access. Several groups such as Na Hele On Trails, Sierra Club, and more would be good at providing oversight as well as potential service trips. This option needs to be included in the Draft EIS.*

Response 20: As discussed in Section 4.8 of the Draft EIS, access to the Ko'olau Forest Reserve Hunting Units, which include portions of the Huelo, Honomanū, Ke'ānae, and Nāhiku portion of the License Area, is managed by the Department of Land and Natural Resources (DLNR) Division of Forestry and Wildlife. In order to hunt in these areas, hunters must first obtain a license from the DLNR and an EMI Permit / Waiver. Access to the hunting units is managed by EMI through eight existing access roads. Hunters are permitted to enter the areas by vehicle but must traverse most areas by foot. Hiking is also a permitted recreational use within the License Area. Hiking access requires a Hiking Waiver from EMI. However, please note that Section 4.8

of the Final EIS has been updated to include additional discussion on recreational facilities and access into the License Area as it relates to recreational activities as shown on pages 4-305 to 4-309.

With regard to the historic trails and roads that are within the License Area, Section 4.5 of the Final EIS as well as Appendix E (Archaeological Literature Review and Field Inspection report) have been revised to include the current inventory of roads and trails in the License Area as shown on pages 4-147 to 4-149. CSH completed a geographic analysis of trails and roads that appear on maps of the License Area. This analysis is limited to trails and roads that were depicted on maps between 1869 and 1992 and available to the public domain. This analysis is also limited to only the roads or trails that extend within the License Area. The majority of roads and trails within the License Area are associated with access to the EMI Aqueduct System. Figure 4-39 has been added to the Final EIS to correspond with the above text (Figure 48 in Appendix E). See pages 4-147 to 4-149 of the Final EIS.

Comment 21: ~ *Every Maui tour brochure for the Hana Hwy shows picturesque taro loi in Keanae and waterfalls galore. Yet the taro is a fraction of what it could be because so many people have had to move away after the water was no longer flowing well. And same goes for the awesomeness of the waterfalls. Impacts on tourism of running streams dry do not seem to be explored substantially.*

Response 21: As noted throughout the EIS, at a minimum the Water Lease would be subject to the IIFS set forth in the CWRM D&O, which ordered increased stream flows in numerous of the East Maui streams. The D&O ordered all diversions to stop on 10 streams, which were identified as taro streams. See EIS Section 1.3.4. The IIFS set under the CWRM D&O also ordered significant returns in stream flow to several other of the East Maui streams that are diverted by the EMI Aqueduct System. We note that the IIFS set under the CWRM D&O expressly took into account “Aesthetic values such as waterfalls and scenic waterways.” This is reflected in Findings of Fact made by CWRM in the CWRM D&O as follows:

When setting IIFS, the information that is considered in connection with aesthetic values such as waterfalls and scenic waterways is the presence of scenic views, waterfalls and whether there is tourism in the area. CWRM D&O FOF 70.

Aesthetics is a multi-sensory experience related to an individual’s perception of beauty. As a subjective value, aesthetics cannot be quantitatively determined. Elements, such as waterfalls and cascading plunge pools that appeal to an observer’s visual and auditory senses. CWRM D&O, FOF 71.

Anticipated impacts related to tourism are discussed in Section 4.9 of the EIS. Specifically, Section 4.9 of the Draft EIS states:

Several scenic view planes can be found within the vicinity of the License Area. Specifically, the License Area is located along the slopes of Haleakalā in East Maui, and affords views of the ocean to the north and the peak of Haleakalā to the south. The scenic drive along the Hāna Highway was recognized in 2000 when President Clinton designated the Hāna Millennium Legacy Trail. The following year it was listed in the National Register of Historic Places. The drive along Hāna Highway is notable for views of waterfalls, including those in streams flowing out of the License Area.

The designation of the scenic drive along the Hāna Highway as the Hāna Millennium Legacy Trail was made during the time of sugarcane cultivation and greater streamflow diversions. However, there have also been observed changes to visual resources in East Maui since the cessation of sugarcane activities in Central Maui as well as increases in daily visitors to the East Maui region. However, please note that Section 4.9 of the Final EIS has been expanded to further discuss scenic vistas, cascading waterfalls, and stream flow in East Maui, as shown on pages 4-311 to 4-312.

Comment 22: ~ *Crop choices are a concern. Responsible sustainable farming that you claim to be supportive of is farming based on rainfall and soil types. Your choices of citrus, cattle are not low water use. Whereas growing market demand would point to planting such crops as coconuts, dates and others. Getting creative, surely with your sales resources, you could create a brand for Maui Plumeria, Best lei in the Islands, perfumes etc for instance. And other drought tolerant crops. Think how your boulevards could be lined with fragrant varietal and historic plumeria, everyone driving by would have to have one! Your plumeria tours would pay more than the farming. Neem trees could be grown for their fertilizer potential and double benefit the surrounding area by increasing permeability and it is cooler in the shade. It is also a medicinal plant, known in Kenya as marobaini meaning forty, because it has 40 different medicinal uses. It is also well recognized in India and beginning to be researched in the West. Draft EIS needs to include responsible and innovative crop choices such as these.*

Response 22: Many crops can be grown in Hawai‘i, but relatively few can be grown at a scale and cost that compete with low-cost volume producers on the mainland, Mexico and elsewhere. For many crops, the Hawai‘i market is too small for economies of scale, and shipping costs and delivery times are a disadvantage for exports. Please note that Mahi Pono’s farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard

crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community.

The crops in Mahi Pono's farm plan were chosen with the goal of increasing Hawai'i's food independence while also meeting criteria for commercial viability and potential. Mahi Pono's farm plan is described in Section 2.1.4 of the EIS. Citrus, row crops, and cattle – all crops included in Mahi Pono's farm plan would accomplish this goal more effectively than the planting of dates, coconuts, plumeria, and neem. The per-acre water requirement for Mahi Pono's cattle ranching operation is expected to be significantly less than the per-acre water requirement typically associated with growing diversified row crops in Hawai'i. The per-acre water requirements for the various crops planned by Mahi Pono are shown Table 2-2 of the Final EIS based on the analysis in the Agricultural and Related Economic Impacts report attached as Appendix I to the EIS.

Comment 23: ~ *There is a gaping hole when it comes to identifying soil types and arable quality across the land in question. The Draft EIS needs to spell out via maps and charts which and how many acres of land are poor arable lands, etc. This information should be available to you because soil types on Maui were well studied and documented, and would be a first step in any good farm plan.*

Response 23: Please note that all of the soil types within the Central Maui agricultural fields and the License Area are documented within Section 4.1.2 of the EIS as well as each soil type's characteristics. Section 4.1.2 of the Draft EIS provides a discussion of three soil classification studies, as follows:

- The U.S. Department of Agriculture (USDA) (2001) Soil Survey Geographic (SSURGO) database and soil survey data gathered by Foote et al. (1972);
- The Hawai'i Land Study Bureau (LSB) Detailed Land Classification, Island of Maui (LSB bulletin no. 7, 1967) and depicted online at the Hawai'i LSB Locator-ARC GIS by the Hawai'i Statewide GIS Program, Office of Planning; and
- The Agricultural Lands of Importance to the State of Hawai'i (ALISH) Classification System, which was developed and compiled in 1977 by the State Department of Agriculture with assistance from the U.S. Department of Agriculture - Natural Resources Conservation Service (NRCS), and the College of Tropical Agriculture, University of Hawai'i.

Section 4.1.2 of the Draft EIS includes descriptions of these various soil classification systems with regard to agricultural potential in Central Maui. Specifically, Section 4.1.2 of the Draft EIS, with regards to Central Maui, states:

According to the LSB Detailed Land Classification, Island of Maui (1967), the agricultural fields of Central Maui that were previously cultivated in sugarcane have an overall productivity rating of A-Excellent (See Figure 4-15). The southern end of the agricultural fields, which is at the farthest reach of the Central Maui field irrigation system is largely rated E-Very Poor with patches of B-Good. The northeastern end of the agricultural fields west of Maliko Gulch includes land rated C-Fair and D-Poor.

According to the ALISH map, the agricultural fields of Central Maui are predominantly classified Prime Land (See Figure 4-16).

Section 4.7.4 of the Draft EIS includes a discussion summarizing a report by Plasch Econ Pacific LLC on Agricultural and Related Economic Impacts (June 2019). The report assesses the economic agricultural impacts of the Proposed Action and is included as Appendix I in the Draft EIS. In Section 5 of Appendix I of the Draft EIS, the agricultural productivity of the 30,000 acres in Central Maui was discussed based on the soil rating systems of the three aforementioned studies. Although this portion of the report was not summarized in Section 4.7.4 of the Draft EIS, it has been in the Final EIS, as excerpted on pages 4-295 to 4-297 to this letter.

As shown on pages 4-295 to 4-297 and as documented in Appendix I of the Draft EIS, the overwhelming majority of the Central Maui agricultural fields are considered to be highly productive with irrigation water. However, with less water available, less acreage would be rated as high-quality farmland.

Hence, as mentioned in Appendix I of the Draft EIS:

Central Maui has some of the best agricultural conditions in the State for farming, including a large area in a compact configuration, high-quality soils, high solar radiation, a location near markets and shipping terminals, and potentially ample water at low delivery costs (assuming a new Water Lease with a reasonable use fee), and for lessees rents that will be comparatively low.

Please note that the above has been added to Section 4.7.4 of the Final EIS as shown pages 4-295 to 4-297. Moreover, the overwhelming majority of the Central Maui agricultural fields (approximately 80%) are rated by the UH LSB as having the highest Overall Productivity Rating

of "A" (on a scale of "A" to "E" with "E" being the lowest soil rating), and a little over 11% has a "B" rating. In other words, about 27,567 acres (90.9%) are high-quality lands rated A or B. The ALISH Classification System, developed and compiled in 1977 by the State Department of Agriculture with assistance from the U.S. Department of Agriculture - NRCS, and the College of Tropical Agriculture, University of Hawai'i. Approximately 25,669 acres of the Central Maui agricultural fields are classified under the ALISH system as "Prime", which means "agricultural land which is land that is best suited for the production of crops because of its ability to sustain high yields with relatively little input and with the least damage to the environment."

Furthermore, as discussed in Section 5.1.4 of the EIS, approximately 22,000 acres of the Central Maui agricultural fields were designated by the State Land Use Commission as Important Agricultural Lands (IAL) under HRS Chapter 205. In order to qualify as IAL land must be, among other things: (1) capable of producing sustained high agricultural yields when treated and managed according to accepted farming methods and technology; (2) contribute to the state's economic base and produce agricultural commodities for export or local consumption; or (3) are needed to promote the expansion of agricultural activities and income for the future, even if not currently in production. As stated in HRS Chapter 205: "The objective for the identification of important agricultural lands is to identify and plan for the maintenance of a strategic agricultural land resource base that can support a diversity of agricultural activities and opportunities that expand agricultural income and job opportunities and increase agricultural self-sufficiency for current and future generations."

Although it is not clear from your comment what area soils you are concerned with, and the EIS does not contemplate farming within the License Area, we note that information regarding soils in the License Area is provided in EIS Section 4.1.2 by four areas: Huelo, Honomanū, Ke'anae, and Nāhiku. A detailed description of the types and characteristics of the soils found within the four portions of the License Area is included in Section 4.1.2 of the EIS. The distribution of these soils in East Maui is illustrated in Figures 4-5 through 4-10.

Comment 24: ~ *County Plan guidelines state a goal of 5 mgd of reclaimed water to be used. No mention is found, it is currently missing from your review and needs to be addressed.*

Response 24: Your comment regarding the "County Plan guidelines state a goal of 5mgd of reclaimed water to be used" is unclear. We are unaware of any County plan guidelines that state this. However, please note that the availability of the use of reclaimed water from the Wailuku-Kahului Wastewater Reuse Facility (WWRF) is discussed in Draft EIS Section 3.1.1.2 (Reclaimed Water), which provides an analysis of the feasibility of the use of reclaimed water from the Wailuku-Kahului WWRF to irrigate the Central Maui agricultural fields. As discussed,

the recycled water alternative using existing R-2 water from the Kahului WWRF could be considered an alternative as a supplemental source. However, R-2 water has limited usability on crops. Based on State of Hawai'i Department of Health regulations and requirements regarding the use of R-2 recycled water, it can be used for subsurface irrigation of crops such as fruit trees where the edible portion has minimal contact with the recycled water. Thus, R-2 recycled water could be appropriate for timber and non-food crops. R-2 recycled water could be further treated to R-1 recycled water, however, the use of R-1 waters on food crops also carries a negative stigma from a commercial marketing perspective. DEM has expressed a desire to upgrade the Wailuku-Kahului WWRF to provide R-1 treatment, however, the upgrade has not been funded and is speculative at this time. Furthermore, any upgrade to the Kahului WWRF would provide, at best, only 5.5 mgd of R-1 treated waters and would require the installation of a transmission line to convey the water to the Central Maui agriculture fields. Additionally, adverse environmental impacts are associated upgrading the Kahului WWRF, which is located in a hazardous and exposed location, at the front of a tsunami floods zone and a 3.2 feet sea level rise exposure area. Further consideration of this alternative has been included in Chapter 3 of the Final EIS, which has also been supplemented with a discussion about the potential new reuse/effluent disposal facility in Central Maui to be located south-west of the Kahului WWRF that is being considered by the County DEM. See pages 3-9 to 3-11 of the Final EIS.

Comment 25: ~ *Management part of the plan should have some details in the Draft EIS. Any other person applying for a state lease has to show in detail how they plan to manage it and improve the land. Usually includes restoring native species.*

Response 25: Your comment about "management part of the plan" in Comment #25 is unclear. However, as discussed in Response #1 and #5 above, the lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans.

Comment 26: ~ *Consider taking a page from Ulupalakua Ranch and work with Art Medieros and Auwahi to not only restore native forests, but increase soil permeability, and perhaps even rainfall in these areas. Their work has been scientifically studied and documented to prove increase in soil permeability in adjacent land due to dryland forest restoration. See these two important documents:*

<https://static1.squarespace.com/static/573a2a872fe131b2351c0330/t/575a2ea927d4bd5d73013749/1465527980840/Perkins+et+al.-2012+Geophysical+Research+Letters.pdf>

<https://static1.squarespace.com/static/573a2a872fe131b2351c0330/t/575a2a6f27d4bd5d73012392/1465526976183/Perkins+et+al+2014+EcoHydro.pdf>

Restoring of native habitats and forest should definitely be part of the Draft EIS. Art Medieros is the most knowledgeable one to advise where and how much land should be allocated.

Response 26: We acknowledge your comments above and we have to assume you are referring to land in East Maui (the location of the proposed Water Lease) as that is the only area under consideration where a forest is located. However, that area does not have the characteristics of a dryland forest. East Maui is considered a rainforest environment as it is one of the wettest places on the island, as well as the State. Moreover, as described in Section 6.2 of Appendix C of the Final EIS (Terrestrial Flora and Fauna Technical Report) it is noted that the Central Maui agricultural fields would be mostly grasses in its natural state (i.e., no agricultural activity) with the potential to give rise to some woody species.

Please note that Section 4.4.1 of the EIS describes the flora in East Maui. The survey in Appendix C conducted by SWCA found that the License Area is comprised of primarily open and closed 'ōhi'a forest accounting for over 60% of the vegetation in the surveyed areas of East Maui. Non-native (Alien) Forest accounts for 23% of the vegetation in the License Area. Uluhe-dominated slopes and wet cliff areas were also observed in the License Area.

Regarding the documents in the links provided in Comment #26, please note that these are not applicable to the Proposed Action as they are focused on Auwahi, located in South Maui, which is a completely different environment and climate from the License Area and the Central Maui agricultural fields.

Comment 27: *~ You say the water table has gotten saline, some of your wells have been compromised and gotten saline. This is a definite concern for everyone on Maui. How much could this be due to commercial fertilizer salt that has gone down into the aquifer in this area, or overuse of groundwater? Artesian springs in Wailuku have dried up. This just points to how critical it is for Maui to focus on replenishing our aquifer. We cannot afford to abandon land or wells due to irreversible damage of any more rise in salinity and compromise of the irreplaceable freshwater lens. In India, whole villages have been abandoned because of that. In California's Central Valley, the wells are all going dry, so there is a race to drill deeper and deeper wells. Then those wells go dry, and they don't stop drilling, they just dig in and drill more furiously than before. The large corporate agribusiness that moved into the area recently has kept all the well drilling rigs busy at their place while neighbor's fruit trees have had to be cut down due to death by non-irrigation. At this point the land is actually sinking because the aquifer has shrunk so intensely. There are innovative ways to respond.*
<https://www.sacbee.com/news/california/big-valley/article229148999.html>

Response 27: The groundwater wells discussed in the EIS are in Central Maui. The salinity of groundwater in Central Maui is a function of (1) the underground flux of fresh water from adjoining aquifers, (2) seepage of rainfall and irrigation water into the ground (groundwater recharge), and (3) groundwater pumping. During the waning years of sugarcane, the salinity of the groundwater in Central Maui increased because (1) stream restoration and drought reduced the supply of surface water for irrigating sugarcane and, in turn, reduced groundwater recharge; and (2) groundwater pumping of brackish water was increased to compensate for the reduction in fresh surface water that would have otherwise been provided from the East Maui streams. We have no information to suggest that the increase in salinity was in any way related to the use of fertilizers. Please note that Mahi Pono has no current plans to drill new wells and that is not considered a feasible alternative as discussed in Section 3.1.1.1 of the EIS.

Please note that no existing wells owned by Mahi Pono are planned to be abandoned as part of the Proposed Action. As discussed in Section 2.1.4 of the Draft EIS, there were 15 brackish water wells that served the Central Maui agricultural fields when they were in sugarcane. Section 2.1.4 of the Final EIS has been updated to reflect that Mahi Pono only has access to 10 of those brackish water wells. See page 2-25 of the Final EIS. A discussion regarding the salinity of these wells is provided in EIS Section 4.2.2, as discussed in Response #29 below.

Comment 28: ~ *There are crops that tolerate salt. Coconuts are one. An exploration of potentials for these plants should be explored. http://www.biosalinity.org/salt-tolerant_plants.htm*

Response 28: Please note that the crops in Mahi Pono's farm plan were chosen with the goal of increasing Hawai'i's food independence while also meeting criteria for commercial viability and potential. Those priorities outweighed the potential of a farm plan that consists entirely of salt-tolerant crops. As discussed in Response #22 above, attempts to grow coconut have met with limited commercial success and was not chosen to be a part of the Mahi Pono farm plan.

Comment 29: ~ *Details of well water tests should be presented in the Draft EIS and considered including dates and any specifics about presence of salts and chemicals such as 24D etc which were used by A and B.*

Response 29: Regarding your comment about well water tests for the Mahi Pono wells, please see the table below, which has been added to Section 4.2.2 of the Final EIS as shown on page 4-75.

State Well No.	TMK Number	Installed Pump Capacity (MGD)	Typical Range of Chlorides (MG/L) from 2003 through 2014¹	CWRM Delineated Aquifer System
4825-001	(2) 3-8-004:001	20.448	225 to 350	Pā‘ia
5226-002	(2) 3-8-006:001	24.048	350 to 550	Kahului
5224-002	(2) 3-8-003:004	15.120	350 to 550	Pā‘ia
5323-001	(2) 3-8-001:006	20.016	No data	Pā‘ia
5424-001	(2) 3-8-001:007	5.760	400 to 700	Pā‘ia
5522-001	(2) 2-5-005:021	8.640	350 to 525	Pā‘ia
5422-001	(2) 2-5-005:054	10.080	350 to 525	Pā‘ia
5422-002	(2) 2-5-005:020	11.664	325 to 475	Pā‘ia
5321-001	(2) 2-5-005:019	30.240	400 to 1600	Pā‘ia
5520-001	(2) 2-7-004:032	10.080	900 to 1600	Ha‘ikū

Please note that the salinity levels fluctuate and therefore a range was provided.

Moreover, please note that Section 2.1.4 has been revised in the Final EIS to more accurately describe the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono, and clarifies that only 10 of the 15 wells are on Mahi Pono lands and thus available for use by Mahi Pono, as shown on page 2-25.

The reference to 15 brackish wells was derived from the CWRM D&O, FOF 738, as that was the number of brackish wells that A&B utilized during its sugar cane operations. However, one of the 15 wells referred to, State Well No. 5128-002, does not serve the Central Maui agricultural fields and four of the other brackish wells are on lands that are not owned by Mahi Pono. As such, Mahi Pono has access to only 10 such wells. Draft EIS Figure 2-5 has been revised, as shown on page 2-24 to more accurately depict the water infrastructure within the Central Maui

¹ There is limited salinity data prior to 2003 and after December 2014, surface water for irrigation use rapidly declined as A&B ramped down operations prior to closing in 2016.

agricultural fields that is available to Mahi Pono to support its farm plan for the Central Maui agricultural fields.

Comment 30: *Thank you for this opportunity to submit my comments on, observations of and concerns about this draft EIS. I would like to hear your responses, ideas and changes to the Draft EIS which includes these valid and important concerns.*

Response 30: Please note that we have updated the Final EIS as applicable, and the Final EIS includes your comments and this response letter. Thank you for your participation in this EIS process.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.² Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

² Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

1907 S. Beretania Street, Suite 400
Honolulu, HI 96826

Dear Mr. Hirokawa and Mr. Matsukawa,

I am hydrologist and professional water resource engineer who has been working on stream and watershed management issues throughout the Hawaiian Islands for 15 years now. I am presently leading a watershed restoration program at Waipa, on the north shore of Kaua'i, and I am involved in hydrologic studies related to streamflow restoration campaigns on Kauai and Maui. In the past, I have worked as a hydrologist for the U.S. Geological Survey (USGS) and under a research appointment through the University of Hawai'i, and I have worked as a water resource engineer for the USDA Natural Resources Conservation Service as well as private engineering firms. I now operate my own business, consulting on various water and watershed management projects and studies. This letter is intended to express professional opinions and submit specific questions that I have related to the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanu, and Huelo License Areas – Draft Environmental Impact Statement (DEIS), dated September 2019. I appreciate the opportunity to review the subject document, and I respectfully present the following comments, questions, and concerns.

First, I object to any long-term water lease being issued by the State of Hawai'i until the subject of watershed management costs for the water lease areas is addressed. At this juncture, watershed management in Hawai'i is in great need of improvement. With certain groups excepted (e.g. The Nature Conservancy), there is not much active watershed management happening in the mauka portions of our drainage basins that I can see. The state Department of Land and Natural Resources – Division of Forestry and Wildlife (DLNR – DOFAW) is responsible for this task on the majority of our state Forest Preserve lands that make up much of the watershed area in urgent need of active management. Unfortunately, this agency is grossly under-funded to carry out such a massive responsibility, and they badly need funding assistance from other entities that would benefit from active watershed management practices. It makes perfect sense that water lessees that extract large volumes of freshwater from our forested watersheds for various uses help to bear the brunt of this burden. The state of Hawai'i has yet to develop a cost-share formula for this purpose, but once it does, water diverters like East Maui Irrigation (EMI) and Mahi Pono, LLC (MP) should be prepared for the substantial expenses associated with implementing watershed management plans in rugged and remote areas.

North Shore Hydrological Services

Matt Rosener, MS, PE, Principal

Also, the water lease unit rates that large water diverters in Hawai'i typically pay are much lower than market value rates in many other states. It seems that a market analysis is warranted in order to establish the fair market value of Hawai'i's water resources. This leads to the following question: how can EMI and MP properly evaluate the economics of their requested 30-year water lease from the East Maui license areas when they don't know what their projected costs will be for water lease rent and their portion of the cost-share arrangement for implementation of watershed management plans? This seems like a cart-before-the-horse scenario to me. With the prices that the state of Hawai'i is charging for control of this critical resource being so much less than those in other states, it makes one wonder if this proposed long-term water lease could be a water grab by an opportunistic foreign entity (MP). Of course, this is the last thing Hawai'i needs in regards to water resource management.

My specific questions about the DEIS and the proposed long-term water leases are as follows:

1. What is the current rate that EMI / MP pay to the State of Hawaii for their Revocable Permit(s) for water diversion from the East Maui license areas? I have been given some information about this topic, and I would like to confirm its accuracy.
2. What is the status of the water lease applicant in regards to any watershed management plan(s) that might satisfy the state's requirement for a long-term water lease?
3. What are the average Operations and Maintenance costs for the entire EMI water aqueduct system?
4. In regards to the "utility scale renewable energy component" of the MP Farm Plan, what amount of water (on average) is anticipated to be used from the EMI aqueduct system for hydropower generation?
5. Is the requested long-term water lease for all water from East Maui streams in excess of the recently-mandated Interim Instream Flow Standards? Or is there a maximum amount associated with the lease application?

I encourage EMI and MP to continue working towards instream flow restoration in waterways that now have IIFs in East Maui. I also encourage EMI and MP to continue working with the East Maui communities to build trust, based on actions and not only words. Mahalo for the opportunity to review the DEIS and ask the questions above. I will appreciate responses with clear and thorough information so that I may better evaluate the proposed water lease

Respectfully,

Matt Rosener, P.E.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Matt Rosener:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am hydrologist and professional water resource engineer who has been working on stream and watershed management issues throughout the Hawaiian Islands for 15 years now. I am presently leading a watershed restoration program at Waipa, on the north shore of Kaua‘i, and I am involved in hydrologic studies related to streamflow restoration campaigns on Kauai and Maui. In the past, I have worked as a hydrologist for the U.S. Geological Survey (USGS) and under a research appointment through the University of Hawai‘i, and I have worked as a water resource engineer for the USDA Natural Resources Conservation Service as well as private engineering firms. I now operate my own business, consulting on various water and watershed management projects and studies. This letter is intended to express professional opinions and submit specific questions that I have related to the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanu, and Huelo License Areas - Draft Environmental Impact Statement (DEIS), dated September 2019. I appreciate the opportunity to review the subject document, and I respectfully present the following comments, questions, and concerns.*

Response 1: We acknowledge your comments and understand that you are commenting based on your professional background as a hydrologist and experience with stream and watershed management issues throughout the State.

Comment 2: *First, I object to any long-term water lease being issued by the State of Hawai'i until the subject of watershed management costs for the water lease areas is addressed. At this juncture, watershed management in Hawai'i is in great need of improvement. With certain groups excepted (e.g. The Nature Conservancy), there is not much active watershed management happening in the mauka portions of our drainage basins that I can see.*

Response 2: We acknowledge your comments. As discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Furthermore, the lands under the jurisdiction of the East Maui Watershed Partnership span over 100,000 acres which includes the entire License Area. The License Area is actively managed by the multiple agencies and organizations, including EMWP, Maui Invasive Species Committee (MISC), DLNR, etc., in partnership with EMI.

Comment 3: *The state Department of Land and Natural Resources – Division of Forestry and Wildlife (DLNR – DOFAW) is responsible for this task on the majority of our state Forest Preserve lands that make up much of the watershed area in urgent need of active management. Unfortunately, this agency is grossly under-funded to carry out such a massive responsibility, and they badly need funding assistance from other entities that would benefit from active watershed management practices. It makes perfect sense that water lessees that extract large volumes of freshwater from our forested watersheds for various uses help to bear the brunt of*

this burden. The state of Hawai'i has yet to develop a cost-share formula for this purpose, but once it does, water diverters like East Maui Irrigation (EMI) and Mahi Pono, LLC (MP) should be prepared for the substantial expenses associated with implementing watershed management plans in rugged and remote areas.

Response 3: Regarding your comment about *the* State Department of Land and Natural Resources – Division of Forestry and Wildlife being grossly underfunded, please note that is outside the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included throughout Chapter 4 of the EIS.

However, it is expected that a budget for management of the License Area lands for watershed productivity will be part of fulfilling the watershed management plan requirement under HRS § 171-58. There are many existing mauka watershed plans, including those implemented by the State's Division of Forestry and Wildlife (DOFAW) and groups like the Watershed Partnerships. As discussed in Section 2.1 of the Draft EIS, A&B was a founding member of the East Maui Watershed Partnership (EMWP), which was the first watershed partnership in the State of Hawai'i and which served as a model for other watershed partnerships throughout the State. In reviewing existing watershed management plans in general, however, DLNR has recently determined that some of the existing watershed plans are not always directly correlated to the water lease area and some plans are old and outdated. In certain places, new threats to watershed health are not addressed in existing watershed plans. Additionally, DLNR determined that estimated budgets in such existing plans may not reflect the current cost of management if the plan is over 5 years old. As such, DLNR will work with proposed water lessees to determine if any existing plan meets the minimum content requirements and sufficiently addresses the protection of watershed forests and fresh water resources in the License Area. If it does not, DLNR will work with the lessee to determine the specific actions needed and jointly develop a new plan or update the existing plan as noted in Response #1 above. It should be noted that the existence of a watershed management plan does not absolve a water lessees' duty to help with the implementation of management actions. A lessee must provide DLNR proof that it is already contributing to the protection of the watershed, and membership in a Watershed Partnership may not fulfill the requirement of implementation.

DLNR and a water lessee will jointly develop a watershed management plan that cites existing management plans, meets the minimum content requirements, and outlines what reasonable management practices are needed for the water lease area and the current estimated costs associated with implementation. The new plan will be specific to the watershed(s) associated with the lease (the sources that feed the lease area) and management will be based on current estimated costs. One of the required elements of a watershed management plan is a budget, which entails a) an estimate of costs and categories of expenditures needed; and b) potential sources of funding for implementing the actions. See on pages 2-2 to 2-4 of the Final EIS.

Comment 4: *Also, the water lease unit rates that large water diverters in Hawai'i typically pay are much lower than market value rates in many other states. It seems that a market analysis is warranted in order to establish the fair market value of Hawai'i's water resources. This leads to the following question: how can EMI and MP properly evaluate the economics of their requested 30-year water lease from the East Maui license areas when they don't know what their projected costs will be for water lease rent and their portion of the cost-share arrangement for implementation of watershed management plans? This seems like a cart-before-the-horse scenario to me. With the prices that the state of Hawai'i is charging for control of this critical resource being so much less than those in other states, it makes one wonder if this proposed long-term water lease could be a water grab by an opportunistic foreign entity (MP). Of course, this is the last thing Hawai'i needs in regards to water resource management.*

Response 4: Please note that an appraisal to determine the fair market value of the Water Lease will be conducted prior to issuance of the Water Lease. The Department of Land and Natural Resources (DLNR), on behalf of the Board of Land and Natural Resources, will commission or approve the commissioning of the appraisal. The Economic and Fiscal Impact Study (Appendix H) prepared for the Draft EIS calculated the Water Lease payment based on the equivalent per unit cost under the existing 2019 revocable permit. As discussed in Section 4.7.3 of the Draft EIS

The revocable permit rent payment set in November 2018 was \$230,964.24, which represents an increase from the rent that was historically paid. Assuming 16.8 mgd was diverted in 2019 from the License Area under the revocable permit, the rent rate would translate to \$0.038 per thousand gallons.

However, please note that this discussion in Section 4.7.3 of the Final EIS has been updated to take into account the latest equivalent per unit cost under the latest revocable permit as shown on pages 4-277 and 4-283.

Comment 5: *My specific questions about the DEIS and the proposed long-term water leases are as follows:*

What is the current rate that EMI / MP pay to the State of Hawaii for their Revocable Permit(s) for water diversion from the East Maui license areas? I have been given some information about this topic, and I would like to confirm its accuracy.

Response 5: As noted above, in Section 4.7.3 of the Final EIS has been updated to take into account the latest equivalent per unit cost under the latest revocable permit as shown on pages 4-277 and 4-283. Hence, EMI pays \$238,362 which represents an increase from the rent that was historically paid. Assuming 32.3 mgd is diverted under the 2021 revocable permit, the Water Lease rent rate would translate to \$0.019 per thousand gallons. This rate of \$0.019 is assumed as the basis for the future annual Water Lease payment to the DLNR.

Comment 6: *What is the status of the water lease applicant in regards to any watershed management plan(s) that might satisfy the state's requirement for a long-term water lease?*

Response 6: As noted in Response #2 above, Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Comment 7: *What are the average Operations and Maintenance costs for the entire EMI water aqueduct system?*

Response 7: As noted in pages 4-277 and 4-283 of the Final EIS, total operational costs for EMI labor, fringe benefits, materials, professional services, taxes, Water Lease, and other expenses are projected to be \$2.22.3 million per year. This would translate to \$0.066 per kgal. A currently unknown factor in EMI's operating cost is the annual Water Lease payment to DLNR.

Comment 8: *In regards to the “utility scale renewable energy component” of the MP Farm Plan, what amount of water (on average) is anticipated to be used from the EMI aqueduct system for hydropower generation?*

Response 8: Please note that under the Proposed Action the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O which is estimated to be approximately 87.95 mgd from the License Area, and an additional 4.37 mgd between Honopou Stream and Māliko Gulch for a total of 92.32 mgd. As noted in Section 2.1.4 of the Final EIS, this water would also be for use in Central and Upcountry Maui. Those uses included the MDWS’ take for its Kamole-Weir WTP and the KAP and use by Mahi Pono and its lessees for agricultural, reservoir, and industrial needs (including dust control, hydroelectric, and fire suppression needs).

Comment 9: *Is the requested long-term water lease for all water from East Maui streams in excess of the recently-mandated Interim Instream Flow Standards? Or is there a maximum amount associated with the lease application?*

Response 9: Please note that under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O.

Comment 10: *I encourage EMI and MP to continue working towards instream flow restoration in waterways that now have IIFSs in East Maui. I also encourage EMI and MP to continue working with the East Maui communities to build trust, based on actions and not only words.*

Response 10: We acknowledge your comments. Please note that the SIA, as well as Section 4.7.2 of the EIS recommends that there be community outreach by the Applicant. However, terms of the Water Lease are at the discretion of the BLNR, and the Water Lease lessee will comply with all such terms.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC’s website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Alexander & Baldwin long term water lease draft EIS comments

Aloha,

On Behalf of the Hana Chapter of the Hawaii Farmers Union United and our approximately 75 active members who are farmers and farm supporters in East Maui, at our General Membership meeting held on Wednesday, October 3, our membership agreed on the following position regarding the Alexander & Baldwin long term water lease draft EIS:

The Hana Chapter opposes any water lease without a clear farm plan showing specific need for water usage.

Sincerely,

Matthew Van Paepeghem
President, Hana Chapter, Hawaii Farmers Union United

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Matthew Van Paepeghem:

Thank you for comments dated October 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *On Behalf of the Hana Chapter of the Hawaii Farmers Union United and our approximately 75 active members who are farmers and farm supporters in East Maui, at our General Membership meeting held on Wednesday, October 3, our membership agreed on the following position regarding the Alexander & Baldwin long term water lease draft EIS:*

The Hana Chapter opposes any water lease without a clear farm plan showing specific need for water usage.

Response 1: We acknowledge your comment and understand that the Hāna Chapter of the Hawai‘i Farmers Union United representing 75 members opposes the Proposed Action. However, please note that Chapter 2 of the EIS clearly articulates the water usage under the Proposed Action.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for

Re: Comments on DEIS Proposed Lease for the Nahiku, Ke'anae
Honomanu, and Huelo License Areas East, Central and UpCountry Maui, Hawaii

Dear Mr. Hirokawa:

On behalf of Nā Moku Aupuni o Ko'olau Hui, Lurlyn Scott, Sanford Kekahuna, and other farmers, fishermen and women, and gatherers of native plants and stream animals in the East Maui region, the Native Hawaiian Legal Corporation submits its comments on the Draft Environmental Impact Statement ("DEIS") submitted by Alexander & Baldwin, Inc. and East Maui Irrigation Co. Ltd (collectively, "A&B") for the Proposed Lease ("Water Lease") for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas published on September 23, 2019.

The DEIS is deficient as it does not address the most pertinent concerns raised in our early consultation comments in a letter we submitted on December 29, 2016 and in our comments on the Environmental Impact Statement Preparation Notice ("EISP") dated March 10, 2017. The DEIS not only fails to meet the content requirements articulated in HAR § 11-200-17, it ignores the responsibility the Board of Land and Natural Resources ("BLNR") has pursuant to HRS chapter 343, the public trust doctrine, and Native Hawaiian rights to ensure that the EIS thoroughly and completely assesses the impacts of a project requiring its approval. HRS § 343-5(c) provides that the "authority to accept a final statement shall rest with the agency receiving the request for approval"; it is not the applicant's decision as to whether the FEIS is sufficiently detailed and complete. The fact that the agency has to make an independent decision is reinforced by decisions of the Hawai'i Supreme Court: *Ka Pa`akai O Ka`aina v. Land Use Commission*, 94 Hawai'i 31, 51, (2000) and *Kelly v. 1250 Oceanside Ptnrs*, 111 Haw. 205 (2006).

The public trust doctrine requires that the BLNR:

. . . take the initiative in considering, protecting, and advancing public rights in the resource at every stage of the planning and decision-making process. Thus, the state may compromise public rights in the resource pursuant only to a decision made with a level of openness, diligence, and foresight commensurate with the high priority these rights command under the laws of our state. Such a duty requires DOH [and the BLNR] to not only issue permits after prescribed measures appear to be in compliance with state regulation, but also to ensure that the prescribed measures are actually being implemented after a thorough assessment of the possible adverse impacts the development would have on the State's natural resources.

Kelly v. 1250 Oceanside Ptnrs, 111 Haw. 205, 231 (2006) (internal citations and marks omitted).

The applicant likewise has important duties. It must adhere to the EIS rules. These rules provide that an “EIS is meaningless without the conscientious application of the EIS process as a whole, and shall not be merely a self-serving recitation of benefits and a rationalization of the proposed action.” HAR § 11-200-14. It is clear that A&B has not taken its responsibilities seriously. A&B has ignored many of the questions and concerns raised in our early consultation comments and comments on the EISPN and are attempting to defer answering these crucial questions until *after* the issuance of the 30-year lease. This proposition defies all logic considering it has been over 16 years since Judge Hifo first required that an EIS must be performed prior to the issuance of a contemplated 30-year lease to A&B. Furthermore, A&B has had over three years to adequately address the concerns raised during the EISPN phase. A&B should not be able to side-step fundamental requirements in their DEIS simply because they are of the position that a 30-year lease will not upset the status-quo of stream diversion conditions that has negatively impacted the region for over 100 years. A&B is taking the same approach in their DEIS as they are in the pending litigation concerning these issues. Namely, they argue mootness on the grounds that certain streams have been restored and therefore there is no harm since issuance of the Water Lease would not create more harm than what has historically existed. The entirety of the DEIS was crafted informed by this false proposition.

The conclusion that documented cultural and environmental impacts have already been addressed per the IIFS decision taints the overall analysis of the DEIS because this conclusion was already set prior to A&B hiring consultants and conducting all of the necessary research involved with implementing the DEIS. The presumption that adverse impacts have already been addressed through the IIFS decision no doubt limits A&B from considering ways in which cultural practices and the environment may be adversely impacted beyond the 27 streams petitioned for, which make up only a fraction of the 33,000 acre License Area which encompass hundreds of streams and tributaries and miles of coastline. Notably, since the amended IIFS for

a portion of the 27 petitioned streams provides only “minimum streamflow levels,” it is questionable whether the IIFS adequately addresses cultural and environmental protections for those streams. To argue that there is no longer an impact because minimal standards are being met is not only flawed but dangerous when applied to the overall analysis of an allegedly objective report. Rather than thoroughly addressing potentially adverse impacts and proposing measures for “avoiding, minimizing, rectifying or reducing” those impacts as required by the EIS rules, A&B has merely provided a “self-serving recitation of benefits and a rationalization of the proposed action.” HAR § 11-200-14. In summary, the DEIS does not provide an objective and accurate analysis of the numerous potential impacts of the Proposed Action and therefore does not provide the BLNR with an adequate roadmap on how to mitigate those impacts moving forward.

The DEIS Fails to Adopt Appropriate Baseline Conditions

In 2003, Judge Hifo resolved the issue of what would constitute the appropriate baseline condition for A&B in preparing an EIS:

... the Court finds that *Confederated Tribes and Bands of the Yaltima Indian Nation v. Federal Energy Regulatory Commission*, 746 F.2d 466, 475-477 (9th Cir. 1984), which held that the relicensing of a power plant needed to be analyzed *as if it were the original licensing of the plant*, is persuasive, as appellants argued, and would require an environmental assessment (EA), and perhaps an environmental impact statement (EIS), depending upon the result of the EA, for a long-term lease which constitutes the first long-term lease of this water since at least 1985.

Hifo Order (emphasis added).

In this instance, under the DEIS, A&B sets the baseline condition at the conditions under which A&B has historically diverted the streams, contrary to an explicit court ruling, from which A&B never appealed after final judgment. As it states:

Baseline Condition – Full Diversion

The lower boundary for the HSHEP model was full diversion by the EMI Aqueduct System in its current configuration as existed under sugar cultivation, which was the prevailing conditions for nearly 100 years. (Trutta, p. 41, 2019) The Full Diversion scenario assumes that all the diversions in the EMI Aqueduct System are fully open or diverting 100% of available low flows, roughly analogous to the stream’s baseflow. The diversions in the EMI Aqueduct System were built to capture 100% of normal low flows plus some small amount of storm runoff. Hawaiian streams are “flashy”, meaning discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions. When low flow conditions persist and water needs call for all the low flow to be diverted, the streams can be dewatered below the diversions resulting in negative

impacts on species habitat and passage. Although the Full Diversion condition has not existed for more than ten years, *it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production.* (Trutta, p. 55-56, 2019) Under Full Diversion conditions, approximately 46% of the total HU remained; or conversely, Full Diversion conditions reduced the number of HU by approximately 54%.

DEIS 4-56 (emphasis added). This DEIS cannot identify the fully diverted status of the streams in the license areas as the baseline condition. Comparing the resulting environmental consequences of its proposed diversions from this perspective would make a mockery of HRS chapter 343 and its implementing rules, HAR subchapter 11-200, as well as defy a court precedent on this very issue.

Moreover, considering the harshest possible alternative of complete diversion under sugar cultivation, the amount of diversion under the Proposed Action seems like a reasonable compromise and a far better alternative. Pursuant to HAR 11-200-17(g), the DEIS must include a “description of the environment in the vicinity of the action, as it exists before commencement of the action.” In order to conform to the actual facts, this description should include post sugar plantation closure conditions that were present immediately before the commencement of the action. HC&S stopped using irrigation water in early 2016. Mahi Pono only recently began test crop cultivations that require water. Hence, there was at least a two-year gap in the supposed “continuation” of the EMI aqueduct at any level of use by this successor-in-interest to HC&S’s irrigation water use. Therefore, using the conditions that existed at the height of water diversion which no longer existed prior to the proposal of the Water Lease as the lower boundary in any assessment of the Proposed Action is a flawed approach and is in direct opposition to both legal precedent and the actual facts.

Median Flow Requirements Fail to Accurately Quantify Diversion Amounts

Throughout the DEIS it is assumed that under the Proposed Action the Water Lease would grant the right to collect up to the maximum amount of water from streams within the License Area allowed by the CWRM D&O, which is estimated to be approximately 87.95 mgd. DEIS at 2-8. This median flow required by the CWRM D&O, however, is the total estimated flow diverted from dozens of streams (and their tributaries) and measured at Honopou Stream, where the EMI Aqueduct System leaves the License Area. *Id.* The allowable diversion amount under the Water Lease, however, provides little assurance that each stream’s required median flow will be met in the absence of quantifying actual diversion amounts on a stream-by-stream basis. Without accurate calculations or estimates regarding the amount of water taken from each individual stream, there can be no accurate assessment of the potential impacts those diversions would have on the streams and the surrounding environment.

The DEIS Fails to Disclose Diversion Locations and Diversion Amounts

In our early consultation comments and comments on the EISPN we expressed that the EIS should provide at a *minimum*:

- Full disclosure of every single diversion along the East Maui Irrigation system (including photographs and descriptions as to how the diversion operates, how much water it diverts from the stream daily (on average and at minimum and maximum), and its precise location);

Pursuant to HAR § 11-200-17(e)(6), the DEIS should contain a project description that includes a summary of “technical data, diagrams, and other information necessary to permit an evaluation of potential environmental impact.” The DEIS fails to adequately disclose how much water will be diverted and when. Notably, the DEIS acknowledges on page 8-1 that the content and parameters of a watershed management plan between the lessee and the DLNR is yet to be resolved. The key components needed to finalize the Water Lease, including its terms, have still not been completed. One would think that one of the most essential terms to the Water Lease would be the amount of water proposed to be diverted and which specific areas those diversions would include. The DEIS discloses no proposed diversion amounts from individual stream sources and how those proposed amounts would impact the surrounding environment. The Water Lease should not be issued until all of the essential facts allowing for its implementation are revealed and subject to public opinion. Anything less would circumvent the very process of calling for an EIS.

While Trutta Environmental Solutions, LLC (“Trutta”) was contracted to develop a Hawaiian Stream Habitat Evaluation Procedure (“HSHEP”) model to assess impacts of surface water diversion, including instream habitat from constriction or diversion of stream flow, creation of barriers to stream animal upstream movement and entrainment of downstream drifting larvae in 33 streams, the model falls short by failing to: (1) quantify the amount of water currently being diverted; (2) identify the amount of water that will be diverted under the Proposed Action; (3) identify specific diversion locations to be used under the Proposed Action; and (4) quantify the impact any modification or action of those diversion locations would pose to native species and the significant cultural implications occurring as a result of limiting the ability to access certain diversion locations while availability of native species at and around those access points would be limited.

The DEIS fails to address key concerns surrounding the diversion of water. Indeed, one of the specifics within the 2018 IIFS that was applied to the HSHEP model was that “[t]he IIFS are the estimated 64% of median base flows (BFQ50), also known as (H90) flows, for stream restoration, and the numbers are *only estimates, to eventually be confirmed by actual flows* from

which the H90 can be established.” (HSHEP at p. 57; *emphasis added*). Reliance on calculations not confirmed by an actual measurement of flows at each individual stream is a flawed approach and must be reevaluated after the appropriate measurements are taken.

We also insisted that the EIS disclose the following information for *each* alternative analyzed:

- The amount of water proposed to be taken from each stream daily (on average and at minimum and maximum);
- The amount of water proposed to be taken from each license area daily (on average and at minimum and maximum);
- The total amount of water proposed to be taken from the entire license areas daily (on average and at minimum and maximum).

Given that there is no disclosure on possible diversion amounts for the Proposed Action, the DEIS further fails to address these concerns over each alternative. Without knowing how much water is proposed to be diverted from each stream, each individual license area, and the entire license areas taken together as a whole, it is impossible to run accurate scenarios on the impacts those diversions would pose.

The DEIS Fails to Address Concerns Over Access to Culturally Important Areas

We have also requested in our early comments and comments on the EISPN that the EIS provide the following:

- Maps indicating all maintenance and/or access roads for the diversion system including identification of all access points at public roads and/or highways;
- Maps that show every single stream within East Maui, including all tributaries from mauka to makai, identified by name; and

HAR § 11-200-17(e)(1) provides that the DEIS should include detailed topographical and regional maps. While the DEIS does provide an array of maps, none of them address the concerns indicated in our comments above and are devoid of showing and/or identifying diversion systems as they are located next to access areas. This information is critical as it relates to the accessibility of areas significant to the traditional and customary practices of gathering, farming, fishing, etc., along streams and streambeds potentially impacted by the Proposed Action. The DEIS fails to address accessibility issues. The EIS should identify the location of access points within the License Area and whether or not those access points will be impacted stream diversion. The EIS should also disclose whether use of access roads or

pathways associated with maintenance of the EMI system will be restricted under the Proposed Action and identify those locations accordingly.

The DEIS Fails to Adequately Consider Alternative Water Sources

We have also raised the following concerns in our previous comments:

- Alternative proposed uses including one that involves the use of water from less than all four license areas and no diversion of water from East Maui.

HAR § 11-200-17(f)(2) states the DEIS should list proposed alternative uses which could attain the objections of the action and to explain in sufficient detail why those alternatives were rejected. Despite the concern raised above in 2016, A&B has not adequately considered the possibility of seeking water sources other than diverting water from the subject license areas in order to attain the objectives of the Proposed Action.

The DEIS Fails to Satisfy *Ka Pa'akai*

The DEIS acknowledges *Ka Pa'akai* but misapplies it by improperly deferring key disclosures required by that precedent to an unknown time. Through its own *Ka Pa'akai* analysis, the DEIS admits that the inquiry does not end once the valued cultural, archaeological, and historical resources have been identified.¹ Accordingly, “the second and third prongs of the *Ka Pa'akai* analysis require the agency to determine how any of the resources may be impacted

¹ A note to HAR 11-200-12 states:

Act 50, Session Laws of Hawai'i 2000, amended the definition of “significant effect” in HRS Section 343-2 to mean “the sum of effects on the quality of the environment, including actions that irrevocably commit a natural resource, curtail the range of beneficial uses of the environment, are contrary to the State's environmental policies or long-term environmental goals as established by law, or adversely affect the economic [or] welfare, social welfare[.], or cultural practices of the community and State.”

Act 50 also amended the definition of “environmental impact statement” or “statement” in HRS Section 343-2 to include the disclosure of effects of a proposed action on cultural practices, as follows:

“environmental impact statement” or “statement” means an informational document prepared in compliance with the rules adopted under section 343-6 and which discloses the environmental effects of a proposed action, effects of a proposed action on the economic [and] welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects.

(emphasis in original).

by the proposed action, and what, if any, feasible measures can be taken to protect the resources.” CIA at 393.

Rather than addressing the second and third prongs of the analysis, there is a generic assumption that application of the IIFS decision has the “potential to reduce or eliminate” the proposed cultural impact and therefore no further recommendation is needed as to the implementation of feasible protective measures. Most importantly, the recommendations given push a more detailed assessment to be provided in the future by a “qualified professional.” Providing a detailed assessment *in the future* rather than submitting a detailed assessment with the DEIS fails to satisfy *Ka Pa’akai* because plans to reasonably protect cultural resources are clearly erroneous if they are only conceptual in form. It also conflicts with the very definition of an EIS,² by depriving the BLNR of the environmental impact studies and alternatives analysis necessary for its informed decision-making.

Relying exclusively on a sister agency like the CWRM and post-dating a more detailed assessment addressing listed and recognized cultural impacts is the very definition of conceptual and goes against the entire purpose of submitting an EIS in the first place. It also contravenes a prior court order in related litigation that explicitly prohibits BLNR from “merely rubber-stamping every CWRM determination.” *Na Moku Aupuni O Ko’olau Hui and Maui Tomorrow v. BLNR*, Civ. No. 03-1-0289-02 (1CC Order filed Oct. 10, 2003 (hereafter, “Hifo Order”).

While there is an extensive list of Traditional Cultural Practices (hereafter, “TCP”) impacted by the Proposed Action and what streams are associated with those practices, the DEIS and the Cultural Impact Assessment (“CIA,” attached as Appendix F) fail to provide any meaningful assessment since there is a lack of disclosure as to the amount of water to be taken from each stream. *See* CIA at 352-72, Tables 13 and 14.

² HAR 11-200-14 provides:

... the EIS process involves more than the preparation of a document; it involves the entire process of research, discussion, preparation of a statement, and review. The EIS process shall involve at a minimum: identifying environmental concerns, obtaining various relevant data, conducting necessary studies, receiving public and agency input, evaluating alternatives, and proposing measures for avoiding, minimizing, rectifying or reducing adverse impacts. An EIS is meaningless without the conscientious application of the EIS process as a whole, and shall not be merely a self-serving recitation of benefits and a rationalization of the proposed action. Agencies shall ensure that statements are prepared at the earliest opportunity in the planning and decision-making process. This shall assure an early open forum for discussion of adverse effects and available alternatives, and that the decision-makers will be enlightened to any environmental consequences of the proposed action.

(emphasis added).

For example, the discussion on (a) the role of fresh water providing for the ecosystem vital to perpetuating the life of marine foods important to residents and (b) the historic use of kākā and kūkaula fishing methods suggests a recognition of the community's reliance on continued fishing and other marine life gathering. CIA at 391-92. The DEIS provides a table of these gathering practices. CIA at 352-71, Table 13. However, without a richer and more detailed revelation of a scientific *assessment of impacts* from past, current and future diversions from the streams identified, BLNR cannot evaluate the quantitative consequences on any affected TCP along stream segments, or in stream mouth ecosystems within the watershed. Environmental disclosures for each of these specific micro-environments is crucial to a complete analysis of TCP impacts and reasonable protective measures specific to those practice locations.

The CIA acknowledges the community residents who rely on both stream life (o'opu, 'ōpae, and hīhīwai) and marine life food sources, all of which rely on the steady flow of fresh water in streams flowing from the mountains to the ocean. CIA at 352-54, 359, 388-89, 392. It acknowledges witnesses who attest to declines in stream life, marine life, and the health of various fish species and populations. *Id.* In general, historic stream gathering of 'ōpae from mauka to Makai, now apparently restricted to the upper reaches of streams due to the availability of cooler water now only in "mountain areas" where stream flows still remain abundant. CIA at 392 (citing to expert Skippy Hau). However, once again, the DEIS is devoid of watershed specific analysis of the impacts of specific diversions in each stream, depriving the reader of any appreciation for the impacts these specific diversions are having on any particular stream watershed. Without location information on diversions, or a scientific assessment on each affected watershed, the BLNR as a regulator would not be able to fashion reasonable protective measures specific to those affected stream stretches affected by specific diversions.

EMI diverts multiple streams, up to four times in some instances, affecting the stream course at varying elevations differently. These multiple diversions along a single stream reflects the gaining and losing nature of that stream segment, which may affect the nature of the protective measures and underscore why a one-size-fits-all approach is inappropriate.

Similarly, the CIA discussion of kupuna who once caught and ate 'ōhua and hinana living in certain tributaries suggests that those locations might be targeted for similar protective measures. CIA at 392. However, without more location-specific data or impact assessments, BLNR would not be able to address possible protective measures that would have to rely on which tributaries are targeted for possible diversions that affect those species.

Again, one of the documented community concerns listed in the CIA was seeking clarification on stream flow, water diversion, and climate statistics as is expressed in the following questions: (1) How much water is being diverted at each location of intakes, ditches, dams, pipes, and flumes?; (2) How much water is being diverted from East Maui to Central

Maui?; and (3) Is climate change accounted for? CIA at 393-94. The recommendation provided is as follows: “It is recommended that these questions be addressed by qualified professionals who possess an understanding of stream flow mechanics, water diversion, and climate statistics within the License Area.” While the more detailed assessment may presumably be found in Appendix A of the DEIS, none of these crucial questions are answered. Notably, these same concerns were brought to the attention of A&B prior to them conducting the aforementioned reports in our EISPN comments back in 2016.

Hence, the DEIS provides none of the disclosures required by the law and denies the BLNR and the public of critical information related to the “unavoidable impacts” of A&B’s proposed use.

Given the above, BLNR is afforded no mechanisms for the reasonable protection of gathering practices that are specific to the habitat locations in the streams affected by diversions.

Streams Not Subject to the 2018 CWRM Decision

The DEIS identifies 13 streams³ not subject to a CWRM IIFS and have never been assessed for how stream diversions from them may have affected their habitats. (See, DEIS at 1-16 to 1-19, Table 1-3). A&B must perform, at a minimum, a *Ka Pa’akai* analysis for each of them and report the results in the EIS, prior to causing any diversions from them. It must also conform to the EIS requirements outlined above, including the “unavoidable impacts” of the use of non-renewable resources, like water, and irreversible curtailment of the uses of the environment, like stream diversions.

These disclosures must be related to each specific stream watershed and brackish water ecosystem that is impacted by the various levels of diversions. A reasonably objective impact assessment would address impacts of each specific diversion on the stream habitat of each particular stream affected by those diversions. There are sound biological reasons for determining how depleting flow in one stream may impact an adjacent stream or other streams within the same region. In other words, the impact assessment should account for cross-stream effects on habitats as well.

Impacts on Flora

As expressed in our comments to the EISPN, we raised a concern that the EIS should not only consider impacts on flora found in the four license areas, but in areas that lie beyond and downstream that are impacted by the Proposed Action’s reduction in streamflows. We further

³ Puakea, Kōlea, Punalu’u, Ka’aiea, ‘O’opuola (Makainali Tributary), Puehu, Nā’ili’ilihaele, Kailua, Hanahana (Ohanui Tributary, aka Hanawana and Hanauna), Hoalua, Waipi’o, Mokuapapa, Ho’olawa (Ho’olawaili and Ho’olawa nui Tributaries), DEIS 1-16 to 1-19, Table 1-3.

stated that the EIS should address the impact of reduced streamflows on the type and amount of vegetation that grows in the streambed, effects on native species, and the proliferation of alien species in and along the streambeds. Not only did the DEIS fail to address vegetation within the streambed, the survey was only conducted within the License Area. The general conclusion in the DEIS is that the Proposed Action would have no impact on terrestrial flora of fauna resources because the action does not require vegetation removal and it involves “the use of roads and a system that has been in place for over 90 years.”

The DEIS clearly did not address the potential adverse impacts reduced streamflows would have on vegetation growing in and around streambeds. Accordingly, a more thorough analysis of this impact should be provided.

Lo’i Kalo

In order to address the actual and potential impacts of diversion on kalo growing, the DEIS recommends that a “botanist, ethnobotanist, or similar qualified professional provide an assessment of the ideal conditions of water flow and water temperature needed for kalo growth in comparison to the current water flow and water temperature of impacted areas in order to understand and address the stated impact.” DEIS at 4-128; *see also*, App. F. CIA at 394-95. Again, it is assumed that the IIFS decision “has the potential to reduce or eliminate this cultural impact,” as eight of the streams identified by community participants have been fully restored in accordance with the IIFS. *Id.* While these assumptions as they relate to certain impact areas are devoid of any meaningful review, there may very well be other areas where kalo or crop growing activity is impacted by diversions. As such, there should be an appropriate assessment for areas where prior dewatering of streams, like Honomanū, which may potentially attract a restoration of traditional taro growing areas abandoned due to the lack of a steady source of irrigation water. Similarly, the historic pattern of lo’i kalo growing area much larger than what currently exists. CIA at 391.

Collectively in this EIS draft, the reader cannot know what the significance of impacts there may be from diversions from individual streams without the specifically located stream diversion meters in place that would generate that information. Without that information the DEIS denies the BLNR and those who are affected at any particular stream specific habitat location that has suffered reduced stream flows that could be affecting stream species and marine food species that rely on the brackish water ecosystem interface where streams discharge into the ocean, both of which are of cultural importance to gatherers. This result is unacceptable and renders this cultural impact assessment fatally defective.

Proposed Action is Vague

The Proposed Action specifies no amount representing a volume of water being sought, other than the supposed surface water amount that would exceed the CWRM IIFS, i.e., 87.95 mgd, the only figure mentioned for possible use in the DEIS. Nevertheless, throughout the DEIS, there is no objective basis to justify an amount based on any demonstrated level of actual need. In fact, the specifications of alternatives prescribe no alternative levels of water diversion, accept a generally worded “Water Lease Volume Alternative” that is imprecise as to actual amounts of water being sought. Since there is no discussion throughout the entire DEIS regarding the amount of water being sought, there is no elaboration as to the need for the volume of water to be diverted under the Water Lease. Instead of offering different alternatives for water needed to irrigate the crops it has been planning to cultivate since January 2016, the DEIS leaves nothing for the BLNR to consider as projected impacts for the desired level of water A&B is seeking, defeating the very purpose of an EIS.

In other words, A&B seeks a lease to 33,000 acres of ceded lands, formerly Crown Lands, for the authority to take whatever amounts of water it decides, subject only to the 2018 CWRM IIFS and what water reservation is established for the DHHL, so long as the water is used for: (1) Irrigation water to support agribusiness operations on 30,000 acres of agricultural land in Central Maui; and (2) the domestic water needs of the MDWS.

Without specifications for water amounts sought beyond the MDWS domestic water needs, the DEIS is a vacuous exercise, as it reveals nothing about the potential impacts that would be generated at *any* level of diversion. A&B, simply put, wants a blank check to be able to disclose impacts from water diversions of unspecified amounts, which it describes in the vaguest of terms. This approach defies a core requirement for EIS content. HRS §343-2 (defining in part “Environmental Impact Statement” as “an informational document ... which discloses the environmental effects of a proposed action, ... and **alternatives to the action** and their environmental effects”) (emphasis added). .

A&B should have used Mahi Pono’s projected water demands for its crop irrigation, reported in detail to the BLNR just last month, in order to accurately incorporate various levels of water diversions from streams. At a minimum, based on Mahi Pono’s public representations, this DEIS should analyze impacts of diverting the levels of water it identified (45-55 mgd) and present those anticipated impacts in a cogent analysis to the BLNR and the general public through a revised and updated DEIS. A&B could have easily done such an impact analysis by assuming different levels of water demand related to projected levels of cultivation on the 30,000 acres it is now identifying as future diversified agricultural areas in Central Maui.

Incidentally, Mahi Pono demonstrated that it has actual calculations for projected water demand. In the October 2019 meeting of the BLNR, Mahi Pono revealed that it is seeking 45-55 mgd for its current agricultural plan. However, there is no hint of any such projected demand in the DEIS, nor any justification for any projected water demand and the impacts those levels of water diversion would generate. Specifically, how much water would be diverted at each individual stream in order to accommodate the demand amount. A meaningful impact assessment cannot be entertained without meeting these two simple criteria: (1) a fair acknowledgment and calculation as to the amount of water demanded; and (2) how that volume of water is proposed to be diverted from stream sources.

After considering the HSHEP model results that the Proposed Action would have a negative impact by reducing native stream animal habitat from “Natural Flow” conditions in its discussion of the 2018 CWRM D&O setting the IIFS, A&B asserts how the CWRM should make decisions about instream flows in their analysis. “[T]he CWRM must weigh the importance of the present or potential instream values with the importance of the present or potential uses of water for noninstream purposes, including the economic impact of restricting such uses. It is also its duty to establish IIFS that protect instream values to the extent practicable and to protect the public interest.” (DEIS at 4-57). Given these considerations, the CWRM was cited in their decision as stating that it is both “reasonable and beneficial to use a portion of East Maui stream water for the development of diversified agriculture on Maui’s central plains.” (DEIS at 4-58, citing CWRM D&O at vi).

While the above considerations may be applicable for the CWRM in setting the IIFS, this analysis is devoid of the specificity required for a meaningful EIS. The present or potential instream values can only accurately be determined when there are actual values, i.e., the amount of water being demanded, is attributed to that value. Importantly, even though the CWRM has agreed that a portion of East Maui stream water should be used for the development of diversified agriculture, it is up to the EIS to determine what that “portion” should be and to justify that value accordingly. The DEIS has failed to do so and is misleading by broadly quoting the CWRM in order to justify diverting an undisclosed amount of stream water *after* the issuance of the subject Water Lease.

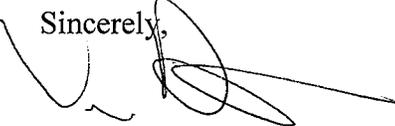

Response to Comments

As the Hawai’i Supreme Court has observed, the “applicant must respond in writing and address all concerns and questions before proceeding with the development of the EIS. Once this phase of the process is complete, the applicant then begins preparation of the EIS.” *Sierra Club v. Office of Planning*, 109 Haw. 411, 415 (2006) (emphasis added). *See also*, HAR §§ 11-200-15(D), -22(C) and -23.

Page 14

A&B has ignored or discounted many of the questions asked in our previous letters and comments. To the extent any of our questions or concerns remains unanswered, we request the EIS not be accepted until those concerns are answered and adequately addressed.

We look forward to the continued participation in the consultation process required to prepare the EIS. Should you have any questions or concerns regarding the above, please do not hesitate to contact our office at (808) 521-2302.

Sincerely,

Vincent Raboteau

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Vincent Raboteau:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *On behalf of Na Moku Aupuni o Ko‘olau Hui, Lurlyn Scott, Sanford Kekahuna, and other farmers, fishermen and women, and gatherers of native plants and stream animals in the East Maui region, the Native Hawaiian Legal Corporation submits its comments on the Draft Environmental Impact Statement ("DEIS") submitted by Alexander & Baldwin, Inc. and East Maui Irrigation Co. Ltd (collectively, "A&B") for the Proposed Lease ("Water Lease") for the Nahiku, Ke'anae, Honomanii, and Huelo License Areas published on September 23, 2019.*

Response 1: We appreciate the Native Hawaiian Legal Corporation’s (NHLC) participation in this EIS process. We acknowledge your comment and it is our understanding that the NHLC is submitting comments on the subject Draft EIS on behalf of Nā Moku Aupuni o Ko‘olau Hui, Lurlyn Scott, Sanford Kekahuna, and other farmers, fishermen, and women, and gatherers of native plants and stream animals in the East Maui region.

Comment 2: *The DEIS is deficient as it does not address the most pertinent concerns raised in our early consultation comments in a letter we submitted on December 29, 2016 and in our*

comments on the Environmental Impact Statement Preparation Notice ("EISPN") dated March 10, 2017.

Response 2: Your comment lacks specificity about NHLC's most pertinent concerns. The Draft EIS was prepared after taking into consideration all of the information that was obtained in connection with the pre-assessment consultation, the comments submitted in response to the EIS Preparation Notice (EISPN), which was published on February 8, 2017, the two voluntary public scoping meetings that we, Wilson Okamoto Corporation (WOC), held during the EISPN public comment period, and in compliance with the EIS context requirements under HAR Title 11, Chapter 200, including without limitation the requirements under HAR § 11-200-17. Specifically, pre-assessment consultation was started in November 2016 with the mailing of letters to numerous parties, including NHLC, seeking comments on the EIS. WOC held two voluntary public EIS scoping meetings (one in Kahului on February 22, 2017, and one at the Ha'ikū Park and Community Center in Pā'ia on February 23, 2017) during the EISPN public comment period. See Appendix K and L for transcripts of the scoping meetings, and Appendix J and M for early consultation letters, and letters commenting on the EISPN. NHLC's comments provided during early consultation, dated December 26, 2016, and NHLC's comments dated March 10, 2017 in response to the EISPN, were addressed and responded to as shown in Appendix J and Appendix M of the Draft EIS. As noted in those letters, NHLC's comments and concerns were considered in the preparation of the Draft EIS with regard to meeting the content requirements under HAR Title 11, Chapter 200.

Comment 3: *The DEIS not only fails to meet the content requirements articulated in HAR § 11-200-17, it ignores the responsibility the Board of Land and Natural Resources ("BLNR") has pursuant to HRS chapter 343, the public trust doctrine, and Native Hawaiian rights to ensure that the EIS thoroughly and completely assesses the impacts of a project requiring its approval. HRS § 343-5(c) provides that the "authority to accept a final statement shall rest with the agency receiving the request for approval"; it is not the applicant's decision as to whether the FEIS is sufficiently detailed and complete. The fact that the agency has to make an independent decision is reinforced by decisions of the Hawai'i Supreme Court: *Ka Pa'akai o Ka'aina v. Land Use Commission*, 94 Hawai'i 31, 51, (2000) and *Kelly v. 1250 Oceanside Ptnrs*, 111 Haw. 205 (2006).*

Response 3: The Draft EIS included a "Content Checklist" identifying each element under HAR § 11-200-17 and where within the text of the Draft EIS information on each particular element could be found. Please note that the Content Checklist has been updated based on updated discussions and additions added to the Final EIS as shown subsequently after the front cover.

Your comment does not explain how the Draft EIS "ignores" the Board of Land and Natural Resources' (BLNR) responsibilities. The BLNR is identified as the accepting authority for this EIS and it will determine if the EIS is acceptable pursuant to the standards under Hawai'i Revised Statutes (HRS) Chapter 343 and HAR Title 11, Chapter 200. We acknowledge that it is not up to the Applicant to make the final determination on whether the EIS is sufficient and acceptable. That role belongs to the applicable accepting authority, as discussed in EIS Section 1.4:

For the purposes of HRS Chapter 343, the applicant for the Water Lease is A&B, pursuant to orders of the BLNR in April and June of 2016, directing A&B to prepare an EIS. In accordance with HAR of the State of Hawai'i Department of Health (DOH), Section 11-200-4(b), the BLNR, as the executive board of the DLNR, is the accepting authority for the proposed EIS because the DLNR is the agency initially receiving and agreeing to process the request for the issuance of a Water Lease at public auction.

Your comment about the BLNR having public trust responsibilities is acknowledged, and that issue is addressed in Response #4 below. Moreover, a discussion regarding the Public Trust Doctrine has been added as Section 1.5 to the Final EIS as shown on pages 1-25 to 1-27.

Comment 4: *The public trust doctrine requires that the BLNR: . . . Take the initiative in considering, protecting, and advancing public rights in the resource at every stage of the planning and decision-making process. Thus, the state may compromise public rights in the resource pursuant only to a decision made with a level of openness, diligence, and foresight commensurate with the high priority these rights command under the laws of our state. Such a duty requires DOH [and the BLNR] to not only issue permits after prescribed measures appear to be in compliance with state regulation, but also to ensure that the prescribed measures are actually being implemented after a thorough assessment of the possible adverse impacts the development would have on the State's natural resources. Kelly v. 1250 Oceanside Ptnrs, 111 Haw. 205, 231(2006) (internal citations and marks omitted).*

Response 4: We acknowledge that the Proposed Action (the issuance of a 30-year Water Lease by BLNR), requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai'i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. The dual roles of BLNR and its sister agency, Commission on Water Resources Management (CWRM), as Public Trustees with regard to the amount of water that the Public Trust Doctrine requires to be left undiverted from the streams in the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to BLNR for the issuance of the Water Lease. As such, we expect BLNR, in its decision-making regarding the requested issuance of the Water Lease, to follow the

judicial guidance that has already been given regarding what is necessary for BLNR to comply with the requirements of the Public Trust Doctrine.

Please note, moreover, that finalization of this EIS does not result in issuance of the Water Lease. Any decision on the Water Lease auction and issuance of the Water Lease would happen only after completion of this EIS, and through a separate process before the BLNR. Accordingly, the present situation is unlike the situation in the *Kelly v. 1250 Oceanside Ptnrs* case cited in your comment above. That case did not deal with a disposition of a Public Trust resource or with the preparation of an EIS. It dealt with alleged failures by the County of Hawai'i Planning Department and the State Department of Health to be proactive before issuing a regulatory permit potentially affecting runoff into protected coastal waters. It was alleged that permits were issued without an adequate evaluation of this potential and, subsequently, excessive runoff occurred during a series of heavy rainstorms. While the Public Trust duty to be proactive was confirmed by the Supreme Court of Hawai'i, upon reviewing the record of the trial held in that case, the Supreme Court of Hawai'i found that no breach of the public trust had actually been proven by the plaintiffs.

In this case, on the other hand, no action on the proposed Water Lease has yet been taken. To the contrary, the Draft EIS and the Final EIS are, in fact, part of the very process that BLNR is proactively requiring of the Applicant in order to fulfill BLNR's Public Trust obligations.

Comment 5: *The applicant likewise has important duties. It must adhere to the EIS rules. These rules provide that an "EIS is meaningless without the conscientious application of the EIS process as a whole, and shall not be merely a self-serving recitation of benefits and a rationalization of the proposed action." HAR § 11-200-14. It is clear that A&B has not taken its responsibilities seriously.*

Response 5: We acknowledge your comments above and agree that the Applicant has important duties and must adhere to the EIS rules prescribed under HRS, Chapter 343 and HAR, Title 11, Chapter 200. As noted in Response #3 above, the Draft EIS fully complies with all relevant requirements, including the content requirements set forth in HAR §§ 11-200-16 and 11-200-17, and includes a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement.

Regarding your comment that these rules provide that an “*EIS is meaningless without the conscientious application of the EIS process as a whole, and shall not be merely a self-serving recitation of benefits and a rationalization of the proposed action.*”, please note that as preparers of the EIS we take an impartial position with regards to the Proposed Action. It is our position that the EIS is not a self-serving recitation of benefits and rationalization of the Proposed Action.

The Draft EIS is extremely detailed and provides a large amount of relevant information in an effort to meet that commitment to transparency.

HRS § 343-2 defines "environmental impact statement" as "an informational document prepared in compliance with the rules adopted under section 343-6 and which discloses the environmental effects of a proposed action, effects of a proposed action on the economic welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects." The Draft EIS discloses the environmental effects of the proposed Water Lease, and the impacts of the proposed Water Lease on the economic welfare, social welfare, and cultural practices of the community and State, as well as the effects of the economic activities arising out of the proposed Water Lease, and presents measures to minimize adverse effects, and also presents alternatives to the Water Lease and the environmental effects of those alternatives.

It is not clear what you mean that "A&B has not taken its responsibilities seriously" or what specific questions and concerns you believe have been ignored. A&B, through its environmental consultants WOC, has engaged in a comprehensive EIS process that started with pre-assessment consultation in the fall of 2016, as described in Response # 2. We respectfully disagree with your comment that A&B has not taken its responsibilities seriously.

Comment 6: *A&B has ignored many of the questions and concerns raised in our early consultation comments and comments on the EISPN and are attempting to defer answering these crucial questions until after the issuance of the 30-year lease. This proposition defies all logic considering it has been over 16 years since Judge Hifo first required that an EIS must be performed prior to the issuance of a contemplated 30-year lease to A&B.*

Response 6: With respect to responses to comments received on the EISPN, the requirements for responding to such comments are set forth under HAR § 11-200-15(d) and differ from the requirements to respond to a comment on a Draft EIS, and those requirements have been satisfied. See Appendix M.

Your comment that A&B is attempting to defer answering your questions until after the issuance of the proposed Water Lease is unclear due to a lack of specificity in your comment. Your comment does not explain or identify examples of how the Applicant is, as you allege, attempting to defer answering questions (which questions you do not specify), until after issuance of the proposed Water Lease. The EIS provides a robust analysis of environmental impacts. Chapter 4 of the Draft EIS provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields, including a description of the existing environment.

The analysis in Chapter 4 considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts.

The Draft EIS also included and relied upon nine technical studies, provided as Appendix A through I, as follows: Appendix A, Assessment of The Environmental Impacts of Stream Diversions on 33 East Maui Streams Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model; Appendix B, East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry; Appendix C, Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease; Appendix D, Historical Structure Assessment (HAS) East Maui Aqueduct System; Appendix E, Archaeological Literature Review and Field Inspection (LRFI) for the Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas; Appendix F, Cultural Impact Assessment (CIA) for the Nāhiku, Ke‘anae, Honomanū and Huelo License Areas; Appendix G, A&B Proposed Water Lease for the Nāhiku, Ke‘anae, Huelo, and Honomanū Social Impact Assessment (SIA); Appendix H, Economic and Fiscal Impact Study Proposed Water Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Area; and Appendix I, East Maui Water Lease: Agricultural and Related Economic Impacts.

You did not identify what specific questions A&B seeks to answer only after the Water Lease is issued. Consistent with the requirements under HAR § 11-200-17(b)(5) and (n), the EIS does identify unresolved issues, and addresses how those issues will be resolved for the Water Lease is issued. See Chapter 8. The unresolved issues will be resolved before issuance of the Water Lease. Those issues being the rental payment that will be charged for the Water Lease, the ultimate amount of the DHHL reservation, and the contents of the watershed management plan. The Water Lease rental payments will remain unresolved until after an appraisal is done, and prior to the issuance of the Water Lease. Our expectation is that the DLNR, on behalf of the BLNR, will commission, or approve the commissioning of, the appraisal.

Although the DHHL reservation amount was anticipated in the Draft EIS (see e.g. Section 2.1.1) that discussion has been updated in the EIS to reflect more current information as to the status of

the expected reservation - the amount of the expected reservation at this point remains as stated in the Draft EIS - 11,455,510 gallons per day. See updated Section 2.1.1 of the Final EIS on pages 2-4 to 2-7.

The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See on pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Finally, your comment that, "it has been 16 years since Judge Hifo first required that an EIS must be performed prior to the issuance of a contemplated long term lease," needs to be placed into the context of subsequent events. Your reference to Judge Hifo's ruling is presumed to be the November 3, 2003 First Amended Final Judgment in Civil No. 03-1-0289-02 in the First Circuit Court of Hawai'i. Less than four years later, following subsequent proceedings, it was noted on page 2 of BLNR's March 23, 2007 Findings of Fact, Conclusions of Law and Decision and Order in the contested case hearing requested by your clients in connection with the Water Lease that, "[a]ll parties now concede that an EA (and potentially an environmental impact statement ("EIS")) must be prepared, amended IIFS must be determined and that this process is likely to take years." Further, it was not until May 8, 2015 at a BLNR hearing in the same proceeding that your clients agreed to withdraw their objection to the Applicant doing the EIS. Work on the Draft EIS was thereafter timely commenced in accordance with BLNR's April 14, 2016 and July 8, 2016 orders.

Comment 7: *Furthermore, A&B has had over three years to adequately address the concerns raised during the EISPN phase. A&B should not be able to side-step fundamental requirements in their DEIS simply because they are of the position that a 30-year lease will not upset the status-quo of stream diversion conditions that has negatively impacted the region for over 100 years.*

Response 7: Regarding your comment about A&B having over three years to address the concerns raised during the EISPN phase, as discussed in Response #2 above, the comments that were provided were addressed and responded to as shown in Appendix M of the Draft EIS, which was published on September 23, 2019. However, please note that the BLNR issued an order on April 14, 2016, directing A&B to scope the EIS, including the identification of the portions of the EIS that could proceed prior to the CWRM issuing a final decision on the petitions for interim instream flow standards (IIFS), and those portions which could not. That scope was filed with the BLNR in June 2016. On July 8, 2016, the BLNR approved the scope and instructed that “A&B and EMI should proceed with the preparation of an environmental impact statement (EIS) in as expeditious manner as possible.” Section 1.4 of the Draft EIS recites this history.

Your comment that A&B should not be able to side-step fundamental requirements in the Draft EIS lacks specificity. However, as discussed in Response #3 above, the Draft EIS fully complies with all relevant requirements, including the content requirements set forth in HAR § 11-200-16 and 11-200-17, and includes a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement.

Regarding your comment that A&B has taken the position that a 30-year lease will not upset the status-quo of stream diversion conditions that has negatively impacted the region for over 100 years, it is recognized that that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions." HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision-making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

However, the streams in East Maui have been diverted for over a century and it is not scientifically feasible to fully document impacts that first took place more than a century ago as pre-diversion data does not exist. Although it is not scientifically feasible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui. Archaeological Literature Review and Field Inspection for the Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and

Huelo License Areas report (Appendix E), which has been further supplemented to include information on the legendary Pōhaku in Wahinepe‘e, archeological resources in Central Maui, climate change impacts on cultural and historical resources, and historical agriculture in East Maui, which provides context about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families as analyzed in the other technical studies.

As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS.

The Assessment of The Environmental Impacts of Stream Diversions on 33 East Maui Streams Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System. The Assessment of The Environmental Impacts of Stream Diversions on 33 East Maui Streams Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) has been updated to include targeted discussions on diversion impacts under the different flow scenarios to native stream habitat units based on comments received to the Draft EIS. As it relates to the human environment, the Cultural Impact Assessment for the Nāhiku, Ke‘anae, Honomanū and Huelo License Areas (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The A&B Proposed Water Lease for the Nāhiku, Ke‘anae, Huelo, and Honomanū Social Impact Assessment (Appendix G) documents community outreach with various stakeholders in a context for understanding the current and historical perceptions of diverting East Maui stream water, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts.

Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

Comment 8: *A&B is taking the same approach in their DEIS as they are in the pending litigation concerning these issues. Namely, they argue mootness on the grounds that certain streams have been restored and therefore there is no harm since issuance of the Water Lease would not create more harm than what has historically existed. The entirety of the DEIS was crafted informed by this false proposition.*

Response 8: Your comment that the Applicant is arguing mootness is acknowledged, but it is not clear where or how within the Draft EIS you think this position is stated. Moreover, the EIS does not present the position that the stream restoration required under the CWRM's Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O) eliminates all impacts. Your comment is directed to an assessment of stream impacts. Section 4.2.1 of the EIS, with respect to East Maui, presents a natural flow baseline condition based upon the HSHEP model provided in Appendix A. Under that condition, which has not existed in over 100 years, it is estimated that there is a potential for up to 1,747,390 habitat units (HU) within the streams within the License Area. Please note that HU are defined as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat. HU have measures of stream size and watershed wetness incorporated into the value which reflect comparative stream width and as a result only linear measures of habitat area are presented. It should be noted that all linear measures are in meters. The assumption underlying the natural flow baseline condition is if no modifications or diversions existed, then this would be the maximum available habitat for native stream species. The number of HU estimated after application of the IIFS requirements under the CWRM D&O, and if the Water Lease is issued for the amount assumed in this EIS, is 1,116,581 HU.

The HSHEP model also provides an assessment of the potential HU that would be available if no Water Lease (i.e., the No Action alternative) was issued and the EMI Aqueduct System was only able to divert 30% of water available at the Honopou Stream boundary after compliance with the IIFS requirements under the CWRM D&O. This is described as the "no action alternative" or "30% remaining flow diversion" scenario. There, the number of HU within all License Area streams would be 1,394,508.

The Proposed Action is a continued impact to the environment. However, when compared to diversions that occurred during sugarcane operations over the last century and more, the Proposed Action will have a lesser impact and several environmental factors are not expected to experience greater impacts as discussed in Chapter 4. Specifically, Section 4.2.1 of the EIS, which summarizes the study included in Appendix A conducted by Trutta Environmental Solutions (Trutta), discusses the application of the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model and stream restoration scenarios. The application of the HSHEP model uses the two boundaries for assessment: the "Full Diversion Condition" (the lower

boundary) and the “Natural Flow Condition” (the upper boundary). The combination of the lower and upper bounds provide the range at which we would expect changes to the diversions to fall within and provides a way to comparatively discuss different flow restoration scenarios as, by definition, the changes must fall somewhere between 100% diversion and 0% diversion. The two scenarios presented, the Proposed Action compliant with the CWRM D&O (Trutta’s 2018 IIFS) and No Action Alternative (30% remaining flow diversion), are examples of how different flow restoration scenarios result in different amounts of habitat units. The HSHEP model is used to quantify these differences based on flow restoration changes at diversions. The HSHEP follows a logical approach and systematically addresses on-the-ground conditions.

We acknowledge, pursuant to HAR § 11-200-17(m), an EIS must consider "mitigation measures proposed to avoid, minimize, rectify, or reduce impact[.]" Regarding stream habitats, Section 4.2.1 of the Final EIS has been updated to include a discussion of general mitigation measures as shown on pages 4-61 to 4-67.

Comment 9: *The conclusion that documented cultural and environmental impacts have already been addressed per the IIFS decision taints the overall analysis of the DEIS because this conclusion was already set prior to A&B hiring consultants and conducting all of the necessary research involved with implementing the DEIS.*

Response 9: For clarification, the EIS does not merely rely on the CWRM D&O and conclude that the cultural and environmental impacts of the Proposed Action and alternatives are addressed thereunder. Further, you have not identified the basis of your conclusion that the EIS analysis determined that all cultural and environmental impacts have been addressed by the IIFS requirements under the CWRM D&O. No such conclusion is made in the EIS. As evidence, the EIS technical studies include recommended mitigation measures, and do not solely rely on the IIFS set forth under the CWRM D&O.

Moreover, your description of the timeline of events is not correct. Work on the EIS started in 2016, well before the June 20, 2018 issuance of the CWRM D&O. BLNR, by order dated April 14, 2016, directed A&B to commence the EIS process and to provide a scope of work for the preparation of an environmental review document pursuant to Chapter 343, HRS. The BLNR instructed that the scope of work should distinguish between those matters that can be undertaken prior to the CWRM decision on the petitions to amend the IIFS, and those matters that require the final CWRM IIFS decision. On June 9, 2016, A&B submitted to the BLNR a Scope of Services for Preparation of a Chapter 343, HRS Environmental Impact Statement for Proposed Lease for the Nahiku, Ke'anae, Honomanū, and Huelo License Areas. BLNR, by order dated July 8, 2016, directed A&B to proceed with the preparation of an EIS.

Pre-assessment consultation was started in November 2016 with the mailing of letters to numerous parties, including NHLC, seeking comments on the EIS. WOC held two voluntary public EIS scoping meetings (one in Kahului on Feb. 22, 2017, and one at the Haiku Park and Community Center in Paia on Feb. 23, 2017) during the public comment period on the EIS Preparation Notice, which was published on February 8, 2017. Transcripts of those public scoping meetings are provided in Appendix K and L.

After these scoping and pre-assessment activities, WOC was able to retain technical consultants to contribute to the assessment of environmental impacts of the Proposed Action. We do not understand why you concluded that technical consultants were retained only after the issuance of the CWRM D&O; in any event, that conclusion is wrong. Moreover, it has been recognized from the start that the EIS would have to take into account whatever decisions CWRM made on the then-pending IIFS petitions, as those conditions necessarily establish the maximum amount of water that could be diverted from petitioned-streams. Moreover, in the same Judge Hifo Order that you cited in Comment # 12, Judge Hifo instructed, with respect to then then-pending IIFS petitions, that "[i]f the BLNR believes it does not have the requisite expertise to investigate, then it should wait until the CWRM has acted or make its own application to establish instream flows reflecting the diversions it proposes to make, before authorizing the diversion." Hifo Order at 5.

The EIS acknowledges that the CWRM D&O, the product of a contested case hearing that was requested in 2010, on an initial IIFS petition that was filed in 2001 and had been the subject of two CWRM decisions (in 2008 and 2010), does provide numerous beneficial environmental and cultural impacts with its flow restoration, and it sets the baseline for the maximum amount of water that could be diverted from the petitioned streams within the License Area. It has been understood for several years that the Draft EIS could not be completed until after issuance of the CWRM D&O as discussed in Response #7 above. As explained in Section 1.4 of the Draft EIS (and in Response #6), in 2001 A&B offered to perform the required HRS, Chapter 343 environmental review, but NHLC, on behalf of Nā Moku objected to A&B undertaking the environmental review process. NHLC did not withdraw its objection regarding the preparation of the HRS, Chapter 343 environmental documents until oral arguments before the BLNR in May 2015, which withdrawal was then documented in the April 14, 2016 order issued by the BLNR, directing A&B to commence the environmental review process and provide a scope of work for the preparation of an environmental review document pursuant to HRS Chapter 343.

The requirements under the CWRM D&O are crucial to the environmental analysis because, as explained in Section 1.3.4 of the Draft EIS:

The June 20, 2018 CWRM D&O establishes a quantity of water that must remain in each stream at specified locations subject to the IIFS Petitions. The CWRM

D&O does not specifically authorize or allocate amounts of water for offstream uses. The CWRM evaluated each of the streams under the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration potential for fish and other stream animals, recreational opportunities, and scenic values. Then the streams were looked at in an integrative approach with consideration for the overall ecological ramifications of the decision. The CWRM also considered the economic ramifications of its decision on offstream uses, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture.

And at Section 2.1:

Independent of the Proposed Action, on June 20, 2018, the CWRM issued its D&O setting IIFS for numerous streams and tributaries of streams in the License Area, which includes water originating and flowing from both State and privately owned lands within East Maui. The CWRM D&O establishes a quantity of water that must remain in each stream at specified locations. The CWRM D&O ordered full stream restoration for 10 streams and partial flow restoration on 12 additional streams (Please refer to Section 1.3.4). Therefore, the maximum amount of water that can be awarded through the Water Lease is what is available for diversion after the CWRM D&O is implemented. This is the premise of the Proposed Action.

Hence, the CWRM D&O was fundamental for assessing the Proposed Action because it sets forth the maximum amount of water that could be diverted and therefore the maximum potential for environmental impact, but in no way was it the sole basis for assessment in the EIS.

The nine technical studies completed for the EIS and the EIS itself identified environmental and cultural impacts that may result from the Proposed Action, and also presented, where appropriate, suggested mitigation measures. Specifically, as it relates to surface water resources and stream habitats, it is anticipated that the Proposed Action will have an adverse impact reducing the amount of stream habitat units that would exist under natural flow conditions as discussed in Section 4.2.1 and Appendix A of the EIS. As it relates to flora and faunal resources, the Proposed Action is anticipated to include maintenance and repair activities that have the potential to impact native flora and faunal resources, especially in pristine environments as discussed in Section 4.4 and Appendix C of the EIS.

As it relates to historical and archeological resources, due to the CWRM D&O, some of the sluice gates must be removed from the stream diversions of particular streams, regardless of whether the Water Lease is issued or not as discussed in Section 4.5 and Appendix D of the EIS.

The effect of the removal of the sluice gates is minimal, as they do not drastically alter the overall physical appearance of the historic EMI Aqueduct System. As it relates to cultural resources and practices, the Proposed Action has the potential to have impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, and access as discussed in Section 4.6 and Appendix F of the EIS. However, with respect to potential regional impacts, in the CIA included with the Draft EIS, Cultural Surveys Hawai'i (CSH) recommended that qualified professionals who possess an understanding of stream flow mechanics, water diversion, and climate statistics within the License Area address certain questions that were raised during consultation. Questions such as "how much water is being diverted at each location of intakes, ditches, dams, pipes, and flumes?", "how much water is being diverted from East Maui to Central Maui?", and "is climate change accounted for?" Since the publication of the Draft EIS, CSH has reviewed the other technical studies prepared for the EIS and added that in addition to the recommendations provided by the other technical studies, that the Proposed Action include monitoring and public reporting of stream flow volumes.

With respect to potential impacts to taro farming, the specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapīpī, and Waiohue. Cultural Surveys Hawaii noted that these streams were addressed through the CWRM D&O proceedings. With respect to impacts to freshwater ecosystems, CSH identified the potential for impacts to Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapīpī, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. And CSH also noted that these streams were addressed through the CWRM D&O proceedings. To address the potential for impacts to these resources/practices, similar to the recommendation noted above, CSH recommends that the Proposed Action include monitoring and public reporting of stream flow volumes, and that EMI's current system of flow meters and totalizers that are reported to CWRM on a monthly basis be maintained and upgraded as needed in order to report accurate information on stream flow and diversion amounts to the community.

With respect to cultural sites, CSH acknowledged that no studies had identified any burial sites within the License Area. Nevertheless, CSH recommended that any personnel involved in access, maintenance, or any other related activities within the License Area be informed of the possibility of inadvertent cultural finds, including human remains, and that in the event any such

sites are inadvertently discovered within the License Area, those discoveries should be reported immediately to the State Historic Preservation Division (SHPD). Moreover, CSH recommended that in the event that iwi kūpuna and/or cultural finds are encountered, consultation with lineal and cultural descendants of the area should be conducted. CSH also recommended, as a proactive measure, that there be an access policy for cultural practitioners within the License Area, similar to the access policy in use for hiking groups. Any such policy would need to be developed in consultation with the State (as landowner of the License Area), and the Water Lease lessee, and in consideration of applicable law related to traditional and customary Native Hawaiian rights. It is noted that in issuing the CWRM D&O, the CWRM identified the minimum criteria to be satisfied in order for a traditional and customary right to be protected by the constitution and State law. See CWRM D&O pages 242 through 245, citing the Supreme Court's holding on this subject in *State v. Pratt*, 127 Hawai'i 206, 277 P. 3d 300 (2012).

As it relates to socio-economic characteristics, the Proposed Action is anticipated to have a number of economic and fiscal impacts as well as agricultural economic related impacts, as discussed in Section 4.7 and Appendices F, G, and I of the EIS. All of these Sections of the EIS and appended reports discuss mitigative measures to the various impacts of the Proposed Action.

Comment 10: *The presumption that adverse impacts have already been addressed through the IIFS decision no doubt limits A&B from considering ways in which cultural practices and the environment may be adversely impacted beyond the 27 streams petitioned for, which make up only a fraction of the 33,000 acre License Area which encompass hundreds of streams and tributaries and miles of coastline.*

Response 10: Your conclusion that the EIS assumes that adverse impacts have been addressed through the IIFS decision is incorrect. See Response #9 above. In addition, contrary to your statement that there are "hundreds" of streams within the License Area, the total number of streams/tributaries within the License Area that could be diverted under the Proposed Action is 25 out of the 36 total streams (which includes its tributaries) as indicated by Table 1-3 in the Final EIS. Your statement that the EIS presumes "*adverse impacts have already been addressed through the IIFS decision [the CWRM D&O]*" is not consistent with the analysis in the EIS. For example, the HSHEP model provided in Appendix A presented an analysis of 100% of the streams within the License Area that could be diverted by the EMI Aqueduct System. Similarly, the Cultural Impact Assessment for the Nāhiku, Ke'anae, Honomanū and Huelo License Areas provided as Appendix F to the Draft EIS, and as further supplemented, includes a regional analysis of the entire License Area, including the non-petitioned streams and the petitioned-streams. Regarding your comment about "miles of coastlines", the study titled East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry, provided as Appendix B, determined that the nutrient delivery from streams in the License Area to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient

concentrations in the ocean do not change substantially, there is no pathway for fishing to be negatively impacted. In other words, the analysis presented in Appendix B concluded that impacts from the Proposed Action to ocean fish are negligible. Please see also our Response #6 regarding the numerous technical reports and environmental subject areas covered in the EIS.

Comment 11: *Notably, since the amended IIFS for a portion of the 27 petitioned streams provides only "minimum streamflow levels," it is questionable whether the IIFS adequately addresses cultural and environmental protections for those streams. To argue that there is no longer an impact because minimal standards are being met is not only flawed but dangerous when applied to the overall analysis of an allegedly objective report. Rather than thoroughly addressing potentially adverse impacts and proposing measures for "avoiding, minimizing, rectifying or reducing" those impacts as required by the EIS rules, A&B has merely provided a "self-serving recitation of benefits and a rationalization of the proposed action." HAR § 11-200-14. In summary, the DEIS does not provide an objective and accurate analysis of the numerous potential impacts of the Proposed Action and therefore does not provide the BLNR with an adequate roadmap on how to mitigate those impacts moving forward.*

Response 11: We assume that your comment that, "*the amended IIFS for a portion of the 27 petitioned streams provides only 'minimum streamflow levels,'*" refers to instream flow standards requiring the minimum amount of streamflow that must remain in any given stream. For clarification, for the East Maui IIFS decision, the minimum stream flows that the CWRM D&O ordered was: 1) full flow restoration for 10 of the petitioned streams; 2) habitat restoration (H₉₀) for five of the petitioned streams; 3) connectivity flow restoration for seven of the petitioned streams; and 4) no change in the IIFS for three of the petitioned streams (one of which is below the ditch diversion system and has never been diverted by the EMI Aqueduct System). Importantly, Trutta Environmental Solutions, LLC, concluded that the IIFS set under the CWRM D&O, from a habitat availability perspective, did "a good job at improving instream habitat over a wide range of streams." See Appendix A at page 12. With respect to the HSHEP model, results were presented for 100% of the streams diverted by the EMI Aqueduct System within the License Area as shown on pages 4-56 to 4-67 which is Figure 12 in the HSHEP report (Appendix A).

Moreover, as discussed in Response #9 above, the Draft EIS, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields, including a description of the existing environment and are not limited to the streams subject to the CWRM D&O. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements. The Draft EIS also included and relied upon nine technical studies (Appendix A, Assessment of The Environmental Impacts of Stream Diversions on 33 East Maui Streams Using the Hawaiian Stream Habitat Evaluation

Procedure (HSHEP) Model); Appendix B, East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry; Appendix C, Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease; Appendix D, Historical Structure Assessment East Maui Aqueduct System; Appendix E, Archaeological Literature Review and Field Inspection for the Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas; Appendix F, Cultural Impact Assessment for the Nāhiku, Ke‘anae, Honomanū and Huelo License Areas; Appendix G, A&B Proposed Water Lease for the Nāhiku, Ke‘anae, Huelo, and Honomanū Social Impact Assessment; Appendix H, Economic and Fiscal Impact Study Proposed Water Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Area; and Appendix I, East Maui Water Lease: Agricultural and Related Economic Impacts). We acknowledge, pursuant to HAR § 11-200-17(m), an EIS must consider "mitigation measures proposed to avoid, minimize, rectify, or reduce impact[.]" A brief summary of anticipated impacts and recommended mitigations measures is provided below with references made to the more detailed sections of the EIS that fully address these matters.

Regarding stream habitats, Section 4.2.1 of the Final EIS has been updated to include a discussion of general mitigation measures as shown on pages 4-61 to 4-67.

Chapter 4 of the EIS, based upon the technical studies and otherwise, provides several mitigation measures recommended for the East Maui License Area.

Field surveys and habitat modeling conducted by Trutta Environmental Solutions, Inc. (Parham 2019) as part of the EIS for the Proposed Action support the IIFS flow restoration scenario in improving instream habitat conditions for native amphidromous stream animals. Native species habitat that were evaluated as part of the study included ‘O‘opu nākea (freshwater fish family Gobiidae), ‘O‘opu alamo‘o (freshwater fish family Gobiidae), ‘O‘opu naniha (freshwater fish family Gobiidae), ‘O‘opu nōpili (freshwater fish family Gobiidae), ‘O‘opu akupa (freshwater fish family Eleotridae), ‘Ōpae kala‘ole (freshwater shrimp), ‘Ōpae ‘oeha‘a (freshwater prawn), and Hihīwai (freshwater snail). Please note that the HSHEP model focuses on changes in instream habitat, entrainment, or barriers to passage for these migratory native stream species with respect to modifications of the stream environment. In the case of the East Maui streams covered by the Draft EIS, the primary impact is streamflow diversion. While the HSHEP model does account for changes in habitat with respect to instream structures, these are minuscule in comparison to the loss of habitat in dewatered stream segments and the entrainment of animals into the EMI Aqueduct System. Thus, the primary mitigation measure is flow restoration and the HSHEP modeling intent was to quantify the flow restoration effect on the native stream species. Thus, the results of the HSHEP model document mitigation measures to restore native stream life to various restoration targets.

The terrestrial flora and fauna study prepared by SWCA Environmental Consultants (2019) as part of the EIS has determined that the Proposed Action, specifically the diversion of water within the existing EMI Aqueduct System, will have no impact on terrestrial flora and fauna resources, nor will the Proposed action increase habitat fragmentation over current conditions subject to avoidance and minimization measures.

The terrestrial flora and fauna study recommended the following avoidance and minimization measures to address impacts to flora (SWCA Environmental Consultants 2019:24):

- A botanical monitor should be on-site during any maintenance activities on cliffsides, near waterfalls, and in other native species-dominated areas to ensure that no listed or candidate species are impacted.
- To avoid the unintentional introduction or transport of new invasive species into more pristine portions of the License Area during aqueduct maintenance activities, all equipment and vehicles arriving from outside the License Area should be power washed and inspected prior to any maintenance activities and any time equipment is relocated on cliffsides, near waterfalls, and in other native species-dominated areas in the License Area.
- Construction material arriving from outside Maui should also be washed and/or visually inspected (as appropriate) for excessive debris, plant materials, and invasive or harmful non-native species (plants amphibians, reptiles, and insects).
- When possible, any raw material used in maintenance activities should be purchased from a local supplier on Maui to avoid introducing non-native species not present on the island.
- Inspection and cleaning activities should be conducted at a designated location. The inspector must be a qualified botanist/entomologist able to identify invasive species that are of concern relevant to the point of origin of the equipment, vehicle, or material.

The terrestrial flora and fauna study recommended the following avoidance and minimization measures to address impacts to fauna (SWCA Environmental Consultants 2019:24-25):

- Regular on-site staff should be trained to identify special-status species with the potential to occur on-site and should know the appropriate measure to be taken if they are present.
- If tree trimming occurs in the *'i'iwi*, Maui parrotbill and crested honeycreeper range (as defined by SWCA Section 5.2.5) from November to June, a qualified biologist should survey the trees for active nests of these species.
- If a downed tree must be removed from a road, trail, or other passageway, it will be inspected for the presence of active bird nests, specifically the nest of an MBTA-

- protected species, that may have been present prior to the tree falling. If an active nest is found, it should be protected in place until the chicks fledge.
- If a Hawaiian goose, Hawaiian stilt, or Hawaiian coot is observed in the area during construction activities, all activities within 100 ft (30 m) of the species should cease, and work should not continue until the species leaves the area on its own accord.
 - If a Hawaiian goose nest is discovered, all activities within 150 ft (46 m) of the nest should cease, and the USFWS should be contacted. Work should not resume until directed by the USFWS.
 - If felling of standing trees occurs during the bat breeding season, direct impacts could occur to juvenile bats that are too small to fly but too large to be carried by a parent. To minimize this impact, no trees taller than 15 ft (4.6 m) should be trimmed or removed between June 1 and September 15.
 - The use of barbless top-strand wire is recommended for all fence construction to avoid entanglement of Hawaiian hoary bat.
 - A qualified biologist should work closely with the USFWS and monitor ESA-listed damselflies to ensure activities do not have a negative impact.

The terrestrial flora and fauna study recommended the following avoidance and minimization measures to address impacts to seabirds (SWCA Environmental Consultants 2019:25):

- Construction activity should be restricted to daylight hours as much as practicable during the seabird peak fallout period (September 15 to December 15) to avoid the use of nighttime lighting that could attract seabirds.
- All outdoor lights should be shielded to prevent upward radiation. This has been shown to reduce the potential for seabird attraction. A selection of acceptable, seabird-friendly lights can be found online at the Kauai Seabird Habitat Conservation Program website: <http://www.kauai-seabirdhcp.info/lighting-homes-businesses/>.
- Outside lights not needed for security and safety should be turned off from dusk through dawn during the fledgling fallout period (September 15 to December 15).

The terrestrial flora and fauna study has recommended the following avoidance and minimization measures to address impacts to the Blackburn's Sphinx Moth (SWCA Environmental Consultants 2019:37):

- A biologist familiar with the species should survey areas of proposed activities for Blackburn's sphinx moth and its larval host plants prior to work initiation. Surveys should be conducted during the wettest portion of the year (usually November–April or several weeks after a significant rain) and within 4 to 6 weeks prior to construction. Surveys should include searches for eggs, larvae, and signs of larval feeding (chewed

- stems, frass, or leaf damage). If moths or the native aiea (*Nothocestrum* spp.) or tree tobacco over 3 feet tall are found during the survey, USFWS should be contacted for additional guidance to avoid take.
- If no Blackburn's sphinx moth, aiea, or tree tobacco are found during surveys, measures should be taken to avoid attraction of Blackburn's sphinx moth to the project location to prohibit tree tobacco from entering the site. Tree tobacco can grow greater than 3 feet tall in approximately 6 weeks. If it grows over 3 feet, the plants may become a host plant for Blackburn's sphinx moth. Therefore, any tree tobacco less than 3 feet tall should be removed. The site should be monitored every 4 to 6 weeks for new tree tobacco growth before, during, and after the proposed ground-disturbing activity. Monitoring for tree tobacco can be completed by any staff, such as groundskeeping or regular maintenance crew, provided with picture placards of tree tobacco at different life stages.

The social impact assessment prepared by Earthplan as part of the EIS has recommended the establishment of "Core Working Group" comprised of geographic communities, environmental, agriculture, and business interests, and public agencies. The group would serve as a forum for exchanging ideas and collaborative efforts, as well as provide feedback and suggestions to Mahi Pono. Each member of the Core Working Group would be expected to reach out to their own networks to extend the discussion beyond the Core Working Group. While there would likely be strong differences in perspectives and opinions, the Core Working Group would need to find ways to establish core principles, common ground and manageable solutions.

The social impact assessment also recognizes that East Maui residents have a unique relationship with the Proposed Action. While impacts are first and foremost culture-related, they are also entrenched in a social context that is the basis for this mitigation recommendation. The social impact of diverting water is generational, one that has affected livelihoods, family cohesion, the ability to integrate with environment for food gathering and recreation, resource stewardship, and personal connections or disconnections with values inherent in their lifestyles.

For the Ke'anae – Wailuānui community to move past historical impacts, the social impact assessment recommends that there needs to be established a point of departure. Mitigation needs to go beyond the physical restoration of streams. It needs to address the social context and include apology and reconciliation. This needs to be done within a cultural foundation that binds the community together, and key players, including Mahi Pono, public agencies and elected officials. The manner and forum for this process should be defined by cultural leaders integral with the process.

In addition to the recommendation provided by the other technical studies conducted as part of the EIS, CSH recommends that the Proposed Action include monitoring and public reporting of

stream flow volumes. At present, EMI maintains a system of flow meters and totalizers that are reported to CWRM on a monthly basis. CSH recommends that this system is maintained and upgraded as needed in order to report accurate information on stream flow and diversion amounts to the community.

Mason Architects recommends documentation of the sluice gates with photos and location sketch plans conforming to the Historic American Engineering Survey (HAER) standards where sluice gates are to be removed or altered is proposed. Many of the sluice gates are unique to a particular stream, and documentation will ensure that nothing is lost over time.

CSH recommends mitigative measures to taro farming impacts, freshwater ecosystem impacts, cultural sites, and access related to the Proposed Action.

Comment 12: *The DEIS Fails to Adopt Appropriate Baseline Conditions.* In 2003, Judge Hifo resolved the issue of what would constitute the appropriate baseline condition for A&B in preparing an EIS:

... the Court finds that Confederated Tribes and Bands of the Yaltima Indian Nation v. Federal Energy Regulatory Commission, 746 F.2d 466, 475-477 (gti' Cir. 1984), which held that the relicensing of a power plant needed to be analyzed as if it were the original licensing of the plant, is persuasive, as appellants argued, and would require an environmental assessment (EA), and perhaps an environmental impact statement (EIS), depending upon the result of the EA, for a long-term lease which constitutes the first long-term lease of this water since at least 1985.

Hifo Order (emphasis added).

Response 12: Contrary to your comment, Judge Hifo's 2003 Order, quoted above, did not examine or opine as to appropriate baseline conditions for an EIS analysis. The Order merely stated that the issuance of the long-term lease, which is the first long-term water lease for the EMI Aqueduct System since 1985, required environmental review and is not an action that could be exempted from environmental review pursuant to the exemptions authorized under HAR § 11-200-8.

Notwithstanding the fact that actions that involve "operations, repairs, or maintenance of existing structures, facilities, equipment, or topographical features, involving negligible or no expansion or change of use beyond that previously existing" are eligible for exemption determinations (see HAR § 11-200-8(a)(1)), Judge Hifo determined that such an exemption for a new Water Lease was inconsistent with statute. Specifically, under HRS § 343-6, exemptions are appropriate for actions that will probably have "minimal or no significant effects on the environment." Judge

Hifo determined that a lease of any or all excess water from the 33,000 acres of State-owned land does not constitute a minimal or no significant effect on the environment. As such, Judge Hifo reversed the applicable holding in the BLNR's Order of January 24, 2003, which held that the disposition of the Water Lease was exempt from further environmental review so long as it merely continued the existing operations and did not expand or change the uses. This EIS is the direct result of Judge Hifo's Order - Judge Hifo ordered that the Water Lease could not be issued until an environmental review was completed.

Judge Hifo's reliance on *Confederated Tribes and Bands of Yakima Indian Nation v. Fed. Energy Regulatory Comm'n*, 746 F.2d 466 (9th Cir. 1984) (hereinafter "*Yakima Nation*") was not to establish any sort of baseline for this EIS. The issue in *Yakima Nation* was not about baseline conditions for an EIS analysis. The issue was whether relicensing of a hydroelectric power plant in 1980, which had originally been licensed in 1930 and therefore predated the enactment of NEPA, required the preparation of an EIS. Although the power plant had been in operation for 50 years, the Ninth Circuit held that, based upon the Federal Power Act, which limited the maximum term of any license to 50 years, relicensing was "substantially equivalent to issuing an original license" and the requirements for preparing an EIS generally applied. *Yakima Nation* did not address what baseline conditions were to be used in the EIS required for the relicensing, but held only that an EIS was required.

Comment 13: *In this instance, under the DEIS, A&B sets the baseline condition at the conditions under which A&B has historically diverted the streams, contrary to an explicit court ruling, from which A&B never appealed after final judgment. As it states:*

Baseline Condition — Full Diversion

The lower boundary for the HSHEP model was full diversion by the EMI Aqueduct System in its current configuration as existed under sugar cultivation, which was the prevailing conditions for nearly 100 years. (Trutta, p. 41, 2019) The Full Diversion scenario assumes that all the diversions in the EMI Aqueduct System are fully open or diverting 100% of available low flows, roughly analogous to the stream's baseflow. The diversions in the EMI Aqueduct System were built to capture 100% of normal low flows plus some small amount of storm runoff. Hawaiian streams are "flashy", meaning discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions. When low flow conditions persist and water needs call for all the low flow to be diverted, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production. (Trutta, p. 55-56, 2019) Under Full Diversion conditions, approximately 46% of the total

HU remained; or conversely, Full Diversion conditions reduced the number of HU by approximately 54%.

DEIS 4-56 (emphasis added). This DEIS cannot identify the fully diverted status of the streams in the license areas as the baseline condition. Comparing the resulting environmental consequences of its proposed diversions from this perspective would make a mockery of HRS chapter 343 and its implementing rules, HAR subchapter 11-200, as well as defy a court precedent on this very issue.

Response 13: We respectfully disagree with your suggestion that there is a relevant court ruling regarding baseline conditions. Please see Response #12 for our response to your assessment of the meaning of Judge Hifo's Order.

Your extensive quotation from page 4-56 of the Draft EIS ignores the description of the "Baseline Condition - Natural Flow" which was provided in the page immediately prior to the page you cited. That description is as follows:

Baseline Condition – Natural Flow

The EMI Aqueduct System has diverted water in its current configuration for nearly 100 years and baseline environmental condition studies (including the distribution and habitat of native stream animals) prior to its construction do not exist. Although there were no studies that describing East Maui stream biota conditions as they existed prior to the construction of the EMI Aqueduct System, the HSHEP model provides a means of estimating the naturally available habitat for stream species under natural conditions, i.e., no water diversions and no impacts on passage or entrainment of animals. (Trutta, p. 12, 2019) Trutta cautions, however, that suitable habitat (number of HU's), which is the focus of the HSHEP model, is not the only thing that may affect species populations. Other factors, such as pollution, disease, or competition with introduced species may also influence the distribution and densities of native animals. (Trutta, p. 66, 2019) This Natural Flow condition, while not, strictly speaking, a baseline condition in that it has not existed for at least 100 years, nevertheless sets the upper boundary for the HSHEP model. (Trutta, p. 41, 2019) In other words, the Natural Flow condition represents 100% of the HU in the 33 streams assessed. Trutta estimates a total of 1,982,176 HU for all the streams in the License Area. (Trutta, p. 57, 59, 60, 61, 2019)

In other words, the Draft EIS and the HSHEP model contemplated an upper and lower boundary for environmental assessment purposes. The lower boundary (the Full Diversion condition) reflects the maximum impact or maximum amount of habitat lost due to diversions. The

proposed Water Lease proposes diversions considerably less than what was done under the Full Diversion condition. The upper boundary (the Natural Flow condition) provides context to the maximum number of habitat units available for native species. The assumption with the Natural Flow condition is if no modifications or diversions existed, then this would be the maximum available habitat for native stream species. However, please note that the above excerpt has been revised based on the updated report included in Appendix A as shown on pages 4-61 to 4-62.

The HSHEP model also reviewed a diversion scenario that was in compliance with the IIFS set forth under the CWRM D&O, and a "no action" alternative where 30% of the flow remaining after compliance with the IIFS under the CWRM D&O is diverted.

The combination of the lower and upper bounds provide the range at which we would expect changes to the diversions to fall within and provides a way to comparatively discuss different flow restoration scenarios as by definition the changes must fall somewhere between 100% diversion and 0% diversion.

The two scenarios presented, "2018 IIFS (Proposed Action)" and "No Action Alternative (30% remaining flow diversion)" are examples of how different flow restoration scenarios result in different amounts of habitat restored, within the lower and upper bounds. The HSHEP model is used to quantify these differences based on flow restoration changes at diversions. The HSHEP follows a logical approach and systematically addresses on-the-ground conditions.

Comment 14: *Moreover, considering the harshest possible alternative of complete diversion under sugar cultivation, the amount of diversion under the Proposed Action seems like a reasonable compromise and a far better alternative. Pursuant to HAR 11-200-17(g), the DEIS must include a "description of the environment in the vicinity of the action, as it exists before commencement of the action." In order to conform to the actual facts, this description should include post sugar plantation closure conditions that were present immediately before the commencement of the action. HC&S stopped using irrigation water in early 2016. Mahi Pono only recently began test crop cultivations that require water. Hence, there was at least a two-year gap in the supposed "continuation" of the EMI aqueduct at any level of use by this successor-in-interest to HC&S's irrigation water use. Therefore, using the conditions that existed at the height of water diversion which no longer existed prior to the proposal of the Water Lease as the lower boundary in any assessment of the Proposed Action is a flawed approach and is in direct opposition to both legal precedent and the actual facts.*

Response 14: As explained in Response #13, the HSHEP model provided a range for the purposes of scientific assessment. It provided information on estimated habitat conditions at the height of diversions (to set a ceiling for the purposes of assessment, as no request has been made

to divert to that extent, and in any event, diversions of that extent would violate the CWRM D&O), and estimated habitat conditions under a theoretical scenario where absolutely no water was diverted. This range was provided for scientific analysis. Note that practically speaking, even under the No Action or no Water Lease scenario, the Applicant has the right to divert approximately 30% of the water available from the Collection Area without any Water Lease. Your comment neglects to acknowledge that the HSHEP model also included a Natural Flow baseline condition scenario, i.e. a scenario where no surface water was diverted.

It is acknowledged that HAR § 11-200-17(g) requires a Draft EIS to include "a description of the environment in the vicinity of the action, as it exists before commencement of the action[.]" The Draft EIS complies with this requirement. For example, Section 2.1.4 acknowledges that A&B terminated sugarcane farming in 2016. It is explained how the average delivery of water through the EMI Aqueduct System to the Central Maui agricultural fields averaged 126 mgd between 2004 and 2013. The Draft EIS also explains how (at the point of publication of the Draft EIS) the majority of the Central Maui agricultural fields were not in active cultivation, and only approximately 20-25 mgd was being diverted by the EMI Aqueduct System. Consistent with the requirement to assess secondary impacts, the EIS describes the anticipated water use and related activities at full implementation of the Mahi Pono farm plan, which was presented as Mahi Pono's 2030 vision. As explained in Section 2.1.5., it is estimated that 10 years will be required for Mahi Pono and lessees to remove volunteer sugarcane and weeds from the approximately 30,000 acres, amend soils, install field improvements, build warehouses and other structures, and plant crops.

In response to your comment that HC&S stopped using irrigation water in early 2016, please note that HC&S stopped sugarcane cultivation in December 2016. See, e.g., EIS Section 2.1.2. In the period that intervened between the cessation of sugar cultivation and Mahi Pono's purchase of the Central Maui agricultural fields in December 2018, A&B endeavored to transition the fields to diversified agriculture and continued to supply water to the MDWS for its Upcountry Maui users. As A&B orally reported to BLNR at its meetings held on November 9, 2017 and November 8, 2018:

- Over the course of 2017, leases were entered into for 4,500 acres of active farming and ranching.
- By 2018, there was 3,000 acres in cultivated (ie. irrigated) pasture, with another 2,000 acres being prepped for irrigated pasture; a 30-acre trial planting of pongamia (an energy plant) had been established, with plans to expand to 250 acres; 600 acres were set aside for another renewable energy project with trial plantings undertaken on 250 acres in 2018; and another 800 acres were leased to farmers for various food and feed crops. So a total of 4,080 acres under active cultivation with 2,000 more acres under preparation.

Moreover, in light of the fact that Mahi Pono has continued to expand its farming in Central Maui, and water has continued to be diverted through the EMI Aqueduct System to support that

effort and continue the supply to MDWS, further updated information has been provided in Section 2.1.4 of the EIS regarding the water diversions authorized for 2021 and Mahi Pono's expected use of that water. See pages 2-30 and 2-32 of the Final EIS. Hence, the Draft EIS, and the Final EIS, correctly describe the environment in the vicinity of the Proposed Action as it exists before the issuance of the requested Water Lease.

Comment 15: *Median Flow Requirements Fail to Accurately Quantify Diversion Amounts.*

Throughout the DEIS it is assumed that under the Proposed Action the Water Lease would grant the right to collect up to the maximum amount of water from streams within the License Area allowed by the CWRM D&O, which is estimated to be approximately 87.95 mgd. DEIS at 2-8. This median flow required by the CWRM D&O, however, is the total estimated flow diverted from dozens of streams (and their tributaries) and measured at Honopou Stream, where the EMI Aqueduct System leaves the License Area. Id. The allowable diversion amount under the Water Lease, however, provides little assurance that each stream's required median flow will be met in the absence of quantifying actual diversion amounts on a stream-by-stream basis. Without accurate calculations or estimates regarding the amount of water taken from each individual stream, there can be no accurate assessment of the potential impacts those diversions would have on the streams and the surrounding environment.

Response 15: You are correct that the Draft EIS assesses the Proposed Action under the assumption that the maximum amount of water available for diversion (estimated to be 87.95 mgd from the License Area as discussed in Section 2.1.2 of the Draft EIS), will be awarded in the proposed Water Lease.

Regarding your comment that the allowable diversion amount under the Water Lease provides little assurance that each stream's required median flow will be met, please note that the CWRM D&O mandates the minimum amount of water that must remain in certain streams (the IIFS), not a requirement that a stream's median flow be met. The CWRM is charged with ensuring the IIFS are being met in the various streams. EMI has made certain adjustments to the EMI Aqueduct System – pursuant to guidance provided by CWRM staff and subject to their verification – to maintain sufficient natural flow to meet the designated IIFS.

It is our understanding that the IIFS is currently being met and will continue to be complied with under the Proposed Action.

What is important in ensuring the IIFS are being met and streams are being protected are the measurements of the amounts of water flowing in these streams at the designated IIFS locations, not how much water is being diverted from these streams. It is our understanding that the CWRM will ensure IIFS are being in each of the specific streams. It is not feasible to measure diversions on a stream-by-stream basis but, again, the diverted amounts are not what is important

with respect to stream protection. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gauges to wash away. In addition, proper gauging would involve some form of stream alteration, such as a weir in order to properly measure stream flow. EMI has never conducted stream gauging as that lays within the expertise the CWRM and the USGS.

As noted in the CWRM D&O, the measurements that EMI take are at Honopou Stream and Māliko Gulch. However, for the purpose of measuring the aggregate flow from entire License Area, the Honopou Stream measurement reading was used.

As discussed in Draft EIS Section 2.1.2 (East Maui/License Area) and 2.1.4 (Central Maui Field System), the long-term average delivery of water by the EMI Aqueduct System up until 1986 had been approximately 165 mgd (prior to any use of water by the MDWS or HC&S on the agricultural fields or for HC&S industrial activities). This measurement was taken at Maliko Gulch. Under the Proposed Action, it is estimated that approximately 87.95 mgd will be diverted from the License Area, and an additional 4.37 mgd will be diverted in between Honopou Stream and Māliko Gulch. Thus, an estimated total of approximately 92.32 mgd would be conveyed to supply the MDWS for users in Upcountry Maui and the agricultural fields in Central Maui. The Proposed Action will also ensure the continued delivery of water for the Nāhiku community, for which MDWS, under a contractual agreement contingent upon issuance of revocable permits or a water lease, is allowed to draw water from EMI's land through EMI's Nāhiku Tunnel. Similarly, other contractual agreements provide water to MDWS from other sources (i.e. not East Maui surface water), and those agreements are also contingent upon issuance of the Water Lease or water revocable permits.

Regarding your comment that *“without accurate calculations or estimates regarding the amount of water taken from each individual stream, there can be no accurate assessment of the potential impacts those diversions would have on the streams and the surrounding environment,”* please note that the HSHEP model used statistical regression estimates for discharge values (BFQ₅₀), which is a method to produce consistent estimates of discharge at ungauged locations. The streamflow estimates are based on the regression relationships published by the USGS in:

Gingerich, S.B., 2005, Median and Low-Flow Characteristics for Streams under Natural and Diverted Conditions, Northeast Maui, Hawaii: Honolulu, HI, U.S. Geological Survey, Scientific Investigations Report 2004-5262, 72

While verifying the baseflow metric with field data is preferable, it will take years to create accurate baseflow values for every stream/tributary in the License Area. If some type of statistical relationship between known gauged sites and ungauged sites was not applied, there

would be no way to make comparable estimates of habitat lost at the diversion locations. Hence, it is our position that the HSHEP model and the analysis of the report included as Appendix A to the EIS accurately assesses the potential impacts of the diversions on stream habitat under the Proposed Action.

Comment 16: The DEIS Fails to Disclose Diversion Locations and Diversion Amounts. *In our early consultation comments and comments on the EISPN we expressed that the EIS should provide at a minimum: • Full disclosure of every single diversion along the East Maui Irrigation system (including photographs and descriptions as to how the diversion operates, how much water it diverts from the stream daily (on average and at minimum and maximum), and its precise location);*

Response 16: EMI has gauges located in several locations across the License Area. These gauges measure the flow in the ditches only. It is not feasible to measure flow in the streams, as there are limited areas that contain the necessary control points to accurately measure streamflow. Further, what is important relative to stream protection is measurement of water flowing in the stream, not the amount diverted from each stream. Similarly, it is not feasible to provide total diversion amounts by a license area, i.e. diversions amounts only from Huelo, diversion amounts only from Nāhiku, etc. While the USGS used to have gauges at each of the License Area boundaries, those gauges were not on individual streams, they were in the ditches at each license area boundary. However, due to USGS cost cutting, several of those gauges were removed. It is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams. This proved entirely impractical due to the flashy nature of the streams, which caused gauges to wash away. In addition, proper gauging would involve some form of stream alteration, such as a weir in order to properly measure stream flow. EMI has never conducted stream gauging as that lays within the expertise the CWRM and the USGS.

Regarding your comment about photographs and descriptions as to how the diversions operate, as discussed in Section 1.3.1 of the Draft EIS, due to the complexity of the EMI Aqueduct System and the level of detail that can be displayed on a map, not all minor diversions could be depicted that are associated with a stream/tributary. Thus, an electronic drawing of the EMI Aqueduct System was georeferenced by Akinaka & Associates, Ltd. (Akinaka) to depict the major diversions on East Maui streams which is Figure 1-1 of the Draft EIS, which has been updated to be consistent with Table 1-3 in the Final EIS as provided on pages 1-19 to 1-22. We also note that EMI registered with CWRM all of its diversions associated with the EMI Aqueduct System in or around 1989.

Moreover, Mason Architects prepared the Historical Structure Assessment East Maui Aqueduct System (HSA), which is included in the EIS as Appendix D and summarized in Section 4.5 of the EIS. The HSA was conducted to make an evaluation and assist SHPD in making a determination on the potential impact to historic properties. The HSA documented 20 representative features of the EMI Aqueduct System, 19 of which were stream diversions. The 19 stream diversions were categorized into three categories: Type A, B, and C Stream Diversions. Specifically, Section 4.5 of the Draft EIS states:

Mason Architects documented 20 EMI Aqueduct System features during their May 2018 field survey and 31 sluice gate examples. Of these features, 19 were stream diversions, the most common of which (i.e. 14 of the 19 stream diversions surveyed) was “Type A Stream Diversion.” The “Type A Stream Diversion” operates by using a dam across the stream bed equipped with a sluice gate to impound water. When the sluice gate is closed, water is impounded behind the dam, such that it can flow out of the impounded pool, and into the ditch system through the intake. When the sluice gate is open, water is able to flow through the dam and is not impounded to a level to reach the intake for the ditch system. A variation (Type A Variation Stream Diversion) of this feature was also documented in Mason Architects field study. This diversion operates with a stilling wall that separates the impounded pool from the intake. When the sluice gate is closed, water will flow overtop the stilling wall and into the intake of the ditch system. Some of the stilling walls have perforations to allow for water to flow through the walls as well. Another variation is a sluice gate at the intake, and when the sluice gate is open, water can flow through the intake into the ditch system.

“Type B Stream Diversion”, accounted for three (3) out of the 19 stream diversion features. “Type B Stream Diversion” operates by using a weir across the stream bed to impound water to a level that will reach the intake. There are sluice gates at the intake, and when they are open, water is able to flow into the intake into the ditch system. When the sluice gates are closed, water is prevented from entering the intake, and flows over the weir, and continues downstream. There was an instance where the intake channel had an additional throw-out gate for the discharge of excess water that would make its way back into the stream.

“Type C Stream Diversion” accounted for two (2) out of the 19 stream diversion features documented. “Type C Stream Diversion” operates by using a weir across the stream bed to impound water that feeds into the intake. The feature does not have a sluice gate, and always open for water to flow into the intake. The intake

channel has a throw-out sluice gate to control how much water is entering the ditch, and when it is open, water returns back to the stream.

Mason Architects also documented a throw-out sluice gate (“Type D Ditch Water Throw-out”) located in the ditch system that would discharge water into a gulch.

During the field survey, there were also various types of sluice gates documented such as ratchet, geared, threaded-shaft, and a board adjusted sluice gates. A sluice gate is a panel of metal, wood boards, or plastic boards that slides vertically in grooves that are set in the sides of the waterway channel. Four types of sluice gates were noted during the field work. Three types use various mechanisms, such as a ratchet, a gear, or a threaded shaft, to move a solid panel vertically in slots set in the channel, and one type is defined by a series of horizontal boards that are slid up and down vertically in slots in the channel. These are explained in more detail in the study (See Appendix D).

Hence, Appendix D of the EIS contains more information regarding the surveyed stream diversions which also includes photographs. Appendix 1 of the Assessment of The Environmental Impacts of Stream Diversions on 33 East Maui Streams Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report provided as Appendix A of the EIS also has photographs of various steam diversions and is included with the Final EIS.

Comment 17: *Pursuant to HAR § 11-200-17(e)(6), the DEIS should contain a project description that includes a summary of "technical data, diagrams, and other information necessary to permit an evaluation of potential environmental impact." The DEIS fails to adequately disclose how much water will be diverted and when.*

Response 17: Regarding your comment that the Draft EIS should contain a project description that includes a summary of technical data, diagrams, and other information pursuant to HAR § 11-200-17(e)(6), please note that Chapter 2 of the EIS describes the Proposed Action in detail, including a description of Mahi Pono's diversified agricultural plan for Central Maui, and provides technical data and diagrams. Moreover, as discussed in Response #6 above, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields, including a description of the existing environment. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural

Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis therein relies in part on the nine technical studies (Appendix A, Assessment of The Environmental Impacts of Stream Diversions on 33 East Maui Streams Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model; Appendix B, East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry; Appendix C, Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease; Appendix D, Historical Structure Assessment East Maui Aqueduct System; Appendix E, Archaeological Literature Review and Field Inspection for the Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas; Appendix F, Cultural Impact Assessment for the Nāhiku, Ke‘anae, Honomanū and Huelo License Areas; Appendix G, A&B Proposed Water Lease for the Nāhiku, Ke‘anae, Huelo, and Honomanū Social Impact Assessment; Appendix H, Economic and Fiscal Impact Study Proposed Water Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Area; and Appendix I, East Maui Water Lease: Agricultural and Related Economic Impacts) that are appended to the EIS.

Contrary to your comment that the "DEIS fails to adequately disclose how much water will be diverted and when", the amount of water proposed for diversion is discussed throughout the EIS. For example, Section 2.1.2 of the EIS explains that with the issuance of the Water Lease under the Proposed Action, the EMI Aqueduct System would divert only the maximum allowable amount under the CWRM D&O from streams within the License Area, which is estimated to be approximately 87.95 mgd. The EMI Aqueduct System is estimated to divert an additional 4.37 mgd from the point that it leaves the License Area at Honopou Stream and collects water from streams on privately owned land to its last diversion at Maliko Gulch. Thus, an estimated total of approximately 92.32 mgd would be conveyed to supply the MDWS for users in Upcountry Maui and the agricultural fields in Central Maui. However, please note that Table 2-1 has been added to Section 2.1.2 of the Final EIS to summarize the total amount of surface water that could be made available from the East Maui streams prior to system losses that take place within the Mahi Pono field irrigation system in Central Maui. See page 2-12 of the Final EIS.

As for the timing of the diversion of the water, as discussed in Section 2.1.5 of the EIS, after the Final EIS is published and accepted by the BLNR, the State of Hawai‘i will conduct appraisals of the water from the License Area, produce lease agreements and a watershed management plan (refer to Section 2.1). Once this is complete the Water Lease will be put to public auction. Once the Water Lease is issued by the BLNR, under the Proposed Action, Mahi Pono can more fully implement its proposed farm plan. Moreover, it is estimated that 10 years will be required for Mahi Pono and lessees to remove volunteer sugarcane and weeds from the approximate 30,000

acres, amend soils, install field improvements, build warehouses and other structures, and plant crops. The predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years (Plasch, 2019). Hence, even under the Proposed Action, the amount of water diverted at any given time will be only what is needed to meet the needs of the authorized users, for example MDWS for Upcountry Maui, and Mahi Pono's agricultural operations in Central Maui. Please note that this statement has been added throughout the Final EIS as applicable as shown on pages xxii, 2-11, and 4-62.

Comment 18: *Notably, the DEIS acknowledges on page 8-1 that the content and parameters of a watershed management plan between the lessee and the DLNR is yet to be resolved. The key components needed to finalize the Water Lease, including its terms, have still not been completed.*

Response 18: You are correct. Page 8-1 of the Draft EIS, which is in within the Chapter noted as "Unresolved Issues", identified the contents and parameters of the watershed management plan as unresolved. However, page 8-1 of the Draft EIS also noted that the watershed management plan would be resolved before BLNR could issue the Water Lease. Section 2.1 of the Draft EIS contains a more robust discussion about the requirements of a watershed management plan and the BLNR's actions in that regard as of the time of the preparation of the Draft EIS, which was published on September 8, 2019. However, Section 2.1 of the EIS has been supplemented to discuss the BLNR's actions of October 11, 2019, where the BLNR approved the minimum content requirements for a watershed management plan. A copy of the BLNR-approved DLNR report is enclosed as Appendix O-1 in the Final EIS. The components of an acceptable watershed management plan and related information based upon the BLNR action of October 11, 2019 have been added to Section 2.1 of the Final EIS, as provided on pages 2-2 to 2-4. The BLNR delegated authority to the DLNR staff to jointly develop watershed management plans with water lessees to ensure that the watershed management plan aligns with the goals of watershed protection to maintain watershed function and water yield and to restore or maintain a certain level of biological integrity that is the foundation of a healthy watershed.

Comment 19: *One would think that one of the most essential terms to the Water Lease would be the amount of water proposed to be diverted and which specific areas those diversions would include. The DEIS discloses no proposed diversion amounts from individual stream sources and how those proposed amounts would impact the surrounding environment. The Water Lease should not be issued until all of the essential facts allowing for its implementation are revealed and subject to public opinion. Anything less would circumvent the very process of calling for an EIS.*

Response 19: The amount of water proposed for diversion from the License Area is noted in numerous sections of the EIS. The maximum amount of water proposed for diversion through the Water Lease is estimated as 87.95 mgd, after the IIFS is met, as described in Section 2.1.2 of the Draft EIS. See also Response #17. Regarding individual diversions from specific streams, as discussed in Response #15 and Response #16, what is important with respect to stream protection is the amount of water flowing in the streams, not measurement of the amount of water being diverted. The Water Lease diversions will come from the streams that were not ordered for Full Restoration under the CWRM D&O. See Table 1-3 of the Final EIS, identifying the areas of the various streams and which streams were ordered for Full Restoration. Note that Table 1-3 has been revised in the Final EIS to provide more clarity and be more consistent with the CWRM D&O as shown on pages 1-19 to 1-22. Figure 1-3 of the EIS also depicts the License Area streams and the applicable status of such streams. Note that the legend of Figure 1-3 has been revised to change the legend nomenclature from "Non-IIFS Streams" to "Non-Petitioned Streams" as shown on page 1-23 of the Final EIS.

All appropriate disclosures have been made in the EIS, and the EIS process has been subject to extensive public review. We similarly expect that the Water Lease process, as a public auction, will involve a public process, consistent with HRS § 171-58.

Comment 20: *While Trutta Environmental Solutions, LLC ("Trutta") was contracted to develop a Hawaiian Stream Habitat Evaluation Procedure ("HSHEP") model to assess impacts of surface water diversion, including instream habitat from constriction or diversion of stream flow, creation of barriers to stream animal upstream movement and entrainment of downstream drifting larvae in 33 streams, the model falls short by failing to: (1) quantify the amount of water currently being diverted; (2) identify the amount of water that will be diverted under the Proposed Action; (3) identify specific diversion locations to be used under the Proposed Action; and (4) quantify the impact any modification or action of those diversion locations would pose to native species and the significant cultural implications occurring as a result of limiting the ability to access certain diversion locations while availability of native species at and around those access points would be limited.*

Response 20: Please note that the HSHEP model does in fact (1) quantify the amount of water currently being diverted; (2) identify the amount of water that will be diverted under the Proposed Action; (3) identify specific diversion locations to be used under the Proposed Action; and (4) quantify the impact any modification or action of those diversion locations would pose to available habitat units for native species. This data and the analysis is presented in the appendices of the "Assessment of The Environmental Impacts of Stream Diversions on 33 East Maui Streams Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model" report conducted by Trutta Environmental Solutions, LLC as it relates to stream habitat, which is included as Appendix A to the EIS. However, please note that the appendices of the subject

report were inadvertently left out of the Draft EIS but have been included in the Final EIS, and the report has been revised for further clarification.

Your comment regarding the cultural implications occurring as a result of limiting access to certain diversion locations is unclear. Please note that the CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui as noted in Section 1.3.4 of the Draft EIS. Moreover, based on comments submitted in response to the Draft EIS, Cultural Surveys Hawai'i (CSH) conducted additional consultation after the publication of the Draft EIS, and the updated CIA and EIS identify impacts to the regional environment, taro farming, and freshwater resources within the License Area based on public documentation and consultation with the community as presented in Section 4.6 of the EIS.

With regards to access in the License Area, as discussed in Section 4.8 of the Draft EIS, public access to the License Area is currently limited to permitted access by hunting groups and hiking clubs and individuals. Access to the Ko'olau Forest Reserve Hunting Units, which include the Huelo, Honomanū, Ke'anae, and Nāhiku portions of the License Area, is managed by the Department of Land and Natural Resources (DLNR) Division of Forestry and Wildlife. In order to hunt in these areas, hunters must first obtain a license from the DLNR and an EMI Permit/Waiver. Access to the hunting units is managed by EMI through eight existing access roads. Hunters are permitted to enter the areas by vehicle but must traverse most areas by foot. Hiking is also a permitted recreational use within the License Area and is limited to hiking clubs. Hiking access requires a Hiking Waiver from EMI. As it relates to access into the License Area for cultural purposes, EMI has never denied anyone access for cultural purposes.

It should be noted that access to the License Area is limited for the safety of entrants. For hunters, hunting grounds are limited to one hunting party per hunting area, as regulated by the DLNR. The hiking groups that currently access the License Area, Sierra Club Maui Group and Mauna Ala Hiking Club, enter the License Area by foot and are guided by a club hiking expert with a manageable number of people.

Please note that Section 4.6 of the Final EIS has been updated to include a discussion as it relates to access into the License Area for cultural and traditional practices as shown in pages 4-171 to 4-252. The recommended mitigation measures relate to access were prepared in consideration of feedback to CSH from Mr. Ferreira and Mr. Tanaka of OHA recommending that the EIS should consider an array of approaches to mitigate potential impacts on practitioner access and use of the License Area, such as the maintenance of a consultation list of willing practitioners that can be used to communicate with and accommodate these individuals and developing an established procedure for cultural access.

CSH recommends that the access policy for the License Area include access by cultural practitioners via a similar process in use for hiking groups and developed in consultation with the landowner (the State) and the Water Lease lessee and in consideration of applicable law related to traditional and customary Native Hawaiian rights.

Comment 21: *The DEIS fails to address key concerns surrounding the diversion of water. Indeed, one of the specifics within the 2018 IIFS that was applied to the HSHEP model was that "[t]he IIFS are the estimated 64% of median base flows (BFQ50), also known as (H90) flows, for stream restoration, and the numbers are only estimates, to eventually be confirmed by actual flows from which the H90 can be established." (HSHEP at p. 57; emphasis added). Reliance on calculations not confirmed by an actual measurement of flows at each individual stream is a flawed approach and must be reevaluated after the appropriate measurements are taken.*

Response 21: As discussed in Response #16, the use of statistical regression estimates for discharge values (BFQ₅₀) is not a flawed approach. The streamflow estimates are based on the regression relationships published by the USGS in:

Gingerich, S.B., 2005, Median and Low-Flow Characteristics for Streams under Natural and Diverted Conditions, Northeast Maui, Hawaii: Honolulu, HI, U.S. Geological Survey, Scientific Investigations Report 2004-5262, 72 p.

The use of statistical regression estimate is a method to produce consistent estimates of streamflow at ungauged locations. While verifying the baseflow metric with field data is preferable, it will take years to create accurate baseflow values for every stream and tributary in the License Area. If some type of statistical relationship between known gauge sites and ungauged sites was not applied, there would be no way to identify the streamflows that the HSHEP model used to estimate the number of habitat units at most diversion locations

Comment 22: *We also insisted that the EIS disclose the following information for each alternative analyzed:*

- *The amount of water proposed to be taken from each stream daily (on average and at minimum and maximum);*
- *The amount of water proposed to be taken from each license area daily (on average and at minimum and maximum);*
- *The total amount of water proposed to be taken from the entire license areas daily (on average and at minimum and maximum).*

Response 22: As discussed in Response #16 above, it is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis, and it is unclear what value such information would add in terms of determining proper stream and

environmental protections. In terms of environmental considerations, as discussed in Response #15, what is important is the amount of water remaining in a stream, not how much water is being taken from a particular stream (or portion of the License Area). Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams proved to be entirely impractical due to the flashy nature of the streams, which caused the gauges to wash away. The total amount of water taken from the License Area is measured, with readings at the Honopou boundary of the License Area.

Regarding the total of water estimated to be available for diversion daily from the License Area, this is described in Section 2.1.2 of the EIS:

With the issuance of the Water Lease under the Proposed Action, the EMI Aqueduct System would divert only the maximum allowable amount under the CWRM D&O from streams within the License Area, which is estimated to be approximately 87.95 mgd. The EMI Aqueduct System is estimated to divert an additional 4.37 mgd from the point that it leaves the License Area at Honopou Stream and collects water from streams on privately owned land to its last diversion at Maliko Gulch. Thus, an estimated total of approximately 92.32 mgd would be conveyed to supply the MDWS for users in Upcountry Maui, Nāhiku, and the agricultural fields in Central Maui.

Hence, approximately 87.95 mgd of stream surface water is estimated to be available for diversion from the License Area under the Proposed Action.

Regarding your third bullet point comment about minimum and maximum daily flows, it is unclear what significance that information is to environmental impacts. As stated in other responses, water will be left flowing in the streams to comply with the CWRM D&O. Nevertheless, although we cannot project that information for future flows under the proposed Water Lease, we can provide historical information about minimum and maximum daily flows in the past. For example, up until 2006, when the long-term average delivery by the EMI Aqueduct System was 165 mgd, the minimum ditch flow experienced was approximately 10 mgd and the highest flow was the capacity of the EMI Aqueduct System (some 400 mgd).

Comment 23: *Given that there is no disclosure on possible diversion amounts for the Proposed Action, the DEIS further fails to address these concerns over each alternative. Without knowing how much water is proposed to be diverted from each stream, each individual license area, and the entire license areas taken together as a whole, it is impossible to run accurate scenarios on the impacts those diversions would pose.*

Response 23: Regarding your comment that there is no disclosure on possible diversion amounts for the Proposed Action, please note that as discussed in Response #22 above that it is assumed that approximately 87.95 mgd on average will be available for diversion from the License Area after compliance with the CWRM D&O. It is estimated that an additional 4.37 mgd can be diverted from the private lands immediately to the west of the License Area. Hence approximately a total of 92.32 mgd of stream surface water is estimated to be available for diversion under the Proposed Action.

We respectfully disagree with your comment that the Draft EIS fails to address these concerns over each alternative. In terms of amounts of water diverted, Chapter 3 of the EIS presents the analysis of two lesser water scenarios, identified as the Reduced Water Volume alternative and the No Action alternative. The Reduced Water Volume alternative analyzes impacts from diversions in amounts less than as presented for the Proposed Action, but more than what would be diverted under the No Action / No Water Lease scenario. Under the No Action alternative, a total of approximately 30.76 mgd would be diverted (with approximately 26.39 mgd of that total coming from the portion of the Collection Area east of Honopou stream). Section 3.4 of the Draft EIS then evaluates and compares each reasonable alternative against several environmental factors. Table 3-2 has been added to the Final EIS so that readers can compare the varying environmental effects of the alternatives and the Proposed Action. See pages 3-49 to 3-80 of the Final EIS.

Regarding your comment that it is impossible to run accurate scenarios without knowing how much water is proposed to be diverted from each stream, each individual license area, and the entire license areas taken together as a whole, please note that what is important when assessing stream/environmental impacts is not how much water is diverted from the streams, but how much water remains in the streams. Further, as discussed in Response #15 above, it is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gauges to wash away. For the purposes of the EIS diversion number readings were used at Honopou Stream (end of the License Area) and Māliko Gulch. Please see Response #15 for additional discussion on this topic.

Comment 24: *The DEIS Fails to Address Concerns Over Access to Culturally Important Areas. We have also requested in our early comments and comments on the EISPN that the EIS provide the following:*

- *Maps indicating all maintenance and/or access roads for the diversion system including identification of all access points at public roads and/or highways;*

- *Maps that show every single stream within East Maui, including all tributaries from mauka to makai, identified by name; and*

Response 24: Regarding maps depicting access roads and trails, Section 4.5 of the Final EIS, as well as Appendix E (Archaeological Literature Review and Field Inspection for the Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas) have been revised to include the current inventory of roads and trails in the License Area. CSH completed a geographic analysis of trails and roads that appear on maps of the License Area. This analysis is limited to trails and roads that were depicted on maps between 1869 and 1992 and available to the public domain. This analysis is also limited to only the roads or trails that extend within the License Area. Section 4.5 of the Final EIS has been updated to include a further discussion regarding these maintenance and access roads, and access points. See pages 4-147 to 4-149, together with Figure 4-39, which has been added to the Final EIS to correspond with the above text (Figure 48 in Appendix D and Figure 4-39 in the Final EIS).

Regarding maps depicting streams and tributaries in East Maui, please note that Figure 1-1 of the Draft EIS shows all of the streams recognized by the CWRM that are or could be diverted by the EMI Aqueduct System. Section 1.3.1 of the Draft EIS explains that:

Figure 1-1 illustrates the EMI Aqueduct System overlaid on the Department of Land and Natural Resources (DLNR) Division of Aquatic Resources (DAR) geographic information system (GIS) data obtained from the State Office of Planning’s GIS download portal. An electronic drawing of the EMI Aqueduct System was georeferenced by Akinaka & Associates, Ltd. (Akinaka) to depict major diversions on East Maui streams shown on a United States Geological Survey (USGS) base layer map obtained from ESRI. Due to the complexity of the EMI Aqueduct System and the level of detail shown on the map, not all of the minor diversions could be associated with a stream or tributary. The stream names shown are from the DAR GIS database but a few of those stream names may differ from how some East Maui residents may refer to them. Moreover, certain streams that were identified during certain proceedings before the Commission on Water Resources Management (CWRM) do not have associated GIS data and therefore could not be precisely located on the map.

Hence, some of the streams could not be depicted as there is not data to depict them.

Comment 25: *HAR § 11-200-17(e)(1) provides that the DEIS should include detailed topographical and regional maps. While the DEIS does provide an array of maps, none of them address the concerns indicated in our comments above and are devoid of showing and/or identifying diversion systems as they are located next to access areas. This information is critical*

as it relates to the accessibility of areas significant to the traditional and customary practices of gathering, farming, fishing, etc., along streams and streambeds potentially impacted by the Proposed Action. The DEIS fails to address accessibility issues. The EIS should identify the location of access points within the License Area and whether or not those access points will be impacted stream diversion. The EIS should also disclose whether use of access roads or pathways associated with maintenance of the EMI system will be restricted under the Proposed Action and identify those locations accordingly.

Response 25: As discussed in Response #24 above, maps depicting access roads and trails have been added to the EIS and Section 4.5 of the Final EIS, as well as Appendix E (Archaeological Literature Review and Field Inspection for the Proposed Lease for the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas), have been revised to include the current inventory of roads and trails in the License Area as shown on pages 4-147 to 4-148. CSH completed a geographic analysis of trails and roads that appear on maps of the License Area. This analysis is limited to trails and roads that were depicted on maps between 1869 and 1992 and available to the public domain. This analysis is also limited to only the roads or trails that extend within the License Area. Please see Response #24 for a more complete discussion about the maps and trails.

Regarding your comment about the Draft EIS failing to address accessibility issues, please note that Section 4.8 of the Draft EIS discusses access into the License Area as it relates to recreational activities. Specifically, Section 4.8 of the Draft EIS states:

The Koʻolau Forest Reserve Hunting Unit encompasses portions of Huelo, Honomanū and Keʻanae Nāhiku within the License Area (See Figure 4-38). The Hunting Unit is administered the DLNR, Division of Forestry and Wildlife. To hunt within the License Area, hunters must obtain a license from the DLNR and an EMI Permit / Waiver. Hunting grounds are limited to one hunting party per hunting area, as regulated by the DLNR. Hunters enter the hunting unit every Saturday and Sunday, as well as holidays observed by EMI. Prior to entering, hunting parties must sign in with the license number obtained from the DLNR, and upon exiting must log in any game that are taken. Access to the hunting grounds is managed by EMI through eight existing EMI access roads. Hunting is permitted year round. Hunting parties may enter the License Area by vehicular access, however, must traverse by foot in most areas.

Hiking is also a permitted recreational use within the License Area and is limited to hiking clubs. Access to the License Area for hiking is acquired through a Hiking Waiver from EMI. Only two hiking clubs currently enter the License Area lands approximately four to six times a year; the Sierra Club Maui Group and Mauna

Ala Hiking Club. They enter on foot, and are guided by a club hiking expert with a manageable number of people.

Other recreational uses are not permitted on the License Area for safety reasons, but trespassing and unpermitted access for hiking, gathering, and illegal hunting does occur on State lands.

However, Section 4.8 has been revised in the Final EIS to include more recreational resources within the subject regions of interest and to include an expanded discussion of access regarding recreational activities within the License Area as shown on pages 4-305 to 4-309.

Moreover, as discussed in Response #9 above, the CIA and Section 4.6 have been updated in the Final EIS to include a discussion regarding access by cultural practitioners as shown on pages 4-248 to 4-251.

Regarding your comment about whether access points into the License Area would be impacted by the stream diversions, please note that under the Proposed Action that EMI would continue to maintain and repair many of the existing access roads and trails a part of the EMI Aqueduct System, many of which are used by the public.

Regarding public access, we also direct you to Section 3.2.2.2 of the Draft EIS, describing a Modified Lease Area alternative, the comparative evaluation of which is provided in Section 3.4. Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, it is assumed under this alternative that public access to and uses within the State-owned land that is outside of a smaller License Area would be managed by a State agency (presumably,

the Division of Fish and Wildlife (DOFAW)) and the areas managed by EMI would be significantly less than it has in the past. DOFAW has not indicated how it intends to regulate those lands. Should there be greater public access to the License Area than currently exists, pursuant to the analysis in Section 3.2.2.2 of the EIS and Appendix C, it is anticipated that there may be an increased introduction or spreading of invasive species within these areas. Furthermore, the discussion of the Modified Lease Area alternative has been expanded to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding impacts to the areas that would allow for more public access as shown on pages 3-21 to 3-24.

Comment 26: *The DEIS Fails to Adequately Consider Alternative Water Sources* We have also raised the following concerns in our previous comments:

- *Alternative proposed uses including one that involves the use of water from less than all four license areas and no diversion of water from East Maui.*

HAR § 11-200-17(f)(2) states the DEIS should list proposed alternative uses which could attain the objections of the action and to explain in sufficient detail why those alternatives were rejected. Despite the concern raised above in 2016, A&B has not adequately considered the possibility of seeking water sources other than diverting water from the subject license areas in order to attain the objectives of the Proposed Action.

Response 26: We respectfully disagree with your comment that A&B has not adequately considered the possibility of seeking water sources other than diverting water from the License Area. Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a No Action alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that could have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects, and therefore those alternatives were discussed, but ultimately not assessed to the same degree as (a) through (d). Additionally, Chapter 3 acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible for reasons discussed in Chapter 3.

Moreover, Chapter 3 has been supplemented in the Final EIS to include further discussion of alternatives that were previously deemed infeasible, and to provide a comparative evaluation table of alternatives, in the interest of greater clarity. See pages 3-49 to 3-80 of the Final EIS.

Comment 27: *The DEIS Fails to Satisfy Ka Pa'akai. The DEIS acknowledges Ka Pa'akai but misapplies it by improperly deferring key disclosures required by that precedent to an unknown time. Through its own Ka Pa'akai analysis, the DEIS admits that the inquiry does not end once the valued cultural, archaeological, and historical resources have been identified' Accordingly, "the second and third prongs of the Ka Pa'akai analysis require the agency to determine how any of the resources may be impacted by the proposed action, and what, if any, feasible measures can be taken to protect the resources." CIA at 393.*

FOOTNOTE 1:

A note to HAR 11-200-12 states:

Act 50, Session Laws of Hawai`i 2000, amended the definition of "significant effect" in HRS Section 343- 2to mean "the sum of effects on the quality of the environment, including actions that irrevocably commit a natural resource, curtail the range of beneficial uses of the environment, are contrary to the State's environmental policies or long-term environmental goals as established by law, or adversely affect the economic [or] welfare, social welfare[.], or cultural practices of the community and State."

Act 50 also amended the definition of "environmental impact statement" or "statement" in HRS Section 343-2 to include the disclosure of effects of a proposed action on cultural practices, as follows:

"environmental impact statement" or "statement" means an informational document prepared in compliance with the rules adopted under section 343-6 and which discloses the environmental effects of a proposed action, effects of a proposed action on the economic [and] welfare social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects.

(emphasis in original).

Rather than addressing the second and third prongs of the analysis, there is a generic

*assumption that application of the IIFS decision has the "potential to reduce or eliminate" the proposed cultural impact and therefore no further recommendation is needed as to the implementation of feasible protective measures. Most importantly, the recommendations given push a more detailed assessment to be provided in the future by a "qualified professional." Providing a detailed assessment **in the future** rather than submitting a detailed assessment with the DEIS fails to satisfy Ka Pa'akai because plans to reasonably protect cultural resources are clearly erroneous if they are only conceptual in form. It also conflicts with the very definition of an EIS, by depriving the BLNR of the environmental impact studies and alternatives analysis necessary for its informed decision-making.*

FOOTNOTE 2:

HAR 11-200-14 provides:

... the EIS process involves more than the preparation of a document; it involves the entire process of research, discussion, preparation of a statement, and review. The EIS process shall involve at a minimum: identifying environmental concerns, obtaining various relevant data, conducting necessary studies, receiving public and agency input, evaluating alternatives, and proposing measures for avoiding, minimizing, rectifying or reducing adverse impacts. An EIS is meaningless without the conscientious application of the EIS process as a whole, and shall not be merely a self-serving recitation of benefits and a rationalization of the proposed action. Agencies shall ensure that statements are prepared at the earliest opportunity in the planning and decision-making process. This shall assure an early open forum for discussion of adverse effects and available alternatives, and that the decision-makers will be enlightened to any environmental consequences of the proposed action.

(emphasis added).

Response 27: It is noted that while this EIS is intended to provide information to the agency, it is not intended to be the sole *Ka Pa'akai* analysis. The EIS is a disclosure document and the Applicant is not required to perform the *Ka Pa'akai* analysis. That responsibility lies with the State and county agencies of the State of Hawai'i. Nevertheless, consistent with the requirements under HRS Chapter 343 and Act 50 (2000) the EIS includes an assessment of effects on the cultural practices through the Cultural Impact Assessment for the Nāhiku, Ke'anae, Honomanū and Huelo License Areas provided as Appendix F. Within that assessment provided in the CIA there is an analysis of the *Ka Pa'akai* factors.

The Applicant acknowledges that with respect to recommendations to protect native Hawaiian cultural resources and practices, the CIA included in the Draft EIS recommended, based upon community consultation, that additional studies be performed and also concluded that that implementation of the CWRM D&O would mitigate the impacts of the Proposed Action given that the CWRM D&O called for full restoration of streams identified as valuable for taro cultivation and full or partial restoration for several other streams in the License Area to protect stream habitat. As explained in Section 7.5.3 of the updated CIA:

The CIA included in the DEIS described potential impacts to the regional environment, taro farming, freshwater ecosystems, and cultural sites. For impacts to the regional environment, taro farming, and freshwater ecosystems, the CIA deferred to other qualified professionals to offer recommendations for mitigation. This updated CIA includes discussion of two additional impacts (access by cultural practitioners and climate change) as well as the mitigation recommendations that have been provided by qualified professionals within the technical studies prepared for the EIS. These studies include the field surveys and habitat modeling conducted by Trutta Environmental Solutions, Inc., the terrestrial flora and fauna study prepared by SWCA Environmental Consultants, and the social impact assessment prepared by Earthplan. Mitigation recommendations also include pertinent information from the CWRM D&O for impacts to taro farming. For those impacts falling within CSH subject matter expertise, CSH offers specific recommendations based upon community consultation, technical knowledge, and relevant research. The mitigation provided in this CIA has the potential to mitigate cultural impacts of the Proposed Action.

In response to comments received on the Draft EIS, Cultural Surveys Hawai‘i (CSH), the consultant who prepared the CIA, reviewed those studies and provides additional analysis included in the Final EIS. Contrary to your comment that BLNR would be deprived of the studies needed for informed decision making, the Draft EIS included a full range of environmental studies that assessed impacts and offered suggested mitigation measures in the event the Water Lease is issued. In light of the numerous technical studies prepared for the EIS, and the related analysis of not only the Proposed Action, but the relevant alternatives, which differ from the water diversions permitted under the CWRM D&O, we cannot agree with your assertion that the EIS relied exclusively on findings and conclusions from CWRM, or that the EIS conflicts with the requirements under HAR § 11-200-14.

With respect to the CIA, as fully documented in the CIA, CSH made extensive efforts to engage in consultation, starting in 2017. CSH conducted two separate rounds of community consultation. The first round of community consultation was conducted during the preparation of the Draft EIS. CSH contacted approximately 150 parties. CIA Table 12 (Community Contact Table) documents CSH's extensive efforts of community outreach and follow-up attempts.

Despite these repeated efforts, only 20 people/agencies responded. In an effort to gather as much information as possible, CSH then turned to the declarations that had been filed by participants in the CWRM proceedings that began in 2001 and concluded in June 2018, as those proceedings addressed 24 of the 36 streams within the License Area that are diverted by the EMI Aqueduct System. The declarations relied on by CSH were made by cultural practitioners, an expert witness, and Nā Moku Aupuni o Ko‘olau, a community of taro farmers, fishermen, and hunters who participated in that extensive process. Following public review of and comment on the Draft EIS, CSH conducted a second round of consultation. This consultation was targeted to those who had provided comments on the Draft EIS and raised specific issues of a cultural impact nature. No additional cultural resources or practices, or details regarding specific areas where access is needed, for specific cultural practices, or to specific cultural sites, were identified during consultation.

The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action. See pages 4-239 to 4-252 of the Final EIS for the revisions to Section 4.6.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM, and recommended by CSH.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

Comment 28: *Relying exclusively on a sister agency like the CWRM and post-dating a more detailed assessment addressing listed and recognized cultural impacts is the very definition of conceptual and goes against the entire purpose of submitting an EIS in the first place. It also contravenes a prior court order in related litigation that explicitly prohibits BLNR from "merely rubberstamping every CWRM determination." Na Moku Aupuni O Ko 'olau Hui and Maui Tomorrow v. BLNR, Civ. No. 03-1-0289-02 (ICC Order filed Oct. 10, 2003 (hereafter, "Hifo Order")).*

Response 28: With regard to the potential effects of the Proposed Action on traditional and customary practices, as discussed in the *Ka Pa`akai* decision, we acknowledge that BLNR will be required to "to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible." *Ka Pa`akai* at, 94 Hawai`i at 35, 7 P. 3d at 1072. BLNR has confirmed that in its Findings of Fact, Conclusions of Law, and Decision and Order filed on March 23, 2007 in the contested case proceeding that is still pending regarding issuance of the proposed Water Lease (the 2007 D&O) as follows:

Public trust principles require that adequate provision be made for the protection of traditional and customary Hawaiian rights, the protection and procreation of fish and wildlife, the maintenance of proper ecological balance and scenic beauty, and the preservation and enhancement of waters of the State for municipal uses, public recreation, public water supply, agriculture and navigation.

2007 D&O COL No. 6 at page 41 (*citing In Re Water Use Permit Applications*, 94 Hawai`i 97, 9 P. 3d 409 (2000)). CWRM, in its June 20, 2018 D&O, also recited the State's constitutional obligation to consider the impacts of stream diversions in East Maui on traditional and customary practices of Native Hawaiians at pages 242 through 245, including the Supreme Court of Hawai`i's more recent holding on this subject in *State v. Pratt*, 127 Hawai`i 206, 277 P. 3d 300 (2012).

In order to facilitate BLNR's compliance with this obligation, the EIS discussed cultural resources and practices, and the impacts to cultural resources and practices, in section 3.4.10 and in 4.6. The EIS also includes a comprehensive CIA prepared by CSH. As noted in Response #27, the CIA now includes information from a second round of consultation, which was done in response to comments submitted on the Draft EIS. We believe that the EIS (including Appendix F) together with the CWRM D&O, provide ample information for the BLNR to consider regarding potential impacts to traditional and customary practices, and that information will enable BLNR, at the point in the future that it is deliberating on the Water Lease, to fulfill its constitutional obligation "to protect the reasonable exercise of customarily and traditionally

exercised rights of Hawaiians to the extent feasible.” *Ka Pa‘akai* at, 94 Hawai‘i at 35, 7 P. 3d at 1072.

Importantly, to the extent that the CIA identified concerns of taro farmers regarding adequate water for their taro cultivation, please note that the CWRM D&O provided for full restoration of flow to the streams in the License Area (streams which NHLC's clients had identified to CWRM to be taro growing areas). Your comment does not explain how or why the full restoration of flow to these streams does not address the concerns identified in the CIA.

Comment 29: *While there is an extensive list of Traditional Cultural Practices (hereafter, "TCP") impacted by the Proposed Action and what streams are associated with those practices, the DEIS and the Cultural Impact Assessment ("CIA," attached as Appendix F) fail to provide any meaningful assessment since there is a lack of disclosure as to the amount of water to be taken from each stream. See CIA at 352-72, Tables 13 and 14.*

For example, the discussion on (a) the role of fresh water providing for the ecosystem vital to perpetuating the life of marine foods important to residents and (b) the historic use of kaka and kakaula fishing methods suggests a recognition of the community's reliance on continued fishing and other marine life gathering. CIA at 391-92. The DEIS provides a table of these gathering practices. CIA at 352-71, Table 13. However, without a richer and more detailed revelation of a scientific assessment of impacts from past, current and future diversions from the streams identified, BLNR cannot evaluate the quantitative consequences on any affected TCP along stream segments, or in stream mouth ecosystems within the watershed. Environmental disclosures for each of these specific micro-environments is crucial to a complete analysis of TCP impacts and reasonable protective measures specific to those practice locations.

Response 29: Regarding your comment about the community's reliance on fishing and gathering, the CIA identified practices including fishing, gathering of rocks for traditional food preparation, and knowledge of, or access to, cultural sites, including but not limited to cultural sites in the A&B/Mahi Pono agricultural fields of Hāmākua Poko and Hāmākua Loa, a legendary pōhaku in Wahinepe‘e, and Papanene Heiau as discussed in Section 4.5 and Section 4.6 of the EIS.

In response to your assertion that the Draft EIS does not "*provide any meaningful assessment since there is a lack of disclosure as to the amount of water to be taken from each stream,*" as discussed in Response #15, EMI has gauges located in several locations across the License Area. These gauges measure the flow in the ditches only. It is not feasible to measure flow in the streams, as there are limited areas that contain the necessary control points to accurately measure streamflow. Similarly, it is not feasible to provide total diversion amounts within only a

particular portion of the License Area, i.e., diversion amounts only from Huelo, diversion amounts only from Nāhiku, etc. The USGS used to have gauges at each of the License Area boundaries, but due to USGS cost cutting, several of those gauges were removed. It is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gauges to wash away. In addition, proper gauging would involve some form of stream alternation. EMI has never conducted stream gauging as that lays within the expertise the CWRM and the USGS. As noted in the CWRM D&O, the measurements EMI take are at Honopou Stream and Maliko Gulch, however, for the purpose of measuring the aggregate flow from entire License Area, the Honopou Stream measurement reading was used.

Moreover, the HSHEP model is a spatially-referenced model that includes all diversions and stream segments within the License Area. The overall summaries of stream results are derived from the impacts on stream segments above and below all major and minor stream diversions associated with the stream. The results from the HSHEP model actually provide the watershed analysis you assert is missing from the EIS. Please refer to Appendix A of the EIS for more details regarding the HSHEP model and analysis.

For purposes of determining impacts to environmental and cultural resources, it would seem that the relevant inquiry is the amount of water to be left in the streams. The CWRM D&O established the minimum IIFS for most of the streams within the License Area. The HSHEP model provides an analysis of the impacts of varying amounts of water within all of the License Area streams to stream habitats and native amphidromous species.

Your comment regarding impacts of past, current and future diversions and BLNR's ability to conduct a quantitative review of impacts to traditional and customary practices is unclear. However, as discussed in Response #7 above, we acknowledge that an EIS must consider cumulative impacts, which means "the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions." HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically feasible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and

stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection for the Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas (Appendix E), which has been further supplemented to include information on the legendary Pōhaku in Wahinepe‘e, archeological resources in Central Maui, climate change impacts on cultural and historical resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments fielded during the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. The Assessment of the Environmental Impact of Stream Diversions on 33 East Maui Streams Using the Hawaiian Stream Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System. As it relates to the human environment, the Cultural Impact Assessment for the Nāhiku, Ke‘anae, Honomanū and Huelo License Areas (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been updated to address comments received on the Draft EIS and post-Draft EIS consultation. The A&B Proposed Water Lease for the Nāhiku, Ke‘anae, Huelo, and Honomanū Social Impact Assessment (Appendix G) documents community outreach with various stakeholders in a context for understanding the current and historical perceptions of diverting East Maui stream water, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century and have shaped the existing environmental conditions described in Chapter 4, albeit to a lesser extent than in the past due to the reduction in stream diversions that could be allowed under the Proposed Action. Please note that Section 4.17 of the Final EIS has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

Specifically, with regards to scientific assessment of impacts from past, with respect to the HSHEP model, there is no data for pre-diversion conditions because there is no data prior to 1960 in the State Division of Aquatic Resources Database associated with stream surveys. The surveys from the 1960s were conducted by the State of Hawai‘i Department of Fish and Game, but even these are far after many diversions were in place across the State. Thus, it is not scientifically possible to provide an assessment of impacts that took place prior to 1960.

Regarding your comment about disclosures of each of the micro-environments, please note that this is not feasible to analyze within an area of 33,000 acres that consist of several different types of habitats as discussed in Section 4.4.1 of the Draft EIS. Specifically, Section 4.4.1 of the Draft EIS states:

SWCA's survey found that the License Area comprises primarily open and closed 'ōhi'a (Metrosideros polymorpha) forest. This type of vegetation accounts for over 60% of the vegetation in the surveyed areas of East Maui. Open 'ōhi'a forests tended to have native species such as 'ōhi'a, pāpala kēpau (Pisonia grandis), and lapalapa (Cheirodendron trigynum) co-dominating with invasive species such as African tulip tree (Spathodea campanulata) and Formosa koa (Acacia confusa). The midstory was often a co-dominant mixture of native and non-native as well, with natives such as hāpu'u fern (Cibotium sp.) and koa (Acacia koa) blending with invasive species such as shoebutton ardisia, mule's foot fern (Angiopteris invecta), and strawberry guava. The understory frequently consisted of uluhe with a mixture of non-native herbaceous species along the margins, including glorybush (Tibouchina herbacea), white ginger (Hedychium coronarium), Koster's curse, Spanish needle, and Job's tears.

Non-native (Alien) Forest accounts for 23% of the vegetation in the License Area and includes Eucalyptus, Casuarine, Falcataria, Araucaria, Fraxinus, Melaleuca, Psidium, and Grevillea spp. Paperbark (Melaleuca quinquenervia) and eucalyptus (Eucalyptus spp.), likely introduced as forestry species, were found during the ground surveys to be the predominant overstory species in this vegetation type. Shoe button ardisia (Ardisia elliptica) and strawberry guava (Psidium cattleianum) were common throughout the midstory, and understory species included a variety of non-native grass species such as basket grass (Oplismenus hirtellus spp. Hirtellus), Job's tears (Coix lachrymal-jobi), and bristly foxtail (Setaria verticillata), in addition to herbaceous species such as Koster's curse (Clidemia hirta), Spanish needle (Bidens pilosa), and tick trefoil (Desmodium triflorum). 'Ie'ie (Freycinetia arborea), a native liana, and laua'e haole (Phlebodium aureum), a non-native epiphytic fern, can occasionally be seen twining through the midstory in this vegetation type.

Uluhe-dominated slopes were seen on ground surveys occurring adjacent to 'ōhi'a forest on relatively steep slopes up and downhill from access roads. These areas were characterized by a generally monotypic understory layer of uluhe with the sporadic presence of native shrubs and trees, including 'ōhi'a, pāpala, kēpau, and lapalapa, but also the less commonly seen native species 'ōhā wai nui (Clermontia arborescens spp. waihia).

*Wet cliff areas are less likely to be impacted by feral pigs and human activities due to their steepness, and thus are more likely to contain threatened or endangered plant species. However, no threatened, endangered, or candidate plants were seen in these areas during the ground surveys, but some less-commonly seen species were noted, including a *Cyrtandra* species (likely *Cyrtandra grayi*), and 'ōhā wai nui. Fern species tend to dominate these areas, most notably *Cyclosorus parasiticus*. *Machaerina*, a native sedge, was also frequently seen.*

With regards to impacts, the Proposed Action is not anticipated to alter each vegetation cover type currently present within the License Area. As such, those areas would remain substantially the same.

With regard to stream environments, the HSHEP quantified how various man-made changes affect Native Hawaiian amphidromous stream animals based on Statewide observations of these animals' distribution and habitat as discussed in Section 4.2.1 of the Draft EIS. The HSHEP mode concluded that the Proposed Action would have a negative impact by reducing native stream animal habitats by approximately 40% that is estimated to be available under natural flow conditions with no diversions.

Hence, a feasible analysis was conducted that had a regional approach when assessing the impacts of the Proposed Action on the above environmental factors.

Comment 30: *The CIA acknowledges the community residents who rely on both stream life (o'opu, `opae, and hihiwai) and marine life food sources, all of which rely on the steady flow of fresh water in streams flowing from the mountains to the ocean. CIA at 352-54, 359, 388-89, 392. It acknowledges witnesses who attest to declines in stream life, marine life, and the health of various fish species and populations. Id. In general, historic stream gathering of `opae from mauka to Makai, now apparently restricted to the upper reaches of streams due to the availability of cooler water now only in "mountain areas" where stream flows still remain abundant. CIA at 392 (citing to expert Skippy Hau). However, once again, the DEIS is devoid of watershed specific analysis of the impacts of specific diversions in each stream, depriving the reader of any appreciation for the impacts these specific diversions are having on any particular stream watershed. Without location information on diversions, or a scientific assessment on each affected watershed, the BLNR as a regulator would not be able to fashion reasonable protective measures specific to those affected stream stretches affected by specific diversions.*

Response 30: You are correct that the CIA participants and several of the declarations used described observations detailing declines in stream life, marine life, and the health of the

watershed. Following public review of and comment on the Draft EIS, CSH conducted a second round of consultation which was targeted to those who had provided comments on the Draft EIS and raised specific issues of a cultural impact nature.

Section 4.6 of the Final EIS has been updated as shown on pages 4-171 to 4-239 enclosed with information relating to the additional consultation dealing with stream life, marine life, and the health of the watershed. Regarding gathering of 'opae, it is acknowledged in Section 4.6 as shown in pages 4-171 to 4-239 that gatherers have noted traveling high into the mountains to find 'opae. However, please note that the HSHEP model included 'opae in its analysis which shows that its habitat will see an increase under the Proposed Action as baseflow is restored to many streams within the License Area when compared to historical stream diversion rates.

With respect to the comment:

However, once again, the DEIS is devoid of watershed specific analysis of the impacts of specific diversions in each stream, depriving the reader of any appreciation for the impacts these specific diversions are having on any particular stream watershed. Without location information on diversions, or a scientific assessment on each affected watershed, the BLNR as a regulator would not be able to fashion reasonable protective measures specific to those affected stream stretches affected by specific diversions.

The HSHEP model is a spatially-referenced model with all diversions and stream segments within the License Area included. The overall summaries of stream results are derived from the impacts on stream segments above and below all major and minor stream diversions associated with the stream. The results from the HSHEP model actually provides exactly what is stated to not exist in the analysis. Please refer to Appendix A of the EIS for more details regarding the HSHEP model and analysis.

Comment 31: *EMI diverts multiple streams, up to four times in some instances, affecting the stream course at varying elevations differently. These multiple diversions along a single stream reflects the gaining and losing nature of that stream segment, which may affect the nature of the protective measures and underscore why a one-size-fits-all approach is inappropriate.*

Response 31: As discussed in Response #30 above, the HSHEP model is a spatially-referenced model with all diversions and stream segments within the License Area included. The overall summaries of stream results are derived from the impacts on stream segments above and below all major and minor stream diversions associated with the stream. The results from the HSHEP model actually provide exactly what is stated to not exist in the analysis. Please refer to Appendix A of the EIS for more details regarding the HSHEP model and analysis.

Comment 32: *Similarly, the CIA discussion of kupuna who once caught and ate `ohua and hinana living in certain tributaries suggests that those locations might be targeted for similar protective measures. CIA at 392. However, without more location-specific data or impact assessments, BLNR would not be able to address possible protective measures that would have to rely on which tributaries are targeted for possible diversions that affect those species.*

Response 32: You are correct that the CIA included with the Draft EIS stated at page 392, "Kūpuna who lived near the streams in the 1920s and 1930s also caught and ate `ōhua and hinana, which were prevalent in tributaries." Mr. Hau reported that back in the 1920s and 30s, those who lived near the streams would catch `ōhua, which would be gathered well before sunrise, where they'd be prepared and put in the dry box and then "eaten like candy." Mr. Hau explained that hinana were prepared and eaten the same way. The kama`āina would see large populations of fish when they were kids but now in their older years, it is rare to find the same species in these streams. In any event, no specific locations for where these were gathered was given.

As stated in Response #30 above, the HSHEP model is a spatially-referenced model with all diversions and stream segments within the License Area included. The overall summaries of stream results are derived from the impacts on stream segments above and below all major and minor stream diversions associated with the stream. The results from the HSHEP model actually provides exactly what is stated to not exist in the analysis. Please refer to Appendix A of the EIS for more details regarding the HSHEP model and analysis.

Comment 33: *Again, one of the documented community concerns listed in the CIA was seeking clarification on stream flow, water diversion, and climate statistics as is expressed in the following questions: (1) How much water is being diverted at each location of intakes, ditches, dams, pipes, and flumes?; (2) How much water is being diverted from East Maui to Central Maui?; and (3) Is climate change accounted for? CIA at 393-94. The recommendation provided is as follows: "It is recommended that these questions be addressed by qualified professionals who possess an understanding of stream flow mechanics, water diversion, and climate statistics within the License Area." While the more detailed assessment may presumably be found in Appendix A of the DEIS, none of these crucial questions are answered. Notably, these same concerns were brought to the attention of A&B prior to them conducting the aforementioned reports in our EISPN comments back in 2016. Hence, the DEIS provides none of the disclosures required by the law and denies the BLNR and the public of critical information related to the "unavoidable impacts" of A&B's proposed use.*

Response 33: Regarding your comment about the enumerated community concerns provided in the CIA:

(1) Regarding the amount of water being diverted at each intake, as discussed in Response # 15, EMI has gauges located in several locations across the License Area. These gauges measure the flow in the ditches only. It is not feasible to measure flow in the streams, as there are limited areas that contain the necessary control points to accurately measure streamflow. Similarly, it is not feasible to provide total diversion amounts of a particular portion of the License Area, i.e. diversion amounts only from the Huelo portion of the License Area, diversion amounts only from the Nahiku portion of the License Area, etc. The USGS used to have gauges at each of the License Area boundaries. However, due to USGS cost cutting, several of those gauges were removed. It is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gauges to wash away. In addition, proper gauging would involve some form of stream alteration, such as a weir in order to properly measure stream flow. EMI has never conducted stream gauging as that lays within the expertise the CWRM and the USGS.

As noted in the CWRM D&O, the measurements EMI takes are at Honopou Stream and Maliko Gulch, however, for the purpose of measuring the aggregate flow from entire License Area, the Honopou Stream measurement reading was used. As discussed in Draft EIS Section 2.1.2 (East Maui/License Area) and 2.1.4 (Central Maui Field System), the long-term average delivery of water by the EMI Aqueduct System up until 1986 had been approximately 165 mgd (prior to any use of water by the MDWS or HC&S on the Central Maui agricultural fields). This measurement was taken at Maliko Gulch. Under the Proposed Action, it is estimated that approximately 87.95 mgd will be diverted from the License Area, and an additional 4.37 mgd will be diverted in between Honopou Stream and Maliko Gulch. Thus, an estimated total of approximately 92.32 mgd would be conveyed to supply the MDWS for users in Upcountry Maui and the agricultural fields in Central Maui.

(2) Regarding the amount over water being diverted for use in Central Maui, as discussed in Section 2.1.2 of the Draft EIS approximately 92.32 mgd would conveyed through the EMI Aqueduct System, most of which (approximately 87.95 mgd) would come from the License Area. Also as discussed in Section 2.1.2, as of the publication of the Draft EIS:

Currently, the EMI Aqueduct System is only diverting approximately 20 mgd. As a result, very little surface stream water is currently being diverted relative to what would be allowed should the Water Lease be awarded per the Proposed Action. However, the amount of water that may be diverted should the Water Lease be issued is substantially less than the

amount that was diverted during normal sugar production. For example, in 2006 it is estimated that the EMI Aqueduct System delivered approximately 156.69 mgd at Maliko Gulch, whereas under the CWRM D&O, it is estimated that the delivery at Maliko Gulch will be approximately 92.32 mgd (Akinaka, 2019)).

That discussion has been further updated to take into account the fact that Mahi Pono has continued to expand its farming in Central Maui, and water has continued to be diverted through the EMI Aqueduct System to support that effort and continue the supply to MDWS, further updated information has been provided in Section 2.1.4 of the EIS regarding the water diversions authorized for 2021 under revocable permits and the expected uses of that water. See pages 2-30 and 2-32 of the Final EIS.

(3) Regarding considerations of climate change, that topic was addressed within the Draft EIS. See for example Section 4.3.1, discussing the expected climate change trends in East Maui, Upcountry Maui, and Central Maui based on latest climate change publications in the State. Moreover, please note that the CIA has accounted for climate change as shown on pages 4-89 to 4-91.

In summary, these questions were addressed by qualified professionals and those analyses are provided in the EIS.

We acknowledge that in its EISPN comment letter, NHLC's requested specific information regarding diversions to a level of detail that is beyond what could feasibly be provided. As discussed under item (1) above, that information does not exist. Moreover, we understand that it was clear throughout the CWRM proceedings that water diverted from the License Area is not measured at every diversion as noted throughout the CWRM D&O. However, Figure 1-1 of the EIS does depict the locations of the major diversions of the EMI Aqueduct System.

Moreover, the HSHEP model does estimate streamflow at all diversion locations based on watershed and rainfall characteristics. The streamflow estimates are based on the regression relationships published by the USGS in:

Gingerich, S.B., 2005, Median and Low-Flow Characteristics for Streams under Natural and Diverted Conditions, Northeast Maui, Hawaii: Honolulu, HI, U.S. Geological Survey, Scientific Investigations Report 2004-5262, 72 p.

These relationships were extended to cover the License Area. The estimation of streamflow and percent diversion are intended to allow for the relative comparative assessment of the streamflow diversion among different segments of the stream and among different streams.

Comment 34: *Given the above, BLNR is afforded no mechanisms for the reasonable protection of gathering practices that are specific to the habitat locations in the streams affected by diversions.*

Response 34: Your comment that BLNR is afforded no mechanism for the reasonable protection of gathering practices is unclear, as the CIA that was included with the Draft EIS, and the further supplemented CIA, provide recommended mitigation measures to protect such practices as discussed in Response #9 above. Section 4.6 of the Final EIS has been supplemented with a more detailed discussion of recommended measures to protect gathering practices. With regards to specific habitat locations in streams being affected by the diversions, please refer to Appendix A as the HSHEP model is a spatially-referenced model with all diversions and stream segments within the License Area included. The overall summaries of stream results are derived from the impacts on stream segments above and below all major and minor stream diversions associated with the stream. The results from the HSHEP model actually provides exactly what is stated to not exist in the analysis.

Comment 35: *Streams Not Subject to the 2018 CWRM Decision* *The DEIS identifies 13 streams not subject to a CWRM IIFS and have never been assessed for how stream diversions from them may have affected their habitats. (See, DEIS at 1-16 to 1-19, Table 1-3). A&B must perform, at a minimum, a Ka Pa'akai analysis for each of them and report the results in the EIS, prior to causing any diversions from them. It must also conform to the EIS requirements outlined above, including the "unavoidable impacts" of the use of non-renewable resources, like water, and irreversible curtailment of the uses of the environment, like stream diversions.*

Response 35: We respectfully disagree with your comment that the non-petitioned streams were never assessed. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which was subject to the CWRM D&O as a "connectivity stream." Moreover, the Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP Model) assessed all streams within the License Area that are, or were, diverted by the EMI Aqueduct System.

The CWRM D&O did not set IIFS for 12 streams within the License Area that are diverted by the EMI Aqueduct System because those streams were not included in the petitions filed by NHLC on behalf of Nā Moku. However, the CWRM D&O did take those streams into account. CWRM D&O at ii. Moreover, while 12 diverted License Area streams were not assessed pursuant to specific petitions to establish IIFS, those streams are subject to the 1988 IIFS set for the East Maui streams. Please note that the CWRM, as is evident from its website, both from its

own research and in conjunction with USGS, has information on the License Area streams, including the non-petitioned streams, which information has been made available to the BLNR. Furthermore, under the revocable permits, annual reports, and now quarterly reports, are submitted by EMI to the BLNR, which identify the total amount of water being diverted from License Area measured at Honopou, i.e., water from both petitioned streams and non-petitioned streams. Hence, the 12 non-petitioned streams were included as part of the overall analysis of the EIS and associated technical studies. In terms of stream habitat, the HSHEP model provided as Appendix A analyzed those streams to assess changes in native amphidromous stream animal habitat with respect to stream diversions which is summarized in Section 4.2.1 of the EIS in the section covering East Maui.

The HSHEP model is a spatially-referenced model with all diversions and stream segments within the License Area included. The overall summaries of stream results are derived from the impacts on stream segments above and below all major and minor stream diversions associated with the stream. The results from the HSHEP model provides an analysis of habitat impacts for petitioned and non-petitioned streams. Please refer to Appendix A of the EIS for more details regarding the HSHEP model and analysis. Depending on the stream diversion type, generally speaking, a diversion can impact stream habitat by removing water from the stream, altering the natural path of the stream water or creates a barrier to movement up and down the stream. However, as long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best.

Regarding your comment about a *Ka Pa'akai* analysis, the CIA included in Appendix F and summarized in Section 4.6, was a regional study that was not limited to only the streams that were addressed by the CWRM D&O. The CIA provides a synopsis of anticipated impacts of the Proposed Action to identified cultural resources and practices and offers mitigation recommendations gathered from the community and other consultant studies. The CIA assessed the impacts, alternatives, and measures to mitigate impacts of the proposed Water Lease on the cultural resources, practices and beliefs identified through this process. The assessment includes discussion of potential impacts on the following: 1) regional environment; 2) taro farming; 3) freshwater ecosystems; 4) cultural sites; 5) access by cultural practitioners; and 6) climate change. CSH then developed recommendations for mitigation based upon CSH's expertise, research and input received during the CIA consultation process, and based upon other technical studies that have been prepared for the EIS. Section 4.6 of the Final EIS has been supplemented with a more detailed discussion of the matters above. See pages 4-239 to 4-252 of the Final EIS.

Regarding your comment about unavoidable impacts, we note that the non-petitioned streams are also included within the discussions within Chapter 6 of the Draft EIS regarding the irretrievable and irreversible commitments of resources. Moreover, as discussed in Section 6.1:

The use of surface/stream water for domestic and agricultural purposes could be viewed as an irretrievable use of the resources, to the extent that the water has been removed from its natural course. However, the use of this surface water is part of the cycle to return the water to the environment. For example, some of the water applied to land will return to the atmosphere through evaporation and transpiration through plants while water entering the ground will eventually discharge into the ocean. Water consumed by humans and animals, will evaporate through breathing and perspiration, and wastewater effluent from cesspools, septic systems and wastewater treatment plants that discharge into the ground will eventually reach the ocean. Water in the atmosphere, including water evaporating from the ocean and land, will fall as rain, including in East Maui, completing the cycle. This is an open cycle involving the movement of water through the atmosphere, land and oceans of the earth.

As part of a global hydrologic cycle, water is generally considered a renewable resource. In any particular location and time, however, there may only be a limited amount available, for example, to flow in streams or be diverted for other uses. To the extent that a commitment is made as to where that water goes or is used, the result is an irreversible use of that water for that period of time. The Proposed Action is a Water Lease with 30-year commitment to the proposed use of water. With careful management and responsible usage, water is a renewable resource and with that understanding the Water Lease would not involve an irretrievable commitment of the water resource.

Comment 36: *These disclosures must be related to each specific stream watershed and brackish water ecosystem that is impacted by the various levels of diversions. A reasonably objective impact assessment would address impacts of each specific diversion on the stream habitat of each particular stream affected by those diversions. There are sound biological reasons for determining how depleting flow in one stream may impact an adjacent stream or other streams within the same region. In other words, the impact assessment should account for cross-stream effects on habitats as well.*

Response 36: Regarding assessing impacts of each specific diversion on the stream habitat, this was evaluated using the HSHEP model as discussed in various responses herein, including specifically Response #11. Values for entrainment and passage were applied to each diversion and the combination of multiple diversion on a stream were also calculated.

Regarding your comment about flow in one stream impacting other streams (cross-stream effects), this is unable to be accurately assessed currently as the HSHEP model cannot analyze this as there is not enough information scientifically available to properly model cross-stream effects.

Comment 37: *Impacts on Flora.* As expressed in our comments to the EISPN, we raised a concern that the EIS should not only consider impacts on flora found in the four license areas, but in areas that lie beyond and downstream that are impacted by the Proposed Action's reduction in streamflows.

Response 37: Please note that Appendix C (Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease) of the EIS that was prepared by SWCA included a survey of the approximately 30,000 acres of agricultural land in Central Maui that it referred to as the "Service Area" and approximately 33,000 acres of land in East Maui referred to in the SWCA report as the License Area. These areas were collectively referred to as the "Study Area" throughout the SWCA report. This report is summarized in Section 4.4 of the EIS, which has been supplemented in the Final EIS with additional information about the Service Area. See pages 4-121 to 4-124 of the Final EIS.

Regarding your comment about assessing the areas downstream of the License Area, please note that those areas were not directly assessed as those lands are primarily privately owned by various entities. However, the HSHEP model addressed streamflow impacts on the stream habitat in Section 4.2.1 of the EIS. Specifically, Section 4.2.1 of the Draft EIS states:

The HSHEP model was designed to quantify how various man-made changes affect native Hawaiian amphidromous stream animals and is based on statewide observations of these animals' distribution and habitat. The HSHEP model considers the primary impacts of surface water diversion, which include loss of instream habitat from constriction or diversion of stream flow, creation of barriers to stream animal upstream movement and entrainment of downstream drifting larvae.

Hence, it can be concluded that barriers created by stream diversions may impact downstream drifting larvae that would otherwise populate downstream habitats.

Comment 38: *We further stated that the EIS should address the impact of reduced streamflows on the type and amount of vegetation that grows in the streambed, effects on native species, and the proliferation of alien species in and along the streambeds. Not only did the DEIS fail to address vegetation within the streambed, the survey was only conducted within the License Area.*

Response 38: A further discussion of the impacts from reduced stream flows on has been added to EIS Section 4.4 and Appendix C of the Final EIS. Section 4.4 of the Final EIS is provided on page 4-121 of the Final EIS.

Regarding your comment about the effects of flows on native species, as discussed in Response 9 above, Draft EIS Appendix A (Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP Model)) prepared by Trutta, addresses streamflow impacts to the stream habitat which is summarized in Section 4.2.1 of the EIS. Specifically, Section 4.2.1 of the Draft EIS it states:

The HSHEP model was designed to quantify how various man-made changes affect native Hawaiian amphidromous stream animals and is based on statewide observations of these animals' distribution and habitat. The HSHEP model considers the primary impacts of surface water diversion, which include loss of instream habitat from constriction or diversion of stream flow, creation of barriers to stream animal upstream movement and entrainment of downstream drifting larvae.

The EIS concludes that the Proposed Action would have an adverse impact by reducing native stream habitat when compared to full natural flow. Under the Proposed Action, the number of habitat units within the License Area is decreased by approximately 36.1%. But, for the purposes of comparison, it is noted that when compared to when the EMI Aqueduct System operated under a full diversion condition, as it did during sugar operations, the number of habitat units within the License Area increases by 13.8%. In other words, 63.9% of the total habitat units remain within the License Area under the Proposed Action.

Comment 39: *The general conclusion in the DEIS is that the Proposed Action would have no impact on terrestrial flora of fauna resources because the action does not require vegetation removal and it involves "the use of roads and a system that has been in place for over 90 years." The DEIS clearly did not address the potential adverse impacts reduced streamflows would have on vegetation growing in and around streambeds. Accordingly, a more thorough analysis of this impact should be provided.*

Response 39: As discussed on page 4-121 of the Final EIS, the conclusion of the study is that the vegetation types would remain largely the same under the Proposed Action as the vegetation that currently exists is based on the continued use of the EMI Aqueduct System as it is currently being used. As this applies to vegetation, vegetation around the EMI Aqueduct System will continue to be managed as it currently is and has been in the past, which may require occasional vegetation removal. As shown on page 4-123 of the Final EIS, EMI has continually worked closely with the Maui Invasive Species Committee (MISC) and other similar agencies to assist in mitigating non-native weeds along the EMI Aqueduct System and access roads. Typical procedures involve EMI staff notifying MISC of sightings and locations of non-native weeds, and then facilitating access to these identified areas so MISC may conduct appropriate treatment methods.

However, please note that Section 3.2.2.2 of the Final EIS has been updated to include an additional analysis addressing the potential increase in public access to the License Area that could result from the Modified Lease Area alternative as shown on pages 3-21 to 3-24. Under this analysis, the magnitude of impacts to vegetation experienced would potentially increase throughout the entire License Area. Should the License Area be modified for greater public access, the magnitude of these impacts would be greater if the public is allowed in the eastern portion of the License Area, as the analysis in the SWCA report included as Appendix C to the EIS demonstrates that native and unique flora and fauna species are more likely to occur in the eastern portions of the License Area. Allowing public access to the western portion of the License Area may have a lesser negative impact on biological resources.

Comment 40: *Lo'i Kalo.* In order to address the actual and potential impacts of diversion on kalo growing, the DEIS recommends that a "botanist, ethnobotanist, or similar qualified professional provide an assessment of the ideal conditions of water flow and water temperature needed for kalo growth in comparison to the current water flow and water temperature of impacted areas in order to understand and address the stated impact." DEIS at 4-128; see also, App. F. CIA at 394-95. Again, it is assumed that the IIFS decision "has the potential to reduce or eliminate this cultural impact," as eight of the streams identified by community participants have been fully restored in accordance with the IIFS. Id. While these assumptions as they relate to certain impact areas are devoid of any meaningful review, there may very well be other areas where kalo or crop growing activity is impacted by diversions. As such, there should be an appropriate assessment for areas where prior dewatering of streams, like Honomanū, which may potentially attract a restoration of traditional taro growing areas abandoned due to the lack of a steady source of irrigation water. Similarly, the historic pattern of lo'i kalo growing area much larger than what currently exists. CIA at 391.

Response 40: As discussed above in Response #35, the CIA was a regional study that was not limited to only the streams that were addressed by the CWRM D&O, but instead included the streams within the License Area, including the non-petitioned streams. It is acknowledged that with respect to recommendations to protect native Hawaiian cultural resources and practices, the CIA appended to the Draft EIS recommended, based upon community consultation, that certain studies be performed. However, those studies were in fact performed and the data and analysis was within the Draft EIS. Moreover, in response to comments received on the Draft EIS, Cultural Surveys Hawai'i (CSH), the consultant who prepared the CIA, reviewed those studies and provides additional analysis included in the Final EIS. In light of the numerous technical studies prepared for the EIS, and the related analysis of not only the Proposed Action, but the relevant alternatives, which differ from the water diversions permitted under the CWRM D&O, we cannot agree with your assertion that the EIS relied exclusively on findings and conclusions from CWRM. The CIA provides a synopsis of anticipated impacts of the Proposed Action to

identified cultural resources and practices and offers mitigation recommendations gathered from the community and other consultant studies. See Response #29 above.

Section 4.6 of the Final EIS has been revised to more fully describe the cultural practices and related impacts for the streams within the License Area, including the non-petitioned streams as shown on pages 4-171 to 4-254 and summarized in Response #29 above.

Regarding your comment about dewatering streams, like Honomanū, and the potential for attracting taro growing areas, as discussed in Response #9, Honomanū Stream was identified as having taro farming impacts. However, it should also be noted as discussed in Section 1.3.4 of the EIS that Honomanū Stream has been ordered to have flow restored as a “Habitat Stream”, which will minimize cultural impacts to taro farming from water diversion at these locations.

The CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. With respect to Honomanū, CWRM D&O, FOF 245 and 247 provide as follows:

245. *There 8 registered diversions in Honomanū, of which five are EMI diversions and one was registered by both EMI and MDWS. The two remaining diversions were registered by Haleakala Ranch for the primary purpose of watering livestock (6,000 to 7,000 heads of cattle) with occasional use for domestic purposes at two cabins on the property. (Honomanū IFSAR § 11.0, p. 80.)*
247. *CWRM records for the hydrologic unit of Honomanū indicate that there are a total of 8 registered diversions. None of the diversions were declared for taro cultivation. (Honomanū IFSAR § 12.0, p. 91.)*

CWRM D&O, FOF 245 & 247.

The historic pattern of lo‘i kalo growing area within East Maui in the vicinity of the License Area was much larger than what currently exists. However, there are no traditions or accounts of regular habitation, cultivation, or intensive land use in the uplands of East Maui generally above 2,000 ft elevation. The portion of the License Area that is located above the 2,000-ft elevation contour includes approximately 19,640 acres. Clarifications on this background have been made to the Archaeological Literature Review and Field Inspection for the Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas report included as Appendix E in the EIS. Section 4.5 of the EIS, has been updated to include a summary discussion on this historical agricultural land use in East Maui, as provided on pages 4-143 to 4-147.

Historically, based on kuleana claims located near the coast there could have been up to 447.6 acres of intensive agriculture land use. Historic maps from 1869 and 1922 indicate that there was approximately 1,208 acres of farmland, including approximately 28.9 acres in use for traditional native Hawaiian agricultural practices. Furthermore, a study conducted by Ladefoged et al. (2009) suggests the potential for approximately 1,153 acres of irrigated wetland agriculture within the region of East Maui, with only approximately 152 acres within the License Area.

The EIS addresses the impacts related to East Maui farms that could be affected by the Proposed Action – that is, the known existing and potential farms that depend on water from the various East Maui streams that flow through the License Area as related to the Proposed Action and alternatives. In response to comments received on the Draft EIS questioning the estimation of East Maui farming, an additional review was conducted to expand upon the information previously provided in Appendix I, the East Maui Water Lease: Agricultural and Related Economic Impacts report, which is summarized in EIS Section 4.7.4 in the section focusing on East Maui. See pages 4-288 to 4-293 of the Final EIS.

Comment 41: *Collectively in this EIS draft, the reader cannot know what the significance of impacts there may be from diversions from individual streams without the specifically located stream diversion meters in place that would generate that information. Without that information the DEIS denies the BLNR and those who are affected at any particular stream specific habitat location that has suffered reduced stream flows that could be affecting stream species and marine food species that rely on the brackish water ecosystem interface where streams discharge into the ocean, both of which are of cultural importance to gatherers. This result is unacceptable and renders this cultural impact assessment fatally defective.*

Response 41: Regarding your comment that the reader cannot know the significance of impacts there may be from diversions from individual streams without the specifically located stream diversion meters, again, what is important as to impacts is the amount of water left in the streams, not the amount of water being diverted. The existing IIFS in all of the streams in the License Area defines how much water, at a minimum, is flowing in each stream. Further, it is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section basis. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gauges to wash away. For the purposes of the EIS diversion number readings were used at Honopou Stream (end of the License Area) and Maliko Gulch. Please also see Response #15 for a discussion regarding stream gauges.

Regarding your comment about stream habitat, as discussed in Response #30, the HSHEP model is a spatially-referenced model that includes all diversions and stream segments within the License Area. The overall summaries of stream results are derived from the impacts on stream

segments above and below all major and minor stream diversions associated with the stream. Please refer to Appendix A of the EIS for more details regarding the HSHEP model and analysis.

Regarding your comment about brackish water ecosystems, with regards to nearshore fisheries and off-shore fisheries, the collected data presented in Appendix B, the East Maui Irrigation Assessment of Streams and the Ocean report, and summarized in Section 4.2.3 of the EIS, suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be negatively impacted. In other words, the analysis presented in Appendix B concluded that impacts from the Proposed Action to ocean fish are negligible. As such, there is no scientifically sound reason to undertake a study of ocean fish in East Maui related to impacts from the Proposed Action. Moreover, evaluation of possible impacts on fisheries and nearshore gathering areas would require rigorous “before/after” experiments to determine changes between periods of diversion and non-diversion, with enough time during each phase for ecosystems to come to an equilibrium. Such an experimental set-up is not feasible, and therefore conclusions based on existing conditions are the most scientifically reasonable way to evaluate potential changes. See East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry report (Appendix B) and EIS Section 4.2.3.

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species (‘O‘opu naniha (*Stenogobius hawaiiensis*), ‘O‘opu akupa (*Eleotris sandvicensis*) and ‘Ōpae ‘oeha‘a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi‘ina‘au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa‘akea will have connectivity flow restoration, while ‘O‘opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on the pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on the pages 4-78 to 4-83 of the Final EIS.

With regard to the CIA, please note that its impacts, mitigations, and recommendations were partially based on the other technical studies conducted in support of this EIS, and also based upon historical research, submittals in the CWRM IIFS proceedings, and direct consultation. Hence, we do not believe that the CIA is defective.

Comment 42: Proposed Action is Vague. *The Proposed Action specifies no amount representing a volume of water being sought other than the supposed surface water amount that would exceed the CWRM IIFS, i.e., 87.95 mgd, the only figure mentioned for possible use in the DEIS. Nevertheless, throughout the DEIS, there is no objective basis to justify an amount based on any demonstrated level of actual need.*

Response 42: Contrary to your comment above, in no way does the Proposed Action seek an amount of surface water "that would exceed the CWRM IIFS." The EIS states in numerous sections that the Water Lease would be in compliance with the IIFS requirements of the CWRM D&O. For example, Section 2.1.2 of the EIS states:

With the issuance of the Water Lease under the Proposed Action, the EMI Aqueduct System would divert only the maximum allowable amount under the CWRM D&O from streams within the License Area, which is estimated to be approximately 87.95 mgd. The EMI Aqueduct System is estimated to divert an additional 4.37 mgd from the point that it leaves the License Area at Honopou Stream and collects water from streams on privately owned land to its last diversion at Maliko Gulch.

We respectfully disagree with your comment that there is no basis justifying use of this amount based upon actual need. The purpose and need for the proposed Water Lease, as well as the objectives of the proposed Water Lease, are presented in Sections 1.1 and 1.2 of the EIS. With regard to water needs, in summary, it is to provide water to approximately 30,000 acres of Central Maui agricultural fields so they can remain productive farmlands, and to continue to supply water to the MDWS Upcountry Maui Water System. It is also noted that EMI's continued provision of water to MDWS from sources other than the EMI Aqueduct System are contractually contingent on EMI securing revocable permits and ultimately the Water Lease.

The EIS presents the needs for this water. Section 2.1.4 of the Draft EIS provides the water demands for the Mahi Pono farm plan at full build-out, as follows:

Water Lease Limited to CWRM D&O Farm Plan

The Mahi Pono farm plan assumes the following:

- *The total surface water available for use after system losses is estimated to be approximately 65.88 mgd.*
- *Surface water can be supplemented by a brackish groundwater amount equal to 20 percent of surface water. Taking into account the CWRM D&O, it is estimated that there could be up to 16.47 mgd of brackish groundwater used in the Central Maui agricultural fields. (Plasch, 2019)*
- *Under the CWRM D&O, the total water available for use on the Central Maui agricultural fields after system losses is approximately 82.35 mgd*
- *That total amount of water will be delivered to approximately 30,000 acres. Of those 30,000 acres:*
 - *Approximately 15,950 acres would be used for farming, including 12,850 acres for orchard crops and 3,100 acres for other crops.*
 - *Approximately 13,800 acres would be used for pasture, of which about 4,700 acres would be irrigated.*
 - *Approximately 250 acres would be used for green energy, such as a solar farm.*

Because there is insufficient surface water to support the entire farm plan, brackish groundwater will also be used.

Given these figures and assumptions, a farm plan consistent with the amount of water available under the CWRM D&O is shown in the table below:

Proposed Use	Acres	Gallon Per Acre a Day	Surface MGD	Ground water MGD	Total MGD	Annual MGD	% of Total
<i>Community Farm</i>	800	3,392	1.87	0.83	2.70	987	3.28%
<i>Orchards (citrus, mac nuts, beverage crops)</i>	12,850	5,089	53.39	12.04	65.43	23,883	79.48%
<i>Tropical Fruits</i>	600	4,999	2.07	0.87	2.94	1,073	3.57%
<i>Row and Annual Crops</i>	1,200	3,392	3.14	0.95	4.09	1,491	4.96%
<i>Energy Crops</i>	500	3,392	1.18	0.53	1.70	622	2.07%
<i>Pasture, irrigated</i>	4,700	1,161	4.20	1.25	5.46	1,992	6.63%
<i>Pasture, unirrigated</i>	9,100	0	0	0	0.00	0	0.00%
<i>Green Energy</i>	250	0	0	0	0.00	0	0.00%
TOTAL	30,000	2,744	65.86	16.47	82.33	30,047.77	100.00%

This farm plan would consist of the following:

- Approximately 20,650 acres of irrigated farm land, including 12,850 of orchard crops, 600 acres of tropical fruit, 1,200 acres of row and annual crops, in addition to a community garden and limited non-GMO energy crops.*
- Approximately 13,800 acres of cattle pasture, comprised of 4,700 acres of irrigated pasture, and 9,100 acres of unirrigated pasture. This should fit the proposed model of grass-finishing on irrigated pasture. The unirrigated acreage is less than 10,000 acres, which helps ensure that that the entire area devoted to unirrigated pasture will remain productive.*

Regarding MDWS' needs, as discussed in Section 2.1.3 of the EIS, with the issuance of the Water Lease in the Proposed Action, the amount of water the MDWS would receive through the EMI Aqueduct System through the Wailoa Ditch is assumed to be consistent with prior use, identified in the CWRM D&O as an average of 7.1 mgd. This water would serve the Upcountry Maui Water System which services the communities of Kula, Pukalani, Makawao Ha'ikū, Hali'imaile, Waiakoa, Kēōkea, Waiohuli, 'Ulupalakua, Kanaio, Olinda, 'Ōma'opio, Kula Kai, and Pūlehu. In Upcountry Maui, the MDWS serves customers' water needs (homes, schools, hospitals, churches, businesses and agriculture) for both domestic (approximately 60% of use)

and agricultural (approximately 40% of use) purposes, including the agricultural users at the KAP. The Proposed Action will benefit the Maui communities by allowing for continued use and maintenance of the EMI Aqueduct System, which supplies water to the MDWS Upcountry Maui Water System at Kamole-Weir. In addition, the Proposed Action will enable the continued provision of water by EMI to the MDWS at Nāhiku and for MDWS' Pi'iholo and Olinda Water Treatment Plants (WTP), which also source the MDWS Upcountry Maui Water System. The provision of water from EMI land to the MDWS is contractually contingent on EMI securing revocable permits and ultimately the Water Lease.

Hence, the EIS clearly presents actual needs for the surface water to be diverted through the Proposed Action.

Comment 43: *In fact, the specifications of alternatives prescribe no alternative levels of water diversion, except a generally worded "Water Lease Volume Alternative" that is imprecise as to actual amounts of water being sought. Since there is no discussion throughout the entire DEIS regarding the amount of water being sought, there is no elaboration as to the need for the volume of water to be diverted under the Water Lease. Instead of offering different alternatives for water needed to irrigate the crops it has been planning to cultivate since January 2016, the DEIS leaves nothing for the BLNR to consider as projected impacts for the desired level of water A&B is seeking, defeating the very purpose of an EIS.*

Response 43: Contrary to your comment, the amount of water being sought is described in Section 2.1.2 of the Draft EIS and in Response #15 above, and in several other sections of the EIS. Moreover, you seem to have misconstrued the analysis provided on the Reduced Water Volume alternative. As explained in Chapter 3:

*Under Section 11-200-17(f), HAR, a DEIS must include a section discussing alternatives which could attain the objectives of the action regardless of cost, in sufficient detail to explain why they were rejected. In each case, the analysis of the alternatives must be sufficiently detailed to allow the comparative evaluation of the environmental benefits, costs, and risks of the Proposed Action and each **reasonable alternative**. Particular attention should be given to alternatives that might enhance the environmental quality or avoid, reduce, or minimize some or all of the adverse environmental effects, costs, and risks. In addition, an analysis of the "no action" alternative should be included.*

The objectives of the Proposed Action are, as presented in Section 1.2 of the EIS, as follows:

In general, the objectives of the issuance of the Proposed Action (Water Lease) are:

- *Preserve and maintain the EMI Aqueduct System, including its access roads*
- *Continue to meet domestic and agricultural water demands in Upcountry Maui*
- *Continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses)*
- *Continue to serve community water demands in Nahiku.*

With those objectives in mind, the EIS presented an analysis of the proposed Water Lease authorizing the amount of diversion that would be permitted from the License Area after compliance with the IIFS set forth in the CWRM D&O (see Chapter 4). The EIS also looked at potential alternatives to that option, consistent with the requirements under HAR § 11-200-17(f). See Chapter 3. With respect to water volume, the EIS assessed the anticipated impacts under a Reduced Water Volume alternative and, as required by HAR § 11-200-17, the anticipated impacts under a No Action / No Water Lease scenario. The Reduced Water Volume alternative analyzes impacts from diversions in amounts less than as presented for the Proposed Action, but more than what would be diverted under the No Action / No Water Lease scenario. Under the No Action alternative, approximately 30.76 mgd would be diverted. Section 3.4 of the Draft EIS then evaluates and compares each reasonable alternative against several environmental factors. Table 3-2 has been added to the Final EIS so that readers can compare the varying environmental effects of the alternatives and the Proposed Action. See pages 3-49 to 3-80 of the Final EIS. As such we respectfully disagree with your statement that the EIS does not provide the BLNR information on projected impacts from varying levels of water diversions.

Regarding your comment about A&B planning to cultivate crops since January 2016, please note that A&B sold the Central Maui agricultural fields to Mahi Pono in December 2018 as discussed in EIS Section 1.1. Hence, the EIS presents the projected Mahi Pono farm plan under a Water Lease scenario (see Section 2.1.4) and under a No Water Lease scenario (i.e., the No Action alternative) (see Section 3.4.13).

Comment 44: *In other words, A&B seeks a lease to 33,000 acres of ceded lands, formerly Crown Lands, for the authority to take whatever amounts of water it decides, subject only to the 2018 CWRM IIFS and what water reservation is established for the DHHL, so long as the water is used for: (1) Irrigation water to support agribusiness operations on 30,000 acres of agricultural land in Central Maui; and (2) the domestic water needs of the MDWS.*

Response 44: The terms and conditions of any Water Lease are at the discretion of the BLNR. As discussed in Response #4 above, the BLNR could elect to issue a water lease that authorizes the use of a lesser amount of water. The BLNR may also issue a Water Lease that covers a

lesser geographical area than the approximately 33,000 acres that were requested in A&B's 2001 application to BLNR for the auction of the Water Lease. The Draft EIS contemplated an alternative of a Modified Lease Area. See Section 3.2.2.2. Moreover, this alternative has been expanded to include a more robust discussion regarding a modified (i.e. smaller) License Area as shown on pages 3-21 to 3-24 of the Final EIS.

You are correct that the water from the Water Lease would be used to farm the Central Maui agricultural fields, within which Mahi Pono envisions cultivating a broad range of food and non-food crops for local consumption by State of Hawai'i residents and visitors. The water would also be used to continue to supply the Upcountry Maui Water System, which serves residential, business, educational, farming, and other uses. And you are correct that the Applicant recognizes that the Water Lease and therefore the water available thereunder would be subject to the rights of DHHL to make a water reservation.

Comment 45: *Without specifications for water amounts sought beyond the MDWS domestic water needs, the DEIS is a vacuous exercise, as it reveals nothing about the potential impacts that would be generated at any level of diversion. A&B, simply put, wants a blank check to be able to disclose impacts from water diversions of unspecified amounts, which it describes in the vaguest of terms. This approach defies a core requirement for EIS content. HRS §343-2 (defining in part "Environmental Impact Statement" as "an informational document ... which discloses the environmental effects of a proposed action, ... and **alternatives to the action** and their environmental effects") (emphasis added).*

Response 45: Once again, we must correct your statement that the EIS did not provide specifications for the water amount being requested. See Response # 15 above. Regarding your comment about potential impacts that would be generated at any level of diversion, the EIS did consider impacts from varying amounts of diverted surface water. The Draft EIS analyzed impacts for each 1 mgd less of surface water related to impacts to the Mahi Pono farm plan under the Reduced Water Volume alternative. Specifically, for each 1 mgd less of surface water there would be a related reduction of 24.51 acres of lands in crops, a reduction in direct sales on Maui of about \$245,000 per year, a reduction in direct sales on Maui of about \$245,000 per year, about 2.4 fewer direct and indirect jobs, and a reduction in State tax revenues of about \$9,000. (Plasch, 2019). Moreover, please note that Table 3-2 has been added to the Final EIS so that readers can compare the varying environmental effects of the alternatives and the Proposed Action. See pages 3-49 to 3-80 of the Final EIS.

We acknowledge that the definition of environmental impact statement under HRS § 343-2 includes the language quoted in your comment. The EIS was prepared consistent with all applicable requirements under HRS chapter 343 and HAR Title 11, Chapter 200. Your comment suggesting that the EIS lacks specificity on the amount of water sought for the Water Lease is

wrong. As discussed in several places in the EIS, including Section 2.1.2, the maximum amount of water that could be diverted through the EMI Aqueduct System from the License Area while maintaining compliance with the CWRM D&O is approximately 87.95 mgd. That water would be used to supply MDWS up to 7.1 mgd and to irrigate the Central Maui agricultural fields. Moreover, Section 2.1.4 of the EIS includes a description of the Mahi Pono farm plan to be implemented within the Central Maui agricultural fields, and that description provides the various estimated water needs for different sections of the farm. It is not clear how you interpreted these figures to be a "blank check" or "unspecified amounts" of water.

We also acknowledge the HRS § 343-2 calls for disclosure of environmental effects of alternatives to the Proposed Action. Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects, and therefore those alternatives were discussed, but ultimately not assessed to the same degree as (a) through (d). Additionally, Chapter 3 acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible for the reasons discussed in Chapter 3.

Chapter 3 of the Draft EIS includes a comparative evaluation of the environmental "benefits, costs, and risks" of the Proposed Water Lease and "each reasonable alternative" i.e. (a) through (d). However, Chapter 3 has been supplemented in response to Draft EIS comments to further address variations of the alternatives that had been dismissed from review, and the overall comparative evaluation of alternatives has been clarified through a comparison chart. See pages 3-49 to 3-80 of the Final EIS.

Comment 46: *A&B should have used Mahi Pono's projected water demands for its crop irrigation, reported in detail to the BLNR just last month, in order to accurately incorporate various levels of water diversions from streams. At a minimum, based on Mahi Pono's public representations, this DEIS should analyze impacts of diverting the levels of water it identified (45-55 mgd) and present those anticipated impacts in a cogent analysis to the BLNR and the general public through a revised and updated DEIS. A&B could have easily done such an impact analysis by assuming different levels of water demand related to projected levels of cultivation on the 30,000 acres it is now identifying as future diversified agricultural areas in Central Maui.*

Response 46: Your suggestion is highly unusual from the perspective of an EIS preparer and is inconsistent with HRS Chapter 343. EISs are prepared to provide as complete of disclosure as is reasonably possible at the time, and to present the impacts of the particular action proposed. The purposes of disclosure and exploration of impacts would be circumvented if the EIS, as you recommend, only analyzed the very short-term uses of the diverted water, the use of which is permitted under revocable permits and not a water lease. HAR § 11-200-1(e) directs that the Draft EIS "shall contain a project description which shall include the following information, but need not supply extensive detail beyond that needed for evaluation and review of the environmental impact . . . (5) Phasing and timing of action." Section 2.1.5 of the EIS provides the timing and phasing of the proposed Water Lease, and explains that Mahi Pono estimates it will need 10 years for full implementation of the farm plan.

An estimated 10 years will be required for Mahi Pono and lessees to remove volunteer sugarcane and weeds from the approximate 30,000 acres, amend soils, install field improvements, build warehouses and other structures, and plant crops. The predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years (Plasch, 2019).

The EIS analyzes the full scope of the Proposed Action and does not seek to provide only an abbreviated analysis as you suggest it should have.

Regarding your comment that water diversion amounts projected by Mahi Pono as of October 2019, please note that Mahi Pono's most recent water use projections as presented to the BLNR in November 2020, are shown on pages 2-30 and 2-32. Moreover, the impacts of both the full amount that could be diverted after taking into account the limitations under the CWRM D&O, and the impacts of lesser amounts of water than the full amount permitted under the CWRM D&O, were analyzed in the EIS. In terms of amounts of water diverted, Chapter 3 of the EIS presents the analysis of two lesser water scenarios, identified as the Reduced Water Volume alternative, and the No Action alternative. The Reduced Water Volume alternative analyzes impacts from diversions in amounts less than as presented for the Proposed Action, but more than what would be diverted under the No Action/No Water Lease scenario. Hence, the 44-55 mgd is analyzed from the perspective of a reduction from the amount diverted under the Proposed Action. Under the No Action alternative, approximately a total of 30.76 mgd would be diverted. Section 3.4 of the Draft EIS then evaluates and compares each reasonable alternative against several environmental factors. Contrary to your statement, such an analysis is not "easily done" as it required analysis from the appropriate technical consultants. However, please note

that Table 3-2 has been added so that readers can compare the varying environmental effects of the alternatives and the Proposed Action. See pages 3-49 to 3-80 of the Final EIS.

Comment 47: *Incidentally, Mahi Pono demonstrated that it has actual calculations for projected water demand. In the October 2019 meeting of the BLNR, Mahi Pono revealed that it is seeking 45-55 mgd for its current agricultural plan. However, there is no hint of any such projected demand in the DEIS, nor any justification for any projected water demand and the impacts those levels of water diversion would generate. Specifically, how much water would be diverted at each individual stream in order to accommodate the demand amount? A meaningful impact assessment cannot be entertained without meeting these two simple criteria: (1) a fair acknowledgment and calculation as to the amount of water demanded; and (2) how that volume of water is proposed to be diverted from stream sources.*

Response 47: Regarding your comment about the October 2019 BLNR meeting, please note that this was after the publication of the Draft EIS, which was on September 8, 2019. Section 2.1.4 of the Final EIS has been updated as shown on pages 2-30 and 2-32, to better explain how much water is available now and expected for the near term for agricultural crops with more current water projections. Your comment that the Draft EIS did not include projected water demands is wrong. Expected water demands of the Mahi Pono farm plan at full build-out was discussed in detail in Section 2.1.4 of the Draft EIS and further discussed Response #42 above. The water demands for various areas of the farm based upon projected farming uses are depicted in gallons per acre a day.

Regarding your question about how much will be diverted at each individual stream in order to accommodate the demand, please note as discussed in Response # 15 above, it is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis. Prior efforts by the CWRM to measure water diversions involved the installation of water gages in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gages to wash away. For the purposes of the EIS, total diversion figures were provided at the Honopou boundary of the License Area and at Māliko Gulch.

Regarding your comment that a meaningful impact assessment cannot be entertained without meeting the two criteria identified in your comment, the amount of water requested is the maximum amount of water available for diversion after compliance with the CWRM D&O (although the amount of water diverted at any given time will be only what is needed to meet the needs of the approved water uses, including the County of Maui DWS and of Mahi Pono's agricultural operations in Central Maui). This is noted in several places throughout the Draft EIS including p. 2-8, which provides "With the issuance of the Water Lease under the Proposed Action, the EMI Aqueduct System would divert only the maximum allowable amount under the CWRM D&O from streams within the License Area, which is estimated to be approximately

87.95 mgd." The EIS also acknowledges DHHL's rights to a water reservation. As for your comment about how the water would be diverted, it will continue to be diverted through the EMI Aqueduct System, which has been in operation for over 100 years.

Comment 48: *After considering the HSHEP model results that the Proposed Action would have a negative impact by reducing native stream animal habitat from "Natural Flow" conditions in its discussion of the 2018 CWRM D&O setting the IIFS, A&B asserts how the CWRM should make decisions about instream flows in their analysis. "[The CWRM must weigh the importance of the present or potential instream values with the importance of the present or potential uses of water for noninstream purposes, including the economic impact of restricting such uses. It is also its duty to establish IIFS that protect instream values to the extent practicable and to protect the public interest." (DEIS at 4-57). Given these considerations, the CWRM was cited in their decision as stating that it is both "reasonable and beneficial to use a portion of East Maui stream water for the development of diversified agriculture on Maui's central plains." (DEIS at 4-58, citing CWRM D&O at vi).*

While the above considerations may be applicable for the CWRM in setting the IIFS, this analysis is devoid of the specificity required for a meaningful EIS. The present or potential instream values can only accurately be determined when there are actual values, i.e., the amount of water being demanded, is attributed to that value. Importantly, even though the CWRM has agreed that a portion of East Maui stream water should be used for the development of diversified agriculture, it is up to the EIS to determine what that "portion" should be and to justify that value accordingly. The DEIS has failed to do so and is misleading by broadly quoting the CWRM in order to justify diverting an undisclosed amount of stream water after the issuance of the subject Water Lease."

Response 48: We strongly disagree with your comment that the EIS is devoid of the specificity required for a meaningful EIS. As discussed in Response #2 above, the Draft EIS fully complies with all relevant requirements, including the content requirements set forth in HAR § 11-200-16 and 11-200-17, and includes a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement. As discussed in Response #6, Chapter 4 of the Draft EIS provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields.

The analysis in Chapter 4 considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social

Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts.

The Draft EIS also included and relied upon nine technical studies, provided as Appendix A through I, as follows: Appendix A, Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP Model); Appendix B, East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry; Appendix C, Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease; Appendix D, Historical Structure Assessment East Maui Aqueduct System; Appendix E, Archaeological Literature Review and Field Inspection for the Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas; Appendix F, Cultural Impact Assessment for the Nāhiku, Ke‘anae, Honomanū and Huelo License Areas; Appendix G, A&B Proposed Water Lease for the Nāhiku, Ke‘anae, Huelo, and Honomanū Social Impact Assessment; Appendix H, Economic and Fiscal Impact Study Proposed Water Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Area; and Appendix I, East Maui Water Lease: Agricultural and Related Economic Impacts. In light of the extensive information, research, and analysis in the Draft EIS, and as further updated in the Final EIS, we believe the EIS provides more than sufficient specificity for a meaningful EIS.

As you assert, the present or potential instream values can only accurately be determined when there are actual values, i.e., the amount of water being demanded. As discussed in Response #42 above, the amount of water estimated to be diverted from the License Area under the Proposed Action is approximately 87.95 mgd. That is estimated to be the maximum amount of stream water that could be diverted from the License Area while maintaining consistency with the IIFS under the CWRM D&O.

We respectfully disagree with your comment that it is up to the EIS to determine what “portion” of the License Area surface water should be used for the development of diversified agriculture. An EIS is a disclosure document to inform decision-makers. In this case, the subject EIS is a disclosure and informational document prepared to disclose the effects of a proposed Water Lease on the economic welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed Water Lease, measures proposed to minimize adverse effects, and alternatives to the Water Lease and their environmental effects. Moreover, the comparative table provided in Chapter 3 of the Final EIS, see pages 3-49 to 3-80, attempts to summarize in tabular format the nature of the varying environmental effects of the alternatives and the Proposed Action.

Regarding your comment that the EIS should justify the amount of water requested, we believe that the EIS properly discloses the impacts of the proposed Water Lease, which are largely beneficial in that a viable local diversified agricultural enterprise is beneficial for Central Maui, and for the County of Maui, as well as the State of Hawai'i, providing numerous jobs, economic and fiscal benefits, and increasing food security. However, the amount of water that is authorized for diversion from the License Area is a matter for BLNR determination at the point that it is issuing a water lease.

Comment 49: *Response to Comments. As the Hawai'i Supreme Court has observed, the "applicant must respond in writing and address all concerns and questions before proceeding with the development of the EIS. Once this phase of the process is complete, the applicant then begins preparation of the EIS." Sierra Club v. Office of Planning, 109 Haw. 411, 415 (2006) (emphasis added). See also, HAR §§ 11- 200-15(D), -22(C) and -23. A&B has ignored or discounted many of the questions asked in our previous letters and comments. To the extent any of our questions or concerns remains unanswered, we request the EIS not be accepted until those concerns are answered and adequately addressed.*

Response 49: You seem to have conflated the rules related to responses to comments. The EIS process provides for two public review and comment period. The first, under HAR § 11-200-15, runs for 30 days from the date that OEQC publishes notice of the EISPN. The second period, described in HRS § 343-5 ("The applicant shall respond in writing to comments received during the review and prepare a final statement.") and HAR § 11-200-22, runs for 45 days from the date of publication of the Draft EIS. These two comment periods impose different standards for how the Applicant is to respond to the comments.

Comments timely submitted on an EISPN must be responded to "in writing and as appropriate, incorporated into the draft EIS" whereas comments timely submitted on a Draft EIS must include a "point-by-point discussion of the validity, significance, and relevance of comments" and a "discussion as to how each comment was evaluated and considered in planning the proposed action." As such, comments timely submitted on a Draft EIS require a more detailed response than responses required for EISPN comment letters. This is perhaps fitting in light of the fact that the Draft EIS contains far more information and studies than is provided in an EISPN. The more detailed information in a Draft EIS, together with the longer public review period, allows an interested commenter to raise specific questions or concerns that then require a point-by-point response.

You do not offer any specific examples of how you think NHLC's comments have been ignored. NHLC was contacted as part of the pre assessment consultation process for this EIS, and in response NHLC submitted a letter dated December 26, 2016. See Appendix J. NHLC was

10238-04
Letter to Mr. Vincent Raboteau
Page 77 of 77
September 3, 2021

notified of the publication of the EISPN. NHLC submitted a letter dated March 10, 2017 in response to the EISPN, and that letter was responded to. Copies are provided in Appendix M.

For clarification, we note that your reference to *Sierra Club v. Office of Planning* was to a citation to *Price v. Obayashi Hawaii Corp.*, 81 Hawaii 171, 180 (1996), and more specifically to the OEQC's 1992 Guidebook for the Hawai'i State Environmental Review Process, which is long obsolete. In fact, the Environmental Impact Statement Rules that were in effect at the time of the *Obayashi* decision were superseded as of August 31, 1996.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Mahalo nui,
Nick Drance

Nicholas James Drance
Kihei, Hi 96753

The conversation today relates to the structure of an antiquated system originated at a time when business had unbridled power. That environment no longer exists. To consider whether or not this lease should be granted pre-supposes that the existing system is appropriate. It is not.

While this may not be the time to create a new, more equitable, efficient and effective system, the need to do so must be taken into consideration, nevertheless. That was not obvious 100 years ago. It is, today.

In addition to that, the entities charged with the responsibility to administer an antiquated, out of day system, do so with seeming impunity. I don't know these individuals personally and I cannot say they do so intentionally. However, from this point forward, whatever happens, happens within the circumstances I describe.

The question before us presupposes the appropriateness of this out of date, inappropriate system but that creates a conundrum. On an individual, personal level, it's understandable that the issue might be viewed through that narrow lens. It's understandable that in a corporate culture, where many accept the status quo, however outdated or inappropriate it might be, that viewing those circumstances through a much broader lens might appear rebellious. Socially unacceptable. So, I don't mean to pass judgement on individuals but as I say, from this moment forward, the need to view these circumstances through that broader lens is obvious.

Those who have the power and responsibility to make these determinations do so in that complicated environment. Difficult as it may be, it's always the right thing to do, to view considerations through a broad lens. Anything less is subjective and by definition, not honest. It's not right to consider some views and disregard others. All views must be taken into consideration at all times, in service to the greatest good.

It is right to respect official Maui County Vision Statement and Core Principles Statements. I've included them here. In the end, they are intended to provide a roadmap toward long term environmental, cultural and economic sustainability. Viewing the issue at hand today, within the lens of an antiquated system that was established in a world far less knowledgeable than today, does not follow the values expressed in these current, official vision statements.

Given that, it is inappropriate to grant the lease in question, as written, at this time. Those charged with the responsibility to govern and make these choices must do so within today's broader lens. You must make your judgements within that broader lens and that means that a long-term lease is wrong. What's right is to rely upon our current system of government to do its job and redefine antiquated, out of date constructs.

I understand business and Mahi Pono deserves the right to fulfill their stated intentions and promises made to the residents of this island. They deserve to be supported to that end. Everyone must conduct themselves in good faith and be encouraged to do so.

As a businessman, I say, one bird is worth two in the bush. In business law, the term is caveat emptor, let the buyer beware. These are universally recognized truths that must be applied at this time. I suggest a two-year lease, with contingencies that the parties can agree upon in good faith. That would allow a broader lens to be applied. That would allow those who have the power to determine these things, to do so in the spirit of stewardship.

2030

VISION STATEMENT

Ua mau ke ea o ka `āina i ka pono

Maui Island will be environmentally, economically, and culturally sustainable with clean, safe, and livable communities and small towns that will protect and perpetuate a pono lifestyle for the future.

Core Values

To achieve our island's vision, we will be guided by the following values:

- A. Adopt responsible stewardship principles by applying sound natural resource management practices;
- B. Respect and protect our heritage, traditions, and multi-cultural resources;
- C. Plan and build communities that include a diversity of housing;
- D. Retain and enhance the unique identity and sense of place;
- E. Preserve rural and agricultural lands and encourage sustainable agriculture;
- F. Secure necessary infrastructure concurrently with future development;
- G. Support efforts that contribute to a sustainable and diverse economy for Maui;
- H. Create a political climate that seeks and responds to citizen input;
- I. Respect and acknowledge the dignity of those who live on Maui;
- J. Establish a sustainable transportation system that includes multiple modes, including walking, biking, and mass transit, as well as automobile-based modes; and
- K. Recognize and be sensitive to land ownership issues and work towards resolution.

Maui County General Plan 2030

CORE PRINCIPLES

To accomplish our vision, the people of our islands must foster and respect the Aloha Spirit. We must consider the future generations of Maui County and be true to these core principles:

1. Excellence in the stewardship of the natural environment and cultural resources;
2. Compassion for and understanding of others;
3. Respect for diversity;
4. Engagement and empowerment of Maui County residents;
5. Honor for all cultural traditions and histories;
6. Consideration of the contributions of past generations as well as the needs of future generations;
7. Commitment to self-sufficiency;
8. Wisdom and balance in decision making;
9. Thoughtful, island-appropriate innovation; and
10. Nurturance of the health and well-being of our families and our communities.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Nick Drance:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The conversation today relates to the structure of an antiquated system originated at a time when business had unbridled power. That environment no longer exists. To consider whether or not this lease should be granted pre-supposes that the existing system is appropriate. It is not.*

Response 1: Your comments are unclear. We assume that your comment relates to the physical condition of the EMI Aqueduct System. In this regard, the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System. We also note that Appendix D of the EIS provides a Historical Structure Assessment East Maui Aqueduct System prepared by Mason Architects to provide an assessment of the historical significance of the EMI Aqueduct System.

Regarding your comment “that environment no longer exists” is unclear. we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe‘e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals’ habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that

Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

Comment 2: *While this may not be the time to create a new, more equitable, efficient and effective system, the need to do so must be taken into consideration, nevertheless. That was not obvious 100 years ago. It is, today.*

Response 2: Again, your comments are unclear. As noted in Response #1 above, we assume that your comment relates to the physical condition of the EMI Aqueduct System. In this regard, the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System. We also note that Appendix D of the EIS provides a Historical Structure Assessment East Maui Aqueduct System prepared by Mason Architects to provide an assessment of the historical significance of the EMI Aqueduct System.

Moreover, it should be noted Mahi Pono expects to invest over \$20 million to increase the efficiency of its Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to Section 2.1.4 of the Final EIS as shown on page 2-25.

Comment 3: *In addition to that, the entities charged with the responsibility to administer an antiquated, out of day system, do so with seeming impunity. I don't know these individuals personally and I cannot say they do so intentionally. However, from this point forward, whatever happens, happens within the circumstances I describe.*

Response 3: Your comments are unclear. As discussed in the Section 2.1.2 of the Final EIS as shown on page 2-7, under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going

on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System. Furthermore, EMI has much of the institutional knowledge needed to properly operate the EMI Aqueduct System.

Comment 4: *The question before us presupposes the appropriateness of this out of date, inappropriate system but that creates a conundrum. On an individual, personal level, it's understandable that the issue might be viewed through that narrow lens. It's understandable that in a corporate culture, where many accept the status quo, however outdated or inappropriate it might be, that viewing those circumstances through a much broader lens might appear rebellious. Socially unacceptable. So, I don't mean to pass judgement on individuals but as I say, from this moment forward, the need to view these circumstances through that broader lens is obvious.*

Response 4: Regarding your comment that the appropriateness of the system, as noted in Response #1 and Response #2 above, we assume that your comment relates to the physical condition of the EMI Aqueduct System. In this regard, the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System. We also note that Appendix D of the EIS provides a Historical Structure Assessment East Maui Aqueduct System prepared by Mason Architects to provide an assessment of the historical significance of the EMI Aqueduct System.

Your comments about viewing circumstances through a broader lens is unclear. However, as noted in Response #1 above, an EIS must consider cumulative impacts, which means “*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*” HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Comment 5: *Those who have the power and responsibility to make these determinations do so in that complicated environment. Difficult as it may be, it's always the right thing to do, to view considerations through a broad lens. Anything less is subjective and by definition, not honest. It's not right to consider some views and disregard others. All views must be taken into consideration at all times, in service to the greatest good.*

Response 5: Your Comment #5 above is unclear. Please note that the EIS is a disclosure document and does not authorize any action. With regards to your comment that all view must be taken into consideration, we note that over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M). The Applicant made every reasonable effort to convey information through the Draft EIS in a manner that is accurate, thorough, and appropriately concise in order to provide the public with an opportunity to fairly analyze the potential impacts of the Proposed Action. Moreover, over 400 comments were received in response to the subject Draft EIS, which will be responded to and reproduced in the Final EIS.

Comment 6: *It is right to respect official Maui County Vision Statement and Core Principles Statements. I've included them here. In the end, they are intended to provide a roadmap toward long term environmental, cultural and economic sustainability. Viewing the issue at hand today, within the lens of an antiquated system that was established in a world far less knowledgeable than today, does not follow the values expressed in these current, and official vision statements.*

Response 6: Thank you for providing vision statements and core principles statements from the Maui County General Plan. We note that the County of Maui Planning Department, in its comment letter on the Draft EIS, wrote that "the proposal is consistent with County long-range plans, such as the Maui Island Plan and our community plans, which include policies and actions to support agriculture, sustainable local food source, conservation, open space and business. In addition, they call for the protection of the environment, near shore waters and water source/aquifers." The Proposed Action does not specifically relate to every single policy and objective as is the case with any project, however, the Proposed Action is supportive of numerous policies and objectives in the plans discussed in Chapter 5. Hence, we respectfully disagree with your comment that the Proposed Action does not follow the values expressed in these current, and official vision statements.

Comment 7: *Given that, it is inappropriate to grant the lease in question, as written, at this time. Those charged with the responsibility to govern and make these choices must do so within today's broader lens. You must make your judgements within that broader lens and that means that a long-term lease is wrong. What's right is to rely upon our current system of government to do its job and redefine antiquated, out of date constructs.*

Response 7: Please note that as discussed in Response #5 the EIS is a disclosure document and does not authorize any action. As discussed in Section 1.4 of the Draft EIS, by order dated July 8, 2016, the Board of Land and Natural Resources (BLNR) directed A&B to proceed with the preparation of an EIS. Prior to that, BLNR, by order dated April 14, 2016, had directed A&B to

commence the EIS process and to provide a scope of work for the preparation of an environmental review document pursuant to Chapter 343, HRS. The BLNR instructed that the scope of work should distinguish between those matters that can be undertaken prior to the CWRM decision on the petitions to amend the IIFS, and those matters that require the final CWRM IIFS decision. On June 9, 2016, A&B submitted to the BLNR a Scope of Services for the Preparation of a Chapter 343, HRS Environmental Impact Statement for the Proposed Lease for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. Hence, the Water Lease decision-making process will commence after the EIS process is complete.

Comment 8: *I understand business and Mahi Pono deserves the right to fulfill their stated intentions and promises made to the residents of this island. They deserve to be supported to that end. Everyone must conduct themselves in good faith and be encouraged to do so.*

Response 8: We acknowledge your comments.

Comment 9: *As a businessman, I say, one bird is worth two in the bush. In business law, the term is caveat emptor, let the buyer beware. These are universally recognized truths that must be applied at this time. I suggest a two-year lease, with contingencies that the parties can agree upon in good faith. That would allow a broader lens to be applied. That would allow those who have the power to determine these things, to do so in the spirit of stewardship.*

Response 9: We acknowledge your comments. Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability." The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough

period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

RE: Public Comments of the Sierra Club on the Draft Environmental
Impact Statement for the Proposed Lease (Water Lease) for the
Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas (East Maui)
by Alexander & Baldwin Inc./East Maui Irrigation Company

Thank you for the opportunity to comment on the draft environmental impact statement (DEIS) submitted by Alexander & Baldwin, Inc. and East Maui Irrigation Co. Ltd (collectively herein A&B) for the proposed leased areas of East Maui.

This DEIS is deficient. As detailed in our comments below, this document fails to meet the standards for an environmental impact statement. It does not incorporate known information about the natural and cultural resources of this area, and relies on large and misleading assumptions for its conclusions. On December 26, 2016, the Native Hawaiian Legal Corporation submitted a letter to you in which it asked that the DEIS provide answers to a number of questions. The DEIS completely avoids answering them. The DEIS fails to disclose the amount of water taken from **each** stream, omits essential maps, and glosses over impacts that have long been raised by those who know this watershed. **We ask that these deficiencies be corrected immediately and a new DEIS be re-released for another full DEIS public comment period.**

I. Diversion structures

EMI built many diversion structures on public land. If EMI no longer has the right to use public land (the no action alternative), then it will have to remove the structures it placed on public land. These diversion structures cause significant impacts. These impacts include: (a) interference with native aquatic species (blocking migration upstream as well as entrainment of larvae); (b) facilitation of mosquito breeding; (c) taking water temporarily from streams (even if the water is not removed from the ahupua‘a); (d) threatening the safety of recreational users of public land; and (f) are inappropriate aesthetic impacts in a natural environment. The DEIS fails to discuss the impact that these structures cause. Perhaps most importantly, it must assess which

of EMI's structures cause the greatest harm to native aquatic species and which ones create mosquito breeding grounds.

The DEIS acknowledges on page 4-58 that "entrainment of larvae at the diversions remains an issue and contributes to the loss of HU. Additional HU may be gained for the native stream species by decreasing entrainment at the diversion locations. Any action or modification of the diversion to decrease entrainment would increase the total restored HU without any additional water released to the stream." The DEIS fails to identify which diversion locations are causing the greatest threat to native species and fails to quantify their impact.

DLNR's 2005 Hawaii's Comprehensive Wildlife Conservation Strategy identified stream diversions and insufficient in-stream flows as a key threat to species on Maui. DLNR identified stream diversion as a threat to 'o'opu nākea, 'o'opu 'alamo'o, 'o'opu nōpili and opa'ē kala'ole. In a May 17, 2010 letter to then-BLNR Chair Laura Thielen, Robert Nishimoto, the environmental program manager for the division of aquatic resources, wrote that "native animals are missing from a number of stream sections where they should naturally exist." He also concluded: **"The removal of stream diversions and the complete restoration of stream flow would be the best possible condition for native aquatic animals."**

The DEIS fails to sufficiently acknowledge these widely accepted facts. It fails to discuss how both diversion structures themselves and the taking of water from streams creates mosquito breeding grounds. Because A&B has no legal right to take any water from public streams without a lease (or a revocable permit), the DEIS must compare the impacts created by granting the lease to not granting the lease. (Thus, for example, the comparison on page 4-102 should compare mosquito populations without diversions – and diversion structures removed – with the conditions that would exist if a lease were granted.)

It would be helpful if the DEIS included the Barrier Assessment report referenced in the Appendix A, HSHEP model report for East Maui Streams. In fact, the June 8, 2019 Assessment of the Environmental Impact of Stream Diversions on 33 East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model is missing its Appendix 1 (results of field surveys) referenced on pages 14, 42 and 62, and Appendix 2 (node and basin values) referenced on pages 45 and 56. Appendix 3 is missing as well. The information in these appendices is very important and must be included in the final EIS.

II. Streams Unaddressed by CWRM's 2018 Decision

In 1988, CWRM adopted interim in-stream flow standards for all streams within east Maui. HAR §13-169-44. The standard was whatever was flowing on June 15, 1988. In response to petitions to establish in-stream flow standards for more than two dozen streams, in June 2018, CWRM finally established substantive standards for 24 streams. That proceeding, however, did not address the water flowing in thirteen other streams that flow within the area covered by the revocable permits: Puakea Stream, Kōlea Stream, Punalu'u Stream, Ka'aiea Stream, O'opuola

Stream (Makanali tributary), Puehu Stream, Naili‘iliha‘ele Stream, Kailua Stream, Hanahana Stream (Ohanui tributary),¹ Hoalua Stream, Waipio Stream, Mokupapa Stream, and Ho‘olawa Stream (Ho‘olawa ili and Ho‘olawa nui tributaries). BLNR has no idea how much water was flowing in these thirteen streams as of June 15, 1988. Thus, the thirteen streams have no meaningful in-stream flow standards.

The DEIS fails to discuss in any detail the impact of continuing to de-water thirteen streams unaddressed by CWRM’s 2018 decision. The DEIS must do a much better job of discussing these 13 streams.

The DEIS should include the High Definition Stream Survey and the High Definition Fish Surveys referenced in the Appendix A, HSHEP model report for East Maui Streams.

To its credit, Appendix A on page 62 mentions that the lease reduces the habitat units on those streams from 588,000 square meters to 88,386 square meters. That is a huge reduction of 85%. It is unfortunate – and misleading – that this fact is not included in the discussion on pages 4-56 and 4-57 of the DEIS.

According to CWRM’s Ayron Strauch, “the diversions are generally designed to take up to about the Q40 flow, so they were probably taking, if they needed it, 100% of the Q70 flow . . .” That suggests that the ditch system completely dewateres the thirteen streams 60% of the time, leaving no water at all directly below the diversions on these 13 streams. Taking all the water from a stream 60% of the time has profound ecological consequences that the DEIS brushes over.

One of those streams, ironically, has seen too much water. For the last few years, A&B has been diverting water from Waipio and Hanehoi streams and dumping that water into Ho‘olawa stream. Excessive dumping has caused stream banks to erode and caused a hazardous condition to recreational users of the stream.

III. Water Available west of Honopou

The DEIS performs mathematical hocus pocus. Simple math from page 2-5 shows that historically 11.06 mgd of water was taken from streams west of state land (west of Honopou Stream) (135.58 mgd at Honopou Stream and 146.64 mgd at Maliko Gulch). On page 2-8, however, the DEIS suggests that only 4.37 mgd are available from the streams west of state land. That is simply not true. The figure provided on page 2-8 is premised on not taking more water because “when rainfall is high in East Maui, the ditches are fuller and there is little needed to supplement the flow.” Yet, in the same way, if BLNR limits the amount of water taken from east Maui, then A&B/EMI/Mahi Pono have 11.06 mgd of water available from the streams west of state land.

¹ Please note that in Findings of Fact 58 and 60 of the June 2018 CWRM decision, CWRM refers to the stream as “Hanahana Stream.” The Hawai‘i Board on Geographic Names, however, refers to the stream as Hanawana. <http://files.hawaii.gov/dbedt/op/gis/bgn/placenames/HBGN%20-%20Maui%20-%20Official%20May%202018.pdf>.

IV. Marine Life

Kumupono Assoc. study of East Maui: “Wai o ke Ola – He Wahi Mo‘olelo no Maui Hikina” was prepared for A&B / EMI in 2001. It provides much historic and contemporary discussion of the robust presence of marine life along east Maui coasts and longtime dependence of east Maui communities on the sea for food supplies. The connection between fresh water stream flows and algae that feeds marine life is well established.

In contrast, Appendix B and the DEIS concludes that East Maui streams flows do not affect conditions for marine life in east Maui, and that east Maui has the wrong ocean conditions to have substantial fish populations. Appendix B offers these conclusions although it includes no survey of ocean fish and measures water chemistry at just seven of 36 streams in the lease area. The conclusions of Appendix B are used throughout the DEIS to justify the “lack of impacts” from EMI’s proposed Alternative 1: diverting all the East Maui streams to the extent permitted by the 2018 CWRM D&O. The EIS needs to acknowledge that there are impacts to ocean fisheries and propose mitigation.

The EIS does not include recent studies of marine fish populations in east Maui or recent interviews with east Maui residents. Residents inform us that they have observed that the recent increase in East Maui flows has started to stimulate increased fish populations in East Maui. The EIS needs to include studies on current fish populations discuss how this trend of increasing fish populations that support traditional Hawaiian gathering practices can continue, rather than not mention that it is happening.

In addition, the EIS should specifically identify the all the projects for which Steve Dollar, Marine Research Consultants, Inc. and Sea Engineering have predicted that a project would have an adverse environmental impact. It should also list all the projects that they predicted would not have an adverse environmental impact.

V. Native and Invasive Flora and Fauna (Appendix C)

Appendix C and the DEIS assume that 140 years of EMI use and management has had no impact on the substantial loss of native flora and fauna on public lands in the Lease Area. This is offensive, and also simply not true.

This brief survey (4 days covering 33,000 acres on the ground and 1 day in the air) drive-by review of flora and fauna is entirely inadequate to inform decision makers of the impacts of the proposed action. None of the Endangered damselfly populations seen by DAR surveys in 2005-06 were seen. No plant list was included in the survey report. The survey does not refer to baseline data available from the extensive 1985 mapping of the E & W Wailuaiki stream basin area that was done as part of a Proposed Hydroelectric plant EIS (Kepler, 1985.) The Flora and Fauna survey also included the 30,000 acres of potential farm lands (referred to as the “use

area”) in the 5 day visit and did a poor job of describing impacts there. It was not clear if the gulches in the “use area” were surveyed; they often serve as habitat areas. No acoustical survey for native bats was done at either survey location.

We think it is fair to say that Sierra Club hike leaders probably know more about the specific flora and fauna conditions of the Lease Area than is found in the Appendix C survey. Section 5.2.3 of the survey reported that no reptiles or amphibians were detected, but hikers regularly encounter a very small frog at Hanawi stream near the Wailoa ditch.

In section 6.1.1 of Appendix C, the consultants conclude that under the proposed action (30 year lease) "Vegetation would remain substantially the same” in the state Lease Area. Sierra Club leaders have watched invasive species such as melastomes, job’s tears, gingers, African Tulip and other pests spread substantially through the Lease Area over the past 30 years of access hikes, while the density and variety of native species diminish. The EIS does not address what mitigations would be needed to make sure that a 30 year lease would not result in the disappearance of most native species in the 1,000 to 2,000 ft elevations in the Lease Area.

The DEIS fails to acknowledge that without active management, invasive species will take over native forests. Active management is critical. Page A-2 of Appendix C documents how much invasive species are crowding out native forests in the area that Mahi Pono/EMI wants to lease. One of the primary justifications that the Land Division offers to leasing out its land is that it does not have the resources to manage public land. If someone is going to lease public land, it should only do so if it prepares and implements a management plan that reduces the threat posed by invasive species.

The EIS should have far more detailed information before declaring that a 30 year extension of the current management style will result in “no impacts.”

Sierra Club leaders remove and report invasive plant introductions in the Lease Area to EMI and the state and have offered to participate in hunting for and eradicating various invasive aliens before they can get established. No one has followed up with our requests recently. In the 1980’s, Sierra Club and EMI teams worked together to remove invasive Banyan trees from the stream beds of the Lease Area. Current EMI leadership has not shown any interest in the public watersheds below 3000 elevation where most of their diverted streams are located in the Lease Area. The East Maui Watershed Partnership includes the Lease area lands on their maps, but only has active management of East Maui lands above 3000 elevation, which is above the Lease Area. The EIS needs to make this fact clear.

The public waters diverted by the EMI systems are the product of two factors: natural rainfall and the watershed lands that receive the rainfall and discharge it into springs and streams. The quantity and quality of future stream flows will depend upon the health of the surrounding watershed lands.

In section 6. of Appendix C, the consultants conclude that the proposed action will have no impacts because “no habitat removal or loss is proposed...”. The EIS ignores the well-documented fact that dewatered streams over time lead to the decimation of native ecosystems and flora and fauna. The EIS proposes no mitigations to improve watershed health other than some mechanisms to prevent introduction of more invasive species on equipment or supplies.

The Appendix C survey provides no guidance for any restoration activities in the Lease Area, which is widely done in EIS documents that are involved with projects, like this one, that will, by law, trigger future management plans.

Section 6.2 of Appendix C concludes that the No Action alternative (no lease awarded) would mean that it would likely not be viable for EMI to maintain the ditch system. The EIS offers no substantial discussion or analyses of others such as County or State maintaining portions of the ditch system for much reduced level of diversion. The idea is simply dismissed as “too speculative” at this time, although the Maui Board of Water Supply has issued a report after investigating the topic.

Section 6.3 concludes that the Reduced Water alternative (alternative 2) would result in more ditch maintenance required and “more human activity in area and greater chance of potential for negative impacts.” This section also concludes (with no proof offered) that increased water flows in the stream would likely have very little impact on native land based flora and fauna and that impacts on aquatic fauna (damsel flies, etc) would vary by stream. The EIS offers no evidence that either of these conclusions is true, yet they are offered as a rationale to decision makers to support the Alternative 1 lease.

Appendix C refers to a future Management Plan for the Lease area that will be done by the State of Hawai‘i for the lease lands as part of any future lease agreement. The lease requirements found in HRS 171-58(e) specify that A&B/Mahi Pono need to jointly prepare a management plan with the State:

(e) Any new lease of water rights shall contain a covenant that requires the lessee and the department of land and natural resources to jointly develop and implement a watershed management plan. The board shall not approve any new lease of water rights without the foregoing covenant or a watershed management plan.

The Appendix C - “Assessment of Terrestrial Flora and Fauna” made absolutely no reference to any need for restoration or management of the public lands in its analyses or recommendations. It seems unlikely that any DEIS considering the impacts of a longterm action can effectively evaluate and mitigate those impacts if the impacts are not clearly quantified in EIS.

Section 6.5 discusses alternative ownership/management of the ditch system and lease area- and concludes that such management “would have effects identical to those described in “proposed Action.” on Terrestrial Flora-Fauna. The DEIS offers no analyses of increased investment in

watershed management that could come with a new “ownership” model.

Section 6.6 dismisses the greater public access alternative (smaller lease area) and concludes that greater access would impact flora and introduce more alien species and impact habitat of native birds. The DEIS offers no analyses of increased access permitting greater restoration / management activities in the watershed lands as has been the case in various areas on Maui that manage public access.

Section 7 offers Avoidance & Minimization measures such as:

- Biological monitor during maintenance in waterfall /cliffside areas
- Wash and inspect equipment before maintenance
- inspect any materials used for maintenance
- monitor ESA damselflies- work with USFWS
- training for onsite staff to recognize endangered species
- sensitivity to i'iwi nests during tree trimming
- use of barbless strand for top wire of fences to avoid bat injuries

While these would be a step forward from current conditions, there is no accountability for these practices actually being employed. Take the example of fencing mentioned. Thousands of acres of Mahi Pono land have recently been fenced, some of which has stands of trees that could serve as potential endangered bat habitat. All of the fencing observed has barbed wire on its top strand. Will all this be changed only if the lease is granted?

VI. Hiking

Why does the DEIS assume that the leaseholder should retain the right to determine who is allowed to hike on public land? It is unfortunate that the comments from the Maui Island Advisory Council to Na Ala Hele were essentially disregarded.

The EIS should include an inventory of roads and trails in the Ko‘olau Forest Reserve. The Highways Act protects public right-of-way on roads and trails owned by the state. When the Ko‘olau forest reserve was created, all roads and trails in the forest reserve became protected rights-of-way. The EIS needs to show the protected roads and trails in the Ko‘olau Forest Reserve. HRS §171-35 requires leases to protect rights-of-way and access to other public lands. *See also Robello v. Cnty. of Maui*, 19 Haw. 168 (1908)

In its December 19, 2016 letter, the Division of Forestry and Wildlife states: “Thus the Division recommends that the areas to be conveyed for a water license be done so through a land agreement that is limited to the infrastructure required for maintenance and conveyance of water, and that any terms of any agreement established for the delivery of water ensure unrestricted public access to the reserves and any state owned roads and trails.” This means that public access to the trails is not at the whim of the leaseholder. The DEIS must reflect this fact.

VII. Easement

On page 3-6 of the DEIS, there is an acknowledgement of the 1938 agreement – a copy of which should be reproduced in an appendix. That 1938 agreement allows DLNR to deliver water to the county without having to purchase the ditch system from anyone – and regardless of whether a lease is granted or not.

The EIS has no discussion of the fact that EMI controls the 4 levels of ditch system west of lease area, which are connected to the East Maui ditch system, but not affected by the lease decision.

VIII. Cultural Impact Assessment (Appendix F)

The EIS must fully acknowledge the impact that past and proposed reduced stream flows have had on the native stream life and marine life that is so directly connected with the ability of Native Hawaiians to engage in traditional cultural practice of fishing and gathering in East Maui.

Appendix F, the Cultural Impact Assessment (CIA), concludes that as long as stream flow standards are met in the east Maui streams subject to the 2018 Water Commission decision, all other streams can be diverted with no impacts to traditional Hawaiian cultural practices. It also concludes that the east Maui coasts do not have reefs and therefore do not support related marine species. The conclusion does not reflect marine life and streamlife studies from east Maui, or generational knowledge in the statements of numerous east Maui kama'āina included in Appendix F(i). Information in kama'āina interviews mentions the importance of stream flows to the abundance of ocean fisheries and related cultural practices of fishing and gathering. Hawaiian cultural users whose interviews are in the CIA agree: increased stream flows are needed to support stream and marine life in enough abundance to allow traditional gathering from both streams and ocean coastlines.

The EIS also needs to evaluate the cultural impacts of increasing the amount of water diverted from many streams compared to the amount diverted the past two years.

IX. Hawaiian Home Lands

HAR §11-200-16 provides:

The environmental impact statement shall contain an explanation of the environmental consequences of the proposed action. The contents shall fully declare the environmental implications of the proposed action and shall discuss all relevant and feasible consequences of the action. In order that the public can be fully informed and that the agency can make a sound decision based upon the full range of responsible opinion on environmental effects, a statement shall include responsible opposing views, if any, on

significant environmental issues raised by the proposal.

The current DEIS contains no specific information regarding the water reservation amounts from the East Maui lease area needed by DHHL. **This information is now available and was publicly offered by DHHL staff at the Oct 9, 2019 BLNR meeting.** These specific legally protected water reservations should be included in the EIS, and Mahi Pono's water use plans must be adjusted accordingly to reflect this amount, in order for the public and agency comment process to be based upon accurate information. The DEIS also assumes in the Executive Summary that Mahi Pono can use the east Maui water until the time that DHHL needs its reservation. A discussion of whether it is legal for A&B /Mahi Pono to assume that the DHHL "water reservation" can be utilized by Mahi Pono until it is "needed by DHHL" should also be included in the EIS. There is no indication in the DEIS how the MP Farm Plan will be adjusted to accommodate for the 11.5 mgd of east Maui Water that DHHL is reserving. The EIS should plainly discuss this. If this would be based upon a need for more water over the first few years of planting and less water when crops are established, using regenerative agricultural methods, as was envisioned in the 2018 CWRM D&O:

115. The estimated water requirements will change not only because some potential partners and lessees are expected to rotate multiple crops that could potentially have different crop coefficients but also because water requirements could change significantly through the use of regenerative agricultural methods.

If Mahi Pono Water demand is expected to decrease over the years, as suggested by the CWRM 2018 review, a timetable for restoration of non-IIIF streams in the Huelo Lease area should also be discussed in the EIS.

X. Agricultural and Related Economic Impacts (Appendix I)

The EIS should acknowledge that Mahi Pono has no track record of successful farming under Maui conditions.

A&B's SEC filings inform their shareholders of the risk that plans for diversified farming on their Maui lands may not work out, even given the company's long history of farming. A&B's 2015 SEC filing states:

The Company is currently evaluating several categories of replacement agricultural activities in the transition to the diversified model, including but not limited to energy crops, agroforestry, grass finished livestock operations, diversified food crops/ agricultural park, and orchard crops. **There is no assurance that the Company's replacement agricultural activities will be economically feasible or improve the Agribusiness segment's operating results.**

The EIS needs to provide the same disclaimer, and not predicate the entire success of Mahi Pono

farming operations on how much east Maui water is sent to Central Maui.

The DEIS asserts that Mahi Pono needs a long-term lease in order to make its investment in agriculture. Does Mahi Pono not understand that even with a long-term lease, CWRM could amend the in-stream flow standards and reduce the amount of water flowing to central Maui? Does Mahi Pono understand that one of the reasons for studying West and East Wailuaiki is so that CWRM can understand the impact of diversions and if necessary order more water to be restored for the health of the streams?

The EIS needs to provide accurate information about the benefits of Central Maui farming. The numbers provided for proposed Mahi Pono profits and past performances of HC&C sugar do not seem logical: “Mahi Pono farm plan is projected to generate more than 338 pounds per year of crops, generating \$155.9 million per year in annual food sales and \$329.5 million per year in combined direct and indirect sales.” (Executive Summary, p.v.). This would mean each pound of crop brought a return of \$461,242.

Table 6 in Appendix I lists “recent sugar” payroll of \$68,000,000 a year. HC&S had 675 workers when they announced that sugar would shut down in 2016. Did each of those workers earn \$100,740 a year (\$68 mil divided by 675)? That seems highly unlikely. The potential “recent sugar profits” presented in Table 6 of Appendix I also needs additional information. A&B’s SEC filings (10K reports) show a very different range of “profits” from 2009 to 2015, the most recent era of sugar growing. Only 4 of those 7 years did the sugar operations show a profit (2010-2013) The other three years showed sizable losses. Only one year (2011) had a profit of \$22 mil. The average of the 4 profitable years was \$14. 9 mil. The figures in the EIS should reflect accurate amounts, not cherry pick one promising year. This incorrect information must be fixed in a new DEIS.

Appendix I assumes that East Maui now has plenty of water due to the 2018 CWRM Decision. It also assumes that dry, windy central Maui is the best place for crops to insure food security for Maui’s future, thereby rationalizes without information that all available east Maui stream water should be sent there to support agriculture. The EIS needs to have an updated analyses of the farming potential of the east Maui area. The current analyses in Appendix I that concludes only 44 acres is available for kalo growing and 35 acres for truck farming in all of East Maui. These figures are based only on information from the communities that Native Hawaiian Legal Corp represented during the East Maui IIFS petition. There is far more land available for both kalo and farming in east Maui in the Huelo lease area.

The EIS incorrectly concludes that no additional stream water would be needed in all of east Maui, based upon the limited information available from the CWRM contested case. That case did not address a dozen other streams. The many communities of the Huelo lease area have wide swarths of fertile lands and no public water supply, resulting in unmet water needs by both Native Hawaiian and non Hawaiian farmers.

XI. Segmentation

A&B's 2015 10K statement acknowledges that the the four state lease areas supplied "approximately 58 percent of the irrigation water used by HC&S" and "A&B also holds rights to an irrigation system in West Maui, which provided approximately 15 percent of the irrigation water used by HC&S over the last ten years." This would indicate that 27 % of irrigation water came from A&B wells.

The EIS needs to include a list and map of the A&B/Mahi Pono wells available to help irrigate the Mahi Pono fields and the latest chloride tests and pumping abilities of those wells.

The EIS states that Mahi Pono's farm plan will use less water than the HC&S sugar operations and provides elaborate tables in Appendix I. The Mahi Pono Farm Plan is one plan, which includes around 34,000 acres irrigated by both east Maui and west Maui stream waters.

The EIS content rules do not allow for segmentation of separate parts of the same project. The 4,000 acres of fields irrigated by West Maui Water should be included in the overall analyses of how much water is needed from what source to have a viable Mahi Pono Farm Plan.

A new DEIS needs to clearly state the overall Mahi Pono Farm Plan and indicate what amounts and proportions of water for the farm plan will come from (a) the four licensed area in east Maui, (b) the area west of the licensed area that feeds the EMI ditch system streams, (c) West Maui streams and (d) Mahi Pono wells.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'ānae, Honomanū and Huelo License Areas

Dear Ms. Marti Townsend:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'ānae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Thank you for the opportunity to comment on the draft environmental impact statement (DEIS) submitted by Alexander & Baldwin, Inc. and East Maui Irrigation Co. Ltd (collectively herein A&B) for the proposed leased areas of East Maui.*

Response 1: Thank you for participating in the Draft EIS review process and providing comments in response to the subject EIS. We offer responses to your substantive comments below.

Comment 2: *This DEIS is deficient. As detailed in our comments below, this document fails to meet the standards for an environmental impact statement.*

Response 2: We respectfully disagree with your comment that the Draft EIS is deficient as the Draft EIS fully complies with all relevant requirements, including the content requirements set forth in HAR § 11-200-16 and 11-200-17, and included a "Content Checklist" identifying each element under HAR § 11-200-17 and where within the text of the Draft EIS information on each

particular element could be found. Please note that the Content Checklist has been updated based on updated discussions and additions added to the Final EIS as shown subsequently behind the front cover.

Comment 3: *It does not incorporate known information about the natural and cultural resources of this area, and relies on large and misleading assumptions for its conclusions.*

Response 3: We respectfully disagree with your comment that the Draft EIS does not incorporate known information about the natural and cultural resources of East Maui as Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures) provides a comprehensive description and impact analysis of the Proposed Action on the License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered existing conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies where no significant effects are expected, and where there may be impacts.

The Draft EIS also included and relied upon nine technical studies that were prepared for the EIS (Appendix A, Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP Model); Appendix B, East Maui Irrigation Assessment of Streams and the Ocean; Appendix C, Terrestrial Flora and Fauna Technical Report; Appendix D, Historical Structure Assessment; Appendix E, Archaeological Literature Review and Field Inspection; Appendix F, Cultural Impact Assessment; Appendix G, Social Impact Assessment; Appendix H, Economic and Fiscal Impact Study; and Appendix I, Agricultural and Related Economic Impacts).

Comment 4: *On December 26, 2016, the Native Hawaiian Legal Corporation submitted a letter to you in which it asked that the DEIS provide answers to a number of questions. The DEIS completely avoids answering them. The DEIS fails to disclose the amount of water taken from each stream, omits essential maps, and glosses over impacts that have long been raised by those who know this watershed. We ask that these deficiencies be corrected immediately and a new DEIS be re-released for another full DEIS public comment period.*

Response 4: We acknowledge that the Native Hawaiian Legal Corporation (NHLC) submitted a letter on December 26, 2016 during the early consultation phase of the EIS process. We respectfully disagree with your comment that the Draft EIS completely avoids answering the questions in the NHLC letter. They were addressed and responded to as shown in Appendix J of the Draft EIS. As noted in the response to NHLC's comment letter, NHLC's comments and concerns were considered in the preparation of the Draft EIS with regard to meeting all relevant requirements, including the content requirements prescribed in HAR § 11-200-17.

Regarding your comment that the Draft EIS fails to disclose the amount of water taken from each stream, please note that EMI has gauges located in several locations across the License Area. These gauges measure the flow in the ditches only. It is not feasible to measure flow in the streams, as there are limited areas that contain the necessary control points to accurately measure streamflow. Similarly, it is not feasible to provide total diversion amounts by License Area, i.e. diversions amounts only from Huelo, diversion amounts only from Nāhiku, etc. The USGS used to have gauges at each of the portions of the License Area boundaries, those gauges were not on individual streams, they were in ditches at each portion of the License Area boundary. However, due to USGS cost cutting, several of those gauges were removed. It is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis. Prior efforts by the Commission on Water Resource Management (CWRM) to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gauges to wash away. In addition, proper gauging would involve some form of stream alteration, such as a weir in order to properly measure stream flow. EMI has never conducted stream gauging as that lays within the expertise the CWRM and the USGS.

As noted in the Findings of Fact, Conclusions of Law, and Decision and Order in Case CCH-MA13-01 (CWRM D&O), the measurements EMI takes are of ditch flow at Honopou Stream and Māliko Gulch, however, for the purpose of measuring the aggregate flow from entire License Area, the Honopou Stream measurement reading was used.

As discussed in Draft EIS Section 2.1.2 (East Maui/License Area) and 2.1.4 (Central Maui Field System), the long-term average delivery of water by the EMI Aqueduct System up until 1986 had been approximately 165 mgd (prior to any use of water by the MDWS or HC&S on the agricultural fields). This measurement was taken at Māliko Gulch. Under the Proposed Action, it is estimated that approximately 87.95 mgd will be diverted from the License Area, and an additional 4.37 mgd will be diverted in between Honopou Stream and Māliko Gulch to convey water to the agricultural fields in Central Maui and supply MDWS for Upcountry Maui. Thus, an estimated total of approximately 92.32 mgd would be conveyed to supply the MDWS for users

in Upcountry Maui and the Central Maui agricultural fields. The Proposed Action will also ensure the continued delivery of water for the Nāhiku community, which, through the MDWS, draws water from EMI's land through EMI's West Makapipi Tunnel 2 (Well No. 4806-07), a development tunnel located directly adjacent to the Koolau Ditch.

Your comment stating that the Draft EIS omits essential maps is unclear as you do not specify which type of maps were omitted that you consider essential. Please note that the Draft EIS provides over 50 figures. Moreover, the Final EIS includes some additional figures in response to comments on the Draft EIS as shown pages 2-15, 2-26, 2-32, 3-6, 3-16, 4-144, 4-146, 4-149, and 5-39 of the Final EIS. Additional figures to the Final EIS include, but are not limited to, the MDWS Upcountry Service Area Map, MDWS Nāhiku Service Area Map, Potential Sites for Well Development Analysis Map, Mapped Roads and Trails within the License Area Map, Underground Injection Control Program Flowchart, Historical Intensive Agricultural in East Maui Map, and various others as shown pages 2-15, 2-26, 2-32, 3-6, 3-16, 4-144, 4-146, 4-149, and 5-39 of the Final EIS.

We respectfully disagree with your comment that the Draft EIS glosses over impacts that have long been raised by those who know the watershed. As noted in Response #3 above, Chapter 4 provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measures, which have also been updated in the Final EIS. The analysis in the EIS also incorporates the information gathered through consultation on the EIS. Chapter 9 of the EIS details the consultation efforts that were undertaken for the EIS.

The Social Impact Assessment (SIA), provided as Appendix G of the Draft EIS, also obtained input from several community members, many of whom have direct and long-term experience with the streams in the subject area. Moreover, the Cultural Impact Assessment (CIA) provided as Draft EIS Appendix F, includes input from interviewees, including additional interviews conducted in response to comments on the Draft EIS, as well as numerous declarations made during the CWRM contested case proceedings.

Please note that as mentioned in Response #2 that the Draft EIS fully complies with all relevant requirements, including the content requirements set forth in HAR § 11-200-16 and 11-200-17, and includes a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement. The EIS includes responses to all of the comment letters received regarding the Draft EIS and edits to the document have been made accordingly. Hence, we believe that the EIS is not deficient and a second Draft EIS does not need to be published.

Comment 5: Diversion structures

EMI built many diversion structures on public land. If EMI no longer has the right to use public land (the no action alternative), then it will have to remove the structures it placed on public land.

Response 5: We disagree with your comment that under the No Action alternative, the diversion structures on public land would have to be removed and that EMI would no longer have a right to use public lands for the EMI Aqueduct System. The Collection Area as defined in Section 1.3.1 of the Draft EIS for the EMI Aqueduct System covers approximately 50,000 acres, of which 33,000 acres are owned by the State (the License Area) and 17,000 acres are privately owned by Mahi Pono and/or EMI. See Draft EIS Figure 1-1 (EMI Aqueduct System Collection Area). The EMI Aqueduct System spans both the State-owned and Mahi Pono/EMI owned lands and is an integrated system. In 1938, the Territory (now the State) of Hawai‘i and EMI entered into an agreement (the “1938 Agreement”) to facilitate and govern the continued auction of long term water licenses of the State-owned portions of the Collections Area so that, regardless of who the successful bidder at auction may be, the EMI Aqueduct System could continue to be operated across both the State-owned and Mahi Pono/EMI owned lands by EMI, the licensee (if not EMI), the State, or both, as the case may be.

To that end, the State and EMI each granted to the other “perpetual” easements to those portions of the EMI Aqueduct System located on the other’s land. The duration of these “perpetual” easements was stipulated to last until the termination of the 1938 Agreement. The 1938 Agreement is still in place and valid. The State may, but is not obligated to, terminate the 1938 Agreement only if the licenses are offered at auction but EMI fails to bid. EMI may, but is not obligated to, terminate the 1938 Agreement if the State fails to offer the licenses at auction. Thus, if no license is offered at auction, the 1938 Agreement provides that EMI may still collect water derived from the EMI-owned portions of the Collection Area and, utilizing the easement granted to it in the 1938 Agreement, transport it across the entirety of the EMI Aqueduct System that traverse State lands. Please note that Section 3.3 of the Final EIS regarding the No Action alternative has expanded its discussion regarding this matter as shown on pages 3-24 to 3-25. A copy of the 1938 Agreement is included as Appendix R to the Final EIS.

Comment 6: *These diversion structures cause significant impacts. These impacts include: (a) interference with native aquatic species (blocking migration upstream as well as entrainment of larvae); (b) facilitation of mosquito breeding; (c) taking water temporarily from streams (even if the water is not removed from the ahupua‘a); (d) threatening the safety of recreational users of public land; and (f) are inappropriate aesthetic impacts in a natural environment. The DEIS fails to discuss the impact that these structures cause. Perhaps most importantly, it must assess which*

of EMI's structures cause the greatest harm to native aquatic species and which ones create mosquito breeding grounds.

Response 6: Diversion structures come in many shapes and sizes and it is incorrect to assume that all diversion structures cause significant impacts. Some diversions do have the potential to cause the impacts listed above in certain circumstances. As it specifically pertains to native species habitat: as long as the diversion does not divert water, change the natural channel pathway, create a barrier, and impound water, then the impacts will be limited as discussed in Appendix A. However, it would be erroneous to assume that all diversion structures cause the impacts that you cite. Diversions come in many different shapes and designs, as discussed in the Historic Structure Assessment provided as Appendix D of the Draft EIS. CWRM will be looking at how specific diversions should be modified in the course of overseeing the implementation of its CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O for the Interim Instream Flow Standards (IIFS) proceedings on the East Maui streams. CWRM ordered in relevant part:

- i. It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.
- j. This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process.
- k. The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.

See CWRM D&O at p. 269.

Moreover, CWRM took aesthetic values and recreational activities into account when setting the IIFS. This is reflected in Findings of Fact (FOF) made by CWRM in the CWRM D&O as follows:

70. *When setting IIFS, the information that is considered in connection with aesthetic values such as waterfalls and scenic waterways is the presence of scenic views, waterfalls and whether there is tourism in the area.*

and

71. *Aesthetics is a multi-sensory experience related to an individual's perception of beauty. As a subjective value, aesthetics cannot be quantitatively determined. Elements, such as waterfalls and cascading plunge pools that appeal to an observer's visual and auditory senses.*

CWRM D&O, FOF 70, 71.

Numerous other FOF addressed the aesthetic values of the specific streams. With respect to recreational matters, CWRM found:

66. *When setting IIFS, the information that is considered in connection with the instream use of outdoor recreation activities is the presence of opportunities for swimming, nature study, fishing, boating, and parks.*

CWRM D&O, FOF 66.

67. *Streams are often utilized for water-based activities such as boating, fishing, and swimming, while offering added value to land-based activities such as camping, hiking, and hunting.*

CWRM D&O, FOF 67.

Please note that the diversions closer to the stream mouth have more impact than those farther from the stream mouth, some designs can entrain larvae or block passage more than other designs, and the amount of water passing is also important when quantifying impacts. The *Assessment of the Environmental Impact of Stream Diversions on 33 East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model* (May 27, 2019) prepared by Trutta Environmental Solutions, Inc. addresses all of these factors on a diversion by diversion basis.

The section entitled, "Diversion Assessments" of Appendix A of the EIS regarding the HSHEP model provides that entrainment is directly related to the proportion of water removed by a diversion. Section 4.2.1 of the Draft EIS discuss how both diversion structures themselves and the taking of water from streams can lead to entrainment, decreasing potential habitat units (HU).

However, generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As mentioned above and discussed in Appendix A, as long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier

to movement, then the physical structure will have a negligible impact on native species habitat at best.

Conversely, meeting the IIFS at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the water flowing into the diversion and back to the stream from another location in the diversion ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

For example, Diversion K-15 on West Kopili‘ula Stream was closed with 100% of the water flowing through the bypass and continuing downstream (See Figure 12 of Appendix A of the EIS). However, the physical diversion structure was still present. Immediately upstream of this diversion, numerous native stream animals were observed. 409 ‘ōpae kala‘ole (*Atyioda bisulcata*) and 5 ‘o‘opu alamo‘o (*Lentipes concolor*) were counted in the stream above the diversion in less than 200 m² of habitat sampled for the study included as Appendix A. Even though the physical diversion structure still exists, the stream flowed downstream uninterrupted and no entrainment or barrier to movement is present. The native stream animals observed were using the habitat immediately upstream of the diversion. Because these animals climb upstream from the ocean, this shows that the physical diversion structure did not prevent the animals from using the area. This being said, if the diversion structure was partially removed to make sure that the bypass opening would not be blocked by debris, then it would almost guarantee that this physical structure would continue to have no or very minor impact on native stream species habitat. Please note that Section 4.2.1 of the Final EIS has been updated to include an expanded discussion regarding stream habitat and native species impacts related to entrainment as shown on pages 4-63 to 4-67.

In summary, altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns. In summary, diversions come in many configurations and sizes, and will have to be assessed individually. However, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat. Exact structure modification will need to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts. Also note that the physical act of removing diversion

structures could generate adverse impacts in certain circumstances that would not occur if the structures were left in place.

Regarding your comment that diversion structures are creating breeding sites for mosquitoes, it is possible that diversion structures could provide breeding sites for mosquitos. Elimination of areas of the structure that cause ponding of water should remove this possibility. Again, complete elimination of the structure is one way to accomplish the goal, but complete removal is not required to eliminate potential mosquito breeding habitat. Please note that the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. Unfortunately, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed.

While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. Anecdotal observations made by Trutta staff members, support the continued presence of Culex mosquitoes under a wide range of stream flows as they reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i. Please note that Section 4.2.1 of the Final EIS has been updated to include the above discussions related to the Culex mosquito as shown on pages 4-58 to 4-61.

Comment 7: *The DEIS acknowledges on page 4-58 that “entrainment of larvae at the diversions remains an issue and contributes to the loss of HU. Additional HU may be gained for the native*

stream species by decreasing entrainment at the diversion locations. Any action or modification of the diversion to decrease entrainment would increase the total restored HU without any additional water released to the stream.” The DEIS fails to identify which diversion locations are causing the greatest threat to native species and fails to quantify their impact.

Response 7: Please note that the HSHEP model focuses on changes in instream habitat, entrainment, or barriers to passage for these migratory native stream species with respect to modifications of the stream environment. In the case of the East Maui streams covered by the Draft EIS, the primary impact to HU is streamflow diversion. While the HSHEP model does account for changes in HU with respect to instream structures, these are minuscule in comparison to the loss of HU in dewatered stream segments and the entrainment of animals into the EMI Aqueduct System. Hence, the HSHEP model clearly demonstrates the link between stream diversion and native stream species habitat. The model quantifies changes to habitat, entrainment and barrier to passage to determine the impact of various management scenarios as presented in Appendix A and summarized in Section 4.2.1 of the EIS. Thus, the primary mitigation measure is flow restoration and the HSHEP modeling intent was to quantify the flow restoration effect on the native stream species. Thus, as it relates to streamflow, the results of HSHEP model in Appendix A and summarized in Section 4.2.1 of the EIS presents mitigation measures through various stream management scenarios that would restore native stream life by increasing HU through various streamflow restoration targets. However, please note that not every scenario was analyzed or discussed due to a large number of permutations resulting from the large number of diversions (approximately 388 separate intakes) and modifications possible.

With that caveat stated, some general guiding concepts can be concluded.

With respect to diversion amount:

Regardless of the way the water is diverted, greater percentages of total streamflow diverted generally result in lower amounts of instream habitat for native stream species.

With respect to diversion location:

When comparing the location of a diversion, diverting comparable amounts of water at higher elevation diversions is less damaging to instream habitat for native stream species than diverting that water at lower elevation diversions. In this case, as the diversion occurs further upstream in the stream, more natural stream flow recovery plus any water passing the diversion result in more instream habitat with unobstructed connection (no entrainment or passage issues) to the ocean.

With respect to a single diversion in comparison to multiple diversions:

Similar to the previous statement, a single diversion at the upstream most diversion location capturing X amount of stream flow will result in more instream habitat than multiple diversions throughout the stream diverting the same amount of stream flow in total (sum of multiple diversion = X). The lower amount of total habitat under the partial water diversion at multiple diversions is the result of the compounding impact of entrainment/passage barriers at each division.

With respect to modifications of the diversion for improved passage and decreased entrainment:

1. Improvements in diversion passage result in more suitable habitat at most flow amounts.
2. At lower flow restoration amounts, modifications to improve passage result in greater gains in suitable habitat than at higher flow restoration amounts.

In general, diversion locations on larger streams that are located nearest to the stream mouth have the greatest impact on stream animal habitat. But this is a scenario-based question, because the marginal gain from a unit of water released at a specific location needs to be compared with the marginal gain for a unit of water at a different location. For example, Diversion A has a greater impact than Diversion B for the first unit of water going from dry to 1 cfs in the stream. But the second unit of water will have a greater impact on Diversion B going from dry to 1 cfs in the stream, than at Diversion A going from 1 cfs to 2 cfs. All of this data for the scenarios is supplied in the appendices of the report included as Appendix A of the EIS.

Comment 8: *DLNR's 2005 Hawaii's Comprehensive Wildlife Conservation Strategy identified stream diversions and insufficient in-stream flows as a key threat to species on Maui. DLNR identified stream diversion as a threat to 'o'opu nākea, 'o'opu 'alamo'o, 'o'opu nōpili and opa'ē kala'ole. In a May 17, 2010 letter to then-BLNR Chair Laura Thielen, Robert Nishimoto, the environmental program manager for the division of aquatic resources, wrote that "native animals are missing from a number of stream sections where they should naturally exist." He also concluded: **"The removal of stream diversions and the complete restoration of stream flow would be the best possible condition for native aquatic animals."***

The DEIS fails to sufficiently acknowledge these widely accepted facts. It fails to discuss how both diversion structures themselves and the taking of water from streams creates mosquito breeding grounds. Because A&B has no legal right to take any water from public streams without a lease (or a revocable permit), the DEIS must compare the impacts created by granting the lease to not granting the lease. (Thus, for example, the comparison on page 4-102 should compare mosquito populations without diversions – and diversion structures removed – with the conditions that would exist if a lease were granted.)

Response 8: The 2005 Hawai‘i Comprehensive Wildlife Conservation Strategy addressed two primary actions that would benefit the native amphidromous stream species:

- Decrease in number of stream diversions and channelized streams; and
- Work with CWRM to ensure net increase in number of streams with biological integrity and Instream Flow Standards sufficient to sustain viable native fish and invertebrate populations.

Please note that the HSHEP model included all of the stream species designated as species-of-concern (eight species) in the 2005 Hawai‘i Comprehensive Wildlife Conservation Strategy, including the four species mentioned above in Comment #8.

The flow restoration scenarios presented in Section 4.2.1 of the Draft EIS decrease the number and amount of stream diversions and apply the IIFS set by the CWRM D&O to improve native stream species habitat. In particular, as discussed in Section 1.3.4 of the Draft EIS, the CWRM D&O significantly reduces the amount of water that can be diverted for offstream uses relative to the capacity and use of the EMI Aqueduct System from when sugar was being cultivated. Ten streams were ordered to have no diversions at all (one of which, Waiokamilo, had stream flow fully restored in 2007) (referred to as “Fully Restored Streams” in Figure 1-3), five were required to return 64% of the median base flow (BFQ₅₀) in the stream at all times (referred to as “Habitat Streams” in Figure 1-3), and seven were required to have 20% of BFQ₅₀ in the stream at all times (referred to as “Connectivity Streams” in Figure 1-3). Thus, the flow restoration scenarios follow actions recommended by the 2005 Hawai‘i Comprehensive Wildlife Conservation Strategy.

Moreover, notwithstanding the statement you attributed to Mr. Nishimoto, the complete removal of all diversion structures is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis, to prevent or mitigate impacts. This point is addressed in more detail above in Response #6.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat. Thus, an increase in habitat was predicted to occur at diverted flows.

As discussed in Response #6 above, although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still

exist under any streamflow scenario. Second, Hawaiian streams are naturally flashy (i.e., they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies regarding controlling introduced poecilid fishes (e.g., guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. Unfortunately, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams we surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed.

While the reactions of poecilid fishes are not a perfect analog for *Culex* mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the *Culex* mosquito (*Culex quinquefasciatus*) is established. Anecdotal observations made by Trutta staff members, support the continued presence of *Culex* mosquitoes under a wide range of stream flows as they reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i. Please note that Section 4.2.1 of the Final EIS has been updated to include the above discussions related to the *Culex* mosquito as shown on pages 4-58 to 4-61.

With respect to your comment that the EIS must compare the impacts created by granting the Water Lease to not granting the Water Lease, as discussed above in Response #5 and explained in Section 3.3 of the EIS, the EIS considers the No Action alternative where no Water Lease is issued. The impacts of the No Action alternative are addressed in Section 3.3. of the EIS. Similarly, the HSHEP model (Appendix A) also modeled the No Action alternative or "30% remaining flow diversion" alternative (the HSHEP model also provided an analysis of the "Natural Condition" scenario where all diversions were modeled as closed with no water diversions and no impact on passage or entrainment of animals.

Comment 9: *It would be helpful if the DEIS included the Barrier Assessment report referenced in the Appendix A, HSHEP model report for East Maui Streams. In fact, the June 8, 2019 Assessment of the Environmental Impact of Stream Diversions on 33 East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model is missing its Appendix 1 (results of field surveys) referenced on pages 14, 42 and 62, and Appendix 2 (node and basin values) referenced on pages 45 and 56. Appendix 3 is missing as well. The information in these appendices is very important and must be included in the final EIS.*

Response 9: Please note that the "Barrier Assessment" you refer to is included in the field survey information in Appendix 1 of Appendix A, and we acknowledge that the appendices to Appendix A were not included in the Draft EIS. All of the appendices are included in the Final

EIS. Please note that the barrier assessments are included in the sections entitled “Diversion Description” in Appendix 1. These discussions, which were done for each one of the 35 diversion locations studied in the HSHEP model, addressing the types of diversions and their impacts on habitat, entrainment and passage.

Comment 10: Streams Unaddressed by CWRM’s 2018 Decision

In 1988, CWRM adopted interim in-stream flow standards for all streams within east Maui. HAR§13-169-44. The standard was whatever was flowing on June 15, 1988. In response to petitions to establish in-stream flow standards for more than two dozen streams, in June 2018, CWRM finally established substantive standards for 24 streams. That proceeding, however, did not address the water flowing in thirteen other streams that flow within the area covered by the revocable permits: Puakea Stream, Kōlea Stream, Punalu‘u Stream, Ka‘aiea Stream, O‘opuola Stream (Makanali tributary), Puehu Stream, Naili‘iliha‘ele Stream, Kailua Stream, Hanahana Stream (Ohanui tributary),¹ Hoalua Stream, Waipio Stream, Mokupapa Stream, and Ho‘olawa Stream (Ho‘olawa ili and Ho‘olawa nui tributaries). BLNR has no idea how much water was flowing in these thirteen streams as of June 15, 1988. Thus, the thirteen streams have no meaningful in-stream flow standards.

[Footnote 1] Please note that in Findings of Fact 58 and 60 of the June 2018 CWRM decision, CWRM refers to the stream as "Hanahana Stream." The Hawai‘i Board on Geographic Names, however, refers to the stream as Hanawana.

<http://files.hawaii.gov/dbedt/opigis/bgn/placenames/HBGN%20-%20Maui%20-%20Official%20May%202018.pdf>

Response 10: Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

While the CWRM D&O did not set IIFS for 12 streams within the License Area that are diverted by the EMI Aqueduct System because those streams were not included in the petitions filed by NHLC on behalf of Nā Moku, the CWRM D&O did take those streams into account. CWRM D&O at ii. Moreover, while 12 diverted License Area streams were not assessed pursuant to specific petitions to establish IIFS, those streams are subject to the 1988 IIFS set for the East Maui streams, as you noted. We cannot opine on whether the status quo IIFS is "meaningful" because we do not understand what is meant by that comment. However, please note that the CWRM, as is evident from its website, both from its own research and in conjunction with USGS, has information on the License Area streams, including the non-petitioned streams,

which information is accessible to the BLNR. Furthermore, under the revocable permits, annual reports, and now quarterly reports, are submitted by EMI to the BLNR, which identify the total amount of water being diverted from License Area measured at Honopou, i.e. water from both petitioned streams and non-petitioned streams. As reported in the third quarter report submitted by EMI to BLNR for the year 2020, the average year to date amount of water diverted from the License Area as measured at Honopou was 23.2 mgd. In 1988, the total amount of water diverted from the License Area as measured at Honopou was approximately 207 mgd. This number is approximately nine times higher than the average amount of water taken from the License Area as of the third quarter in 2020. EMI has not constructed any new diversions or expanded the existing diversion structures in the non-petitioned streams in the years since the establishment of the IIFS in 1988. Thus, it is safe to assume that the IIFS is being met for each of the non-petitioned streams.

Your comment that the CWRM D&O refers to Hanahana Stream but that the correct name is Hanawana Stream is noted, however, the link provided in your comment does not work. Several places in the EIS note the CWRM D&O reference and that Hanahana Stream is also known as Hanawana Stream, including on page 1-4 and Tables 1-2 and 1-3 of the Draft EIS.

Comment 11: *The DEIS fails to discuss in any detail the impact of continuing to de-water thirteen streams unaddressed by CWRM's 2018 decision. The DEIS must do a much better job of discussing these 13 streams.*

Response 11: As noted in Response #10, there are 12 non-petitioned within the License Area that are or can be diverted by the EMI Aqueduct System. All of the diverted or potentially diverted streams within the License Area were included as a part of the overall analysis of the EIS and associated technical studies. The EIS addresses all streams within the License Area. Within Appendix A, the non-petitioned streams referred to in your comments *were* analyzed using the HSHEP model to assess changes in native amphidromous stream animal HU with respect to stream diversions which is summarized in Section 4.2.1 of the EIS in the section covering East Maui. Appendix B analyzed how the Proposed Action (including the non-petitioned streams) would potentially impact the nearshore environment in East Maui which is summarized within Section 4.2.3. Appendix C analyzed how the Proposed Action (including the non-petitioned streams) would potentially impact the flora and fauna within the License Area on a watershed- by- watershed basis using data produced by the HSHEP model and Hawai'i Gap Analysis Program (HIGAP) data provided by state, along with surveys conducted within the region which is summarized in Section 4.4 of the EIS. Appendix E and F reviewed the history, as well as the cultural and traditional resources and practices of the License Area, including the Huelo License area where the non-petitioned streams are located. Appendix H and I both review the economic impacts of the Proposed Action and associated alternatives which included the

non-petitioned streams. Hence, these studies were regional studies that were not limited to only the petitioned-streams.

Comment 12: *The DEIS should include the High Definition Stream Survey and the High Definition Fish Surveys referenced in the Appendix A, HSHEP model report for East Maui Streams.*

Response 12: As discussed in Response #9, the appendices for the HSHEP model report included as Appendix A were not included in the Draft EIS. However, the appropriate appendices for the report in Appendix A have been included in the Final EIS.

Comment 13: *To its credit, Appendix A on page 62 mentions that the lease reduces the habitat units on those streams from 588,000 square meters to 88,386 square meters. That is a huge reduction of 85%. It is unfortunate – and misleading – that this fact is not included in the discussion on pages 4-56 and 4-57 of the DEIS.*

Response 13: Note that the portion of the HSHEP report (Appendix A) that your comment refers to is limited in applicability to the non-petitioned streams only; it does not apply to all streams in the License Area. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams. Further, in that the non-petitioned streams currently have a ‘status quo’ IIFS, the Water Lease would not result in a “reduction” of 85% of habitat units for those streams. Rather, the Proposed Action, i.e., proposed Water Lease, represents a continuation of the level of diversion on these streams that historically occurred for many years. Your comment refers specifically to two scenarios -- the Natural Flow scenario and the Full Diversion scenario -- considered under the HSHEP model, but which are scenarios that are not proposed in the EIS as the Proposed Action or alternatives. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams. Therefore, it would have been misleading to, as you suggested, breakout the impacts to the non-petitioned streams in Section 4.2.1 of the EIS, as it applies to the Proposed Action.

Comment 14: *According to CWRM’s Ayron Strauch, “the diversions are generally designed to take up to about the Q40 flow, so they were probably taking, if they needed it, 100% of the Q70 flow . . .” That suggests that the ditch system completely dewateres the thirteen streams 60% of the time, leaving no water at all directly below the diversions on these 13 streams. Taking all the water from a stream 60% of the time has profound ecological consequences that the DEIS brushes over.*

Response 14: Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams and will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The HSHEP model in Appendix A and summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units by 36.1% from the Natural Flow condition (i.e., no diversions). In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Comment 15: *One of those streams, ironically, has seen too much water. For the last few years, A&B has been diverting water from Waipio and Hanehoi streams and dumping that water into Ho'olawa stream. Excessive dumping has caused stream banks to erode and caused a hazardous condition to recreational users of the stream.*

Response 15: Please note that EMI has made adjustments to its individual intakes based on the amount of rainfall (which leads to increased stream flow) to draw only the required amount of stream flow so that there is no excess water that exits the EMI Aqueduct System at Ho'olawa Stream. In addition, in compliance with the CWRM D&O, EMI will no longer be diverting any water from Hanehoi Stream as it was ordered for full restoration.

With regards to negative impacts due to the conveyance of diverted water in the stream channel associated with failure of the streambanks or stream channel, such impacts could be mitigated by standard streambank restoration practices. It should be noted that most of the streambank erosion will be caused by high flow associated with storms and the conveyance flows may not be the cause of the streambank failures.

Comment 16: Water Available west of Honopou

The DEIS performs mathematical hocus pocus. Simple math from page 2-5 shows that historically 11.06 mgd of water was taken from streams west of state land (west of Honopou Stream) (135.58 mgd at Honopou Stream and 146.64 mgd at Maliko Gulch). On page 2-8, however, the DEIS suggests that only 4.37 mgd are available from the streams west of state land. That is simply not true. The figure provided on page 2-8 is premised on not taking more water

because “when rainfall is high in East Maui, the ditches are fuller and there is little needed to supplement the flow.” Yet, in the same way, if BLNR limits the amount of water taken from east Maui, then A&B/EMI/Mahi Pono have 11.06 mgd of water available from the streams west of state land.

Response 16: We respectfully disagree with your comment. Please note that the 11.06 mgd is the measured difference at median flow. In the past, the ditches at median flow were already full and diversion in this area was not required. The 4.37 mgd (Q₉₅ flow) is based on taking from this area during the drier periods when more water is needed to supplement flows from the License Area. Additionally, some water that was diverted east of Honopou during Q₅₀ and higher flow events was stored in reservoirs before Māliko Gulch. This water was metered at Honopou and during lower flow times when water from those reservoirs would be released would be erroneously counted again at Māliko Gulch as if it was included in the measure difference in the median flows as coming from outside of the License Area. Hence, the 4.37 mgd is more accurate of what is typically available in between Honopou Stream and Māliko Gulch.

Comment 17: Marine Life

Kumupono Assoc. study of East Maui: “Wai o ke Ola – He Wahi Mo‘olelo no Maui Hikina” was prepared for A&B / EMI in 2001. It provides much historic and contemporary discussion of the robust presence of marine life along east Maui coasts and longtime dependence of east Maui communities on the sea for food supplies. The connection between fresh water stream flows and algae that feeds marine life is well established.

In contrast, Appendix B and the DEIS concludes that East Maui streams flows do not affect conditions for marine life in east Maui, and that east Maui has the wrong ocean conditions to have substantial fish populations. Appendix B offers these conclusions although it includes no survey of ocean fish and measures water chemistry at just seven of 36 streams in the lease area. The conclusions of Appendix B are used throughout the DEIS to justify the “lack of impacts” from EMI’s proposed Alternative 1: diverting all the East Maui streams to the extent permitted by the 2018 CWRM D&O. The EIS needs to acknowledge that there are impacts to ocean fisheries and propose mitigation.

Response 17: Regarding your comment about the Kumupono Assoc. study of East Maui, please note that this resource was used in the Archaeological Literature Review and Field Inspection (LRFI) (Appendix E) and the Cultural Impact Assessment (Appendix F), both of which were conducted in support of the EIS.

Your comment about Appendix B stating that the East Maui has the wrong ocean conditions to have substantial fish populations is unclear. Nowhere is this stated in Appendix B or the Draft EIS. Please note that the primary focus of the survey conducted for East Maui Irrigation

Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, because the nutrient concentrations in the ocean do not change substantially due to stream diversions as proposed under the Water Lease, there is no pathway for fishing to be negatively impacted. This analysis means that impacts to ocean fish from the Proposed Action are negligible.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of

estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83 of the Final EIS.

Please note that both the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) and the HSHEP model (Appendix A) involved field work in East Maui whereas the Kumupono Assoc. study of East Maui did not. The Kumupono study is more comparable to the CIA (Appendix F), involving interviews of East Maui residents and their recollections and perceptions. The CIA also notes that several commenters to the Draft EIS stated that they have observed an increase in fish returning to the nearshore coastal environments since the cessation of sugarcane operations in 2016. The CIA (CIA Section 7.5.2) has been updated to include information in the analysis of cultural impacts, specifically in the analysis of impacts to freshwater ecosystems, as summarized in Section 4.6 of the EIS, see pages 4-239 to 4-252 of the Final EIS.

Moreover, as noted within the CIA, the preferred method of fishing was open ocean fishing for the people who lived along the coast of East Maui based on background research conducted by Cultural Surveys Hawai'i (CSH) (*Ka 'Oihana Lawai 'a: Hawaiian Fishing Tradition* by Daniel Kahā'ulelio (2006)). Land Commission Awards analyzed by CSH also indicate that claims were made for fresh water and off-shore fisheries. See EIS Appendix F (CIA), Section 4.1.1.

Comment 18: *The EIS does not include recent studies of marine fish populations in east Maui or recent interviews with east Maui residents. Residents inform us that they have observed that the recent increase in East Maui flows has started to stimulate increased fish populations in East Maui. The EIS needs to include studies on current fish populations discuss how this trend of increasing fish populations that support traditional Hawaiian gathering practices can continue, rather than not mention that it is happening.*

Response 18: Regarding your comment that the EIS does not include recent studies on marine fish populations in East Maui, please note that this is not within the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are discussed throughout Chapter 4 of the EIS.

As discussed in Response #17, the analysis presented in Appendix B concluded that impacts from the Proposed Action to ocean fish in nearshore marine or estuarine reach habitats are negligible; therefore there is no scientifically sound reason to undertake a study of ocean fish in East Maui related to impacts from the Proposed Action. Moreover, evaluation of possible impacts on fisheries and nearshore gathering areas would require rigorous "before/after" experiments to determine changes between periods of diversion and non-diversion, with enough time during each phase for ecosystems to come to an equilibrium. As such an experimental set-up is not feasible because conclusions based on existing conditions are the most scientifically reasonable way to evaluate potential changes as presented in the East Maui Irrigation Assessment of Streams and the Ocean report (Appendix B) and summarized in Section 4.2.3 of the EIS. The survey results indicating that nearshore mixing in the study areas was of a magnitude to bring stream-derived nutrients to background marine levels should be adequate to address the concerns brought up in the comments. However, if it was possible to conduct the controlled before/after experiment it would have provided an unequivocal scientifically rigorous set of results to clarify/confirm that this is the case (e.g., changes/no changes to marine nutrient availability). The differentiation between fisheries and gathering areas is that fisheries generally

occur offshore in open waters, while gathering areas are within the reach of people from the shoreline.

Regarding your comment about recent interviews with East Maui residents, the Social Impact Assessment (SIA), contained in Appendix G of the EIS and summarized in Section 4.7.2 of the EIS, obtained input from several community members, many of whom have direct and long-term experience with the streams in the subject area. As discussed in Section 4, Preliminary Community Issues, in the SIA, seven focus groups were convened in November 2018. Participants in these sessions included residents, farmers and ranchers, and people who are active in environment and sustainability efforts. These participants lived in Ke‘anae, Wailuānui, Huelo, Ha‘ikū, Kula, Makawao and Pukalani. Moreover, the Cultural Impact Assessment (CIA), Appendix F to the EIS, obtained input from three interviewees, as well as numerous declarations made during the CWRM D&O proceedings. Also, CSH, the consultant that prepared the CIA, conducted follow-up interviews with several commenters who provided specific comments on the CIA portion of the Draft EIS to obtain more cultural information from those who have a connection with East Maui which have been included in the Final EIS. Regarding your comment that the EIS should discuss this trend as it relates to cultural practices, please note that Section 4.6 of the Final EIS has been updated to include the comments received during the Draft EIS phase, which discusses an observed increase in fish populations, as shown on page 4-168 of the Final EIS and as it relates to freshwater ecosystems as shown on pages 4-245 to 4-247.

Regarding your comment that residents have informed Sierra Club of an observed increase in fish populations, please note that several commenters of the EIS and CIA participants have noted “positive changes” that they have observed since the cessation of sugarcane operations such as an increase in fish populations returning to the nearshore coastal environments, as shown on page 4-168.

Comment 19: *In addition, the EIS should specifically identify the all the projects for which Steve Dollar, Marine Research Consultants, Inc. and Sea Engineering have predicted that a project would have an adverse environmental impact. It should also list all the projects that they predicted would not have an adverse environmental impact.*

Response 19: The information you requested is not within the scope of the EIS nor is it relevant. Please refer to Response #18 above regarding the scope of the EIS.

Comment 20: *Native and Invasive Flora and Fauna (Appendix C)*

Appendix C and the DEIS assume that 140 years of EMI use and management has had no impact on the substantial loss of native flora and fauna on public lands in the Lease Area. This is offensive, and also simply not true.

Response 20: We respectfully disagree with your comment that the Draft EIS and Appendix C assume that there have been no impacts to native flora and fauna in the License Area. We acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui. Section 4.4 of the EIS specifically addresses the impacts of the Proposed Action to flora and fauna resources within the License Area, including a discussion of the cumulative impacts, which is also discussed in Section 4.16 of the EIS. Appendix C (Terrestrial Flora and Fauna Technical Report) of the EIS that was prepared by SWCA included a survey of approximately 33,000 acres of land in East Maui referred to in the SWCA report as the "License Area" and approximately 30,000 acres of agricultural land in Central Maui that it referred to as the "Service Area." These areas were collectively referred to as the "Study Area" throughout the SWCA report. This report is summarized in Section 4.4 of the EIS, which has been supplemented in the Final EIS. Appendix C has been updated based on comments received on the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. See page 3-32 of the Final EIS.

Appendix C concluded that the flora and faunal resources in the License Area would remain substantially the same under the Proposed Action as compared to current conditions as there will only be routine maintenance and repair activities that occur in the License Area under the Proposed Action. Hence, there is not anticipated to be any significant or adverse impacts to flora or fauna due to the Proposed Action.

Comment 21: *This brief survey (4 days covering 33,000 acres on the ground and 1 day in the air) drive-by review of flora and fauna is entirely inadequate to inform decision makers of the impacts of the proposed action. None of the Endangered damselfly populations seen by DAR surveys in 2005-06 were seen. No plant list was included in the survey report. The survey does not refer to baseline data available from the extensive 1985 mapping of the E & W Wailuaiki stream basin area that was done as part of a Proposed Hydroelectric plant EIS (Kepler, 1985.)*

The Flora and Fauna survey also included the 30,000 acres of potential farm lands (referred to as the “use area”) in the 5 day visit and did a poor job of describing impacts there. It was not clear if the gulches in the “use area” were surveyed; they often serve as habitat areas. No acoustical survey for native bats was done at either survey location.

Response 21: Regarding your comment about the length of time to conduct physical surveys related to the flora and fauna resources, ground and aerial surveys were conducted in 2017 and 2018 by SWCA to field-verify vegetation types and species found during previous surveying and mapping efforts. It was determined that the HIGAP vegetation data layer produced by Gon et al. (2006) was highly representative of the vegetation found in the Study Area. Thus, HIGAP mapping data was used to estimate species distributions and potential impacts for the entire 33,000-acre License Area. Threatened and endangered species were categorized by each species' potential to occur in each vegetation type based on habitat needs. Methods have been further clarified in Appendix C, as summarized in Section 4.4 of the Final EIS as shown on page 4-113.

Regarding your comment that none of the endangered damselfly populations seen by DAR surveys, please note as discussed in Section 4.4.2 of the Draft EIS:

*Twelve invertebrates were observed during the surveys, consisting of the Blackburn’s damselfly (*Megalagrion blackburni*), Hawaiian upland damselfly (*Megalagrion hawaiiense*), citrus swallowtail butterfly (*Papilio xuthus*), Monarch butterfly (*Danaus plexippus*), housefly (*Musca domestica*), smaller lantana butterfly (*Strymon bazochii*), mud dauber (*Sceliphron caementarium*), wandering glider (*Pantala flavescens*), green darner (*Anax junius*), Aedes mosquito (*Aedes* sp.), walking stick (*Sipyloidea sipyilus*), and witch moth (*Ascalapha odorata*). All these invertebrates are common in East Maui.*

While the endangered damselfly species were not observed, damselfly species were observed during the survey conducted by SWCA. Moreover, it is acknowledged that other species of damselfly are known to, or may, occur within the License Area as indicated by Table 4-5 of the Draft EIS. However, please note that Table 4-5 of the Draft EIS (Table 4-10 in the Final EIS) has been revised to include the Blackburn’s sphinx moth, which the United States Fish and Wildlife Service (USFWS) indicated in its comments on the Draft EIS may occur in the License Area. Moreover, during the field work conducted by Trutta, pictures of damselfly were captured and are included in Appendix A.

Regarding your comment about the 1985 EIS regarding East and West Wailuāiki streams, please note that this was reviewed by SWCA in response to this comment and no changes were required to the report included in Appendix C to the EIS or to the EIS text.

Appendix C (Terrestrial Flora and Fauna Technical Report) of the EIS that was prepared by SWCA also included a survey of the approximately 30,000 acres of agricultural land in Central Maui that SWCA referred to as the "Service Area" (not the "use area" as you stated in your comment). Please note that SWCA updated the description of the Service Area, which includes gulches, in Section 5.1.3.3 of Appendix C as follows: "*The gulches in the Service Area are composed of mostly non-native and/or invasive species. Along with the surrounding area, the gulches have been heavily impacted by prior and current land uses, such as residential and agricultural developments.*"

Regarding your comment that no acoustic survey was done to detect native bats, it was not within the scope of the EIS to conduct an acoustical study in Central Maui. It is known that the Hawaiian hoary bat occurs within this region. As noted in Section 4.4.2 of the EIS and in Appendix C, mitigation to address the potential of impacts to Hawaiian hoary bat include:

If felling of standing trees occurs during the bat breeding season, direct impacts could occur to juvenile bats that are too small to fly but too large to be carried by a parent. To minimize this impact, no trees taller than 15 feet (4.6 m) should be trimmed or removed between June 1 and September 15.

and

The use of barbless top-strand wire is recommended for all fence construction to avoid entanglement of Hawaiian hoary bat.

Moreover, please note that the above mitigation measures are also consistent to what the USFWS provided in their Draft EIS comment letter regarding the Hawaiian hoary bat.

Comment 22: *We think it is fair to say that Sierra Club hike leaders probably know more about the specific flora and fauna conditions of the Lease Area than is found in the Appendix C survey. Section 5.2.3 of the survey reported that no reptiles or amphibians were detected, but hikers regularly encounter a very small frog at Hanawi stream near the Wailoa ditch.*

Response 22: You are correct that the Terrestrial Flora and Fauna Technical Report provided as Appendix C noted that no reptiles or amphibians were detected during the ground surveys conducted. Moreover, it is noted that there are not any amphibians or terrestrial reptiles that are native to Hawai'i. Hence, any amphibians or terrestrial reptiles within the License Area are considered invasive species. However, please note that Trutta Environmental Solutions did observe amphibians during their stream surveys which is noted and discussed in Appendix A of the EIS. Specifically, the amphibian species observed as described in Appendix A were all

introduced species. Wrinkled frogs were observed on Hanawā Stream as stated in the “Biotic Surveys” section of Appendix A.

Comment 23: *In section 6.1.1 of Appendix C, the consultants conclude that under the proposed action (30 year lease) "Vegetation would remain substantially the same" in the state Lease Area. Sierra Club leaders have watched invasive species such as melastomes, job's tears, gingers, African Tulip and other pests spread substantially through the Lease Area over the past 30 years of access hikes, while the density and variety of native species diminish. The EIS does not address what mitigations would be needed to make sure that a 30 year lease would not result in the disappearance of most native species in the 1,000 to 2,000 ft elevations in the Lease Area.*

Response 23: Please note that under the Proposed Action, no vegetation removal in the License Area is anticipated except occasionally during routine maintenance and repair activities of the EMI Aqueduct System. Moreover, instream flow throughout the License Area is expected to increase and diverted water will be significantly less than what was historically diverted from the License Area during sugarcane operations. Hence, vegetation is expected to remain substantially the same and no direct impacts to flora or fauna are expected as discussed in Section 4.4.1 and Section 4.4.2 of the Draft EIS.

We respectfully disagree with your comment that the EIS does not address mitigation measures to prevent the disappearance of native species in the 1,000 to 2,000 foot elevations. Note that the elevation of the highest ditch that is part of the EMI Aqueduct System, the Ko‘olau Ditch, is approximately 1,400 feet, not 2,000 feet and the EIS addresses mitigation measures that are applicable to the License Area. Appendix C and in Section 4.4.1 of the Draft EIS provide that endangered or threatened species and critical habitats exist in higher elevations of the License Area. As a mitigation measure, Section 4.4.1 of the Draft EIS states:

To avoid the introduction or transport of new invasive plant species into more pristine portions of the License Area during EMI Aqueduct System maintenance activities, all equipment and vehicles arriving from outside the License Area should be washed and inspected prior to any maintenance activities on cliff sides, near waterfalls, and in other native species-dominated areas in the License Area. Such washing and inspecting should be done at a designated location.

However, please note that the Section 4.4.1 of the Final EIS has been updated to include additional mitigation measures based on comments received on the Draft EIS, as shown on pages 4-121 to 4-124.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable Watershed Management Plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Comment 24: *The DEIS fails to acknowledge that without active management, invasive species will take over native forests. Active management is critical. Page A-2 of Appendix C documents how much invasive species are crowding out native forests in the area that Mahi Pono/EMI wants to lease. One of the primary justifications that the Land Division offers to leasing out its land is that it does not have the resources to manage public land. If someone is going to lease public land, it should only do so if it prepares and implements a management plan that reduces the threat posed by invasive species.*

Response 24: As discussed in Response #23 above, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans as discussed in Section 2.1 of the Draft EIS. However, please note that Section 2.1 of the Final EIS has been updated to include the East Maui Watershed Partnership Management Plan and the BLNR approved minimum content requirements regarding watershed management plans which includes invasive species management as shown pages 2-2 to 2-4 of the Final EIS.

Moreover, EMI has worked closely with the Maui Invasive Species Committee (MISC) to assist in mitigating non-native weeds along the EMI Aqueduct System and access roads. Typical procedures involve EMI staff notifying MISC or other agencies of sightings and locations of non-native weeds, and then facilitating access to these identified areas to conduct appropriate treatment methods. EMI has committed to continuing to work with MISC in order to institute more stringent protocols for equipment sanitization and protection of the License Area.

The above discussion has been added to Section 4.4.1 of the Final EIS as shown on pages 4-121 to 4-124.

Comment 25: *The EIS should have far more detailed information before declaring that a 30 year extension of the current management style will result in “no impacts.”*

Response 25: As discussed in Response #23 above, no vegetation removal is anticipated except occasionally during routine maintenance and repair activities of the EMI Aqueduct System. Moreover, stream flow throughout the License Area is expected to increase and will be significantly less than what was historically diverted from the License Area during sugarcane operations. Hence, vegetation is expected to remain substantially the same and no direct impacts to flora or fauna are expected as discussed in Section 4.4.1 and Section 4.4.2 of the Draft EIS.

Comment 26: *Sierra Club leaders remove and report invasive plant introductions in the Lease Area to EMI and the state and have offered to participate in hunting for and eradicating various invasive aliens before they can get established. No one has followed up with our requests recently. In the 1980’s, Sierra Club and EMI teams worked together to remove invasive Banyan trees from the stream beds of the Lease Area. Current EMI leadership has not shown any interest in the public watersheds below 3000 elevation where most of their diverted streams are located in the Lease Area. The East Maui Watershed Partnership includes the Lease area lands on their maps, but only has active management of East Maui lands above 3000 elevation, which is above the Lease Area. The EIS needs to make this fact clear.*

Response 26: We acknowledge your comment that Sierra Club leaders actively remove and report invasive plant introduction in the License Area to EMI and the State, and that the Sierra Club and EMI have worked cooperatively together in the past to remove invasive plants from the License Area. As discussed in Response #24 above, EMI has continually worked closely with MISC to assist in mitigating non-native weeds along the EMI Aqueduct System and access roads. Typical procedures involve EMI staff notifying MISC of sightings and locations of non-native weeds, and then facilitate access to these identified areas so MISC may conduct appropriate treatment.

Regarding your comment that EMI leadership has not shown any interest in the public watersheds below 3,000 feet, this is not true. EMI continues to work with MISC by reporting sighting of invasive weeds and coordinating access in these areas, which are well below the 3,000’ level. EMI personnel also monitor the License Area for signs of feral ungulates.

Regarding the East Maui Watershed Partnership, the lands under the jurisdiction of the East Maui Watershed Partnership span over 100,000 acres which includes the entire License Area.

The License Area is actively managed by the multiple agencies and organizations, including EMWP, MISC, DLNR, etc., in partnership with EMI. EMI does not recall the Sierra Club reaching out to do any invasive species removal.

Comment 27: *The public waters diverted by the EMI systems are the product of two factors: natural rainfall and the watershed lands that receive the rainfall and discharge it into springs and streams. The quantity and quality of future stream flows will depend upon the health of the surrounding watershed lands.*

In section 6 of Appendix C, the consultants conclude that the proposed action will have no impacts because “no habitat removal or loss is proposed...” The EIS ignores the well-documented fact that dewatered streams over time lead to the decimation of native ecosystems and flora and fauna. The EIS proposes no mitigations to improve watershed health other than some mechanisms to prevent introduction of more invasive species on equipment or supplies.

Response 27: We acknowledge your comments regarding the source of the public waters. Please note that the HSHEP model in Appendix A estimates streamflow at all diversion locations based on watershed and rainfall characteristics. Regarding your comment that the quantity and quality of future stream flows depend upon the health of the surrounding watershed lands, please note as discussed in Response #23 above, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans.

The applicable language from Section 6 of the Terrestrial Flora and Fauna Technical Report (Appendix C) states, "*Since there is no habitat removal or loss proposed, impacts are not quantified but are described in qualitative terms.*" Regarding your comment that dewatered streams over time lead to the decimation of native ecosystems, please see Response #20 above regarding cumulative impacts.

Appendix C of the Draft EIS specifically addresses the flora and fauna considerations of the Proposed Action and alternatives. To minimize the impacts to flora and fauna in the License Area, Section 7 of Appendix C identifies several avoidance and minimization measures, including measures to avoid the introduction of additional invasive species to the License Area, which is harmful to the watershed and to native flora which are also reflected in Section 4.4 of the EIS. Moreover, regarding your comment that the EIS does not propose any mitigation measures for watershed health, Section 2.1 of the Draft EIS acknowledges the requirement for watershed management under HRS § 171-58(e).

It is recognized that Hawai‘i’s fresh water originates from the forest, which capture and absorb hundreds of inches of rain each year, allowing for slow infiltration and replenishment of our

aquifers and streams. Based upon this understanding, the legislature added sub-section (e) to HRS § 171-58, requiring the incorporation of a watershed management plan into all water lease agreements to help protect freshwater resources (surface and groundwater). In addition to sustaining ground and surface water supplies, healthy forests reduce erosion by holding soil in place, improve water quality, and provide habitat for unique and endangered plants and animals. Focusing on watershed management plans that target mauka protection actions (fencing, removal of hooved animals from important watershed forests, invasive weed control, etc.) that benefit native forests is essential if water lessees are going to have a reliable long-term supply of fresh water.

Comment 28: *The Appendix C survey provides no guidance for any restoration activities in the Lease Area, which is widely done in EIS documents that are involved with projects, like this one, that will, by law, trigger future management plans.*

Response 28: As discussed in Response #18 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by DLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B’s former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included throughout Chapter 4 of the EIS. The impacts of the alternatives to the Proposed Action are discussed in Chapter 3 of the EIS.

Moreover, regarding your comment about restoration activities, as discussed in Response #23 above, the lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans and will be required to jointly develop a watershed management plan with the DLNR. One of the goals of a watershed management plan is to identify priority outcomes essential to maintain and *restore* biological integrity to the maximum extent practicable which include but is not limited to:

1. Removal and control of non-native hooved animals (pigs, goats, deer, sheep, cattle) from important watershed forests.
2. Removal or containment of damaging invasive plants and animals that threaten important watershed forests.
3. Monitoring and controlling other forest threats including fires, predators, and plant diseases.
4. Restoring and out-planting native species in important watershed areas and buffer zones.

5. Communication, outreach and community education to build capacity for citizen-based watershed protection.

However, Appendix C does provide detailed avoidance and mitigation measures to minimize impacts of the Proposed Action to flora and fauna which are summarized in Sections 4.4.1 and 4.4.2 of the Draft EIS. Moreover, the discussion of these avoidance and mitigation measures has been expanded on as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS.

Comment 29: *Section 6.2 of Appendix C concludes that the No Action alternative (no lease awarded) would mean that it would likely not be viable for EMI to maintain the ditch system. The EIS offers no substantial discussion or analyses of others such as County or State maintaining portions of the ditch system for much reduced level of diversion. The idea is simply dismissed as “too speculative” at this time, although the Maui Board of Water Supply has issued a report after investigating the topic.*

Response 29: Regarding your comment that the EIS offers no substantial discussion or analysis of others maintaining or operating the EMI Aqueduct System, this is discussed in Section 3.1.2 of the Draft EIS, as follows:

During public scoping for the DEIS in 2016 and 2017, it was suggested that the EMI Aqueduct System should be brought under new ownership, without the further involvement of A&B and EMI, and potentially under public ownership. Ownership of the EMI Aqueduct System changed in January 2019 to include Mahi Pono, which intends to pursue diversified agriculture in Central Maui. Consideration of another change in ownership is too speculative at this point to warrant analysis. A change in the ownership of the EMI Aqueduct System will not enhance environmental quality or avoid, reduce, or minimize all or even some adverse environmental effects, costs, or risks of the Proposed Action. As discussed elsewhere in this DEIS, EMI has been operating the EMI Aqueduct System since the start of construction in the 1870s. Few have the knowledge to operate and maintain this unique and complex system, consisting of approximately 388 separate intakes, 24 miles of ditches, and 50 miles of tunnels, as well as numerous small dams, intakes, pipes, 13 inverted siphons and flumes. Furthermore, the EMI Aqueduct System is not for sale, and forced acquisition of the system is projected to be prohibitively expensive, resulting in substantial costs to the public. For these reasons, this alternative is viewed as a highly speculative and unreasonable alternative, and one that would not meet the objectives of the Proposed Action. Therefore, it was dismissed from further review.

Hence, it was deemed to be speculative as the EMI Aqueduct System is not for sale, there had not been a cost appraisal of the system, and few have the skills or knowledge to operate the extensive and complex EMI Aqueduct System.

We are aware of the Board of Water Supply's (BWS) Temporary Investigative Group (TIG) Report, which was published after the Draft EIS, on the potential acquisition of the EMI Aqueduct System by the County, speaks directly to the "ownership change" alternative referenced in your comment. To provide further context, on July 19, 2019, the Maui County BWS formed the subject TIG to explore options for ensuring public access to water, including the feasibility of purchasing and maintaining the EMI Aqueduct System.

Based upon information available in relation to findings and conclusions of the TIG report, it is our assessment that the County's potential acquisition of the EMI Aqueduct System remains speculative. Furthermore, much of the institutional knowledge needed to properly operate the EMI Aqueduct System would be lost under any change in ownership scenario. This could reduce the efficacy of the system, the new owner may not have the expertise needed to properly maintain it, and possibly lead to additional and unforeseen environmental impacts. Moreover, a change in ownership would presumably directly contradict the objectives of the Proposed Action as outlined within the EIS. It is noted that the TIG report's proposal for water rates for the Central Maui agricultural fields is nearly ten times that of what is being charged to the Agricultural Park and Upcountry agricultural users, thus rendering the economic viability of agriculture on the Central Maui fields unfeasible.

For purposes of assessment in this EIS, it is assumed that an alternative owner of the EMI Aqueduct System would be required to meet goals of the Proposed Action as described in this EIS, including meeting the Proposed Action's stated objective to support an economically feasible, sustainable diversified agricultural operation across the Central Maui agricultural fields.

For the reasons discussed above, the County's acquisition of the EMI Aqueduct System, and the County's pursuit of a water lease from the BLNR are viewed as speculative and an unreasonable alternative. However, the existence of the TIG Report and its findings have been acknowledged in Section 3.1.2 of the Final EIS, as shown on pages 3-19 to 3-20. A copy of the TIG Report has been included in the Final EIS as Appendix Q.

Comment 30: *Section 6.3 concludes that the Reduced Water alternative (alternative 2) would result in more ditch maintenance required and "more human activity in area and greater chance of potential for negative impacts." This section also concludes (with no proof offered) that increased water flows in the stream would likely have very little impact on native land based flora and fauna and that impacts on aquatic fauna (damselflies, etc) would vary by stream. The*

EIS offers no evidence that either of these conclusions is true, yet they are offered as a rationale to decision makers to support the Alternative 1 lease.

Response 30: To clarify, Section 6.3 of Appendix C states that, “*The increased water flows in the streams would likely have very little impact on terrestrial flora and fauna.*” Hence, this statement refers to all existing flora and fauna within the License Area and is not limited to native species. As discussed in Section 5.1.2.1 of Appendix C in the Draft EIS, the majority (60%) of the License Area is already composed of “Open / Closed ‘Ōhi‘a Forest,” which mainly constitutes the higher elevation areas where water is not diverted as shown by Figure A-2. Moreover, the areas surrounding the EMI Aqueduct System tend to be composed of “alien forest” which consist of non-native species. Hence, due to this it is anticipated under the “Reduced Water Volume” alternative, which would involve more human activity due to increased ditch maintenance needs, an increase in water flow in the streams would likely have little impact on native land based flora and fauna in the areas where more stream flow would be restored, as compared to the No Action alternative (i.e., no Water Lease). However, as noted in Section 6.3 of Appendix C the impacts would vary on a stream-by-stream basis. Please note that Appendix C and Section 4.4 of the Final EIS has been updated as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131 to discuss how the Proposed Action would potentially impact the flora and fauna within the License Area on a watershed by watershed basis, using data produced by the HSHEP model and HIGAP data provided by state, along with surveys conducted within the region.

Regarding aquatic fauna, and specifically damselflies as raised in your comment, under the Reduced Water Volume alternative, the HSHEP model (Appendix A) conducted an analysis of impacts to damselflies, which concluded that return to natural flow conditions should improve damselfly habitat. However, the restoration of baseflow will likely also improve habitat conditions for a number of introduced predator and competitor species of the native damselflies and thus may not in itself increase damselfly populations. Hence, under the Reduced Water Volume alternative, the more water is returned to natural flow conditions, the more of an increase in damselfly habitat there will be. This has been added to Section 3.4.3 of the Final EIS as shown on page 3-27.

Comment 31: *Appendix C refers to a future Management Plan for the Lease area that will be done by the State of Hawai‘i for the lease lands as part of any future lease agreement. The lease requirements found in HRS 171-58(e) specify that A&B/Mahi Pono need to jointly prepare a management plan with the State:*

(e) Any new lease of water rights shall contain a covenant that requires the lessee and the department of land and natural resources to jointly develop and implement a watershed

management plan. The board shall not approve any new lease of water rights without the foregoing covenant or a watershed management plan.

The Appendix C - "Assessment of Terrestrial Flora and Fauna" made absolutely no reference to any need for restoration or management of the public lands in its analyses or recommendations. It seems unlikely that any DEIS considering the impacts of a longterm action can effectively evaluate and mitigate those impacts if the impacts are not clearly quantified in EIS.

Response 31: As discussed in Response #18, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B’s former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included throughout Chapter 4 of the EIS.

Moreover, as discussed in Response #23 above, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans.

However, Appendix C does provide detailed avoidance and mitigation measures for actions within the East Maui License Area, which are summarized in Sections 4.4.1 and 4.4.2 of the Draft EIS. However, please note that these avoidance and mitigation measures have been expanded on as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131.

Comment 32: *Section 6.5 discusses alternative ownership/management of the ditch system and lease area- and concludes that such management “would have effects identical to those described in “proposed Action.” on Terrestrial Flora-Fauna. The DEIS offers no analyses of increased investment in watershed management that could come with a new “ownership” model.*

Response 32: It is unknown whether any increase in investment in watershed management would come as the result of new ownership of the EMI Aqueduct System (which is not for sale in any event). However, as discussed in Response #29 above, alternative ownership of the EMI Aqueduct System is purely speculative and furthermore, would not achieve the objectives of the Proposed Action.

Comment 33: *Section 6.6 dismisses the greater public access alternative (smaller lease area) and concludes that greater access would impact flora and introduce more alien species and impact habitat of native birds. The DEIS offers no analyses of increased access permitting*

greater restoration / management activities in the watershed lands as has been the case in various areas on Maui that manage public access.

Response 33: Any alternative or variation of an alternative that would increase public access to the License Area would have the potential to increase impacts to flora and fauna species that are present in the License Area. Increased access into the License Area would presumably allow for hiking, hunting, gathering, and other recreational and/or cultural activities to take place. An increase in these activities would result in increased vegetation trampling, which, depending on degree of access and use of the area, may have a significant impact on existing flora. In addition, the potential for weed, rapid ‘ōhi‘a death, and little fire ant introduction and invasion would increase. Weeds, by definition, can outcompete most flora for space and nutrient resources. Weed invasions, if they were to occur, would decrease the quality and quantity of habitat available for native plant species, which in turn may decrease the quality of critical habitat for the Maui parrotbill and crested honeycreeper. The presence of vehicles and humans for various activities in the License Area could disrupt the normal behavior of wildlife and temporarily displace individuals from roadside habitat. Human noise and activity would increase due to an increase in access, which would have a negative impact on wildlife.

Increasing the area open to public use would increase the potential for these impacts to flora and fauna to take place and potentially increase the intensity of the impacts throughout the License Area. Should the License Area be modified for greater public access, the intensity of these impacts would be greater if the public is allowed in the eastern portion of the License Area, as the analysis in Appendix C demonstrates that native and unique flora and fauna species are more likely to occur in the eastern portion of the License Area. Allowing public access to the western portion of the License Area may have a lesser negative impact on biological resources. Hence, under this alternative, it is recommended that the Water Lease lessee work with the respective State agency to design an appropriate boundary that protects the integrity and safety the EMI Aqueduct System and staff, as well as minimize public access to the eastern portions of the License Area.

Please note that the above discussion has been added to Section 6.6 of Appendix C and Section 3.2.2.2 of the Final EIS as shown on pages 3-21 to 3-24.

Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from RP area as shown on page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion

of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place.

Comment 34: *Section 7 offers Avoidance & Minimization measures such as:*

- *Biological monitor during maintenance in waterfall /cliffside areas*
- *Wash and inspect equipment before maintenance*
- *inspect any materials used for maintenance*
- *monitor ESA damselflies- work with USFWS*
- *training for onsite staff to recognize endangered species*
- *sensitivity to i'iwi nests during tree trimming*
- *use of barbless strand for top wire of fences to avoid bat injuries*

While these would be a step forward from current conditions, there is no accountability for these practices actually being employed. Take the example of fencing mentioned. Thousands of acres of Mahi Pono land have recently been fenced, some of which has stands of trees that could serve as potential endangered bat habitat. All of the fencing observed has barbed wire on its top strand. Will all this be changed only if the lease is granted?

Response 34: You are correct that Section 7 of Appendix C (Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease) provides the above avoidance and minimization measures. As discussed in Response #23 above, these avoidance and minimization measures have been expanded on as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS.

In response to your concern about accountability, it is anticipated that any Water Lease issued by BLNR will include conditions imposed upon the lessee. In this case, it is anticipated that mitigation measures presented in the EIS will inform the BLNR as to what conditions it may wish to impose upon the Water Lease lessee. Should the Water Lease be awarded such that Mahi Pono can proceed with its desired farm plan, Mahi Pono would comply with any applicable Water Lease terms, including removal of barbed wire, if required. Mahi Pono installed the barbed wire strand as a deterrent to deer, which, if unchecked, could destroy crops. Even if no Water Lease is granted, Mahi Pono has indicated that it will work with the State Division of Fish and Wildlife (DOFAW) and the Department of Agriculture to determine whether the existing fences are a danger to the Hawaiian hoary bats and if so, whether an effective alternative can be implemented to deter deer from entering on to the farm land.

Comment 35: Hiking

Why does the DEIS assume that the leaseholder should retain the right to determine who is allowed to hike on public land? It is unfortunate that the comments from the Maui Island Advisory Council to Na Ala Hele were essentially disregarded.

Response 35: We respectfully disagree with your comment that the Draft EIS assumes that the Water Lease lessee should retain the right to determine who is allowed on public land. Conversely, Section 4.8 of the Draft EIS states:

The Ko'olau Forest Reserve Hunting Unit encompasses portions of Huelo, Honomanū and Ke'anae Nāhiku within the License Area (See Figure 4-38). The Hunting Unit is administered the DLNR, Division of Forestry and Wildlife. To hunt within the License Area, hunters must obtain a license from the DLNR and an EMI Permit / Waiver. Hunting grounds are limited to one hunting party per hunting area, as regulated by the DLNR. Hunters enter the hunting unit every Saturday and Sunday, as well as holidays observed by EMI. Prior to entering, hunting parties must sign in with the license number obtained from the DLNR, and upon exiting must log in any game that are taken. Access to the hunting grounds is managed by EMI through eight existing EMI access roads. Hunting is permitted year round. Hunting parties may enter the License Area by vehicular access, however, must traverse by foot in most areas.

Hiking is also a permitted recreational use within the License Area, and is limited to hiking clubs. Access to the License Area for hiking is acquired through a Hiking Waiver from EMI.

Hence, access into the License Area is managed in partnership by the DLNR and EMI. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

We acknowledge that the Maui Island Advisory Council sent a letter to the Nā Ala Hele, Trails & Access Program on December 21, 2016 during the early consultation phase of the EIS process. We respectfully disagree with your comment that the Draft EIS completely disregards the comments in the Maui Island Advisory Council letter to the Nā Ala Hele, Trails & Access Program. Those comments were addressed and responded to as shown in Appendix J of the Draft EIS. As noted in the response to that comment letter, the Maui Island Advisory Council's comments and concerns were considered in the preparation of the Draft EIS with regard to

meeting all relevant requirements, including the content requirements prescribed in HAR § 11-200-17.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access to areas that are not within the License Area. Please also see Response #33 regarding the revised License Area under the most recent revocable permits and projections related to the geographical extent of the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to a more robust discussion regarding the impacts from experiencing an increase in public access in the License Area

Comment 36: *The EIS should include an inventory of roads and trails in the Ko‘olau Forest Reserve. The Highways Act protects public right-of-way on roads and trails owned by the state. When the Ko‘olau forest reserve was created, all roads and trails in the forest reserve became protected rights-of-way. The EIS needs to show the protected roads and trails in the Ko‘olau Forest Reserve. HRS §171-35 requires leases to protect rights-of-way and access to other public lands. See also Robello v. Cnty. of Maui, 19 Haw. 168 (1908)*

Response 36: Section 4.5 of the Final EIS, as well as Appendix E (Archaeological Literature Review and Field Inspection) have been revised to include the current inventory of roads and trails in the License Area. CSH completed a geographic analysis of trails and roads that appear

on maps of the License Area. This analysis is limited to trails and roads that were depicted on maps between 1869 and 1992 and available to the public domain. This analysis is also limited to only the roads or trails that extend within the License Area. Section 4.5 of the Final EIS has been updated to include a further discussion regarding these maintenance and access roads, and access points. See pages 4-147 to 4-149 of the Final EIS, together with Figure 48 in Appendix D, which has been added to the Final EIS to correspond with the above text (Figure 4-39 in the Final EIS).

HRS § 171-35 does not require a lessee to protect rights of way and access to other public lands. To the extent that HRS § 171-35 (Lease provisions; generally) applies to a water lease, it gives the BLNR discretion on whether and how to address reservations of rights of way and access to other public lands. The section of the law you cited provides as follows:

Every lease issued by the board of land and natural resources shall contain:

1. The specific use or uses to which the land is to be employed;
2. The improvements required; provided that a minimum reasonable time be allowed for the completion of the improvements;
3. Restrictions against alienation as set forth in § 171-36;
4. The rent, as established by the board or at public auction, which shall be payable not more than one year in advance, in monthly, quarterly, semiannual, or annual payments;
5. Where applicable, adequate protection of forests, watershed areas, game management areas, wildlife sanctuaries, and public hunting areas, reservation of rights-of-way and access to other public lands, public hunting areas, game management areas, or public beaches, and prevention of nuisance and waste; and
6. Such other terms and conditions as the board deems advisable to more nearly effectuate the purposes of the state constitution and of this chapter.

The issue in the case you cited from the Supreme Court of the Territory of Hawai‘i, Robello v. Maui Cnty., 19 Haw. 168 (1908) was whether the easement of the public in an existing highway was extinguished by a lease to a private party when a new road was planned at some time in the future. The Court held that the lessee took his lease with full knowledge of the existing highway due to the reference on the map and actual knowledge of the existence of the road and was therefore not allowed to erect fences blocking the old road. The Court further held that no injunction should have been granted restraining the County from removing lessees fences to keep the public road open. This case is not applicable to the proposed Water Lease.

Comment 37: *In its December 19, 2016 letter, the Division of Forestry and Wildlife states: “Thus the Division recommends that the areas to be conveyed for a water license be done so*

through a land agreement that is limited to the infrastructure required for maintenance and conveyance of water, and that any terms of any agreement established for the delivery of water ensure unrestricted public access to the reserves and any state owned roads and trails.” This means that public access to the trails is not at the whim of the leaseholder. The DEIS must reflect this fact.

Response 37: As mentioned in Response #35 above, Section 3.2.2.2 of the Draft EIS analyzes the Modified Lease Area alternative. Under the “Modified Lease Area” alternative assessed in Section 3.2.2.2 the Draft EIS, it is assumed that access to and uses within the State-owned land that is outside of a smaller License Area would be managed by the State (presumably, DOFAW). DOFAW has not indicated how it intends to regulate those lands. Should there be greater public access to the License Area than currently exists, pursuant to the analysis in Section 3.2.2.2 of the EIS and Appendix C, it is anticipated that there may be an increased introduction or spreading of invasive species within these areas.

Comment 38: Easement

On page 3-6 of the DEIS, there is an acknowledgement of the 1938 agreement – a copy of which should be reproduced in an appendix. That 1938 agreement allows DLNR to deliver water to the county without having to purchase the ditch system from anyone – and regardless of whether a lease is granted or not.

The EIS has no discussion of the fact that EMI controls the 4 levels of ditch system west of lease area, which are connected to the East Maui ditch system, but not affected by the lease decision.

Response 38: We disagree with the statement that the “1938 agreement allows DLNR to deliver water to the county without having to purchase the ditch system from anyone – and regardless of whether a lease is granted or not.” A copy of the 1938 Agreement has been appended to the EIS as Appendix R. The EMI Aqueduct System is a fully integrated system that is wholly owned and operated as such by EMI, both at the time that the 1938 Agreement was entered into and presently.

First, if a lease (or license) is granted, the 1938 Agreement contemplates that the licensee will control the delivery of the water arising on the State land. There is nothing in the 1938 Agreement that provides for a portion of the water arising on the State lands to be withheld from auction and thereby carved out of the lease or license and reserved for delivery to the County.

Second, for the sake of argument, in the event that a carve-out from auction *were* to be permitted, or a lease *were not* to be granted, the State’s easement across the private land would only allow for conveyance of water by the State to the western boundary of the License Area, which

boundary is at Honopou Stream. The 1938 Agreement does not grant the State any right to use those portions of the EMI Aqueduct System that are located *west* of Honopou Stream. For the State to be able to deliver water collected in the License Area to the County of Maui Department of Water Supply ("MDWS"), an easement would have to be secured to utilize the Wailoa Ditch from Honopou Stream westward to Kamole Weir -- which is the point where the MDWS is able to receive water.

Regarding your comment about there being four levels of ditch system west of the License Area, it is correct that there are four levels of EMI Aqueduct System located west of the License Area. Figure 2-2 (EMI Aqueduct System) shows the ditches that are located on private lands west of the License Area. It is noted in Section 2.1.2 of the Draft EIS that the EMI Aqueduct System is estimated to divert an additional 4.37 mgd in this area. However, please note that area is situated on privately owned lands and is not subject to the CWRM D&O or the Water Lease. As such, there is indeed acknowledgement of EMI's control of a ditch system west of the License Area in the EIS document.

Comment 39: Cultural Impact Assessment (Appendix F)

The EIS must fully acknowledge the impact that past and proposed reduced stream flows have had on the native stream life and marine life that is so directly connected with the ability of Native Hawaiians to engage in traditional cultural practice of fishing and gathering in East Maui.

Response 39: As discussed in Response #20 above, we acknowledge that an EIS must consider cumulative impacts, which means "the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions." HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision-making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease. Please note that under the Proposed Action, significantly less water will be diverted from the streams in the License Area than occurred over the past century and more. However, because streams in East Maui have been diverted for over a century, it is not scientifically possible to fully document impacts that first took place more than a century ago as pre-diversion data does not exist. Moreover, we acknowledge that cultural practices and subsistence lifestyles that are unique to East Maui communities have a direct relationship with the health and abundance of native stream and estuarine habitats, as well as the region's overall environmental integrity. This is described in the technical studies that were prepared for the EIS including the Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure

(HSHEP Model) (Appendix A); East Maui Irrigation Assessment of Streams and the Ocean (Appendix B); and Terrestrial Flora and Fauna Technical Report (Appendix C).

Comment 40: *Appendix F, the Cultural Impact Assessment (CIA), concludes that as long as stream flow standards are met in the east Maui streams subject to the 2018 Water Commission decision, all other streams can be diverted with no impacts to traditional Hawaiian cultural practices. It also concludes that the east Maui coasts do not have reefs and therefore do not support related marine species. The conclusion does not reflect marine life and streamlife studies from east Maui, or generational knowledge in the statements of numerous east Maui kama'āina included in Appendix F(i).*

Response 40: Your comment that the CIA "*concludes that as long as stream flow standards are met in the East Maui streams subject to the 2018 Water Commission decision, all other streams can be diverted with no impacts to traditional Hawaiian cultural practices,*" is a misstatement of the CIA's conclusions. Rather, the CIA acknowledges that the Proposed Action may impact Native Hawaiian cultural resources and practices and provides for several recommendations to mitigate those impacts. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject

to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, pages 4-239 to 4-252. The CIA, and Section 4.6 of the EIS, have been updated to include identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA that was attached to the Draft EIS are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been proposed by CWRM, CSH, and other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and, 3) facilitate access via an appropriate access policy and procedure for

cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law as discussed in Section 4.6 of the Final EIS.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the Lease Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Your comment that the EIS concludes that there are no reefs and does not support related marine life is an incorrect assumption. There are no statements in the EIS or within the East Maui Irrigation Assessment of Streams and the Ocean report (Appendix B) or the other technical studies alleging this. Rather, this report analyzed the interactions of the streams in the License Area with the related ocean environments and concluded that:

The effects of stream water on marine waters must be considered minor in these habitats. This result is supported by the physical processes associated with relatively small input of stream water to the vastly larger ocean environment. The prevailing conditions of extreme mixing by physical forces is the most important factor in diminishing the zone of influence of stream water in a marine setting. In all cases where it was possible to sample across the boundary where streams flowed into the ocean, there were sharp gradients reflecting the intense mixing of stream water to background ocean levels. Observation of the habitats in these transition zones indicated that they were primarily composed of sand and barren

rock. Owing to continual, intense wave energy, these nearshore areas do not constitute important habitats for coral reef communities and associated marine species. Beyond the narrow transition zone, the influence of stream water is minimal owing to rapid intense mixing. These processes should not be affected by changes in stream flow related to seasonal variation of diversions.

As for the risks of impacts to fishing, the collected data presented in Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be negatively impacted. Please note that the report acknowledged that different results could occur with respect to linking stream discharge to estuarine function in other areas. But due to the harsh physical conditions of East Maui, stream flow rates do not greatly impact marine ecosystem function.

Moreover, Section 4.2.3 has been updated to discuss that the HSHEP model used by Trutta to conduct an analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals contained herein as Appendix A, also considered estuarine reaches present in the stream segments subject to analysis as shown on pages 4-78 to 4-83. Using the HSHEP model coupled with aerial imagery available, the stream mouth areas of each stream subject to analysis were reviewed for the potential for estuary segments present. The presence of a terminal waterfall, possibility of estuary habitat, and the extent of embayment at the stream mouth were also noted. Table 4-6 of the Final EIS shows the results for all of the East Maui streams within the License Area associated with the EMI Aqueduct System. Furthermore, the subsequent Table 4-7 of the Final EIS, shows the five streams that have any possibility of an estuarine reach. Of these five streams, three streams (Waiahue, Pi'inaau, and Honomanu) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reach, Pa'akea will have connectivity flow restoration, while 'O'opuloa will have no flow restoration and will remain as per the 1988 IIFS. Thus overall, the majority of estuarine habitat that exists in the License Area will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-

DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83.

Comment 41: *Information in kama'āina interviews mentions the importance of stream flows to the abundance of ocean fisheries and related cultural practices of fishing and gathering.*

Hawaiian cultural users whose interviews are in the CIA agree: increased stream flows are needed to support stream and marine life in enough abundance to allow traditional gathering from both streams and ocean coastlines.

The EIS also needs to evaluate the cultural impacts of increasing the amount of water diverted from many streams compared to the amount diverted the past two years.

Response 41: We acknowledge your comment about kama'āina interviews that mention the importance of stream flows to the abundance of the ocean fisheries. Please note that several commenters of the EIS and CIA participants have noted both positive changes (increase in fish populations returning to the nearshore coastal environments, increase in water flow rate for taro farming) and negative changes (increased erosion causing near-shore brown water and blockages of culverts from uprooted vegetation) to the regional environment since the halting of diversion after the closing of HC&S commercial sugar operations in Central Maui in 2016. However, as noted in Response #40 above, from an ocean chemistry standpoint, the results of the study in Appendix B suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. See Appendix B, Section 5. The CIA recognizes 25 streams that were identified by community participants as having an estuary environment that may be impacted by streamflow as presented in Tables 14 through 16 in the CIA.

Moreover, as discussed in Response #17 above, Table 4-7 of the Final EIS shows the five streams that have any possibility of an estuarine reach based on HSHEP model as shown on pages 4-78 to 4-83.

The HSHEP model used in Trutta Environmental Solutions' report (Appendix A), it clearly and directly addresses the impacts of streamflow diversion on the native amphidromous stream species (including opae, 'o'opu and hīhīwai). Due to an increase in streamflow under the Proposed Action when compared to historical diversion rates, opae, 'o'opu and hīhīwai are anticipated to have an increase in HU. However, these HU will slightly decrease from current conditions as more water is gradually diverted as the Mahi Pono farm plan develops to full build-out as outlined in Section 4.2.1 of the EIS.

The CIA and EIS identify impacts to the regional environment, taro farming, and freshwater resources within the License Area based public documentation and consultation with the community as presented in Section 4.6 of the Draft EIS. Specifically, Section 4.6 of the Draft EIS states:

4. *Participant Kyle Nakanelua is concerned with the act of diverting water. He explicitly states that “when those places dry up that adversely impacts the way of life, the cultural practice if you will” and it “adversely impacts the people’s way of life that live there.”*
 - a. *To support this claim, Mr. Nakanelua states that ‘ōpae was once prevalent in the streams that flowed through their family property named Lakini. He relates that when he began to regularly clean the property his grandmother would still catch ‘ōpae. He adds that today there is no ‘ōpae but there are prawns. When CSH asked if ‘ōpae was being overpicked, he replied “no” because “we were the only one there.” He also does not think the introduction of prawns is to blame but believes “that the flow of water is impactful” and has seen the water decline since 1989.*
5. *A 2014 declaration provided by Dan Clark from Ke’anae stated he needs cool, fast running water for optimal kalo production. Due to low stream flow results, there has been an increase in disease to his kalo, which decreases production.*
6. *Jonah Jacintho states in his 2014 declaration that due to a lack of stream flow, fish populations have decreased therefore he cannot fish as much. To increase the population of ocean fish, fresh water is integral for spawning and nutrients. He*

also added that more water in stream beds would also increase 'o'opu, prawn, and hīhīwai populations.

Section 4.6 of the EIS summarizes the findings of the CIA as follows:

Based on information gathered from the cultural and historical background, and the community consultation, significant cultural resources were identified within the License Area, as well as outside of the License Area. It should be acknowledged that although some of the impacted cultural resources exist outside of the License Area, what takes place within the License Area directly affects these cultural practices and resources. At present, there is documentation and testimony indicating traditional and customary Native Hawaiian rights are currently being exercised within the License Area. Cultural resources, practices, and beliefs were identified as currently existing within the License Area. In addition, East Maui, which includes the License Area and beyond the License Area, maintains a rich subsistence and cultural history.

Additionally, the CIA and Section 4.6 of the Final EIS have been updated to more specifically include identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action based on community consultation (see Responses #18 & 40) as shown on pages 4-239 to 4-252 . The revised CIA includes community input regarding recent changes observed as a result of stream flow changes in the recent past.

Comment 42: Hawaiian Home Lands
HAR §11-200-16 provides:

The environmental impact statement shall contain an explanation of the environmental consequences of the proposed action. The contents shall fully declare the environmental implications of the proposed action and shall discuss all relevant and feasible consequences of the action. In order that the public can be fully informed and that the agency can make a sound decision based upon the full range of responsible opinion on environmental effects, a statement shall include responsible opposing views, if any, on significant environmental issues raised by the proposal.

*The current DEIS contains no specific information regarding the water reservation amounts from the East Maui lease area needed by DHHL. **This information is now available and was publicly offered by DHHL staff at the Oct 9, 2019 BLNR meeting.** These specific legally protected water reservations should be included in the EIS, and Mahi Pono's water use plans*

must be adjusted accordingly to reflect this amount, in order for the public and agency comment process to be based upon accurate information. The DEIS also assumes in the Executive Summary that Mahi Pono can use the east Maui water until the time that DHHL needs its reservation. A discussion of whether it is legal for A&B /Mahi Pono to assume that the DHHL “water reservation” can be utilized by Mahi Pono until it is “needed by DHHL” should also be included in the EIS. There is no indication in the DEIS how the MP Farm Plan will be adjusted to accommodate for the 11.5 mgd of east Maui Water that DHHL is reserving. The EIS should plainly discuss this.

Response 42: We respectfully disagree with your comment that the Draft EIS does not contain specific information regarding the water reservation amounts from the License Area. Section 2.1.1 of the Draft EIS states:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL’s Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, based on the above, the Draft EIS assumed that DHHL would make a reservation for approximately 11.5 mgd. Section 2.1.1 of the Draft EIS also explains that the DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B / EMI, Mahi Pono, the DLNR’s Land Division, and DHHL staff and consultants.

Section 2.1.1 has been updated in the Final EIS to acknowledge that the results of the Beneficiary Consultation were presented to the Hawaiian Homes Commission (HHC) on May 30, 2019, as agenda item G-2. The HHC passed a motion to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation

request approved by HHC is for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Kēōkea-Waiohuli + 1,027,510 gpd non-potable water for Pulehunui) of water. This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. Section 2.1.1 of the EIS has also been revised to acknowledge the action of the HHC of May 30, 2019, as shown on pages 2-4 to 2-7 of the Final EIS. As of this time, it is our understanding the water reservation request has not been made to CWRM.

We acknowledge that temporary uses of the DHHL reservation water are not addressed under HRS § 171-58. We further acknowledge that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessee and the DHHL would be necessary to allow the Water Lease lessee to make any temporary use of water reserved for DHHL.

Within the Draft EIS, the analysis of this reduction in available water for the Water Lease lessee falls under the analysis of the Reduced Water Volume alternative. Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water). The DHHL reservation was acknowledged in the Draft EIS ("Projections of the amount of government water available from the License Area at Honopou stream after taking into account the CWRM D&O, is approximately 87.95 mgd. This amount would be subject to further reduction in accordance with the DHHL reservation once called upon for use by the DHHL."). As discussed in EIS Section 3.2.1, Mahi Pono intends to farm as much of the Central Maui agricultural lands as it is possible based on how much water is available under the Water Lease.

Comment 43: *If this would be based upon a need for more water over the first few years of planting and less water when crops are established, using regenerative agricultural methods, as was envisioned in the 2018 CWRM D&O:*

115. The estimated water requirements will change not only because some potential partners and lessees are expected to rotate multiple crops that could potentially have different crop coefficients but also because water requirements could change significantly through the use of regenerative agricultural methods.

If Mahi Pono Water demand is expected to decrease over the years, as suggested by the CWRM 2018 review, a timetable for restoration of non-IIIF streams in the Huelo Lease area should also be discussed in the EIS.

Response 43: Please note that the CWRM D&O was issued prior to the sale of the approximately 30,000 acres of agricultural land in Central Maui to Mahi Pono. The Mahi Pono farm plan is not the agricultural activities contemplated under the CWRM D&O. The CWRM D&O envisioned that there would be multiple farmers involved in the cultivation of the 30,000 acres. However, with the acquisition of the Central Maui agricultural lands by Mahi Pono, there is now a unified Mahi Pono farm plan that is based upon using, at maximum build out, the amount of surface water available for diversion after compliance with the CWRM D&O as discussed in Chapter 2 of the Draft EIS.

Conversely, the Mahi Pono farm plan is expected to need increasing amounts of irrigation water as it progresses toward full build out of the Mahi Pono farm plan as discussed in Section 2.1.5 of the Draft EIS, as follows:

An estimated 10 years will be required for Mahi Pono and lessees to remove volunteer sugarcane and weeds from the approximate 30,000 acres, amend soils, install field improvements, build warehouses and other structures, and plant crops. The predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years (Plasch, 2019).

Hence, contrary to your comment, Mahi Pono's water demands are not expected to decrease over the years but, rather they would increase as the Mahi Pono farm plan is realized. However, the Mahi Pono farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community.

The Mahi Pono farm plan will evolve over time based on a number of factors, including the available supply of surface water, experience which will be gained on crops that can grow well in Central Maui, crops that are profitable, market demand, etc. The Mahi Pono farm plan and its impacts discussed within the EIS are based on full operations by about

2030, assuming no major setbacks. However, water will be diverted from the License Area to Central Maui only as needed at any given time.

Your comment that a timetable for restoration of non-petitioned streams in the Huelo portion of the License Area should be discussed in the EIS is unclear. There are no pending petitions to establish new IIFS for the 12 non-petitioned streams within the License Area, nor are we aware of any requirement to establish new IIFS for those streams. However, the EIS contemplates a variety of alternatives, including an alternative that includes a Water Lease that authorizes diversions in amounts less than would be allowed under the CWRM D&O. That "Reduced Water Volume" alternative could entail a reduction in diversions from the petitioned streams or the non-petitioned streams, or both. The analysis provided in the HSHEP model presents impacts to habitat units for various species under four different stream flow scenarios, i.e., "natural flow" (no diversions whatsoever), "full diversion" (diverting 100% of available low flows), the "2018 IIFS" diversions (diversions consistent with the IIFS established under the CWRM D&O), and the "no Water Lease" diversion scenario (diversion of 30% of flow after compliance with the CWRM D&O). This information is provided for each stream within the License Area that is or has been diverted. As such, the EIS includes data and analysis regarding related impacts from changes in flows within the non-petitioned streams. However, as noted, and contrary to your comment, the water needs for the Mahi Pono farm plan are expected to increase over time as the amount of cultivated acreage in Central Maui increases.

Comment 44: Agricultural and Related Economic Impacts (Appendix I)

The EIS should acknowledge that Mahi Pono has no track record of successful farming under Maui conditions.

Response 44: The Mahi Pono team has significant experience cultivating diverse crops and managing cattle operations on more than 100,000 acres on the continental U.S. Also, the company has established market channels, and substantial financial resources. In its first 18 months of existence, Mahi Pono has hired over 200 workers from Maui, most of whom have farm experience on the island. It is acknowledged that Mahi Pono is new to farming in Hawai'i. However, they come with significant farming credentials that bode well for a diversified agricultural undertaking of the size contemplated for the Central Maui agricultural fields. If Mahi Pono is successful, Central Maui will be able to remain in cultivated agricultural open space, and be put into use in a manner consistent with numerous State and County land use plans and designations.

Comment 45: *A&B's SEC filings inform their shareholders of the risk that plans for diversified farming on their Maui lands may not work out, even given the company's long history of farming. A&B's 2015 SEC filing states:*

*The Company is currently evaluating several categories of replacement agricultural activities in the transition to the diversified model, including but not limited to energy crops, agroforestry, grass finished livestock operations, diversified food crops/ agricultural park, and orchard crops. **There is no assurance that the Company's replacement agricultural activities will be economically feasible or improve the Agribusiness segment's operating results.***

The EIS needs to provide the same disclaimer, and not predicate the entire success of Mahi Pono farming operations on how much east Maui water is sent to Central Maui.

Response 45: A&B's SEC filings are not within the scope of the EIS, nor does HRS Chapter 343 require such a disclaimer about the financial feasibility of a particular undertaking. Please see Response #18 regarding the scope of the EIS. It should also be noted that the SEC filings you mention in your comment were made before the Central Maui lands were sold to Mahi Pono, which as discussed in Response #44 above, is an entity whose team has significant farming experience.

It seems entirely evident that the Mahi Pono farm plan will require water, and the more reliable access to water that can be provided to the Central Maui agricultural fields, the greater the ability for Mahi Pono (or any farmer) to be responsive to the ever-changing agricultural market demands while also being sensitive to the existing local farming community. However, the EIS provides two versions of the Mahi Pono farm plan. One version anticipates farming under a Water Lease that authorizes diversions in the amount consistent with the CWRM D&O. The other version contemplates the farm plan in the event that there is no Water Lease. Please see Chapters 2 and 3 of the EIS. As such, the EIS does not "predicate the entire success of Mahi Pono farming operations on how much east Maui water is sent to Central Maui" as stated in your comment.

Please also note as discussed in Response #44 above that, while success can never be predicted for any business or organization, Mahi Pono is well positioned to take on the challenge of putting Central Maui back into sustainable agriculture.

Comment 46: *The DEIS asserts that Mahi Pono needs a long-term lease in order to make its investment in agriculture. Does Mahi Pono not understand that even with a long-term lease, CWRM could amend the in-stream flow standards and reduce the amount of water flowing to*

central Maui? Does Mahi Pono understand that one of the reasons for studying West and East Wailuaiki is so that CWRM can understand the impact of diversions and if necessary order more water to be restored for the health of the streams?

Response 46: The EIS assesses impacts from alternatives to the proposed Water Lease and one of those alternatives is the Reduced Water Volume alternative. In other words, an alternative where authorized diversions are less than would otherwise be permitted under the CWRM D&O. As such, the potential for changes to authorized diversion amounts is addressed in the EIS, whether those changes are made pursuant to additional amendments to the IIFS for East Maui streams established by CWRM or for any number of other reasons.

Nevertheless, a long-term Water Lease is being sought to support Mahi Pono's substantial investment in farming, including the planting of orchard crops (citrus, macadamia nuts, coffee, avocado, etc.) which take many years to reach full production. Over 80% of the land in crop will be used for orchards, which reflects a long-term commitment to Hawai'i agriculture. We also note that the EIS contemplated and assessed an "Alternative Lease Duration" option within Chapter 3 of the EIS, as well as a "Reduced Water Volume" alternative.

It is acknowledged that under the CWRM D&O, CWRM determined that Waiohue and West Wailuaiki streams were to remain un-diverted as habitat reference streams, explaining that "*We have much to learn about stream restoration and the conditions needed for recruitment of native fauna into streams that have been diverted for over one hundred years. These un-diverted habitat reference streams will provide critical baseline data to validate and improve the theoretical restoration models that will inform future decisions.*" CWRM D&O at v. It is also acknowledged that the order section of the D&O states:

The Commission has no authority over DAR and therefore requests that the Board authorize DAR to monitor whether or not the flows implemented for East Wailuaiki of H90 and full restoration of West Wailuaiki have resulted in any difference in the biology or ecology of these two streams as compared to the other.

CWRM D&O at 270.

In summary, it is acknowledged that CWRM intends for these two streams to be studied in the future in combination with one another to see the impact, if any, of full restoration versus habitat restoration (CWRM D&O, COL 135). The results of this comparison are unknown to anyone at this juncture, as are its implications.

Comment 47: *The EIS needs to provide accurate information about the benefits of Central Maui farming. The numbers provided for proposed Mahi Pono profits and past performances of HC&C sugar do not seem logical: “Mahi Pono farm plan is projected to generate more than 338 pounds per year of crops, generating \$155.9 million per year in annual food sales and \$329.5 million per year in combined direct and indirect sales.” (Executive Summary, p.v.). This would mean each pound of crop brought a return of \$461,242.*

Response 47: Please note that the production figure in the Executive Summary of the Draft EIS should read 338 million pounds per year, not 338 pounds. This was a typo and has been corrected in the Final EIS, including the Executive Summary as shown on page xii.

However, please note that Section 4.7.3 and Section 4.7.4 of the Draft EIS correctly describes accurate information regarding the benefits of the Mahi Pono farm plan. At Section 4.7.3:

At full operations, the Mahi Pono farm plan will cause a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops. Annual sales are expected to reach \$155.9 million. The pastures would support a cattle herd of about 7,300 cow-and-calf animal units, produce over 4,300 calves per year, and generate revenues of about \$4.8 million per year. The solar farm would generate about 82,125 mW of electricity per year, with revenues of about \$8.2 million per year. Combined farm and energy revenues would reach \$168.9 million per year in direct sales (far exceeding the 2006 revenues from sugar production of \$101 million, and the \$116 million average for the 2008 to 2013 period).

And at Section 4.7.4:

At full development, the Mahi Pono farm plan would result in a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops.

Impacts related to agricultural economics are discussed in detail in Section 4.7.4 of the EIS based on findings in Appendix I. Please refer to Section 4.7.4 and Appendix I to see discussions regarding the numerous benefits anticipated as a result of the Proposed Action. In summary, at full build-out, the Mahi Pono farm plan is anticipated to produce a significant amount of crops

for both local consumption and export generating significant beneficial economic and fiscal impacts, providing numerous direct and indirect jobs, and State and County tax revenues.

Comment 48: *Table 6 in Appendix I lists “recent sugar” payroll of \$68,000,000 a year. HC&S had 675 workers when they announced that sugar would shut down in 2016. Did each of those workers earn \$100,740 a year (\$68 mil divided by 675)? That seems highly unlikely. The potential “recent sugar profits” presented in Table 6 of Appendix I also needs additional information. A&B’s SEC filings (10K reports) show a very different range of “profits” from 2009 to 2015, the most recent era of sugar growing. Only 4 of those 7 years did the sugar operations show a profit (2010-2013) The other three years showed sizable losses. Only one year (2011) had a profit of \$22 mil. The average of the 4 profitable years was \$14.9 mil. The figures in the EIS should reflect accurate amounts, not cherry pick one promising year. This incorrect information must be fixed in a new DEIS.*

Response 48: As described in Section 4.7.4 of the Draft EIS and shown in Table 5 (not Table 6) of Appendix I, the employment figure for Recent Sugar (Years 2008 to 2013) was 620 direct jobs earning \$34.3 million per year, or an average of \$55,295 per job. The \$68 million payroll is for both direct and indirect jobs.

The scenario “Recent Sugar” covers the years 2008 to 2013, and the profits are derived from both direct sales and indirect sales related just to HC&S (Maui sugar operations). The numbers in A&B’s 10-K reflect not only the Maui sugar profits, but also the company’s total agribusiness operations combined, including Kauai Coffee, KT&S, A&B Fleet Services, and A&B’s renewable energy projects, which were much broader than just HC&S. Therefore, the numbers are not comparable. The figures used in the EIS were not “cherry-picked” but rather chosen to reflect just Maui sugar operations, as is relevant for this EIS

Operating profits for the sugar operations were estimated at 10% of direct and indirect sales—a common approach for estimating profits. The purpose of estimating profits is to estimate corporate income tax to the State. For Recent Sugar (Years 2008 to 2013), corporate taxes were about 4% of total State revenues derived directly and indirectly from sugar operations (\$0.22 million per year ÷ \$5.08 million, Table 6 of Appendix I).

Comment 49: *Appendix I assumes that East Maui now has plenty of water due to the 2018 CWRM Decision. It also assumes that dry, windy central Maui is the best place for crops to insure food security for Maui’s future, thereby rationalizes without information that all available east Maui stream water should be sent there to support agriculture. The EIS needs to have an updated analyses of the farming potential of the east Maui area. The current analyses in Appendix I that concludes only 44 acres is available for kalo growing and 35 acres for truck*

farming in all of East Maui. These figures are based only on information from the communities that Native Hawaiian Legal Corp represented during the East Maui IIFS petition. There is far more land available for both kalo and farming in east Maui in the Huelo lease area.

Response 49: As summarized Section 4.7.4 of the Draft EIS and Appendix I, “East Maui Water Lease: Agricultural and Related Economic Impacts”

Central Maui has some of the best agricultural conditions in the State for farming, including a large area in a compact configuration, high-quality soils, high solar radiation, a location near markets and shipping terminals, and potentially ample water at low delivery costs (assuming a new Water Lease with a reasonable use fee), and for lessees rents that will be comparatively low.

The basis for this finding is given in Subsection 5.a of Appendix I (pp. 13 to 22), along with Figures 4 to 12 (pp. 70 to 78) in Appendix I.

Without sufficient water to irrigate crops, most of Central Maui would change from green expanses of farmland to fire-prone dry-land grasses. However, since diversified crops require much less water than sugarcane, there is sufficient water to restore many of the streams in East Maui and to grow crops in Central Maui.

Regarding your comment about farming in East Maui, Appendix I and Section 4.7.4 of the Final EIS have been updated based on comments received on the Draft EIS regarding taro farming in East Maui as shown on pages 4-288 to 4-293. Specifically, the updated analysis for taro farms in East Maui (from the Honopou to Nāhiku portions of the License Area, including those farms using water from the non-petitioned streams not subject to the CWRM D&O, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing/historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro farms. This acreage is assumed for all lease alternatives since nearly all potential new taro cultivation is assumed to draw water from fully restored taro streams which will have the same flows under all alternatives.

The updated analysis for truck farms in East Maui from the Honopou to Nāhiku portions of the License Area, including those farms using water from the non-petitioned streams not subject to the CWRM D&O, are assumed to cover about 45 acres by 2030. Ten acres were added to the

truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This acreage is assumed for all alternatives since nearly all potential new cultivation is assumed to draw water from fully restored taro streams which will have the same flows for all alternatives.

Comment 50: *The EIS incorrectly concludes that no additional stream water would be needed in all of east Maui, based upon the limited information available from the CWRM contested case.*

That case did not address a dozen other streams. The many communities of the Huelo lease area have wide swarths of fertile lands and no public water supply, resulting in unmet water needs by both Native Hawaiian and non-Hawaiian farmers.

Response 50: As discussed in Response #49 above, the analysis presented in Appendix I as it relates to the East Maui kalo and truck farms included the non-petitioned streams not covered by the CWRM D&O, which includes the communities of the Huelo portion of the License Area. Specifically, as noted above in Response #10, the CWRM did not address or amend the existing IIFS for 12 streams which flow through land designated as agriculture in the communities of Huelo and Kailua. The CWRM, did, however, address and provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, restoration for taro farming. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Comment 51: Segmentation

A&B's 2015 10K statement acknowledges that the the four state lease areas supplied "approximately 58 percent of the irrigation water used by HC&S" and "A&B also holds rights to an irrigation system in West Maui, which provided approximately 15 percent of the irrigation water used by HC&S over the last ten years." This would indicate that 27 % of irrigation water came from A&B wells.

Response 51: Water from the West Maui irrigation system is beyond the scope of the EIS. That water does not contribute to the irrigation of the Central Maui agricultural fields (the approximately 30,000 acres). The EIS looks at the water diverted from East Maui streams through the EMI Aqueduct system. The EMI Aqueduct System does not comingle water with the West Maui irrigation system as they are completely separate systems. Moreover, the source of water for the West Maui irrigation system comes from privately owned lands and is not from State-owned lands. Hence, the West Maui water is not be included in this analysis.

Draft EIS Section 2.1.4 (Central Maui Field System) explains:

In addition to the surface water imported from the EMI Aqueduct System to the Central Maui field irrigation system, the irrigation infrastructure includes fifteen brackish water wells that can supplement surface water to approximately 17,200 acres of the plantation at the lower elevations (CWRM D&O, FOF 738). These brackish wells extract groundwater from the subsurface aquifers lying beneath the agricultural lands, and which are cyclically dependent on recharge derived from the irrigation of the overlying lands by water from the EMI Aqueduct System. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water. Groundwater, however, can be delivered to 7,000 acres at higher elevations via a shared pipeline that served as a penstock line for a hydroelectric unit (CWRM D&O, FOF 739).

Draft EIS Figure 2-5 (Central Maui Infrastructure Map) identifies the wells in the Central Maui agricultural fields. However, please note that Section 2.1.4 has been revised in the Final EIS to more accurately describe the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono, and clarifies that only 10 of the 15 wells are on Mahi Pono lands and thus available for use by Mahi Pono, as shown page 2-25 of the Final EIS.

The reference to 15 brackish wells was derived from the CWRM D&O, FOF 738, as that was the number of brackish wells that A&B utilized during its sugar cane operations. However, one of the 15 wells referred to, State Well No. 5128-002, does not serve the Central Maui agricultural fields and four of the other brackish wells are on lands that are not owned by Mahi Pono. As such, Mahi Pono has access to only 10 such wells. Draft EIS Figure 2-5 (Figure 2-7 in Final EIS) has been revised, as shown on page 2-25 of the Final EIS, to more accurately depict the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono to support its farm plan for the Central Maui agricultural fields.

Comment 52: *The EIS needs to include a list and map of the A&B/Mahi Pono wells available to help irrigate the Mahi Pono fields and the latest chloride tests and pumping abilities of those wells.*

Response 52: Please see Response #51 and page 2-24 of the Final EIS referred to therein regarding a figure depicting the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono to support its farm plan for the Central Maui agricultural fields.

In response to your request for chloride numbers for the Mahi Pono wells, please see the table below, which has been added to Section 4.2.2 of the Final EIS as shown on page 4-75.

State Well No.	TMK Number	Installed Pump Capacity (MGD)	Typical Range of Chlorides (MG/L) from 2003 through 2014¹	CWRM Delineated Aquifer System
4825-001	(2) 3-8-004:001	20.448	225 to 350	Paia
5226-002	(2) 3-8-006:001	24.048	350 to 550	Kahului
5224-002	(2) 3-8-003:004	15.120	350 to 550	Paia
5323-001	(2) 3-8-001:006	20.016	No data	Paia
5424-001	(2) 3-8-001:007	5.760	400 to 700	Paia
5522-001	(2) 2-5-005:021	8.640	350 to 525	Paia
5422-001	(2) 2-5-005:054	10.080	350 to 525	Paia
5422-002	(2) 2-5-005:020	11.664	325 to 475	Paia
5321-001	(2) 2-5-005:019	30.240	400 to 1600	Paia
5520-001	(2) 2-7-004:032	10.080	900 to 1600	Haiku

Please note that the salinity levels fluctuate and therefore a range was provided.

Comment 53: *The EIS states that Mahi Pono’s farm plan will use less water than the HC&S sugar operations and provides elaborate tables in Appendix I. The Mahi Pono Farm Plan is one plan, which includes around 34,000 acres irrigated by both east Maui and west Maui stream waters. The EIS content rules do not allow for segmentation of separate parts of the same project. The 4,000 acres of fields irrigated by West Maui Water should be included in the overall analyses of how much water is needed from what source to have a viable Mahi Pono Farm Plan.*

Response 53: It is incorrect to say that the Mahi Pono farm plan is one plan that is irrigated by both East Maui water (through the EMI Aqueduct System) and West Maui stream water. The

¹ There is limited salinity data prior to 2003 and after December 2014, surface water for irrigation use rapidly declined as A&B ramped down operations prior to closing in 2016.

Central Maui agricultural fields owned by Mahi Pono and repeatedly identified in the Draft EIS are comprised of approximately 30,000 acres of land and can be irrigated by water from the EMI Aqueduct System. The Mahi Pono farm plan, which is described in numerous places in the Draft EIS, including Table 2-1 (Mahi Pono Farm Plan) provides a plan for diversified agriculture over approximately 30,000 acres in Central Maui. Draft EIS Table 2-1 also indicates what water is expected to come from surface water through the EMI Aqueduct System and what amounts are expected to come from groundwater. We respectfully disagree with your view that the EIS, which fully assesses the impacts of the proposed Water Lease, the water from which would be used for irrigation purposes in Central Maui, and domestic and irrigation purposes in Upcountry Maui, is taking a segmented approach to environmental review. The Proposed Action is not a part of a larger action and there is no improper segmentation. Segmentation occurs when an applicant proposes more than one "action" that triggers the environmental review requirements under HRS § 343-5. If only one action is proposed, there cannot be segmentation. Here, there is only one "action" triggering Chapter 343 review -- the proposed Water Lease. There is no "action" being proposed with respect to the 4,000 acres in West Maui. The 4,000 acres in West Maui are part of an entirely separate farming operation, and that farming operation is not irrigated by the EMI Aqueduct System and not dependent upon the Water Lease. Further, the 30,000 acres of former sugarcane fields that are being converted to diversified agriculture under Mahi Pono's farm plan will not receive any diverted stream water from West Maui, and the 4,000 acres in West Maui will not receive any diverted stream water from East Maui. Moreover, the source of water for the West Maui Irrigation System comes from privately owned lands and is not from State-owned lands. The West Maui fields are a stand-alone agricultural operation with clear independent utility and are outside of the scope of this EIS for the Water Lease.

Comment 54: *A new DEIS needs to clearly state the overall Mahi Pono Farm Plan and indicate what amounts and proportions of water for the farm plan will come from (a) the four licensed area in east Maui, (b) the area west of the licensed area that feeds the EMI ditch system streams, (c) West Maui streams and (d) Mahi Pono wells."*

Response 54: To address item (c), as explained in Responses #51 and #53, West Maui streams are irrelevant to the analysis in this EIS, as no West Maui stream water is associated with the proposed Water Lease or irrigation of the Central Maui agricultural fields and Mahi Pono's West Maui fields are located outside the service area of the EMI Aqueduct System and are therefore not served by any streams within the License Area.

Regarding your item (a), as noted in the CWRM D&O, the measurements EMI takes are at Honopou Stream and Māliko Gulch, however, for the purpose of measuring the aggregate flow from the entire License Area, the Honopou Stream measurement reading was used. As discussed in Draft EIS Section 2.1.2 (East Maui/License Area):

With the issuance of the Water Lease under the Proposed Action, the EMI Aqueduct System would divert only the maximum allowable amount under the CWRM D&O from streams within the License Area, which is estimated to be approximately 87.95 mgd.

Regarding your item (b), the projected amount of surface water from the limited area of private land west of the License Area is also addressed in the EIS, including in Section 2.1.2, as follows:

The EMI Aqueduct System is estimated to divert an additional 4.37 mgd from the point that it leaves the License Area at Honopou Stream and collects water from streams on privately owned land to its last diversion at Māliko Gulch. Thus, an estimated total of approximately 92.32 mgd would be conveyed to supply the MDWS for users in Upcountry Maui, Nāhiku, and the agricultural fields in Central Maui.

Hence a total of approximately 92.32 mgd of stream surface water is estimated to be available for diversion under the Proposed Action. Approximately 7.1 mgd will be taken from that amount to supply the MDWS.

Regarding your item (d), as discussed in Response #52 above, Mahi Pono owns 10 wells that can serve the Mahi Pono agricultural fields in Central Maui, all of which are located within the Pā‘ia, Kahului and Ha‘ikū aquifers. Collectively, those 10 wells have an installed pump capacity of approximately 156 mgd. However, the installed pumping capacity is not an indication of how much water can be reliably provided by these wells. Under the Proposed Action, Mahi Pono is assumed to be able to pump approximately 21.31 mgd of groundwater. While this number is less than what was pumped during sugar cane cultivation, under the Proposed Action, the recharge of the underlying aquifers in Central Maui that provide the source for these brackish wells will be less than it was during sugar cultivation, due to less surface water flowing to the Central Maui agricultural fields. Furthermore, while high salinity water could be used to irrigate sugar cane, it cannot be used for many other crops. Hence, the ability of these brackish wells to supplement Mahi Pono’s water needs is constrained.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.² Should you wish to request a copy of the Final EIS or portions thereof, please

² Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC’s website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

10238-04
Letter to Ms. Marti Townsend

RE: East Maui Water Lease Draft-EIS
Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomano, + Huelo License Areas

Aloha Mr. Earl Matsukawa & Mr. Ian Hirokawa,

My name is Simon Russell, Managing Member for Hui 'O Mālama 'Āina. Mahalo for receiving these questions and comments. As a resident of Upcountry Maui, and a career farmer, truly I look forward to a future of adequate food production across Hawaii that has the capacity to sustain our citizens, should that need ever arise. Additionally, It would be very good if sufficient revenues were generated from the sale of public trust waters, so that watershed ecosystems restoration and efficient management can occur in as soon a timeframe as is possible.

Mahalo to the applicant for this tremendous body of very detailed and descriptive work. It's 2700 page entirety is impressive and quite overwhelming. It would be very helpful if the applicant were to resubmit this application in order for our Maui community and its very time challenged county leadership to fully read and understand this DEIS. A supporting fact for that magnanimous gesture is that perhaps many of the questions people will ask regarding the applicant's submittal and the proposed action is that their questions will be answered if our community and it's leaders have the time needed to fully read this tome of a document. This could actually save the applicant time in the long run, as it will reduce the amount of time needed to respond to questions, and with holidays approaching, that should be a serious consideration.

While myself and a large portion of my agriculture ohana are holding our breaths hoping that Mahi Pono Holdings LLC and its many subsidiaries will do the right thing and make Maui agriculture it's main source of revenue, to me the signs coming out of our community are not encouraging. My perception of their staying power is that in many cases, the company is already wearing out its welcome on the first year. This company, and its partners EMI and A&B have repeatedly refused to appear in person at county council meetings regarding this very lengthy and significant Draft Environmental Impact Statement, as well as refusing to engage with the County Board of Water Supply, despite several cordial written requests in that respect.

I look forward to reading your responses to these questions I have carefully drafted and am presenting to you.

Throughout the line of questioning pursuant to the DEIS East Maui Water Lease, I am attaching the following 5 documents to my email in support of the line of questioning:

1. National Weather Service Drought Information Statement from October 2019.
2. DEIS Section 3.1.2 Aqueduct Ownership (Pages 87 – 88) regarding no alternative scenarios for ownership of the means of delivering water out of the East Maui license areas.
3. DEIS Section 3.3 No Action (Pages 89-90) regarding a "Perpetual water lease" Issued in 1938 by the Territory of Hawaii.
4. The Nature Conservancy Statement regarding the East Maui Irrigation Company supplied 60Bn Gallons/year of clean water to end users.
5. Credible source of water prices in California to compare and contrast Hawaii's \$5/MG to California's \$373 + Delivery/ Acre foot for agriculture water.

Here is a list of questions I kindly request complete answers to:

1. What happens if/when the farming activity associated with the attainment of this lease ceases for any length of time?
2. Will The applicant refile the DEIS to allow more time for review of this significant document and its ultimate consequences?
3. How many local farmers/farming entities has Mahi Pono contacted to see if their very large business will affect those smaller farming entities revenues or labor pools?
4. What economic impact does Mahi Pono foresee its agriculture operations having on the local famers growing identical or similar crops?
5. What impact will the "Community Farms" (that Mahi Pono is building and populating with farmers) that it will be delivering water to have on the existing Kula Agriculture park?
6. What impact will Mahi Pono's agriculture operations have on the availability of farmer laborers on Maui?
7. How many farm workers will come from Maui, and how many off island workers will our communities be expected to absorb?
8. Where will temporary laborers come from?
9. How many homes will be needed to house the Mahi Pono Work force in the next 5 years?

10. What happens with the water lease if/when the farming activity associated with the attainment of this lease ceases for over one year?
11. What happens with the water lease if/when the farming activity associated with the attainment of this lease ceases for more than 3 years?
12. Why should the state of Hawaii grant a 30-year lease when Maui has been experiencing prolonged D3(Extreme) drought levels(NWS Drought Document Attached), and prolonged D2(Severe) drought levels?
13. Are climate change models predicting adequate levels of rainfall to sustain the operations as described in this 2700-page EIS?
14. What is the applicant doing with regards to considering the planting and use of water conservation practices?
15. What is the average demand per acre for crop use during the term of this lease?
16. What amounts of water will EMI/A&B/Mahi Pono et. Al. allocate to riparian areas and domestic areas should the lease be in effect, and prolonged extreme drought does not supply enough water for the stated Mahi Pono farming operations:
 - a. What happens to the domestic users supply, how much will be available?
 - b. How much water will be available to the agriculture users that are dependent upon county waters?
17. With the value of commercial agriculture water in California being approximately \$1140 per Million Gallons, why should the state of Hawaii sell it at \$5/ Million?
18. In times of drought, what price should the state of Hawaii charge for its water? California Tripled its prices for water in the 2014-2015 drought season. Can Mahi Ponos business plans bear water price spikes due to drought conditions? If so, for how long?
19. Here is a California water price update (Attached):
<https://journalofwater.com/jow/improved-water-supplies-lead-to-drop-in-agricultural-water-prices/> 1 acre foot has 326,000 gallons of water .2018 California Central Valley water prices were \$373.16 / Acre foot which equals about \$1.14/ KGal. Interestingly, the California water user also pays an operations and maintenance fee of \$76.84/A.F. This comes out to 24 Cents/KGal in maintenance fees.
 In California the delivery cost of 1MGal is \$240 or \$373/Acre Foot . This means that at California rates plus delivery, 1 MGal of agriculture water is costing \$1,380, which is 276 times the price set by Hawaii's BLNR. This takes this line of questioning to the 2700-page DEIS Document Section 3.1.2 (Attached): Aqueduct Ownership. **Please explain you position on other entities bidding on this lease, and paying the State of Hawaii a fair market price?**
20. Explain Section 3.3 (Attached) and the legal standing that A&B had under the 1938 lease in "Perpetuity" as relates to the fact that the territory is now non-existent? Does that contract still have any legal standing in the State of Hawaii under our Constitution and its Public Trust Doctrine? Please provide a copy of that 1938 perpetual East Maui water lease document for evidence of the agreement.
21. Please explain the way that water reaches the 36,000 "Upcountry "Users through the Kahakapao, and Pi'iholo reservoirs.
22. Please explain exactly why the Kahakapao reservoir was built, and what if any restrictions that there are for domestic water use.
23. Please explain why EMI is permitted to divert stream flow on its private property without a lease, license, or a permit, Vs. on State owned lands where it does need a permit or a lease to divert water into the delivery system.
24. Please explain if Upcountry Maui's demand for water could be met with source from Waikamoi, rather than pumping from Kamole Weir during drought time. The Nature Conservancy claims on their website that 60 Bn Gallons of clean water flows out of EMI's delivery systems Annually, which is 164,383,561 gallons/ day.

25. At California rates, the State of Hawaii could profit by \$82M / year if it took over the system. Why is this not a viable alternative to a foreign pension fund profiting from our public trust resources?
26. If A&B sold 50% of the EMI to Mahi Pono, what would it take for it to consider selling it's remaining 50% to a local water utility to ensure that Hawaii's water resources are well cared for.
27. Will EMI/A&B/Mahi Pono consider placing housing in the watershed areas so that consistent and regular maintenance of roads, ditches, controls and aqueducts can be most efficient?
28. Explain any plans to develop more water resources from East Maui's watersheds.
29. Please explain how the ditches will be maintained, especially with regards to the use of pesticides for weed control.
30. If pesticides used for controls leech, seep, or runoff into the Upcountry water system what will EMI do?
31. What exactly is the applicant doing to build trust in the community that relies on the water that it is asking to use?
32. What exactly is the applicant doing to communicate with local and county regulatory authorities regarding this DEIS and future developments around water use?
33. How does profiting a Canadian pension fund support the intent of Article XI Section 7 since Canadians are not our citizens, and clearly water and its benefits should be conferred to Hawaii citizens, not a foreign corporation or pension fund.

In Conclusion I would like to share these comments with you:

1. Hawaii will be much better off controlling its own water, obeying the public trust doctrines specific commands and returning any profits to the watersheds that make this life giving water. He who controls the water controls the future.
2. Giving our waters and related revenues away to a foreign pension fund or other investor is not a sound financial plan for the state of Hawaii. Selling 90 MGD from East Maui at the current agriculture rate of \$1.10 would equal \$36 M/yr. If farmers on Oahu can make profits at higher (approximately double) rates than Maui's and California's rates are hundreds of times higher, it is not financially prudent for the State of Hawaii to give away such a precious and sacred resource almost for free (\$5/ MGal).
3. Lastly, it will take decades to transition from where we are now to whatever is the prevailing paradigm that our future becomes. Lets all look to the BLNR and the CWRM as a guidepost to realize the commands of the Constitution Article XI Section 7:
Section 7. The State has an obligation to protect, control and regulate the use of Hawaii's water resources for the benefit of its people.

It is incumbent upon you and your agencies and organizations to support the watersheds of Hawaii so that they may regain their capacity to supply abundant and life-giving Wai, but you all must realize that the watershed ecosystems need to be restored to make that possibility a reality.

Submitted with hope for our collective future and our sacred Wai resources,

Simon Russell

Drought Information Statement
National Weather Service Honolulu HI
959 AM HST Thu Oct 10 2019

...WET SEASON BEGINS WITH POCKETS OF EXTREME DROUGHT OVER PORTIONS OF MAUI AND THE BIG ISLAND...

SYNOPSIS...

Upper level disturbances combined with above normal low level moisture helped produce higher than average rainfall over many areas of the state. However, most of this rainfall missed the worst drought areas. These include localized areas of extreme drought, or the D3 category on the U.S. Drought Monitor map, over the northern and southern tips of the Big Island, and along the lower leeward slopes of Haleakala on Maui. Severe drought, or the D2 category, also existed along the lower Hamakua slopes on the Big Island, leeward Maui, the west half of Molokai, southwest Lanai, and all of Kahoolawe.

On Oahu, an increase in rainfall helped reduce the coverage of moderate drought, or the D1 category, along the lower leeward slopes of the island. At present, D1 conditions only remained over lower west Oahu from Ewa to Waianae.

SUMMARY OF IMPACTS...

Kauai
There are no drought areas in Kauai County.

Oahu
Satellite based vegetation health data indicated poor conditions from Ewa to Waianae. Conditions from Ewa to Hawaii Kai have improved over the past month.

Maui County
On Maui, pasture conditions remained very poor along most of the lower leeward slopes of Haleakala from Kihei to Kaupo. Serious brushfires continue to cause problems, most recently over the area from Maalaea to Ukumehame, which was under severe drought. Occasional afternoon heavy rainfall along a corridor from Ulupalakua to Makena helped improved conditions, but satellite based vegetation health data corroborated by some ground reports indicated that pasture conditions remained very poor from Kepuni to Kaupo, and from Wailea to Maalaea. On Molokai, satellite-based vegetation health data indicated poor conditions on the west half of the island. Vegetation conditions were also poor over southwest Lanai. While this area is normally dry, the satellite data, confirmed by visual inspection, showed that conditions appeared to be worse than normal.

Big Island.
Reports from ginger and sweet potato producers along the Hamakua Coast indicated that crop growth was being affected by the dry conditions. Insect damage has also increased. Ranchers operating in a localized area near South Point reported very poor pasture conditions despite much better conditions not too far away. These conditions were also detected by the satellite based data and corroborated by photos. In addition to these reports, the satellite-based data indicated that the worst vegetation conditions on the island were along the lower leeward slopes of the Kohala Mountains south of Hawi and near Upolu Airport.

DROUGHT MITIGATION ACTIONS

A Stage 1 Water Shortage declaration, issued by the Maui County Department of Water Supply, remained in effect for Upcountry Maui. The declaration requests residents to voluntarily reduce water consumption by 10 percent.

Assistance programs from the U.S. Department of Agriculture's Farm Service Agency have been implemented for farmers and ranchers in Maui County and the Big Island due to the ongoing drought conditions.

LOCAL DROUGHT OUTLOOK

The Long-Lead Hawaiian Islands Outlook issued on September 19 by the NOAA Climate Prediction Center shows probabilities favoring above normal rainfall across the state through the remainder of 2019. Probabilities also favor above normal temperatures across the state through the rest of 2019 due to the forecast of persistent above average sea surface temperatures around the Hawaiian Islands. The next long-lead outlook will be issued by the Climate Prediction Center on September 19.

For the rest of 2019, drought conditions should ease with the onset of the Hawaiian Islands wet season along with the forecast for above normal rainfall. The wet season weather systems provide a higher likelihood of rainfall getting into the leeward areas which currently have drought.

NEXT ISSUANCE DATE...

The next Drought Information Statement will be issued on November 8, 2019 or sooner if necessary in response to significant changes in conditions.

\$\$

ditch systems, and the Central Maui field irrigation system has 48 major reservoirs¹. The combined storage capacity of these existing reservoirs is approximately 1,344 mg (Akinaka, 2019). Most of these reservoirs, however, have not been used since the closure of sugar in 2016 and others have not been used because they do not meet dam safety requirements. As a result, many will require extensive upgrades to put them back into service. These upgrades could cost between \$50 – 100 million (Akinaka, 2019). Obtaining permits to upgrade and repair these reservoirs will also be challenging due to current dam safety requirements. Assuming that the existing reservoirs can be restored to their full capacity of 1,344 mg, and the amount of flow available for irrigation under the Proposed Action is approximately 92.32 mgd, then the existing reservoirs could provide about 16 days of storage capacity.

The existing reservoirs are fed by the EMI Aqueduct System so they can be filled when the amount of water delivered exceeds the amount used. The EMI Aqueduct System, however, is not designed to capture and convey high-volume freshet flows which overwhelm and bypass the diversions. If such freshet flows (in excess of the IIFS standards under the CWRM D&O) could be captured, it could significantly increase storage capacity.

If an additional storage volume of 1,200 mg is assumed, an additional two weeks of flow could be provided at the rate of 82.36 mgd. Combined with the storage capacity of the restored and existing reservoirs, a total of about a month of storage would be available, which would provide a substantial supply to weather periods of low rainfall during the dry season. Moreover, since captured freshet flows would be used to replenish the restored and existing reservoirs between freshets, the period that stored water could be used could be extended even longer.

A single reservoir of this size (to hold 1,200 mg) could be located upstream of the Koolau Ditch within Hānawī Gulch. This area is preferable for the location of a reservoir to capture and store water because of its elevation and rainfall. The reservoir would be created by damming a ravine above the ditch so it can be fed by gravity flow and allow streamflow to continue in compliance with the CWRM D&O. Based on a rough estimate, a reservoir of this size would encompass about 30 acres with a 4,000 foot long dam structure standing approximately 150 tall at its highest point. (Akinaka, 2019). Construction of such a reservoir would be in the order of some \$300 million. (Akinaka, 2019). Dams are uniquely engineered structures that require knowledge and experience in dam safety, particularly how to safely handle water flows in and out of the structure through appurtenant features, as well as mitigating the hazards of water passing through the dam embankment itself (seepage). Dams sustain high hydrostatic water loads, which can result in failure of the embankment if they are not properly designed. (DLNR, The Hawai'i Dam and Reservoir Safety Program, FY 2017). It is very unlikely such a reservoir could be constructed as its environmental impacts would be considerable in terms of impacts to views and public safety concerns.

3.1.2 Aqueduct Ownership

During public scoping for the DEIS in 2016 and 2017, it was suggested that the EMI Aqueduct System should be brought under new ownership, without the further involvement of A&B and EMI, and potentially under public ownership. Ownership of the EMI Aqueduct System changed

¹ GIS data provided by the State Office of Planning does not include all 48 reservoirs within the Central Maui agricultural fields.

in January 2019 to include Mahi Pono, which intends to pursue diversified agriculture in Central Maui. Consideration of another change in ownership is too speculative at this point to warrant analysis. A change in the ownership of the EMI Aqueduct System will not enhance environmental quality or avoid, reduce, or minimize all or even some adverse environmental effects, costs, or risks of the Proposed Action. As discussed elsewhere in this DEIS, EMI has been operating the EMI Aqueduct System since the start of construction in the 1870s. Few have the knowledge to operate and maintain this unique and complex system, consisting of approximately 388 separate intakes, 24 miles of ditches, and 50 miles of tunnels, as well as numerous small dams, intakes, pipes, 13 inverted siphons and flumes. Furthermore, the EMI Aqueduct System is not for sale, and forced acquisition of the system is projected to be prohibitively expensive, resulting in substantial costs to the public. For these reasons, this alternative is viewed as a highly speculative and unreasonable alternative, and one that would not meet the objectives of the Proposed Action. Therefore, it was dismissed from further review.

3.2 Alternative Analysis

3.2.1 Reduced Water Volume Alternative

The BLNR cannot authorize a lease that allows the use of more water than can be diverted under the CWRM D&O. However, the BLNR could elect to issue a water lease that authorizes the use of a lesser amount of water. Projections of the amount of government water available from the License Area at Honopou stream after taking into account the CWRM D&O, is approximately 87.95 mgd. This amount would be subject to further reduction in accordance with the DHHL reservation once called upon for use by the DHHL. The CWRM estimated that the amount of water potentially available after implementation of the CWRM D&O might be enough for about 90% of the irrigation needs for the approximately 23,000 IAL lands in Central Maui (although it is not clear if the CWRM D&O took into account the future DHHL reservation). However, there are approximately 30,000 agricultural acres in Central Maui (largely, but not exclusively, IAL lands), and Mahi Pono has expressed an intention to farm as much of that land as possible.

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. Under the Reduced Water Volume alternative, depending on the amount of water authorized under the Water Lease, the MDWS may receive no water from the Wailoa Ditch or some amount up to 7.1 mgd. The greater the reduction in the amount authorized under the Water Lease, proportionally less water will be available to the MDWS.

3.2.2 Water Lease With Different Terms

3.2.2.1 Alternative Lease Duration

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have

viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

3.2.2.2 Modified Lease Area

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

3.3 No Action

Under a 1938 agreement between the Territory of Hawai'i and A&B, A&B was given a perpetual right and easement to convey water through those portions of the EMI Aqueduct System located within State lands, and to divert the water so conveyed through the EMI Aqueduct System, and A&B granted the Territory a similar perpetual right and easement. This agreement is in place irrespective of the issuance of any Water Lease. The No Action alternative would result in no Water Lease being issued from the State. However, under the 1938 agreement and a related calculation involving isohyet analysis of rainfall patterns, it is understood that approximately 30% of the water in the License Area streams is derived from the privately owned lands. Therefore, the EMI Aqueduct System could continue to divert approximately 30% of the water available from the Collection Area, plus the 4.37 mgd from that portion of the Collection Area that is derived from privately owned lands outside of the License Area between Honopou stream and Māliko Gulch. Under the No Action alternative, it is assumed that an estimated total of 26.39 mgd is available to be diverted from that portion of the Collection Area east of Honopou stream, and approximately 4.37 mgd of surface water would be available from privately owned lands (i.e. not within the License Area) between Honopou stream and Māliko Gulch. Thus, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System under the No Action alternative would be approximately 30.76 mgd (Akinaka, 2019). This reduction in water would significantly limit Mahi Pono's ability to develop robust diversified agriculture in Central Maui, and would have associated detrimental impacts on food production and economic benefits that would be achieved under the Proposed Action.

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. As a consequence, domestic and agricultural water needs in Upcountry Maui would need to be met by alternative water sources that would need to be

developed by the MDWS. At this point in time, it is unknown whether sufficient groundwater resources exist in Upcountry Maui to meet these water demands. It is anticipated that the development of alternative water-source infrastructure would be prohibitively expensive, and depending upon the specific sources, or combination of sources, could result in significant direct adverse impacts to the environment.

3.4 Comparative Evaluation of Reasonable Alternatives

Alternatives are to be evaluated based upon the extent to which they are able to satisfy the objectives of the Proposed Action. An EIS must include a comparative evaluation of the environmental benefits, costs, and risks of the Proposed Action and each reasonable alternative. The objectives of the action are to:

- Preserve and maintain the EMI Aqueduct System, including its access roads
- Continue to meet domestic and agricultural water demands in Upcountry Maui
- Continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses)
- Continue to serve community water demands in Nāhiku

A comparative evaluation of impacts to relevant environmental characteristics and the various alternatives is provided in the following section (the impacts analysis for the Proposed Action is provided in Chapter 4).

3.4.1 Topography

Neither the Proposed Action nor any of the alternatives are expected to have any significant effect on topography within the License Area because no topographic changes to the License Area are proposed under the Proposed Action or the alternatives. Some construction related to the preparation of the Central Maui agricultural fields for the Mahi Pono farm plan and related agricultural facilities is anticipated under the Proposed Action, and would likely take place under the Modified Lease Area alternative as well. The extent of Mahi Pono's implementation of its farm plan and related facilities under either the Reduced Water Volume alternative or the Alternative Lease Duration alternative would depend upon the degree of certainty required to warrant such investment.

3.4.2 Soils

East Maui

Neither the Proposed Action nor any of the alternatives are expected to have any significant effect on soils within East Maui because no changes are proposed under the Proposed Action or the alternatives. However, under the Modified Lease Area alternative, there may be some adverse impact to soils within the License Area through greater public access to and use of the License Area.

SHARE

the blue ‘opelu, a native lobelia.

TNC protects the native species that live in Waikamoi by managing the invasive weeds and animals threatening their survival. Our scarce funding goes towards on-the-ground land management, which is at the heart of what we do.

WHY TNC SELECTED THIS SITE

The East Maui watershed spans more than 100,000 acres across the windward slopes of Haleakala, the 10,000-foot dormant volcano that dominates the east side of Maui. This vast koa-`ohi`a forest is the last stronghold for 63 species of rare plants and 13 species of birds, seven of them endangered. The Conservancy established a preserve at Waikamoi, in the heart of the watershed, to provide a sanctuary for these birds and for hundreds of other native Hawaiian species.

WHAT TNC HAS DONE/IS DOING

Waikamoi Preserve became a reality in 1983 when the Haleakala Ranch Company granted a conservation easement to TNC over 5,230 acres. The preserve was expanded in 2014 when landowner Alexander & Baldwin conveyed a conservation easement over an additional 3,721 adjacent acres, bringing the total to 8,951 acres and making Waikamoi the largest private nature preserve in the state. The preserve protects part of the 100,000-acre East Maui Watershed, which provides 60 billion gallons of clean water annually to Maui's residents, businesses and agricultural community. TNC, Haleakala Ranch and Alexander & Baldwin continue to work together (as part of the East Maui Watershed Partnership) to protect some of the best remaining forest in all of Hawai'i.

Waikamoi Preserve is managed in partnership with the State Department of Land & Natural Resources through the Natural Area Partnership Program.

LIMITED ACCESS

Open for guided hikes, educational trips, and research opportunities.

Improved Water Supplies Lead to Drop in Agricultural Water Prices

September 16, 2019

Westlands Water District, in California's Central Valley, administers a supplemental water transfer program to make up the difference between its available water supplies and the needs of its growers

each year. The cost of water, along with a charge to cover the cost of operations and maintenance (“O&M”), is passed along to the growers who receive the water.

In 2018, supplemental water transfers totaled 102,870 AF—with 20,321 AF provided under the Yuba Accord, and the remainder was Central Valley Project (“CVP”) water. The growers paid an average of \$373.16/AF for the water and \$76.84/AF in O&M charges to Westlands and San Luis & Delta Mendota Water Authority.

Water supplies have improved significantly since the drought emergency ended. In 2018, South-of-the-Delta agricultural water users received CVP allocations of 50%, and water prices are about 1/3 of what they were during the peak of the drought. There were no leases in 2017, when allocations were 100%.

Prices ran up to approximately \$1,100/AF in 2014 and 2015, when CVP allocations for agricultural water users were 0%. In 2016, when allocations were at 5%, prices for supplemental leases were \$641.30/AF. In 2013, the final CVP allocation for South-of-the-Delta agricultural users was 20%, and prices averaged \$360/AF. The historical average price for the period from 2000-2012 (prior to the California drought) was \$198/AF.

Mr. Simon Russell
Hui 'O Mālama 'Āina
simon@homallc.org

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'ānae, Honomanū and Huelo License Areas

Dear Mr. Simon Russell:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'ānae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *As a resident of Upcountry Maui, and a career farmer, truly I look forward to a future of adequate food production across Hawaii that has the capacity to sustain our citizens, should that need ever arise. Additionally, it would be very good if sufficient revenues were generated from the sale of public trust waters, so that watershed ecosystems restoration and efficient management can occur in as soon a timeframe as is possible.*

Response 1: Your comments are acknowledged. As discussed in Section 2.1.4 of the EIS, the Mahi Pono farm plan will support food sustainability goals for the State. See also Section 5.2 of the EIS discussing how the Mahi Pono farm plan supports Governor Ige's Sustainability Initiative. Section 4.7.4 of the EIS further explains that at full operation, the Mahi Pono farm plan is anticipated to generate approximately 65% of total farm (crops and cattle) sales from within the State market and approximately 35% of total farm sales from exports. However, the Hawai'i market is too small to use all of the farm products expected to be produced on the Central Maui agricultural fields, and thus some export is necessary. Section 2.1.4 of the Final EIS has been revised to include additional information on Mahi Pono's farm plan, as shown in pages 2-28 and 2-32.

The rental payments due under the Water Lease will be distributed into the State Special Land Development Fund (as is done for payments due on all the other leases and revocable permits in the State). The Office of Hawaiian Affairs (OHA) receives 20% of the revenue generated from each lease while the Department of Hawaiian Home Lands (DHHL) receives 30% of the revenue generated, as discussed in Section 4.7.3 of the EIS. However, please note that the State of Hawai'i Department of Land and Natural Resources (DLNR) administers the Fund, i.e., decides how to use the revenue generated.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under Hawai'i Revised Statutes (HRS) § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses priority outcomes essential to maintain or restore biological integrity of the watershed. The goals of the watershed management are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the Final EIS.

Furthermore, as described in Section 2.1 of the EIS, A&B was a founding member of the East Maui Watershed Partnership (EMWP). Under the Proposed Action, it is anticipated that the Water Lease lessee will continue to pursue watershed management activities either through an existing watershed management plan or a newly developed watershed management plan or some combination of both. The existing EMWP Management Plan was prepared in July 2009 and amended in July 2018, attached to the EIS as Appendix O. The EMWP Management Plan describes the watershed resources such as water, cultural / physical resources, native flora and fauna, and recreational resources. The EMWP Management Plan identifies the watershed threats and management objectives for the East Maui Watershed.

Comment 2: *Mahalo to the applicant for this tremendous body of very detailed and descriptive work. Its 2700 page entirety is impressive and quite overwhelming. It would be very helpful if the applicant were to resubmit this application in order for our Maui community and its very time challenged county leadership to fully read and understand this DEIS. A supporting fact for that magnanimous gesture is that perhaps many of the questions people will ask regarding the applicant's submittal and the proposed action is that their questions will be answered if our*

community and its leaders have the time needed to fully read this tome of a document. This could actually save the applicant time in the long run, as it will reduce the amount of time needed to respond to questions, and with holidays approaching, that should be a serious consideration.

Response 2: Your comment is acknowledged. While the EIS is somewhat lengthy due to the numerous technical studies, please note that the comment period is set by statute, HRS § 343-5, and there is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comments were received during the statutory comment period.

Comment 3: *While myself and a large portion of my agriculture ohana are holding our breaths hoping that Mahi Pono Holdings LLC and its many subsidiaries will do the right thing and make Maui agriculture its main source of revenue, to me the signs coming out of our community are not encouraging. My perception of their staying power is that in many cases, the company is already wearing out its welcome in the first year. This company, and its partners EMI and A&B have repeatedly refused to appear in person at county council meetings regarding this very lengthy and significant Draft Environmental Impact Statement, as well as refusing to engage with the County Board of Water Supply, despite several cordial written requests in that respect.*

I look forward to reading your responses to these questions I have carefully drafted and am presenting to you.

Response 3: Thank you for your carefully drafted questions. Regarding your comment about Mahi Pono making agriculture its main source of revenue, Mahi Pono is an agricultural company and the main source of its revenue is and will be from agriculture and its agricultural activities as discussed in detail in Section 4.7.4 of the EIS. Specifically, Section 4.7.4 of the Draft EIS states:

At full development, the Mahi Pono farm plan would result in a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops. Annual sales are expected to reach about \$155.9 million. The pastures would support a cattle herd of about 7,300 cow-and-calf animal units (au), produce over 4,300 calves per year, and generate revenues of about \$4.8 million per year. Thus, total farm sales would be about \$160.7 million per year, of which an estimated \$104.4 million (65%) would be Hawai'i sales and \$56.2 million export sales (35%).

Based on recently built or approved solar farms, the solar farm would generate about 82,100 MW of electricity per year, with revenues of about \$8.2 million per year paid by MECO to the solar-farm operator. Combined farm and energy revenues would reach about \$168.9 million per year in direct sales (exceeding the 2006 revenues from sugar production of \$101 million, and the \$116 million average for the 2008-to-2013 period). Purchases of goods and services by farmers and the families of employees would generate indirect sales and, in turn, these suppliers would generate more indirect sales by their purchase of goods and services. The indirect sales are estimated at about \$160.7 million per year. Total direct-plus-indirect sales would be about \$329.5 million, of which about \$273.8 million would be on Maui and about \$56.2 million on O`ahu.

About \$24.9 million of consumption expenditures would be subject to the excise tax on final sales, and about \$248.2 million subject to the excise tax on intermediate sales. Rental income from leasing land to other farmers and to an energy company would be about \$1 million per year. Profits from farm operations, energy operations, and indirect sales would be about \$33 million.

Regarding meetings with the Maui County Council, A&B, after the close of its sugar operations and prior to the sale of its agricultural fields to Mahi Pono, appeared before the Council to discuss its diversified agricultural plans, at that time, for the former sugar lands. Mahi Pono has individually met with several members of the Maui County Council, but Mahi Pono has not been formally invited to provide testimony at a formal meeting of the County Council or any of its committees. Mahi Pono has also had various meetings with community groups such as Go Maui, Maui Tomorrow, Mā`alaea Community Association, Pukalani Community Association, and the Alliance of Maui Community Associations regarding the Mahi Pono farm plan and use of water from East Maui streams, and conducted farm tours with members of the community.

Mahi Pono is also working with the County of Maui Department of Water Supply (MDWS), as well as the County Corporation Counsel and Mayor's offices, to help coordinate continued deliveries of surface water to the County's Kamole-Weir Water Treatment Plant (WTP) and the Kula Agricultural Park (KAP).

Comment 4: *Throughout the line of questioning pursuant to the DEIS East Maui Water Lease, I am attaching the following 5 documents to my email in support of the line of questioning:*

- 1. National Weather Service Drought Information Statement from October 2019.*

2. *DEIS Section 3.1.2 Aqueduct Ownership (Pages 87 – 88) regarding no alternative scenarios for ownership of the means of delivering water out of the East Maui license areas.*

3. *DEIS Section 3.3 No Action (Pages 89-90) regarding a “Perpetual water lease” Issued in 1938 by the Territory of Hawaii.*

4. *The Nature Conservancy Statement regarding the East Maui Irrigation Company supplied 60Bn Gallons/year of clean water to end users.*

5. *Credible source of water prices in California to compare and contrast Hawaii’s \$5/MG to California’s \$373 + Delivery/ Acre foot for agriculture water.*

Response 4: Thank you for providing the resources mentioned in Comment #4 above as they helped provide context to your subsequent comments below.

Comment 5: *Here is a list of questions I kindly request complete answers to:*

What happens if/ when the farming activity associated with the attainment of this lease ceases for any length of time?

Response 5: Regarding your comment about what would happen if agricultural activities ceased for any length of time after the Water Lease is obtained, this is highly speculative to assess within the EIS, and is therefore not a reasonable alternative. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included throughout Chapter 4 of the EIS. However, it is expected that any Water Lease issued by the State will authorize the use of water for particular purposes. As such, it is assumed that if farming activity stopped for any period of time, there would likely be a corresponding decrease in the amount of water diverted from East Maui by the EMI Aqueduct System for the same period.

We note that Chapter 3 of the EIS and the underlying studies discuss alternatives to the Proposed Action, including the alternative of "No Action." The "No Action" scenario means one where no Water Lease is issued. Chapter 3 and the underlying studies assess the anticipated impacts in East Maui, Upcountry Maui, and Central Maui, under the no Water Lease scenario. The "No Action" scenario described in the EIS assumes that Mahi Pono would continue to farm the Central Maui agricultural fields to the extent feasible, whereas the scenario you posit entails a period of leasing of water and Central Maui farming, followed by an unidentified event that

causes Mahi Pono to stop farming. As noted above, it is expected that the Water Lease, if issued, will be issued conditioned upon specific uses of the water, and the lessee would have to comply with those requirements in order to divert the State's East Maui stream water under the Water Lease.

Relatedly, we note that impacts resulting from the diversion of a lesser amount of water than in the Proposed Action are discussed in Section 3.2.1 of the EIS and throughout Section 3.4, which provides a comparative evaluation of various alternatives, including the "No Action" alternative .

Comment 6: *Will the applicant refile the DEIS to allow more time for review of this significant document and its ultimate consequences?*

Response 6: As discussed in Response #2 above, there is no statutory mechanism that provides for time extensions of the comment period. Hence the comment period for the Draft EIS was not extended. All comments received on the Draft EIS have been responded to in the Final EIS, which will be made available for public review and BLNR decision-making on the acceptability of the Final EIS.

Comment 7: *How many local farmers/farming entities has Mahi Pono contacted to see if their very large business will affect those smaller farming entities revenues or labor pools?*

Response 7: While Mahi Pono does not keep records of the exact number of local farmers that have been contacted during its outreach efforts, it has contacted numerous farmers. These farmers include sweet potato farmers on islands of Maui and Moloka'i, onion farmers on Maui and O'ahu, papaya farmers on the island of Hawai'i, ranchers on Maui and the island of Hawai'i, and taro farmers on Maui.

These farmers have expressed tremendous comfort in the fact that Mahi Pono's stated goal – which was reiterated to these farmers during these outreach efforts – is to increase the food sustainability of the State of Hawai'i by reducing the State's reliance on imported food. Mahi Pono is not focused on competing with other local farmers, and is actively trying to avoid this scenario by supporting local farmers. One of the most significant benefits to the local farming community is the development of a Community Farm, which will provide local farmers with access to farmable land and water at a very reasonable cost. See e.g. Final EIS Section 4.7.4 describing Mahi Pono's planned lease rent to be \$150 per acre per year.

Please note that a factor in the Mahi Pono farm plan, as stated in the EIS, is to be sensitive to the existing local farming community. "Mahi Pono does not want to displace local farmers by planting competing crops or artificially accelerating the ramp-up of operations, both of which

could have the potential to drive local farmers out of the market." See EIS Section 2.1.4. We also note that focus group sessions held as part of the Social Impact Assessment (SIA) conducted for the EIS and provided as Appendix G to the EIS and summarized in Section 4.7.2 of the EIS, included considerations of impacts to local farming. As discussed in Section 4 of the SIA, seven focus groups were convened in November 2018. Participants in these sessions included residents, farmers and ranchers, and people who are active in environment and sustainability efforts. These participants lived in Ke‘anae, Wailuānui, Huelo, Ha‘ikū, Kula, Makawao and Pukalani. The participants of those focus groups are identified in Tables 7 through 13 of Appendix G. Table 8 of the SIA identifies the ranchers and farmers that participated in the focus groups, with additional farmers being identified in Table 10. The SIA, summarized in Section 4.7.2 of the EIS, obtained input from several community members, many of whom have direct and long-term experience with the streams in East Maui. In particular, Section 5.3.2.3 of the SIA entitled "Local Farmers and Ranchers" discusses the potential social impacts of the Proposed Action on local farmers and ranchers:

The effect of the proposed water lease on Maui-based farmers, rangers and flower growers will depend on whether they can participate in future diversified agriculture in Central Maui. Thus far, there has been discussion regarding setting aside land for local farmers and eventually creating support facilities and services intended to provide means to reduce costs for individual farms. Little or no mention has been made regarding including livestock farmers in Mahi Pono's farm plan.

For Upcountry Maui farmers in the current and 262-acre expansion of Kula Agricultural Park, the effect of the proposed action will depend on how much water they can receive if the water lease is granted. There is a current allocation for the Kula Agricultural Park and the 262-acre expansion.

For East Maui farmers, the proposed water lease would continue to divert water from streams not designated for full restoration, although some are mandated to have partial restoration to support the stream habitat. When active diversion resumes, it is expected that an overall decrease in stream flow will occur in East Maui when compared to current conditions, but there will be an overall increase in stream flow compared to when sugar was fully operational in Central Maui.

Table 8 of the SIA in the Final EIS summarizes the concerns identified by farmers and ranchers who participated in the focus groups.

Regarding your question about impacts on labor pools, the economic and fiscal impacts of the Proposed Action were also assessed in the Economic and Fiscal Impact Study report attached to the EIS as Appendix H and summarized in Section 4.7.3 of the EIS. The impacts of the Proposed Action on the agricultural economy are described in Section 4.7.4 of the EIS and Appendix I, the Agricultural and Related Economic Impacts report. This analysis is discussed in more detail below in response to your Comments #8, #9, and #10 below. It is anticipated that attracting farm workers overall should be easier than in the recent past because of the long-term adverse economic effects of COVID-19 on tourism and Maui's economy.

Comment 8: *What economic impact does Mahi Pono foresee its agriculture operations having on the local farmers growing identical or similar crops?*

Response 8: As noted in Response #7, the EIS explains that Mahi Pono's farm plan is sensitive to local farmers. Section 2.1.4 describes the Mahi Pono farm plan as follows:

Mahi Pono's farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation. All of these things must be considered when developing an evolving and feasible diversified agricultural plan for Central Maui.

Another factor in developing the farm plan is to be sensitive to the existing local farming community. Mahi Pono does not want to displace local farmers by planting competing crops or artificially accelerating the ramp-up of operations, both of which could have the potential to drive local farmers out of the market. Mahi Pono's goals for its diversified farm plan will be guided by its core principles of using reasonable and environmentally responsible "best management practices", planting non-GMO crops, and growing food for local consumption.

Agricultural and related economic impacts under the Proposed Action are discussed in Section 4.7.4 of the EIS. Specifically, Section 4.7.4 of the Draft EIS states:

The farm plan will evolve over time based on a number of factors, including the available supply of surface water, experience which will be gained on crops that grow well in Central Maui, crops that are profitable, the size of the market for profitable crops, etc. Nevertheless, current estimations are that 80% of the Central Maui fields will be used for orchards, which reflect a long-term commitment to agriculture. About 800 acres would be used for community farms

of 1, 5 and 10 acres. The solar farm is assumed to use approximately 250 acres. Mahi Pono plans on leasing approximately 2,050 acres to other farmers.

However, please note that the above has been updated in the Final EIS to explain that the 2,050 acres leased to other farmers will include 800 acres for Community Farms, 500 acres for energy crops and 750 for other crops, as shown in page 4-300 of the Final EIS. Moreover, as noted in the EIS and discussed in more detail in Appendix I (Agricultural and Related Economic Impacts report) the Mahi Pono farm plan proposes low rents for its Community Farm tenants:

Subject to the terms of the Water Lease, Mahi Pono plans to offer favorable lease terms for community farms, including anticipated rents of \$150 per acre per year. This rate is low compared to annual per-acre rents of about \$350 for large farm parcels on O‘ahu, over \$500 for most State farmland on O‘ahu, and over \$160 for most farmland in State Ag Parks on the Neighbor Islands. Other farm tenants will be charged market rents.

Comment 9: *What impact will the “Community Farms” (that Mahi Pono is building and populating with farmers) that it will be delivering water to have on the existing Kula Agriculture Park?*

Response 9: As discussed in Section 2.1.3.2 of the EIS, water demands at the KAP are served by the County using non-potable water from diversions of the same streams that serve the Kamole-Weir WTP through the Wailoa Ditch. Section 2.1.3.2 of the Draft EIS states:

As of late 2015, the Maui County Office of Economic Development calculated that the current use for the KAP is approximately 548,191 gpd of which 80-90 percent of delivered water is from surface water sources with the remaining portion from basal aquifer wells.

However, please note that the above has been supplemented in the Final EIS as shown on pages 2-20 to 2-21 to include a discussion regarding the 262-acre KAP expansion and the water allocation from the EMI Aqueduct System (which expansion and allocation was identified in the Draft EIS).

As discussed in Section 4.7.4 of the EIS, should the Water Lease be issued as proposed, it is anticipated that about 1,510 acres of farmland in Upcountry Maui would be irrigated with water from the EMI Aqueduct System, including the KAP and the KAP expansion area, and many small Upcountry farms. Existing Upcountry Maui farming is assumed to continue. Other than additional farming at the KAP expansion, no significant increase of commercial agriculture is expected to occur in Upcountry Maui, primarily because Central Maui, should the proposed Water Lease be issued offers an abundant supply of high-quality farmland, higher solar radiation, flatter terrain, a location closer to markets and shipping terminals, and potentially far better

access to water at a lower water rate. However, it is also anticipated that some residents of Upcountry Maui may engage in limited semi-commercial agriculture because they are attracted to the farming lifestyle, and farming would lower their property taxes. These semi-commercial farmers may sell some of their crops to help cover operating costs.

Comment 10: *What impact will Mahi Pono's agriculture operations have on the availability of farmer laborers on Maui?*

Response 10: At full operations of the Mahi Pono farm plan, currently estimated to occur around 2030, an estimated 790 farming and crop-processing jobs will be provided in Central Maui (direct jobs) (about 160 more jobs than provided by HC&S sugar operations in 2006). As explained in Section 4.7.4:

The increase in employment would be gradual, with most jobs filled by former sugarcane workers, skilled workers from Maui and other islands, recent graduates of agricultural-schools and colleges, and unskilled workers who would receive on-the-job training.

Approximately an additional 227 indirect jobs on Maui will be generated by the purchase of goods and services, for a total exceeding 1,000 new jobs on Maui. Hiring workers will be spread out over a number of years as fields are planted, orchards mature, processing facilities are built, etc. Assuming 10 years to reach full operations, direct employment on Maui will increase by an average of about 80 jobs per year, while total direct and indirect jobs will increase by an average of about 100 jobs per year. The latter figure is less than 8% of the 1,270 annual job increase projected for the years 2020 to 2030 by the State for the County of Maui (DBEDT, "Population and Economic Projections for the State of Hawai'i to 2045, June 2018).

first 18 months of existence Mahi Pono had hired over 200 workers, all of whom were living on Maui when hired. They were attracted by the type of work, wages and benefits.

Based on past hiring, nearly all future employees are expected to come from Maui. Also, at least in the near-term, attracting workers should be easier than in the recent past because of the long-term adverse economic effects of COVID-19 on tourism and Maui's economy. It may take years to rebuild the economy, and the Mahi Pono farm plan will contribute significantly to this rebuilding.

Comment 11: *How many farm workers will come from Maui, and how many off island workers will our communities be expected to absorb?*

Response 11: Please see Response #10. Since most, if not all, farm workers are expected to come from Maui, few off island workers are expected to be absorbed in Maui communities.

Comment 12: *Where will temporary laborers come from?*

Response 12: Mahi Pono does not plan to hire any temporary laborers. As described in Response #10 above, at full operations of the Mahi Pono farm plan, currently estimated to occur around 2030, an estimated 790 farming and crop-processing jobs will be provided in Central Maui (direct jobs) (about 160 more jobs than provided by HC&S sugar operations in 2006). Based on past hiring, nearly all future employees are expected to come from Maui. In its first 18 months of existence Mahi Pono had hired over 200 workers, all of whom were living on Maui when hired. They were attracted by the type of work, wages and benefits.

Comment 13: *How many homes will be needed to house the Mahi Pono Work force in the next 5 years?*

Response 13: As discussed more fully in Responses #10 - 12, since most, if not all, farm workers are expected to come from Maui, few homes will be required for workers new to the island. In any case, Mahi Pono will pay wages and provide benefits sufficient to attract and retain workers.

Comment 14: *What happens with the water lease if/when the farming activity associated with the attainment of this lease ceases for over one year?*

Response 14: The scenario you describe in your Comment #14 above is not within the scope of the EIS. The scope of the EIS is described in Response #5 above. Moreover, your Comment #14 is substantially the same as your Comment # 5, and we refer you to Response #5. It is expected that any Water Lease issued by the State will authorize the use of water for particular purposes, and the lessee would have to comply with those requirements in order to retain its rights under the Water Lease. As such, it is assumed that if farming activity stopped for any period of time, there would likely be a corresponding decrease in the amount of water diverted from East Maui by the EMI Aqueduct System for the same period.

Comment 15: *What happens with the water lease if/when the farming activity associated with the attainment of this lease ceases for more than 3 years?*

Response 15: Please see Responses #5 and #14 above.

Comment 16: *Why should the state of Hawaii grant a 30-year lease when Maui has been experiencing prolonged D3 (Extreme) drought levels (NWS Drought Document Attached), and prolonged D2 (Severe) drought levels?*

Response 16: The surface water that is being diverted under the Proposed Action will come from the License Area in East Maui, as well as from private lands owned by EMI. As discussed in Response #17 below, East Maui is expected to see an increase in rainfall in the future due to climate change. Moreover, as discussed in Section 4.3.1 of the EIS, East Maui is one of the wettest regions in the State receiving over 200 inches of rainfall per year. Specifically, Section 4.3.1 states:

The License Area is located along Maui's Ko'olau coastline. Mountains obstruct trade-wind air flow and create wetter climates on north and northeast facing mountain slopes. Persistent trade winds and orographic lifting of moist air result in recurrent clouds and frequent rainfall on windward slopes. When trade winds are present, the vertical development of clouds is restricted by the trade-wind inversion layer. The altitude of the inversion, however, varies over time and space and is affected by thermal circulation patterns, such as land and sea breezes. Most of Maui is usually immersed in the moist air layer below the inversion. On the windward slopes of Haleakalā, which includes the License Area, mean rainfall exceeds 200 inches per year. In the past, this region has experienced as much as 28 inches of rain in 24 hours. Monthly average rainfall is generally evenly distributed, and rainfall levels range from as much as 300 inches in the lands above Nāhiku, to a low of 75 inches found in regions above Ke'anae. On average, USGS data indicates rainfall ranges from 101-454 inches per year, making this region one of the wettest places in the State of Hawai'i.

Section 4.3.1 of the Final EIS has been expanded to include information from the archeological literature review and field inspection (LRFI) report (Appendix E), the Cultural Impact Assessment (CIA) report (Appendix F), and the Terrestrial Flora and Fauna Technical Report (Appendix C) prepared for this EIS as shown on pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

We note that the materials you provide identify serious brushfires in certain areas of Maui. As noted in the EIS, both under current conditions and under the proposed Water Lease, water use does and will continue to include water used for reservoirs and fire protection.

Note that Section 1.1 of the EIS describes the purpose and need for the Proposed Action. In regards to drought, drought like conditions are anticipated to occur within Upcountry Maui as

well as Central Maui as discussed in Section 4.3.1 of the EIS. These regions are currently reliant on water transported from East Maui via the EMI Aqueduct System and are expected to continue to be reliant in the future, and water delivery is expected to continue should the Water Lease be issued as proposed. Moreover, the water delivered to the MDWS through Wailoa Ditch is an important back-up source for the Lower Kula and Upper Kula Systems during dry periods as the Wailoa Ditch is the more reliable of the three Upcountry surface water sources. Water is pumped uphill from the Kamole-Weir WTP to the Upper and Lower Kula systems during dry periods. Therefore, these systems also depend on the EMI Aqueduct System in crucial, drought times. Please note that Section 2.1.3.1 of the Final EIS has been supplemented to include this information as shown on pages 2-19 to 2-20. Hence, under the Proposed Action, the Water Lease would enable the EMI Aqueduct System to continue to convey water to Upcountry Maui as well as to the agricultural fields in Central Maui to implement Mahi Pono's farm plan.

Furthermore, it is also understood that notwithstanding any changes to stream flows due to climate change, the use of the water under the Water Lease will have to adhere to the Interim Instream Flow Standards (IIFS) set forth in the Commission on Water Resources Management Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O).

Comment 17: *Are climate change models predicting adequate levels of rainfall to sustain the operations as described in this 2700-page EIS?*

Response 17: Regarding your comment about the climate change models, the EIS includes the most recent information regarding climate change within its analysis. As discussed in Section 4.3.1 of the Draft EIS:

Regular trade winds are key in driving the Hawai'i's hydrological cycle, generating rainfall which helps maintain Maui's water supply. However, a recent study showed that Hawai'i's trade winds have decreased in frequency by approximately 30% over the past 37 years, from 291 days per year in 1973, to 210 days per year in 2009 (Garza et. al, 2012). The decrease in the trade winds could have serious implications for the Hawaiian Islands, including adversely impacting local agriculture, native ecosystems and endangered species, and the State's limited freshwater supply.

Overall, the State of Hawai'i is experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude,

and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014)...

Climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. Such rainfall patterns increase the amount of stormwater runoff flowing through the region, including through the streams within the License Area that reach the shoreline. The expected climatic changes in precipitation patterns and streamflow will influence the quantities and concentration of stormwater runoff entering the nearshore environments and coastal waters, resulting in increased sedimentation, impacting coral reefs. However, because of the continuous wave energy in shore areas in East Maui, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species. (SE & MRC, 2019).

Moreover, a 2019 USGS publication titled “*Estimated Groundwater Recharge from a Water-Budget Model Incorporating Selected Climate Projections, Island of Maui, Hawai‘i*” discussed in Section 4.2.2 and Section 4.3.1 of the Final EIS identifies certain aquifer sectors and aquifer systems that will experience either increases or decreases due to climate projections. In the scenarios presented in the USGS report, the aquifer systems in the Ko‘olau Aquifer Sector are projected to see some of the largest increases in recharge, whereas aquifer systems in the Central Aquifer Sector are projected to see decreases in recharge due to changes in rainfall patterns from future climate change trends. However, please note that under the Proposed Action, surface water is diverted from the East Maui License Area (which lies largely over the Ke‘anae, Waikamoi and Honopou aquifers in the Ko‘olau Aquifer Sector (See EIS Figure 4-17)), to the Central Maui agricultural fields, which largely lie over the Pā‘ia Aquifer in the Central Aquifer Sector (See EIS Figure 4-18).

As detailed in Section 4.2.2 of the EIS, the groundwater pumpage within the Ko‘olau Aquifer Sector is far below the Sustainable Yield (SY). This section of the EIS also addresses the anticipated impacts to the Central Aquifer Sector from the conveyance of East Maui surface water to Central Maui for irrigation purposes. Section 4.2.2 of the EIS has been updated to reflect the USGS report, as shown on page 4-71 for East Maui and page 4-76 for Central Maui.

Regarding the "operations" mentioned in your comment, we assume you are referring to the Mahi Pono farm plan operations. Therefore, in addition to the information above, we note that

Mahi Pono has several water conservation strategies planned, as more fully discussed in Response # 18 below.

Comment 18: *What is the applicant doing with regards to considering the planting and use of water conservation practices?*

Response 18: Your Comment #18 is unclear. We assume your comment is directed toward Mahi Pono's diversified agricultural activities in the Central Maui agricultural fields, as that is the only location identified for planting.

Regarding water conservation practices, Mahi Pono expects to invest over \$20 million to increase the efficiency of its Central Maui Field Irrigation System (i.e. the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to Section 2.1.4 of the Final EIS as shown on page 2-25.

Mahi Pono has also implemented several water saving strategies for the Central Maui agricultural fields and continues to evaluate additional methods. Mahi Pono's water saving strategies include the following:

- Planting windbreaks in the fields.
- Incorporating significant uses of weed mat along plant lines, which will reduce evapotranspiration and erosion.
- Mowing rather than plowing inter-rows to preserve organic matter and keep cover to prevent soil erosion.
- Operating within the terms of a Conservation Plan from the U.S. Department of Agriculture - Natural Resources Conservation Service (NRCS), which includes swales and diversions for erosion protection,
- Practicing rotational grazing of livestock,
- Planting permanent tree crops that will develop canopies that will assist with soil moisture retention and reduce evapotranspiration.

Mahi Pono plans to plant various crops as discussed in Section 2.1.4 of the EIS. Planting takes into account areas that can be irrigated with the East Maui surface water as well as areas that can be irrigated with brackish water from Mahi Pono's groundwater wells. As explained in EIS

Section 4.7.4, most of the water for irrigating crops must come from surface water. Upper fields can be irrigated only with surface water. Lower fields can be irrigated with a mix of surface water and brackish groundwater. Because of salinity, the use of brackish water on the lower fields is limited to about 30% of the water applied. Combining the upper and lower fields, the overall water split across all 30,000 acres would be approximately 80% surface water and 20% brackish groundwater water.

The total surface water available for use after system losses within the Central Maui Field Irrigation System is estimated to be approximately 65.88 million gallons a day (mgd). Surface water can be supplemented by a brackish groundwater amount equal to 20 percent of surface water. Taking into account the CWRM D&O's impact on the amount of surface water, it is estimated that there could be up to 16.47 mgd of brackish groundwater used after system losses in the Central Maui agricultural fields. As such, Table 2-1 of the Draft EIS, updated as Table 2-2 of the Final EIS, provides the estimated water usage (both surface and groundwater) at full operations for the various farming activities planned. See pages 2-28 to 2-29 of the Final EIS.

Comment 19: *What is the average demand per acre for crop use during the term of this lease?*

The average demand of water in gallons per acre per day for each type of crop is discussed in Table 2-1 of the Draft EIS, which is now Table 2-2 of the Final EIS, entitled "Mahi Pono Farm Plan" as discussed in Response #18 above and shown on page 2-29 (the table has been slightly revised to address rounding errors).

Comment 20: *What amounts of water will EMI/A&B/Mahi Pono Et. Al. allocate to riparian areas and domestic areas should the lease be in effect, and prolonged extreme drought does not supply enough water for the stated Mahi Pono farming operations:*

- a. What happens to the domestic users supply, how much will be available?*
- b. How much water will be available to the agriculture users that are dependent upon county waters?*

Response 20: Use of the East Maui stream water will be subject to compliance with the CWRM D&O. Specifically discussed in Section 1.3.4 of the Draft EIS:

The June 20, 2018 CWRM D&O establishes a quantity of water that must remain in each stream at specified locations subject to the IIFS Petitions. The CWRM D&O does not specifically authorize or allocate amounts of water for offstream uses. The CWRM evaluated each of the streams under the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration potential for fish and other stream animals, recreational

opportunities, and scenic values. Then the streams were looked at in an integrative approach with consideration for the overall ecological ramifications of the decision. The CWRM also considered the economic ramifications of its decision on offstream uses, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture.

Theoretical models of un-diverted total and base flows were used in the majority of the streams to set the IIFS. The IIFS is a numeric flow rate, measured in cubic feet per second (cfs) that must remain in the stream at a certain location. The CWRM used a median base flow (BFQ₅₀) to make their decision, which is an amount of stream flow that can be expected to be found in the stream at least 50% of the time. Base flow is a smaller component of the stream's total flow. Total flow includes water input from normal rainfall and storm events. Depending on the location, the base flow standard can vary, therefore it is typically measured at a lower elevation downstream that is more accessible.

To set the IIFS, the CWRM grouped the streams into four broad categories with different objectives and management strategies: (i) conveyance of water to kalo growing areas for community use; (ii) water for streams with high biological value, (iii) water for streams that have barriers to biological or ecological improvements, and (iv) noninstream use of water for municipal and agricultural uses. (See Figure 1-3). The CWRM D&O significantly reduces the amount of water that can be diverted for offstream uses relative to the capacity and use of the EMI Aqueduct System when sugar was being cultivated. Ten streams were ordered to have no diversions at all (one of which, Waiokamilo, had stream flow fully restored in 2007) (referred to as "Fully Restored Streams" in Figure 1-3), 5 were required to return 64% of BFQ₅₀ in the stream at all times (referred to as "Habitat Streams" in Figure 1-3), and 7 were required to have 20% of BFQ₅₀ in the stream at all times (referred to as "Connectivity Streams" in Figure 1-3).

Hence the CWRM D&O restored streamflow for many of the riparian areas in East Maui, and under the Proposed Action compliance with the IIFS under the CWRM D&O is required. As noted in Response #16, it is also understood that notwithstanding any natural changes to stream flows, the use of water under Water Lease will have to adhere to the IIFS under the CWRM D&O.

Regarding your comment about effects on domestic users and agricultural users on the County system should there be a prolonged extreme drought, this is a hypothetical situation and hard to assess. It is unknown how much less water you are envisioning there will be. However, the

current agreement that provides the MDWS access to water from the EMI Aqueduct System and water at Nāhiku contains provisions for the parties to cooperate during times of drought, and for the MDWS to impose use restrictions on its customers. It is envisioned should a Water Lease be successfully secured as proposed in the EIS, that a new water delivery agreement with MDWS would be entered into and that these types of drought-sharing provisions and terms would be addressed. The continuation of surface water supplies to the Upcountry Maui Water System are contingent upon the issuance of the proposed Water Lease.

Comment 21: *With the value of commercial agriculture water in California being approximately \$1140 per Million Gallons, why should the state of Hawaii sell it at \$5/ Million?*

Response 21: The source of the California water rate number that you cite is unclear. However, our understanding is that water rates vary widely throughout California depending upon the source of the water, method of delivery (i.e., at the source vs. delivered to the farm), capital infrastructure, drought conditions, and other factors. There is no single rate for water in California. Moreover, conditions in California vary greatly from those in Maui, therefore it is difficult to make any meaningful comparisons between California rates and Maui water rates. In the case of the Proposed Action and the rate projected in the EIS, the water rate paid to the State is for raw water, available at the source. This figure does not take into account the added cost of operations and maintenance associated with the Water Lease lessee's use of the EMI Aqueduct System, but the EMI Aqueduct System is needed to collect and deliver the water to the end user(s) under the Proposed Action. The comparable scenario in California would be to make water available at the river or stream, and make it the farmers' responsibility to get the water from the river or stream to their farms.

Moreover, as discussed in Section 4.7.3.1.d of the Draft EIS, the rental amount due under the Water Lease will be based on an appraisal conducted prior to issuance of the Water Lease as required under HRS Chapter 171. Please note that Section 4.7.3.1.d of the Final EIS has been updated to take into account the most recent revocable permits approved by the DLNR in November 2020 as shown on pages 4-277 and 4-283.

Comment 22: *In times of drought, what price should the state of Hawaii charge for its water? California Tripled its prices for water in the 2014-2015 drought season. Can Mahi Ponos business plans bear water price spikes due to drought conditions? If so, for how long?*

Response 22: As discussed in Response #21 above, the rental amount due under the Water Lease will be based on an appraisal conducted prior to the issuance of the Water Lease, which is within the purview of the BLNR as required under HRS Chapter 171.

Comment 23: *Here is a California water price update (Attached):*

<https://journalofwater.com/jow/improved-water-supplies-lead-to-drop-in-agricultural-water-prices/> 1 acre foot has 326,000 gallons of water .2018 California Central Valley water prices were \$373.16 / Acre foot which equals about \$1.14/ KGal. Interestingly, the California water user also pays an operations and maintenance fee of \$76.84/A.F. This comes out to 24 Cents/KGal in maintenance fees.

*In California the delivery cost of 1MGal is \$240 or \$373/Acre Foot . This means that at California rates plus delivery, 1 MGal of agriculture water is costing \$1,380, which is 276 times the price set by Hawaii's BLNR. This takes this line of questioning to the 2700-page DEIS Document Section 3.1.2 (Attached): Aqueduct Ownership. **Please explain your position on other entities bidding on this lease, and paying the State of Hawaii a fair market price?***

Response 23: As discussed in Response #21 above, our understanding is that there are a variety of water rates changed in California. For example, our reviewed identified that the Central California Irrigation District charges \$13 per acre-foot to \$95 per acre-foot (\$0.04 per thousand gallons to \$0.292 per thousand gallons) for water delivered to farms, depending on the volume used and season (Central California Irrigation District, February 25, 2020). Higher rates are also charged when water supplies are low. In the case of the Proposed Action and the rate projected in the EIS, the water rate paid to the State was for raw water, available at the source. This figure does not take into account the added cost of operations and maintenance associated with the Water Lease lessee's use of the EMI Aqueduct System, but the EMI Aqueduct System is needed to collect and deliver the water to the end user(s) under the Proposed Action. The comparable scenario in California would be to make water available at the river or stream, and make it the farmers' responsibility to get the water from the river or stream to their farms.

As discussed in Section 4.7.3.1.d of the Draft EIS, the rental amount due under the Water Lease will be based on an appraisal conducted prior to issuance of the Water Lease.

In the interim, the amount that the State has charged EMI/A&B for water at the source (for 2021, approximately \$0.019 per thousand gallons) under the revocable permits appears comparable to the rates charged by the Central California Irrigation District.

Your reference to Section 3.1.2 of the Draft EIS, which discusses potential public ownership of the EMI Aqueduct System, is unclear. Nevertheless, we note that section has been updated in the Final EIS to address the report prepared by the County of Maui Board of Water Supply (BWS), which formed a Temporary Investigative Group (TIG) to explore options for ensuring

public access to water, including the feasibility of purchasing and maintaining the EMI Aqueduct System. The TIG prepared a TIG Report, that includes its own valuation of the EMI Aqueduct System, which was not based on an appraisal, and recommends that the County take immediate steps to secure ownership and control of the EMI Aqueduct System. The TIG Report was made public on October 16, 2019, after the publication of the Draft EIS. Hence, Section 3.1.2 has been updated accordingly in the Final EIS as shown on pages 3-19 to 3-20.

Regarding your question about the Applicant's position on other entities bidding for the proposed Water Lease, the EIS was prepared to support the application for the issuance of a long-term Water Lease for the purpose of developing, diverting, transporting and use of the State's East Maui waters through the EMI Aqueduct System for the purpose described in the EIS. The EIS also contemplates the environmental effects of variations on the Proposed Action, including scenarios where the amount of water permitted for the Water Lease is insufficient to supply Central Maui and Upcountry Maui. Thus, the EIS analyzes proposed uses of the water, but is not necessarily tied to a specific applicant (although Section 1.3.3 of the Draft EIS explains how A&B, on May 14, 2001, requested that the State offer at public auction a long-term water lease under HRS § 171-58 for the, "*right, privilege, and authority to enter and go upon*" the License Area for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System). Hence, any party who intends to use the water in a manner consistent with the EIS analysis could, presumably, use the EIS to support a bid on the Water Lease at public auction. As discussed elsewhere in this letter and in the EIS, an appraisal to determine the fair market value of the Water Lease will be conducted prior to issuance of the Water Lease. Our expectation is that the DLNR, on behalf of the BLNR, will commission, or approve the commissioning of, the appraisal.

Comment 24: *Explain Section 3.3 (Attached) and the legal standing that A&B had under the 1938 lease in "Perpetuity" as relates to the fact that the territory is now non-existent? Does that contract still have any legal standing in the State of Hawaii under our Constitution and its Public Trust Doctrine? Please provide a copy of that 1938 perpetual East Maui water lease document for evidence of the agreement.*

Response 24: The EMI Aqueduct System is owned and operated by the East Maui Irrigation Company, LLC. Please note that the 1938 Agreement between A&B / EMI (referred to as "the Company") and the Territory of Hawai'i, which has been added to the Final EIS as Appendix R, acknowledges EMI's ownership of the EMI Aqueduct System. Pursuant to the 1938 Agreement, the Territory of Hawai'i (now the State) granted perpetual easements to EMI for those portions of the EMI Aqueduct System located on State lands. See EIS Section 3.3, which has been updated in the Final EIS to further discuss rights the EMI Aqueduct System has to a limited

amount of water collection irrespective of any Water Lease. See pages 3-24 to 3-25 of the Final EIS.

As described in Section 2.1.2 of the Draft EIS, the EMI Aqueduct System spans both State-owned and EMI-owned lands and is an integrated system. Relative to the proposed Water Lease, the Collection Area for the EMI Aqueduct System covers approximately 50,000 acres, of which 33,000 acres are owned by the State and 17,000 acres are privately owned. See Draft EIS Figure 1-1 (EMI Aqueduct System Collection Area). The EMI Aqueduct System also collections water from purely private lands located to the west of the Collection Area, as noted in Figure 1-1. As mentioned above, under the 1938 Agreement, the State and EMI each granted to the other “perpetual” easements to those portions of the EMI Aqueduct System located on the other’s land. The duration of these “perpetual” easements was stipulated to last until the termination of the 1938 Agreement. The 1938 Agreement is still in place and valid. The State may, but is not obligated to, terminate the 1938 Agreement only if the licenses are offered at auction but EMI fails to bid. EMI may, but is not obligated to, terminate the 1938 Agreement if the State fails to offer the licenses at auction. Thus, if no license is offered at auction, the 1938 Agreement provides that EMI may still collect water derived from the EMI owned portions of the Collection Area and, utilizing the easement granted to it in the 1938 Agreement, transport it across the portions of the EMI Aqueduct System that transverse State lands.

The 1938 Agreement defines the “Territory” to include its “successors” (i.e., the State). EMI has not failed to bid at any auction of licenses, so the condition precedent for the State to have the right to terminate has not occurred. While the State has not yet offered the licenses at auction, EMI has not exercised its right to terminate and is instead a proponent of the Proposed Action which would lead to the licenses being offered at auction for the purpose of the continued integrated operation of the EMI Aqueduct System. Neither party has terminated the 1938 Agreement.

We note that CWRM, at p. iii of the Executive Summary of the CWRM D&O, characterized the EMI Aqueduct System as “a valuable asset that delivers offstream public trust benefits such as drinking water, as well as irrigation water for reasonable and beneficial uses.” CWRM further stated, at p. vi: “The Commission’s intent in this decision is to ensure that a sufficient amount of offstream water is available to support the cultivation of diversified agricultural crops on the lands designated as IAL [Important Agricultural Lands] in central Maui.” The continued existence of the 1938 Agreement, with its mutual grant of easements, is necessary in order for the uses of East Maui stream water envisioned by CWRM to be possible. As such, the continued recognition of the 1938 Agreement would appear to be consistent with the Public Trust Doctrine as it has been interpreted by CWRM. Please also refer to Response #38 below which discusses

the BLNR's responsibility with respect to any public trust obligations related to the Proposed Action.

Comment 25: *Please explain the way that water reaches the 36,000 “Upcountry” Users through the Kahakapao, and Pi’iholo reservoirs.*

Response 25: As discussed in Section 2.1.3.1 of the Draft EIS, the water delivered to the Olinda/Upper Kula WTP is stored in two reservoirs: the 30 mg Waikamoi reservoir and the 100 mg Kahakapao reservoir. The source of water for the Olinda Water WTP is the Upper Waikamoi (Kula) Flume surface water diversion system. However, please note that this region, where the Upper Waikamoi (Kula) Flume collects water, is not part of the License Area. The water supplied to the Upper Waikamoi (Kula) Flume is not from the License Area streams and is not supplied through the EMI Aqueduct System.

Regarding the Pi’iholo reservoir, the source of this water is from the Lower Waikamoi (Kula) Flume surface water diversion system, as discussed in Section 2.1.3.1 of the EIS. The Lower Waikamoi (Kula) Flume diverts water from various streams in the Ha’ikū Uka Watershed (Waikamoi, Puohokamoa, Ha’ipua’ena, and Honomanū), owned by EMI, into to the 50 g Pi’iholo reservoir, which then feeds the the Pi’iholo Water Treatment Facility (Pi’iholo WTF). The Pi’iholo WTP then supplies water to the Lower Kula System which serves the Lower Kula community. As with the Upper Waikamoi (Kula) Flume, the Lower Waikamoi (Kula) Flume is not part of the License Area and the water supplied to the Lower Waikamoi (Kula) Flume is not from the License Area streams and is not supplied through the EMI Aqueduct System. However, the MDWS’ access to water for the Upper Waikamoi (Kula) and Lower Waikamoi (Kula) Flumes is dependent are contingent upon the issuance of the Water Lease.

Regarding your comment about 36,000 Upcountry users, we assume you are referring to statements in the EIS that the Upcountry Maui Water System, which is comprised of three separate subsystems (the Upper Kula System, the Lower Kula System, and the Makawao System), is estimated to serve over 35,000 people, and the overall service area includes several businesses, churches, Kamehameha Schools, Hawaiian Homelands and government facilities. The Kamole-Weir WTP, which receives water through the EMI Aqueduct System, supplies water to the Makawao System. The Upcountry Maui Water System is described in Section 2.1.3.1 of the EIS. Please note, following publication of the Draft EIS, we received additional information from the MDWS which resulted in edits to Section 2.1.3.1 that provide clarification to the Upcountry Maui Water System as shown in pages 2-13 to 2-20 of the Final EIS. Also please note that Figure 2-4 has been added to Section 2.1.3.1 of the Final EIS to depict the three Upcountry Maui Water System’s subsystems service areas. See page 2-15 of the Final EIS.

Comment 26: *Please explain exactly why the Kahakapao reservoir was built, and what if any restrictions that there are for domestic water use.*

Response 26: Please note that this is outside the scope of the EIS. Please refer to Response #5 above regarding the scope of the EIS. However, it can be assumed that due to the low treatment capacity of the Olinda / Upper Kula WTP, the Kahakapao reservoir was built by MDWS to store water diverted during high flows to better service the communities of Upper Kula. We are unaware of any restrictions on domestic water use as that is within the purview of MDWS.

Comment 27: *Please explain why EMI is permitted to divert stream flow on its private property without a lease, license, or a permit, Vs. on State owned lands where it does need a permit or a lease to divert water into the delivery system.*

Response 27: As discussed in Response #24 above, the 1938 Agreement (copy appended to the EIS as Appendix R) clearly recognized that EMI did not need a license from the Territory (now the State as the Territory's successor) to divert and convey in the EMI Aqueduct System water derived from privately owned watershed lands. All such stream diversions are registered with the CWRM.

Comment 28: *Please explain if Upcountry Maui's demand for water could be met with source from Waikamoi, rather than pumping from Kamole Weir during drought time. The Nature Conservancy claims on their website that 60 Bn Gallons of clean water flows out of EMI's delivery systems annually, which is 164,383,561 gallons/ day.*

Response 28: History has proven that the Upper and Lower Waikamoi (Kula) Flume surface water diversion systems need to be supplemented with water delivered from the Kamole-Weir WTP, which is supplied with water from the EMI Aqueduct System during periods of drought. As discussed in Section 2.1.3.1 of the EIS, average daily use by the MDWS at Kamole-Weir WTP is 7.1 mgd out the 13 mgd total for all surface water sources in the Upcountry Maui Water System. Hence, the water supplied from the EMI Aqueduct System directly accounts for over half of the total surface water used in the Upcountry Maui Water System. This is addressed in more detail in Response #20 above.

Moreover, MDWS has a backlog of requests for new water meters in the Upcountry Maui Water System area due to the lack of adequate water availability as described Section 2.1.3.1 of the EIS. Hence, the water received from the EMI Aqueduct System is critical to continue a reliable and adequate source of water for MDWS to supply to Upcountry Maui.

Regarding your comment about claims made by the Nature Conservancy on their website, we would like to clarify that the Nature Conservancy website claims the 100,000-acre East Maui Watershed provides 60 billion gallons of clean water annually to Maui's residents, businesses, and agricultural community, not EMI's delivery systems. As stated in Section 1.3.1 of the Draft EIS:

The EMI Aqueduct System collects surface stream water from approximately 50,000 acres of land (Collection Area), of which approximately 33,000 acres are owned by the State of Hawai'i (which includes lands within Nāhiku, Ke'anae, Honomanū, and Huelo) (License Area), and the remaining approximately 17,000 acres which are privately owned (See Figure I-1).

The 100,000 acres of the East Maui Watershed spans well beyond the Collection Area of the EMI Aqueduct System.

Comment 29: *At California rates, the State of Hawaii could profit by \$82M / year if it took over the system. Why is this not a viable alternative to a foreign pension fund profiting from our public trust resources?*

Response 29: We are unclear as to how you calculated that the State of Hawai'i could profit by \$82M/year if it took over the EMI Aqueduct System. We acknowledge the materials enclosed with your comment letter include a write up explaining that "growers" in the California Central Valley paid an average of \$373.16 per acre foot for water and \$76.84 per acre foot in operation and maintenance charges. For context, we note that the cost of water at the source, such as under the proposed Water Lease, is much less than the cost of delivered water. However, we cannot comment further because we do not understand the basis for your assertion of \$82M/year.

Moreover, as discussed in Section 3.1.2 of the EIS, forced acquisition of the EMI Aqueduct System is projected to be prohibitively expensive, as the market value of the EMI Aqueduct System is expected to be significant. Costs incurred for condemning the EMI Aqueduct System would result in substantial costs to the public. Moreover, a change in the ownership of the EMI Aqueduct System will not enhance environmental quality or avoid, reduce, or minimize all or even some adverse environmental effects, costs, or risks of the Proposed Action. As previously noted in Response #23, Section 3.1.2 of the Final EIS has been updated to acknowledge the BWS TIG that was made available after the publication of the Draft EIS, as shown on pages 3-19 to 3-20 of the Final EIS. As discussed in both the Draft EIS and the Final EIS, this alternative continues to appear speculative and not consistent with the objectives of the Proposed Action.

In response to your comment about a “foreign pension fund” we note that under the Proposed Action, Mahi Pono will introduce new agricultural activity to the State of Hawai‘i, which will benefit the State by increasing food production, employment, payroll, profits for farm tenants and companies supplying goods and services, and tax revenues to the State and County of Maui. While profits from Mahi Pono’s farming activities, when they exist, will be distributed to its investors, most of the economic benefits will remain in Hawai‘i. Please note that farming activity typically requires significant upfront investment, with much later returns. In this case, that significant capital investment is being provided by Mahi Pono’s investors.

Comment 30: *If A&B sold 50% of the EMI to Mahi Pono, what would it take for it to consider selling its remaining 50% to a local water utility to ensure that Hawaii’s water resources are well cared for.*

Response 30: This is not within the scope of the EIS. Please refer to Response #5 above regarding the scope of the EIS. Moreover, any such sale is entirely speculative. The EIS does discuss an alternative ownership of the EMI Aqueduct System in Section 3.1.2, as discussed in Response #29 above and as shown on pages 3-19 to 3-20 of the Final EIS. Moreover, it is expected that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will take into consideration all appropriate information consistent with the Public Trust Doctrine. See pages 1-25 to 1-27 of the Final EIS, which provides a discussion regarding the Public Trust Doctrine as it relates to the Proposed Action, which has been added as Section 1.5 of the Final EIS.

Comment 31: *Will EMI/A&B/Mahi Pono consider placing housing in the watershed areas so that consistent and regular maintenance of roads, ditches, controls and aqueducts can be most efficient?*

Response 31: We assume that by "the watershed area" you are referring to the East Maui License Area. It would not be feasible to locate housing in the watershed areas for a number of reasons. First, building homes and providing access, electricity, potable water, waste disposal, etc. is not included as part of the Proposed Action, which is described in Response #5 above and Section 2.1 of the EIS. Second, the License Area is within the State Conservation District (See Draft EIS Figure 5-1). Obtaining necessary approvals from the State and County may prove difficult. As discussed in the Section 2.1.2 of the Final EIS as shown on page 2-7, under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System.

Comment 32: *Explain any plans to develop more water resources from East Maui's watersheds.*

Response 32: Your Comment #32 is unclear as we are unsure of where specifically you mean regarding "East Maui's watersheds." Moreover, we are unsure if you mean by the Applicant or by other entities. The Applicant currently has no plans to develop more water resources within the East Maui watershed, either within or outside of the License Area. Moreover, we are unaware of any other entities planning to develop more water resources within East Maui watersheds.

However, Section 3.1.1 of the EIS explores the potential for developing water resources to replace or supplement stream diversion water as an alternative, but that alternative was determined to be infeasible and also determined to have more potential for adverse environmental impacts than the Proposed Action.

Moreover, with regard to the MDWS, by letter dated July 24, 2020 and provided as Appendix P to the Final EIS, MDWS confirmed that it has "*no current plans or anticipated future expansion or improvement of the system within the EIS Areas at this time.*"

Comment 33: *Please explain how the ditches will be maintained, especially with regards to the use of pesticides for weed control.*

Response 33: As discussed in the Section 2.1.2 of the Final EIS as shown on page 2-7, under the Proposed Action, "maintenance and repair" involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System.

Moreover, EMI has established a number of standard operating procedures to address the clean-up of trash and debris within the License Area. Besides recognizing unnecessary debris in the field during routine maintenance tasks, EMI has conducted specific identification and removal operations of debris that has been observed from previous field work. EMI also has in place a practice of removing any equipment and excess materials it brings into the License Area to perform work on the EMI Aqueduct System as soon as the job(s) is completed.

Regarding your comment about pesticide use, as discussed in Section 4.12 pesticide use is regulated by both State and Federal law. The use of these chemicals is compliant with all laws

regulating pesticide use, and certified commercial applicators are utilized as required. Act 45 which was passed by the 2018 Hawai'i Legislature and effective on January 1, 2019 required that all Certified Applicators of Restricted Use Pesticides (RUP) submit a report of the RUP that were applied each year. This report as well as any other report required by law is publicly available from the respective government entity. The State of Hawai'i DOA's Pesticide Branch also provides regulatory oversight over EMI's pesticide use. In accordance with this oversight, records of pesticide use must be kept and made available to the Pesticide Branch upon request at any time. It is also noted that since January 2020 EMI committed to discontinuing use of Round-Up. This information has been included in the Final EIS as shown on pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations.

Comment 34: *If pesticides used for controls leech, seep, or runoff into the Upcountry water system what will EMI do?*

Response 34: As mentioned in Response #33 above, the use of pesticides will be within Federal and State regulations. Federal and State regulations require best management practices related to pesticide use which minimizes leeching into water resources.

Additionally, as noted in Response #33, EMI has committed to discontinuing its use of Round-Up. This commitment has been in effect since January 2020.

Comment 35: *What exactly is the applicant doing to build trust in the community that relies on the water that it is asking to use?*

Response 35: The Applicant has complied with the stated conditions of the revocable permits that have been granted by the BLNR, and that compliance involves transparency and working within the community. The conditions of the revocable permits include the submittal of quarterly reports that summarize the Applicant's water usage for that particular quarter, the distribution of that water on the Central Maui farm by field, and the additional information from the Applicant that includes (but is not limited to) the following:

1. That EMI is in compliance with the June 20, 2018 order of CWRM establishing the IIFS for East Maui.
2. That no water is wasted, and if the Board finds that a use of water is not reasonable and beneficial and does not comply with the permitted uses, such water uses shall be ceased within a timeframe determined by the DLNR.
3. A status update as to the degree to which the flow of each stream has been restored, and which structures have been removed as required by CWRM.

4. An update on meetings of an interim committee established by the BLNR to discuss water usage issues in the License Area. This committee consists of five members, representing A&B, Maui Farm Bureau, Office of Hawaiian Affairs, Native Hawaiian Legal Corp, and the County of Maui.
5. An estimate of water requirements for each crop per acre per day

With respect to item #4 above, these meetings are particularly focused on ensuring EMI's use of diverted water remains as transparent as possible by mandating the establishment of a committee made up of a diverse group of members to discuss collective water usage issues in the area.

Moreover, the SIA, as well as Section 4.7.2 of the EIS recommends that there be community outreach by the Applicant. However, terms of the Water Lease are at the discretion of the BLNR, and the Water Lease lessee will comply with all such terms.

Comment 36: *What exactly is the applicant doing to communicate with local and county regulatory authorities regarding this DEIS and future developments around water use?*

Response 36: The EIS has been prepared under the procedural provisions of HRS, Chapter 343, and HAR, Title 11, Chapter 200, which allows for public review and participation. Early consultation prior to the preparation of the EIS Preparation Notice (EISPN) started in 2016. Specifically, pursuant to HAR 11-200-9(b)(1) which requires the applicant, at the earliest practicable time, to seek the advice and input of the lead county agency responsible for implementing the county's general plan for each county in which the proposed action is to occur, the County of Maui Planning Department was consulted during every stage of the EIS process as noted in Chapter 9 of the EIS.

The State Office of Environmental Quality Control (OEQC) published the EISPN on February 8, 2017, and that publication initiated a 30-day public comment period. Following publication of the EISPN for the Proposed Action, two voluntary public scoping meetings were held to notify and initiate consultation with the community for the preparation of a Chapter 343, HRS, EIS. This process is discussed in Chapter 9 of the EIS. The purpose of this outreach process was to inform and obtain input from the community on relevant issues or concerns that should be considered in the preparation of the EIS documentation for the Proposed Action.

The Draft EIS was published on September 23, 2019 initiating a 45-day public comment period. A Draft EIS Notification was sent to numerous people and agencies, as shown in Table 9-2 of the Draft EIS, including the County of Maui's Department of Fire and Public Safety, Department of Environmental Management, Department of Housing and Human Concerns, Department of Parks and Recreation, Department of Planning, Department of Public Works, Department of

Transportation, Department of Water Supply, Office of Economic Development, Department of the Corporation Counsel, Maui County Council, and Police Department. The Draft EIS Notification informed interested parties of the Proposed Action and solicited relevant public comment on subjects of concern for EIS documentation. The list of agencies that have been consulted with as well as participated in this EIS process is within Table 9-1 and Table 9-2 of the Draft EIS. Table 9-3 has been added to the Final EIS, which shows the various agencies that provided comments on the Draft EIS, all of which have been responded to as shown in Appendix N of the Final EIS.

Comment 37: *How does profiting a Canadian pension fund support the intent of Article XI Section 7 since Canadians are not our citizens, and clearly water and its benefits should be conferred to Hawaii citizens, not a foreign corporation or pension fund.*

Response 37: Please note that Article XI Section 7 of the Hawai'i State Constitution is related to water resources. The text of Article XI Section 7 states:

The State has an obligation to protect, control and regulate the use of Hawaii's water resources for the benefit of its people.

The legislature shall provide for a water resources agency which, as provided by law, shall set overall water conservation, quality and use policies; define beneficial and reasonable uses; protect ground and surface water resources, watersheds and natural stream environments; establish criteria for water use priorities while assuring appurtenant rights and existing correlative and riparian uses and establish procedures for regulating all uses of Hawaii's water resources.

CWRM is the agency that was established to administer Article XI Section 7 of the Hawai'i State Constitution through the State Water Code, Chapter 174C, HRS for the purpose of protecting the State's water resources. As discussed in Section 1.3.4 of the EIS, in June 2018, the CWRM set IIFS for 24 streams in the License Area. This is discussed in more detail in Response #20 above. Moreover, the Proposed Action provides numerous beneficial and reasonable offstream uses which are aligned with Article XI Section 7, such as perpetuating diversified agriculture in Central Maui and supporting domestic and agricultural water uses in Upcountry and Central Maui. See EIS Section 2.1. We also note that Article XI Section 3 of the Hawai'i Constitution is relevant to considerations related to the proposed Water Lease. It provides:

The State shall conserve and protect agricultural lands, promote diversified agriculture, increase agricultural self-sufficiency and assure the availability of

agriculturally suitable lands. The legislature shall provide standards and criteria to accomplish the foregoing.

Lands identified by the State as important agricultural lands needed to fulfill the purposes above shall not be reclassified by the State or rezoned by its political subdivisions without meeting the standards and criteria established by the legislature and approved by a two-thirds vote of the body responsible for the reclassification or rezoning action.

Approximately 22,000 acres of the Central Maui agricultural fields to be farmed by Mahi Pono are designated as Important Agricultural Lands, and the continued supply of water to irrigation those lands was among the considerations undertaken by CWRM in setting the IIFS.

As discussed in Response #1 above, revenue generated from the Water Lease, as well as all other State leases and revocable permits, go to the State Special Land Development Fund, which benefits the State and Hawai'i citizens. Moreover, the economic and fiscal impacts of the Proposed Action are expected to have a beneficial impact for the State and Maui residents in the form of generating jobs, taxes paid to the state, the continuance of water delivery for domestic and agricultural uses to Upcountry and Central Maui, and increasing local food production, which impacts were assessed in the Economic and Fiscal Impact Study attached to the EIS as Appendix H and summarized in Section 4.7.3 of the EIS. The impacts of the Proposed Action on the agricultural economy are described in Section 4.7.4 of the EIS and Appendix I, the Agricultural and Related Economic Impacts assessment. This analysis is discussed in more detail above in response to your Comments #8 and #9.

Comment 38: In Conclusion I would like to share these comments with you: Hawaii will be much better off controlling its own water, obeying the public trust doctrines specific commands and returning any profits to the watersheds that make this life giving water. He who controls the water controls the future.

Response 38: Regarding your comment about Hawai'i being better off controlling its own water, please note that issuance, as well as the terms and conditions of, the Water Lease is within the purview of the State BLNR. Hence, the Applicant, if the Water Lease is issued, cannot take more water than what is allowed within the Water Lease, moreover the Applicant must comply with the CWRM D&O. The water is controlled by the State and its appropriate agencies.

Regarding water being a public trust, we acknowledge that the Proposed Action (the issuance of a 30-year Water Lease by BLNR), requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai'i constitutional and statutory

provisions that, together with relevant case law, comprise the Public Trust Doctrine. As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. As previously noted in Response #30, Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action. See pages 1-25 to 1-27 of the Final EIS.

Comment 39: *Giving our waters and related revenues away to a foreign pension fund or other investor is not a sound financial plan for the state of Hawaii. Selling 90 MGD from East Maui at the current agriculture rate of \$1.10 would equal \$36 M/yr. If farmers on Oahu can make profits at higher (approximately double) rates than Maui's and California's rates are hundreds of times higher, it is not financially prudent for the State of Hawaii to give away such a precious and sacred resource almost for free (\$5/MGal).*

Response 39: Please note that the as discussed in Response #1 above, the revenue generated from the Water Lease goes to the State which is distributed into the State Special Land Development Fund. Moreover, please note as discussed in Response #23 above, the amount that the State has charged EMI/A&B for water at the source (about \$0.019 per thousand gallons) is comparable to the rates charged by the Central California Irrigation District (Appendix H, Munekiyo Hiraga, "Economic and Fiscal Impact Study," June 2019, Table 4). For Recent Sugar (2006 to 2013), the delivery cost was \$0.048 per thousand gallons (Appendix I, "East Maui Water Lease: Agricultural and Related Economic Impacts", Plasch Econ Pacific LLC, June 2019, Table 1). Thus, the total cost for delivered water was \$0.067 per thousand gallons (\$0.019 + \$0.048). Assuming that the State will continue to charge \$0.019 for water, the cost of delivered water in 2030 will increase to \$0.08 to per thousand gallons, depending on how much water is diverted from East Maui to Central Maui which has been calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Additionally, and as discussed in Response #21, the State BLNR will not be giving away any water. The amount of lease rent payments due under the Water Lease has not yet been determined, but that amount will be established by the BLNR pursuant to an appraisal to determine the fair market value of the Water Lease.

Comment 40: *Lastly, it will take decades to transition from where we are now to whatever is the prevailing paradigm that our future becomes. Let's all look to the BLNR and the CWRM as a guidepost to realize the commands of the Constitution Article XI Section 7: **Section 7.** The State has an obligation to protect, control and regulate the use of Hawaii's water resources for the benefit of its people.*

Response 40: Your comments are acknowledged. As discussed in Response # 37 above, the Proposed Action is within the intent of Article XI Section 7 of the Hawai‘i State Constitution.

Comment 41: *It is incumbent upon you and your agencies and organizations to support the watersheds of Hawaii so that they may regain their capacity to supply abundant and life-giving Wai, but you all must realize that the watershed ecosystems need to be restored to make that possibility a reality.*

Response 41: Your comments are acknowledged. Please note, as discussed in Response #1 above, the Water Lease lessee will be subject to applicable requirements under HRS § 171-58 regarding watershed management plans. As discussed in EIS Section 2.1 (See pages 2-2 to 2-4 of the Final EIS), included in the content requirements for a watershed management are specific goals and objectives, as follows:

1. Goals
 - a. Identifies priority outcomes essential to maintain or restore biological integrity to the maximum extent practicable. Generally including, but not limited to:
 - i. Removal and control of non-native hooved animals (pigs, goats, deer, sheep, cattle) from important watershed forests.
 - ii. Removal or containment of damaging invasive plants and animals that threaten important watershed forests.
 - iii. Monitoring and controlling other forest threats including fires, predators, and plant diseases.
 - iv. Restoring and out-planting native species in important watershed areas and buffer zones.
 - v. Communication, outreach and community education to build capacity for citizen-based watershed protection.
2. Objectives
 - a. Description of specific management actions needed to achieve goals
 - b. Description of location targeting where the action will occur
 - c. Implementation schedules and timeframe
 - d. Identification of specific outcomes and performance metrics expected

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

10238-04
Letter to Mr. Simon Russell

Subject: EMI Questions to Address

Comments and questions,

How could you authorize a 30 year lease of a county water system when the applicant of a newly formed business has no history of water management, no corporate performance, no agriculture or livestock expertise demonstrated and no credit history?

How about a 5 year lease with requirements for extension conditional on demonstration and performance requirements to award an extension, perhaps an additional 5 years.

Why are there no allowances for water to promote local and regional farming for East Maui including Hana? Why does all the water go to central Maui?

Fisherman say that flowing streams provide nutrients for the attraction of local fish close to shore. This would make it more cost effective as there would don't be a need to go away from the shore to fish. Why is there not allocation of waters to promote stream flow to promote local fishing?

Thanks,

Allen Greenfield
Hana, HI

Subject: Comments on the Draft EIS from A & B, EMI

Dear Ian Hirokawa and the BLNR,

I submit my comments in response to the Draft Environmental impact Statement from EMI and A&B.

Now is the time for the County of Maui to step up and take their rightful responsibility for the people and NOT relinquish this precious water resource. The proposal of water rights to Mahi Pono is inconsistent with the cultural and public values of Maui and Hawaii Islands.

The request for lease of 30 years is extraordinarily and unjustifiably long length of time for any agreement. An agreement of this time frame would fail to anticipate known or unknown future factors which might affect this watershed's future including unforeseen natural occurrences, altercations, maintenance, and climatic change events.

In addition, any consideration of this exhaustive, lengthy draft, must first receive a thorough and complete review along with robust scrutiny from BLNR staff and Legal counsel supporting Maui Mayor and Council and Maui County. Given the length and breadth of this draft report, the current timeline is inappropriate for the County agencies, as well as the public, to give substantive comments. The County at a minimum must reevaluate the current timeline and allow more time to check and review this report as well as authorize additional rounds of staff and public review and input.

In my read of the first part of the report, I have the following comments and questions:

Have Mahi Pono estimates on page v, crops, yields, profits and potential jobs been verified?

The Mahi Pono farm plan page v, includes a utility scale renewable energy component that will further Hawaii's goals of having 100% renewable energy by 2045. This time period of 25 years is too far out for any useful benefit and should be by 2030.

Social Impact Assessment (SIA), Earthplan page x: "The SIA recommends that clearly defined interest groups, or stakeholder groups are established that include geographic communities, environmental, agriculture and business interests, and public agencies. Each group would be encouraged to reach consensus on their own needs, concerns, opportunities and possible solutions." This "feel good" section of a collaborative nature is not enforceable or supported by any regulatory guidance or codes and should not be included as submitted.

The Objective of Action in section 1-2, can be achieved through appropriate Maui County oversight and operation and **NO** lease is necessary.

Instream use, section 1-9, HRS 171C-71 (2) (D), numbers 8 and 9 have a long contentious history relating to what has been deemed appropriate for use of water for local irrigation and traditional/ceremonial, and these rights **MUST Not** be compromised in any way.

Section 2-1 states: "A substantial amount of private funds will be used to maintain and operate the EMI Aqueduct System." Using public funding for leased water; Definitely **NO**. Any lease agreement must charge appropriately to cover **ALL** expenses of the watershed and must not be a gift to a private corporate applicant paid for by the public.

Section 2.1.3.1 states: "The Upcountry Maui Water System serves a total population of approximately 35,251, and the County anticipates the population will grow to approximately 43,675 by 2030. As there is no "excess" supply of water for Upcountry Maui, the MDWS customers have been required to adhere to strict conservation measures during periods of drought." This is another reason the County should retain control of the entire system and ensure that upcountry Maui is guaranteed adequate supplies today and into the future. "Moreover, there is a long waiting list of Upcountry Maui residents seeking water meters, some of whom have been waiting for over a decade." This is inexcusable and another example of poor planning and management. Yet another reason to retain control and provide the necessary water resources. Conservation management by the County is imperative to provide for the future water needs of the public in an everchanging hydrologic environment.

Section 2.1.5 states: "An estimated 10 years will be required for Mahi Pono and lessees to remove volunteer sugarcane and weeds from the approximate 30,000 acres, amend soils, install field improvements, build warehouses and other structures, and plant crops." We have already experienced record numbers of fires this year and current regulations are ill prepared to safeguard the public and the stated estimate of 10 years is inappropriately long to ensure a safe environment in the drought years ahead.

Section 3.1.2 states: "January 2019 to include Mahi Pono, which intends to pursue diversified agriculture in Central Maui. This change in ownership has no track record and their performance remains untested at this point to warrant analysis." Yes, and Mahi Pono has demonstrated agricultural activities by bringing cattle in vacated grasslands, yet left thousands of acres of land abandoned with dry brush and sugar cane which has been a principal contributor to fire dangers on Maui. Contributing also to the increase of record heat in central Maui.

Section 3.3 states: "Under a 1938 agreement between the Territory of Hawai'i and A&B, A&B was given a perpetual right and easement to convey water through those portions of the EMI Aqueduct System located within State lands, and to divert the water so conveyed through the EMI Aqueduct System, and A&B granted the Territory a similar perpetual right and easement. This agreement is in place irrespective of the issuance of any Water Lease. The No Action alternative would result in no Water Lease being issued from the State. However, under the 1938 agreement and a related calculation involving isohyet analysis of rainfall patterns, it is understood that approximately 30% of the water in the License Area streams is derived from the privately owned lands. Therefore, the EMI Aqueduct System could continue to divert approximately 30% of the water available from the Collection Area, plus the 4.37 mgd from that portion of the Collection Area that is derived from privately owned lands outside of the License Area between liko Gulch." **NO**... Based on an old, outdated agreement, this 1938 agreement should be **nullified**, their perpetual right of easement should be revoked, and the applicant should **NOT be** allowed to **extort water rights from the State**.

Please understand, I do not have the time to review this entire 2700 page draft, in the time allotted, nor do I possess the expertise to validate or substantiate this exhaustive revised draft. Because the comment period is nearly over, and for the reasons stated above, I strongly urge the BLNR, Maui Mayor, Council and Maui agencies **REJECT** this report, **Revoke** the 1938 agreement, request a more streamlined submittal and evaluate options for considering a 5year lease with renewable options with substantive performance goals and objectives to support and enhance the Maui watershed, while Maui County retains control of the water rights and oversight operations.

Respectfully,

Allen Greenfield, Hana, HI

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas

Dear Mr. Greenfield:

Thank you for comments dated November 3, 2019, and November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai'i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

November 3, 2019 Email

Comment 1: *I submit my comments in response to the Draft Environmental impact Statement from EMI and A&B.*

Now is the time for the County of Maui to step up and take their rightful responsibility for the people and NOT relinquish this precious water resource. The proposal of water rights to Mahi Pono is inconsistent with the cultural and public values of Maui and Hawaii Islands.

Response 1: We acknowledge your comments. However, please note that the authorization of the issuance of the Water Lease is not the County of Maui's decision. The decision lies with the State of Hawai'i Board of Land and Natural Resources (BLNR).

With regards to your comment that the Proposed Action is inconsistent with the cultural values, the Draft EIS adequately discusses the impacts of the Proposed Action both in terms of the effects on habitat and on traditional and customary Native Hawaiian resources and practices. Specifically, in terms of habitat, Appendix A and Section 4.2.1 of the Draft EIS presented the HSHEP model that was designed to quantify how various man-made changes affect native amphidromous stream animals, whether positive or negative, and is based on Statewide observations of these animals' distribution and habitat. The HSHEP model has been used to determine an appropriate balance between instream and offstream water uses. Impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B of the EIS. Impacts to terrestrial flora and fauna, including threatened and endangered species, are analyzed in Section 4.4 and Appendix C of the EIS. As it relates to traditional and customary resources and practices, please note that Cultural Surveys Hawai'i (CSH) provides a detailed and comprehensive report accounting the history of East Maui. This report is included in Appendix E and summarized in Section 4.5 of the EIS. The EIS includes an assessment of effects on native Hawaiian cultural resources and practices through the Cultural Impact Assessment (CIA) prepared by CSH and provided as Appendix F.

The information provided satisfies the EIS content requirements. This information will also inform BLNR in the future, when it is deliberating on the issuance and terms of the Water Lease. Regarding the mandated protection of the Public Trust, the dual roles of the BLNR and its sister agency, the Commission on Water Resource Management (CWRM), as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine.

Under the Public Trust Doctrine, BLNR will have to balance competing considerations before making a decision on the Water Lease. The balancing that BLNR is required to perform under the Public Trust Doctrine was described at length by the Hawai'i Supreme Court in *In Re Water Use Permit Applications*, 94 Hawai'i 97, 9 P. 3d 409 (2000) ("Waiahole I") and summarized in Section 1.5 of the Final EIS, which has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action.

With regard to the potential effects of the Proposed Action on traditional and customary resources and practices, as discussed in the *Ka Pa'akai* decision, we acknowledge that BLNR will be required to "to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible." *Ka Pa'akai*, 94 Hawai'i at 35, 7 P. 3d at 1072. BLNR has previously so stated in its Findings of Fact, Conclusions of Law, and Decision and Order filed on March 23, 2007 in the contested case proceeding that is still pending regarding the Proposed Action (the 2007 D&O) as follows:

Public trust principles require that adequate provision be made for the protection of ***traditional and customary Hawaiian rights***, the protection and procreation of fish and wildlife, the maintenance of proper ecological balance and scenic beauty, and the preservation and enhancement of waters of the State for municipal uses, public recreation, public water supply, agriculture and navigation.

2007 D&O COL No. 6 at page 41 (citing *Waiahole I*). In its June 20, 2018 Findings of Fact, Conclusions of Law and Decision and Order (CWRMD&O), the CWRM also recited the State's constitutional obligation to consider the impacts of stream diversions in East Maui on traditional and customary practices of Native Hawaiians at pages 242 through 245, including the Supreme Court of Hawai'i's more recent holding on this subject in *State v. Pratt*, 127 Hawai'i 206, 277 P. 3d 300 (2012).

The EIS (including Appendix F) together with the CWRM D&O, provide ample information for the BLNR to consider regarding potential impacts to traditional and customary practices, and that will enable BLNR, at the point that it is deliberating on the Water Lease, to fulfill its constitutional obligation "to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible." *Ka Pa'akai* at, 94 Hawai'i at 35, 7 P. 3d at 1072.

Your comment regarding public values is unclear as it does not identify which public values you are referring to. The socio-economic impacts of the Proposed Action are addressed at length in Section 4.7 of the Draft EIS, and in further detail in Appendices G through I (Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report). Draft EIS Section 4.7 has subsections addressing impacts to populations and impacts (Section 4.7.1), impacts to social

characteristics (Section 4.7.2), impacts to the economy and other fiscal considerations (4.7.3), and impacts to the agricultural economy. (4.7.4). The potential socio-economic impacts of the alternatives to the Proposed Action considered by the Draft EIS are analyzed in Section 3.4.11 (Social Characteristics), 3.4.12 (Economic and Fiscal Resources), and 3.4.13 (Agricultural and Related Economic Resources). The Draft EIS thoroughly addressed cumulative socio-economic impacts in Section 4.17. That discussion has been further supplemented on pages 4-331 to 4-336 of Section 4.17 by updates in the Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report.

Comment 2: *The request for lease of 30 years is extraordinarily and unjustifiably long length of time for any agreement. An agreement of this time frame would fail to anticipate known or unknown future factors which might affect this watershed's future including unforeseen natural occurrences, altercations, maintenance, and climatic change events.*

Response 2: We acknowledge your comments. Regarding your comments about the length of time the Water Lease is being requested for, Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1 and the impacts of that alternative throughout Section 3.4. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover its planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Regarding your comment about the watershed's future, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding

watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development by the water lessee and DLNR and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. pages 2-2 to 2-4 of Section 2.1 of the EIS have been updated to reflect this new information about the contents of an acceptable watershed management plan. The minimum content requirements under the category of "Goals" specifically addresses priorities to maintain or restore the biological integrity of the watershed, including but not limited to actions that call for managing invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Regarding maintenance, under the Proposed Action, "maintenance and repair" involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System.

Regarding climate change, climate change is discussed in Section 4.3.1 of the Draft EIS and sea level rise is addressed in Section 4.3.2 of the EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

Section 4.3.1 of the Final EIS has been expanded to include information from the Archaeological Literature Review and Field Inspection (LRFI) (Appendix E), CIA (Appendix F), and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown on pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Comment 3: *In addition, any consideration of this exhaustive, lengthy draft, must first receive a thorough and complete review along with robust scrutiny from BLNR staff and Legal counsel supporting Maui Mayor and Council and Maui County. Given the length and breadth of this draft report, the current timeline is inappropriate for the County agencies, as well as the public, to give substantive comments. The County at a minimum must reevaluate the current timeline and allow more time to check and review this report as well as authorize additional rounds of staff and public review and input.*

Response 3: Please note that as discussed in Response #1 above, the decision regarding the acceptance of the EIS and authorization of the Water Lease lies with the BLNR, not the County of Maui. Please note that the EIS is a disclosure document and does not authorize any action.

Regarding your comment about the length and breadth of the Draft EIS and the inappropriate timeline to give substantive comments, please note that the 45-day period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai‘i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 4: *In my read of the first part of the report, I have the following comments and questions:*

Have Mahi Pono estimates on page v, crops, yields, profits and potential jobs been verified?

Response 4: Your comments about whether the Mahi Pono estimates being verified is unclear. However, please note that the Mahi Pono farm plan was prepared by Mahi Pono’s farm team after consultation with Hawai‘i-based farmers and agricultural experts.

Comment 5: *The Mahi Pono farm plan page v, includes a utility scale renewable energy component that will further Hawaii's goals of having 100% renewable energy by 2045. This time period of 25 years is too far out for any useful benefit and should be by 2030.*

Response 5: Please note that full development of the proposed Mahi Pono farm plan is expected by 2030 before the year 2045 which is the State’s current target year to have 100% renewable energy.

Comment 6: *Social Impact Assessment (SIA), Earthplan page x: “The SIA recommends that clearly defined interest groups, or stakeholder groups are established that include geographic communities, environmental, agriculture and business interests, and public agencies. Each group would be encouraged to reach consensus on their own needs, concerns, opportunities and possible solutions.” This “feel good” section of a collaborative nature is not enforceable or supported by any regulatory guidance or codes and should not be included as submitted.*

Response 6: Your comment is unclear. The SIA, as well as Section 4.7.2 of the EIS recommends that there be community outreach by the Applicant. As discussed in Response #3 above, the EIS is a disclosure document and does not authorize any action or impose conditions. However, terms of the Water Lease are at the discretion of the BLNR, and the Water Lease lessee will comply with all such terms.

Comment 7: *The Objective of Action in section 1-2, can be achieved through appropriate Maui County oversight and operation and NO lease is necessary.*

Response 7: We respectfully disagree with your comment as this is discussed in Section 3.1.2 of the Draft EIS, as follows:

During public scoping for the DEIS in 2016 and 2017, it was suggested that the EMI Aqueduct System should be brought under new ownership, without the further involvement of A&B and EMI, and potentially under public ownership. Ownership of the EMI Aqueduct System changed in January 2019 to include Mahi Pono, which intends to pursue diversified agriculture in Central Maui. Consideration of another change in ownership is too speculative at this point to warrant analysis. A change in the ownership of the EMI Aqueduct System will not enhance environmental quality or avoid, reduce, or minimize all or even some adverse environmental effects, costs, or risks of the Proposed Action. As discussed elsewhere in this DEIS, EMI has been operating the EMI Aqueduct System since the start of construction in the 1870s. Few have the knowledge to operate and maintain this unique and complex system, consisting of approximately 388 separate intakes, 24 miles of ditches, and 50 miles of tunnels, as well as numerous small dams, intakes, pipes, 13 inverted siphons and flumes. Furthermore, the EMI Aqueduct System is not for sale, and forced acquisition of the system is projected to be prohibitively expensive, resulting in substantial costs to the public. For these reasons, this alternative is viewed as a highly speculative and unreasonable alternative, and one that would not meet the objectives of the Proposed Action. Therefore, it was dismissed from further review.

Hence, it was deemed to be speculative as the EMI Aqueduct System is not for sale, there had not been a cost appraisal of the system, and few have the skills or knowledge to operate the extensive and complex EMI Aqueduct System. Furthermore, should another entity manage the EMI Aqueduct System, the EMI Aqueduct System would still require repair and maintenance activities and access to the License Area. Accordingly, the impacts from this alternative are expected to be identical to the Proposed Action.

We are aware of the County Board of Water Supply (BWS) Temporary Investigative Group (TIG) Report, which was published after the Draft EIS, which explores the potential acquisition of the EMI Aqueduct System by the County, speaks directly to the “ownership change” alternative referenced in your comment. To provide further context, on July 19, 2019, the Maui County BWS formed the TIG to explore options for ensuring public access to water, including the feasibility of purchasing and maintaining the EMI Aqueduct System.

Based upon information available in relation to findings and conclusions of the TIG report, it is our assessment that the County’s potential acquisition of the EMI Aqueduct System remains speculative. Furthermore, much of the institutional knowledge needed to properly operate the EMI Aqueduct System would be lost under any change in ownership scenario. This could reduce the efficacy of the system, the new owner may not have the expertise needed to properly maintain it, and possibly lead to additional and unforeseen environmental impacts. Moreover, a change in ownership would presumably directly contradict the objectives of the Proposed Action as outlined within the EIS. It is noted that the TIG report's proposal for water rates for the Central Maui agricultural fields is nearly ten times that of what is being charged to the Agricultural Park and Upcountry agricultural users, thus rendering the economic viability of agriculture on the Central Maui fields unfeasible.

For purposes of assessment in this EIS, it is assumed that an alternative owner of the EMI Aqueduct System would be required to meet goals of the Proposed Action as described in this EIS, including meeting the Proposed Action's stated objective to support an economically feasible, sustainable diversified agricultural operation across the Central Maui agricultural fields.

For the reasons discussed above, the County’s acquisition of the EMI Aqueduct System, and the County’s pursuit of a water lease from the BLNR are viewed as speculative and an unreasonable

alternatives. However, the existence and findings of the TIG Report has been acknowledged in Section 3.1.2 of the Final EIS. A copy of the TIG Report has been included in the Final EIS as Appendix P.

Comment 8: *Instream use, section 1-9, HRS 171C-71 (2) (D), numbers 8 and 9 have a long contentious history relating to what has been deemed appropriate for use of water for local irrigation and traditional/ceremonial, and these rights **MUST Not** be compromised in any way.*

Response 8: We acknowledge your opinion on the appropriateness of certain instream uses defined under HRS § 174C-3, namely "(8) The conveyance of irrigation and domestic water supplies to downstream points of diversion; and (9) The protection of traditional and customary Hawaiian rights." Please note that the statutory reference to HRS Chapter 171C was a typo in the Draft EIS which has been corrected in the Final EIS to reference HRS Chapter 174C.

The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that "existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted." Moreover, the prior licenses issued to EMI for the License Area in the past continued to recognize the rights of other property owners "for domestic purposes and the irrigation of kuleanas entitled to the same." See CWRM D&O, (Finding of Fact) FOF 55.

Similarly, the relevant revocable permits issued by the State include a clause whereby "*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water. . . .*" It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all constitutionally protected traditional and customary rights.

As discussed in Response #2 above, the Draft EIS adequately discusses the impacts of the Proposed Action both in terms of the effects on habitat and on traditional and customary Native Hawaiian practices. Specifically, in terms of habitat, Appendix A and Section 4.2.1 of the Draft EIS presented the HSHEP model was used to quantify the impacts of flow restoration on native stream animal habitat to determine an appropriate balance between instream and offstream water uses. Impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B of the EIS. Impacts to terrestrial flora and fauna, including threatened and endangered species, are analyzed in Section 4.4 and Appendix C of the EIS. As it relates to traditional and customary, please note that CSH provides a detailed and comprehensive report accounting the history of East Maui. This report is included in Appendix E and summarized in Section 4.5 of the EIS. The EIS includes an assessment of effects on the cultural practices through the CIA provided as Appendix F.

The information provided satisfies EIS content requirements. This information will also inform BLNR in the future, when it is deliberating on the issuance and terms of the Water Lease. Under the Public Trust Doctrine, BLNR will have to balance competing considerations before making a decision on the Water Lease. The balancing that BLNR is required to perform under the Public Trust Doctrine was described at length by the Hawai'i Supreme Court in *In Re Water Use Permit Applications*, 94 Hawai'i 97, 9 P. 3d 409 (2000) ("Waiahole I") and summarized in Section 1.5 of the Final EIS.

With regard to the potential effects of the Proposed Action on traditional and customary practices, as discussed in the *Ka Pa 'akai* decision, we acknowledge that BLNR will be required to "to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible." *Ka Pa 'akai*, 94 Hawai'i at 35, 7 P. 3d at 1072. BLNR has previously so stated in its Findings of Fact,

Conclusions of Law, and Decision and Order filed on March 23, 2007 in the contested case proceeding that is still pending regarding the Proposed Action (the 2007 D&O) as follows:

Public trust principles require that adequate provision be made for the protection of *traditional and customary Hawaiian rights*, the protection and procreation of fish and wildlife, the maintenance of proper ecological balance and scenic beauty, and the preservation and enhancement of waters of the State for municipal uses, public recreation, public water supply, agriculture and navigation.

2007 D&O COL No. 6 at page 41 (citing *Waiahole I*). CWRM, in its June 20, 2018 D&O, also recited the State's constitutional obligation to consider the impacts of stream diversions in East Maui on traditional and customary practices of Native Hawaiians at pages 242 through 245, including the Supreme Court of Hawaii's more recent holding on this subject in *State v. Pratt*, 127 Hawai'i 206, 277 P. 3d 300 (2012).

The EIS (including Appendix F) together with the CWRM D&O, provide ample information for the BLNR to consider regarding potential impacts to traditional and customary practices, and that will enable BLNR, at the point that it is deliberating on the Water Lease, to fulfill its constitutional obligation "to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible." *Ka Pa'akai* at, 94 Hawai'i at 35, 7 P. 3d at 1072.

Comment 9: *Section 2-1 states: "A substantial amount of private funds will be used to maintain and operate the EMI Aqueduct System." Using public funding for leased water; Definitely NO. Any lease agreement must charge appropriately to cover ALL expenses of the watershed and must not be a gift to a private corporate applicant paid for by the public.*

Response 9: Yes, you are correct that Section 2.1 of the EIS states that a substantial amount of *private* funds will be used to maintain and operate the EMI Aqueduct System. The sentence before this in Section 2.1 specifically notes that "*The Proposed Action will not require the use of public funds.*" Hence, no public funds will be used to implement the Proposed Action.

Comment 10: *Section 2.1.3.1 states: "The Upcountry Maui Water System serves a total population of approximately 35,251, and the County anticipates the population will grow to approximately 43,675 by 2030. As there is no "excess" supply of water for Upcountry Maui, the MDWS customers have been required to adhere to strict conservation measures during periods of drought." This is another reason the County should retain control of the entire system and ensure that upcountry Maui is guaranteed adequate supplies today and into the future. "Moreover, there is a long waiting list of Upcountry Maui residents seeking water meters, some of whom have been waiting for over a decade." This is inexcusable and another example of poor planning and management. Yet another reason to retain control and provide the necessary water resources. Conservation management by the County is imperative to provide for the future water needs of the public in an everchanging hydrologic environment.*

Response 10: We acknowledge your comments. However, as discussed in Response #7 above, we are aware of the County BWS TIG Report, which was published after the Draft EIS, on the potential acquisition of the EMI Aqueduct System by the County, speaks directly to the "ownership change" alternative referenced in your comment. To provide further context, on July 19, 2019, the Maui County BWS formed the TIG to explore options for ensuring public access to water, including the feasibility of purchasing and maintaining the EMI Aqueduct System.

Based upon information available in relation to findings and conclusions of the TIG report, it is our assessment that the County's potential acquisition of the EMI Aqueduct System remains speculative.

Furthermore, much of the institutional knowledge needed to properly operate the EMI Aqueduct System would be lost under any change in ownership scenario. This could reduce the efficacy of the system, the new owner may not have the expertise needed to properly maintain it, and possibly lead to additional and unforeseen environmental impacts. Moreover, a change in ownership would presumably directly contradict the objectives of the Proposed Action as outlined within the EIS. It is noted that the TIG report's proposal for water rates for the Central Maui agricultural fields is nearly ten times that of what is being charged to the Agricultural Park and Upcountry agricultural users, thus rendering the economic viability of agriculture on the Central Maui fields unfeasible.

For purposes of assessment in this EIS, it is assumed that an alternative owner of the EMI Aqueduct System would be required to meet goals of the Proposed Action as described in this EIS, including meeting the Proposed Action's stated objective to support an economically feasible, sustainable diversified agricultural operation across the Central Maui agricultural fields.

For the reasons discussed above, the County's acquisition of the EMI Aqueduct System, and the County's pursuit of a water lease from the BLNR are viewed as speculative and an unreasonable alternatives. However, the existence and findings of the TIG Report has been acknowledged on pages 3-19 to 3-20 in Section 3.1.2 of the Final EIS. A copy of the TIG Report has been included in the Final EIS as Appendix P.

Comment 11: *Section 2.1.5 states: "An estimated 10 years will be required for Mahi Pono and lessees to remove volunteer sugarcane and weeds from the approximate 30,000 acres, amend soils, install field improvements, build warehouses and other structures, and plant crops." We have already experienced record numbers of fires this year and current regulations are ill prepared to safeguard the public and the stated estimate of 10 years is inappropriately long to ensure a safe environment in the drought years ahead.*

Response 11: We acknowledge your comments. Section 4.10 of the Draft EIS describes conditions in Central Maui, including a recognition of wildfires ("wildfires in Central Maui on fallow fields formerly in sugar cultivation, have generated intense smoke and dust over relatively short periods of time until they have been extinguished.") and projects that the transition from sugarcane to diversified agriculture may affect air quality from an increase in equipment emissions and in the very short-term, from dust from uncultivated land. Given the expanse of the agricultural fields in Central Maui, extra precaution must be exercised near its boundaries. Particularly in these areas, mitigation measures will include keeping fallow land to a minimum which is a recognized risk for wildfires, =. As discussed in Sections 7.4 and 7.5 of the EIS, more frequent wildfires may occur if agricultural activity in the Central Maui agricultural fields are abandoned due to the return of the natural arid and dry windy conditions, more weedy plants, and less/no water being used to irrigate the area. Under the Proposed Action, it is expected that there would be a reduction in risk of wildfires due to the irrigation of the Central Maui agricultural fields as Mahi Pono incrementally increases the amount of farmed acreage over time.

The Mahi Pono farm team also follows Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to their current farming activities.

Comment 12: *Section 3.1.2 states: "January 2019 to include Mahi Pono, which intends to pursue diversified agriculture in Central Maui. This change in ownership has no track record and their performance remains untested at this point to warrant analysis." Yes, and Mahi Pono has demonstrated agricultural activities by bringing cattle in vacated grasslands, yet left thousands of acres of land*

abandoned with dry brush and sugar cane which has been a principal contributor to fire dangers on Maui. Contributing also to the increase of record heat in central Maui.

Response 12: Please note that nowhere in the EIS is it stated, “*This change in ownership has no track record and their performance remains untested at this point to warrant analysis.*” Rather Section 3.1.2 of the Draft EIS states:

Ownership of the EMI Aqueduct System changed in January 2019 to include Mahi Pono, which intends to pursue diversified agriculture in Central Maui. Consideration of another change in ownership is too speculative at this point to warrant analysis. A change in the ownership of the EMI Aqueduct System will not enhance environmental quality or avoid, reduce, or minimize all or even some adverse environmental effects, costs, or risks of the Proposed Action.

Regarding the fallow land, please note that this is due to the amount of water that can be diverted to the Central Maui agricultural fields for irrigation of crops. Please note that Section 2.1.4 of the Final EIS has been revised to reflect Mahi Pono's current and near-term expected water use, which details average water being diverted from East Maui streams through the EMI Aqueduct System and how that water will be used. It important to note that as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet the needs of the approved water uses, including the MDWS and of Mahi Pono's agricultural operations in Central Maui.

With regards to fire danger, please refer to Response #11 above.

Comment 13: Section 3.3 states: “*Under a 1938 agreement between the Territory of Hawai‘i and A&B, A&B was given a perpetual right and easement to convey water through those portions of the EMI Aqueduct System located within State lands, and to divert the water so conveyed through the EMI Aqueduct System, and A&B granted the Territory a similar perpetual right and easement. This agreement is in place irrespective of the issuance of any Water Lease. The No Action alternative would result in no Water Lease being issued from the State. However, under the 1938 agreement and a related calculation involving isohyet analysis of rainfall patterns, it is understood that approximately 30% of the water in the License Area streams is derived from the privately owned lands. Therefore, the EMI Aqueduct System could continue to divert approximately 30% of the water available from the Collection Area, plus the 4.37 mgd from that portion of the Collection Area that is derived from privately owned lands outside of the License Area between liko Gulch.*” **NO...** *Based on an old, outdated agreement, this 1938 agreement should be nullified, their perpetual right of easement should be revoked, and the applicant should NOT be allowed to extort water rights from the State.*

Response 13: Please note that as described in Section 3.3 of the Draft EIS, the Territory (now the State) of Hawai‘i and EMI entered into an agreement (the “1938 Agreement”) to facilitate and govern the continued auction of long term water licenses of the State-owned portions of the Collection Area so that, regardless of who the successful bidder at auction may be, the EMI Aqueduct System could continue to be operated across both the State-owned and Mahi Pono/EMI owned lands by EMI, the licensee (if not EMI), the State, or both, as the case may be. Section 3.3 of the EIS has been expanded to discuss this. Moreover, please note that the 1938 Agreement has also been included in the Final EIS as Appendix R. The 30% figure was agreed to between the BLNR and EMI at the end of 1987 to represent the amount of water originating from private (vs. State) lands in the 50,000-acre Collection Area, and was based on estimates of the average annual total yields from the streams in License Area. Prior to that time, the USGS provided a table in which USGS estimated, for each of the four license areas, the percentages of

water estimated to have arisen on State land versus private land. This was explained in the testimony and exhibits submitted to CWRM throughout the contested case hearing on the Interim Instream Flow Standard (IIFS) petitions. Copies of relevant documents on this subject have been appended to the Final EIS as Appendices R-1, R-2, R-3, R-4, and R-5, and are further described in Section 3.3 of the Final EIS.

However, please note that a detailed legal analysis of the 1938 Agreement is beyond the scope of assessing environmental impacts within this EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the State-owned Nāhiku, Ke‘anae, Honomanū, and Huelo lands (License Area) for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 14: *Please understand, I do not have the time to review this entire 2700 page draft, in the time allotted, nor do I possess the expertise to validate or substantiate this exhaustive revised draft. Because the comment period is nearly over, and for the reasons stated above, I strongly urge the BLNR, Maui Mayor, Council and Maui agencies **REJECT** this report, **Revoke** the 1938 agreement, request a more streamlined submittal and evaluate options for considering a 5year lease with renewable options with substantive performance goals and objectives to support and enhance the Maui watershed, while Maui County retains control of the water rights and oversight operations.*

Response 14: We acknowledge your comments and we provide detailed responses to your points in the responses above.

November 4, 2019 Email

Comment 15: *How could you authorize a 30 year lease of a county water system when the applicant of a newly formed business has no history of water management, no corporate performance, no agriculture or livestock expertise demonstrated and no credit history?*

Response 15: Please note that the Water Lease has not been issued. As noted in Response #3 above, the EIS is a disclosure document and does not authorize any action. As discussed in Section 1.4 of the Draft EIS, by order dated July 8, 2016, the BLNR directed A&B to proceed with the preparation of an EIS. Prior to that, BLNR, by order dated April 14, 2016, had directed A&B to commence the EIS process and to provide a scope of work for the preparation of an environmental review document pursuant to Chapter 343, HRS. The BLNR instructed that the scope of work should distinguish between those matters that can be undertaken prior to the CWRM decision on the petitions to amend the IIFS, and those matters that require the final CWRM IIFS decision. On June 9, 2016, A&B submitted to the BLNR a Scope of Services for the Preparation of a Chapter 343, HRS Environmental Impact Statement for the Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. Hence, the Water Lease decision-making process will commence after the EIS process is complete.

Comment 16: *How about a 5 year lease with requirements for extension conditional on demonstration and performance requirements to award an extension, perhaps an additional 5 years.*

Response 16: We acknowledge your comments. However, as noted in Response #2 above, Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in

Section 3.2.2.1 and the impacts of that alternative throughout Section 3.4. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation.

Comment 17: *Why are there no allowances for water to promote local and regional farming for East Maui including Hana? Why does all the water go to central Maui?*

Response 17: Please note that not all of the water available in the East Maui streams is going to Central Maui. The CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the several of the streams in the License Area as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams whose IIFS were not amended by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the CIA, Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for taro were identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references. The CWRM did,

however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration status); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Specifically, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O "*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*" (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS.

Comment 18: *Fisherman say that flowing streams provide nutrients for the attraction of local fish close to shore. This would make it more cost effective as there would don't be a need to go away from the shore to fish. Why is there not allocation of waters to promote stream flow to promote local fishing?*

Response 18: Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited

areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of

10238-04

Letter to Mr. Allen Greenfield

Page **15** of **15**

September 3, 2021

estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanu, and Huelo License Area

Please accept my comments on the subject DEIS.

I care deeply about this proposed lease of public water because I am a 20-year resident of Maui and am an upcountry homeowner. I am concerned that access to and control of Maui's water rights and resources may have been illegally claimed to be the assets of private corporations seeking to advance their business agendas at the expense of the environment, other community members and the native Hawaiian people.

The draft EIS should include whether the State of Hawaii is meeting its fiduciary responsibility to Native Hawaiians regarding their claim to revenue sharing as granted by the State Constitution.

The draft EIS should include how to resolve the foundational question of who has the legal authority to control the management of Maui's water, decide on its value and who derives the benefits of its financial value.

The draft EIS should include a detailed opinion of the legal status, merits and validity of the respective party claims to access and control the water lease areas of Nahiku, Ke'anae, Honomanu, and Huelo.

The draft EIS should include and review the outcome and relative significance of Nelson v. the Hawaiian Homes Commission. There were six individual plaintiffs that filed a first amended complaint alleging that the State Defendants and DHHL had violated Article XII, Section 1 of the Hawai'i State Constitution.

The draft EIS should include a review, relevance and then render an opinion on the Hawaii state legislature constitutional provision to make sufficient sums available for the following purposes:

- (1) development of home, agriculture, farm and ranch lots;
- (2) home, agriculture, aquaculture, farm and ranch loans;
- (3) rehabilitation projects to include, but not limited to, educational, economic, political, social and cultural processes by which the general welfare and conditions of native Hawaiians are thereby improved;

(4) the administration and operating budget of the department of Hawaiian homelands; in furtherance of (1), (2), (3) and (4) herein, by appropriating the same in the manner provided by law.

The draft EIS should include a review and render an opinion of the Plaintiffs assertions that the State failed to make sufficient sums available to DHHL for the four purposes enumerated above.

The draft EIS should include a review and render an opinion on Count 2 (Nelson v Hawaiian Homes Commission), that the Plaintiffs alleged that DHHL breached its trust duties to its beneficiaries by failing to request sufficient sums from the State. The progress of this case and the appeals provides insight into the dissatisfaction of beneficiaries with regard to revenue sharing.

The draft EIS should include a detailed rationale if it is determined the concerns expressed above are seen as requests for information that are beyond the scope of this EIS action. The legitimate right of each party to participate in this EIS review and be legally eligible to enter into a water lease should be clearly documented before proceeding. If necessary, the proper authorities in the State of Hawaii government should be contacted to provide any needed information that would inform those directly involved with DEIS review.

The draft EIS should include a public recognition in all reports that there has been an ongoing legal challenge regarding the water rights in question and that while banks and other institutions may recognize the existing legal understanding (i.e. deeds) that have benefited certain companies for many years, the matter is not settled and therefore until it is, no water lease should be entered into.

I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,

Arnie Koss

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Koss:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I care deeply about this proposed lease of public water because I am a 20-year resident of Maui and am an upcountry homeowner. I am concerned that access to and control of Maui’s water rights and resources may have been illegally claimed to be the assets of private corporations seeking to advance their business agendas at the expense of the environment, other community members and the native Hawaiian people.*

Response 1: We acknowledge your comments. Please note that pursuant to Hawai‘i Revised Statutes (HRS) 171-58, “Disposition of water rights may be made by lease at public auction as provided in this chapter or by permit for temporary use on a month-to-month basis under those conditions which will best serve the interests of the State and subject to a maximum term of one year and other restrictions under the law...” Hence, it is prescribed by law for water rights to be made by lease as determined by the State of Hawai‘i Board of Land and Natural Resources (BLNR). Moreover, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B’s 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the

judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown in pages 1-25 to 1-27.

Comment 2: *The draft EIS should include whether the State of Hawaii is meeting its fiduciary responsibility to Native Hawaiians regarding their claim to revenue sharing as granted by the State Constitution.*

Response 2: Please note that it is not within scope of the EIS to investigate whether or not the State of Hawai'i is meeting its fiduciary responsibility with regards to revenue sharing. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'ānae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

However, please note that the lessee of the proposed Water Lease will pay lease rent to the State. Moreover, the Office of Hawaiian Affairs (OHA) should receive 20 percent of the Water Lease rents while the Department of Hawaiian Home Lands (DHHL) should receive 30 percent of the water lease rents. The DHHL funds are deposited into the Native Hawaiian Rehabilitation Fund pursuant to Hawai'i State Constitution Article XII, Section 1, and is used to fund programs as prioritized in the Native Hawaiian Development Program Plan adopted by the Hawaiian Homes Commission. The financial impacts of the Water Lease as contemplated under the Proposed Action are discussed in detail in the analysis conducted for the Economic and Fiscal Impact Study report included as Appendix H and is summarized in Section 4.7.3 of the EIS.

Comment 3: *The draft EIS should include how to resolve the foundational question of who has the legal authority to control the management of Maui's water, decide on its value and who derives the benefits of its financial value.*

Response 3: Please note that this is not within the scope of the EIS. As noted in Response #2 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'ānae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural

water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

However, as noted in Response #1 it is prescribed by law for water rights to be made by lease as determined by the BLNR. The processes governing the use of the water are subject to the Public Trust Doctrine. The Proposed Action (the issuance of a 30-year Water Lease by BLNR), requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai'i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. The dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease. As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action as shown in pages 1-25 to 1-27.

Moreover, with regard to financial values, Section 2.1.5 of the Draft EIS states:

After the Final EIS (FEIS) is published and accepted by the BLNR, the State of Hawai'i will conduct appraisals of the water from the License Area, produce lease agreements and a Watershed Management Plan (refer to Section 2.1). Once this is complete the Water Lease will be put to public auction. Once the Water Lease is issued by the BLNR, under the Proposed Action, Mahi Pono can implement its proposed farm plan.

Hence, formal appraisals will be conducted after the EIS process is complete.

Comment 4: *The draft EIS should include a detailed opinion of the legal status, merits and validity of the respective party claims to access and control the water lease areas of Nahiku, Ke'anae, Honomanu, and Huelo.*

Response 4: Please note that this is not within the scope of the EIS to include a detailed opinion of the legal status, merits, and validity of the Applicant and BLNR. As noted in Response #2 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for

the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 5: *The draft EIS should include and review the outcome and relative significance of Nelson v. the Hawaiian Homes Commission. There were six individual plaintiffs that filed a first amended complaint alleging that the State Defendants and DHHL had violated Article XII, Section 1 of the Hawai'i State Constitution.*

Response 5: Please note that this is not within the scope of the EIS. As noted in Response #2 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

However, specific information regarding the DHHL's future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes

Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui), as shown in pages 2-4 to 2-7. This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. As explained in pages 2-4 to 2-7 of the Final EIS, the DHHL water reservation process involves several steps before a reservation amount is formally identified and approved. However, as of this time, it is our understanding that DHHL has not yet made its water reservation request to CWRM.

Comment 6: *The draft EIS should include a review, relevance and then render an opinion on the Hawaii state legislature constitutional provision to make sufficient sums available for the following purposes:*

- (1) development of home, agriculture, farm and ranch lots;*
- (2) home, agriculture, aquaculture, farm and ranch loans;*
- (3) rehabilitation projects to include, but not limited to, educational, economic, political, social and cultural processes by which the general welfare and conditions of native Hawaiians are thereby improved;*
- (4) the administration and operating budget of the department of Hawaiian homelands; in furtherance of (1), (2), (3) and (4) herein, by appropriating the same in the manner provided by law.*

Response 6: Please note that it is not within scope of the EIS to render an opinion on the Hawai'i State Legislature Constitutional provision to make sufficient sums available for the purposed listed in your Comment #6. As noted in Response #2 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 7: *The draft EIS should include a review and render an opinion of the Plaintiffs assertions that the State failed to make sufficient sums available to DHHL for the four purposes enumerated above.*

Response 7: Please note that it is not within scope of the EIS to render an opinion of the plaintiffs assertions that the State failed to make sufficient sums available to the DHHL for the purposes listed in your Comment #6. As noted in Response #2 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B’s former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

However, specific information regarding the DHHL's future water reservation as it relates to the Proposed Action, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS and in Response #5 above.

Comment 8: *The draft EIS should include a review and render an opinion on Count 2 (Nelson v Hawaiian Homes Commission), that the Plaintiffs alleged that DHHL breached its trust duties to its beneficiaries by failing to request sufficient sums from the State. The progress of this case and the appeals provides insight into the dissatisfaction of beneficiaries with regard to revenue sharing.*

Response 8: Please note that it is not within scope of the EIS to render an opinion on Count 2 (Nelson v Hawaiian Homes Commission), that the Plaintiffs alleged that DHHL breached its trust duties to its beneficiaries by failing to request sufficient sums from the State. As noted in Response #2 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B’s former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

However, specific information regarding the DHHL's future water reservation as it relates to the Proposed Action, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS and in Response #5 above.

Comment 9: *The draft EIS should include a detailed rationale if it is determined the concerns expressed above are seen as requests for information that are beyond the scope of this EIS action. The legitimate right of each party to participate in this EIS review and be legally eligible to enter into a water lease should be clearly documented before proceeding. If necessary, the proper authorities in the State of Hawaii government should be contacted to provide any needed information that would inform those directly involved with DEIS review.*

Response 9: Regarding your comment about the EIS should include a detailed rationale, as noted in Response #2 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B’s former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS. The EIS is an environmental disclosure document that assesses a proposed action against environmental resource categories. It is not a decision-making document.

With regards to your comment that each party needs to be legitimate right and eligibility to participate in this EIS review is unclear. However, as stated in Section 1.4 of the Draft EIS, “For the purposes of HRS Chapter 343, the applicant for the Water Lease is A&B, pursuant to orders of the BLNR in April and June of 2016, directing A&B to prepare an EIS.” Furthermore, as noted in Response #1 above, pursuant to Hawai‘i Revised Statutes (HRS) 171-58, “Disposition of water rights may be made by lease at public auction as provided in this chapter or by permit for temporary use on a month-to-month basis under those conditions which will best serve the interests of the State and subject to a maximum term of one year and other restrictions under the law...” Hence, it is prescribed by law for water rights to be made by lease as determined by the State of Hawai‘i Board of Land and Natural Resources (BLNR).

With regards to your comment that prior to proceeding, proper authorities in the State of Hawai‘i government should be contacted to provide any needed information that would inform those directly involved in EIS process, please note that over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M), of which many comments were provided by State and County agencies.

Comment 10: *The draft EIS should include a public recognition in all reports that there has been an ongoing legal challenge regarding the water rights in question and that while banks and*

other institutions may recognize the existing legal understanding (i.e. deeds) that have benefited certain companies for many years, the matter is not settled and therefore until it is, no water lease should be entered into.

Response 10: As noted in Response #1 above, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown in pages 1-25 to 1-27.

Comment 11: *I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.*

Response 11: We acknowledge your comments and appreciate your participation in this process.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

WILSON OKAMOTO CORPORATION

Please accept my comments on the Draft EIS o the proposed EMI 30 year lease.

I have been a Honopou resident landowner living in the East Maui Watershed area for the past 44 years.

The Draft EIS needs to include the following information:

How will the severe and ongoing destruction of the watershed be addressed?

Feral pigs, cows, deer have destroyed the forest and undergrowth, leaving muddy pockets and wallows that breed disease spreading mosquitoes. The rivers are filled with mud and invasive species have robbed the forest's ability to absorb the rainfall and release it gradually keeping the streams clear and clean. I have swam and lived around the streams in my neighborhood for over 4 decades and witnesses the alarming degradation.

A five year lease with an option to renew instead of a 30 year lease would be a better option.

EMI seems to have totally abandoned its roll as caretaker and protector of this public Treasure. It needs to earn the right to continue to manage this resource.

All streams should maintain a constant flow.

Leave 30%stream flow in the 13 streams. Share the water for the O'opu and other living things.

The Rainforest is degrading. I am asking that the DEIS include a plan on how this crisis will be addressed.

Sincerely,

Beverly Young

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Young:

Thank you for comments received November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *How will the severe and ongoing destruction of the watershed be addressed?*

Response 1: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting

native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

Comment 2: *Feral pigs, cows, deer have destroyed the forest and undergrowth, leaving muddy pockets and wallows that breed disease spreading mosquitoes. The rivers are filled with mud and invasive species have robbed the forest's ability to absorb the rainfall and release it gradually keeping the streams clear and clean. I have swam and lived around the streams in my neighborhood for over 4 decades and witnesses the alarming degradation.*

Response 2: We acknowledge your comments. as discussed in Response #1 above, the lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans and will be required to jointly develop a watershed management plan with the DLNR. One of the goals of a watershed management plan is to identify priority outcomes essential to maintain and *restore* biological integrity to the maximum extent practicable which include but is not limited to:

1. Removal and control of non-native hooved animals (pigs, goats, deer, sheep, cattle) from important watershed forests.
2. Removal or containment of damaging invasive plants and animals that threaten important watershed forests.
3. Monitoring and controlling other forest threats including fires, predators, and plant diseases.
4. Restoring and out-planting native species in important watershed areas and buffer zones.
5. Communication, outreach and community education to build capacity for citizen-based watershed protection.

Additionally, Appendix C provides detailed avoidance and mitigation measures to minimize impacts of the Proposed Action to flora and fauna which are summarized in Sections 4.4.1 and 4.4.2 of the Draft EIS. Moreover, the discussion of these avoidance and mitigation measures has been expanded on as shown in pages 4-121 to 4-124 and pages 4-129 to 4-131.

With regards to mosquitos, please note that the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS.

Although the HSheP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. Second, Hawaiian streams are naturally flashy (i.e., they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poeciliid fishes (e.g., guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. Unfortunately, this did not occur with increased streamflow. The introduced poeciliid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poeciliid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed.

While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasiatus*) is established. Anecdotal observations made by Trutta staff members, support the continued presence of Culex mosquitoes under a wide range of stream flows as they reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i. Please note that Section 4.2.1 of the Final EIS has been updated to include the above discussions related to the Culex mosquito as shown in pages 4-58 to 4-61.

Specifically, as it relates to invasive species, it is noted in Appendix C that that low-elevation portions of the License Area are already highly impacted by invasive plants. However, it is noted in Appendix C that high-elevation portions of the License Area are predominately dominated by native species and is very likely to contain habitat for several endangered or threatened species. Impacts related to flora and fauna as a result of the Proposed Action are discussed in Section 4.4 of the EIS. Please note that Section 4.4.1 and Section 4.4.2 have been revised in the Final EIS based on comments received on the Draft EIS to further outline the existing conditions of the License Area and more accurately reflect targeted mitigation measures based on feedback provided by the DLNR and USFWS. See pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS.

Comment 3: *A five year lease with an option to renew instead of a 30 year lease would be a better option.*

Response 3: We acknowledge your comments. Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in*

establishing successful diversified agricultural operations and crops that may take years to reach economic viability." The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Comment 4: *EMI seems to have totally abandoned its roll as caretaker and protector of this public Treasure. It needs to earn the right to continue to manage this resource.*

Response 4: We respectfully disagree with your comment. A&B (EMI is its subsidiary) was a founding member of the East Maui Watershed Partnership (EMWP), which was the first watershed partnership in the State of Hawai'i and which served as a model for other watershed partnerships throughout the State. The lands under the jurisdiction of the EMWP span over 100,000 acres which includes the entire License Area. The License Area is actively managed by

the multiple agencies and organizations, including EMWP, Maui Invasive Species Committee (MISC), DLNR, etc., in partnership with EMI. EMI continues to work with MISC by reporting sighting of invasive weeds and coordinating access in these areas, which are well below the 3,000' level. EMI personnel also monitor the License Area for signs of feral ungulates.

Comment 5: *All streams should maintain a constant flow. Leave 30% stream flow in the 13 streams. Share the water for the O'opu and other living things.*

Response 5: We acknowledge your comments. With regards to your comment about leaving 30% flow in the 13 streams, please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream." Under the Proposed Action, the proposed Water Lease requests to divert the maximum amount of water from the License Area after compliance with the CWRM D&O. Please note that the non-petitioned streams were included as part of the overall analysis of the EIS and associated technical studies. Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The HSHEP model in Appendix A and summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species, including 'o'opu. Due to an increase in streamflow under the Proposed Action when compared to historical diversion rates, 'o'opu are anticipated to have an increase in habitat units (HU). However, these HU will slightly decrease from current conditions as more water is gradually diverted as the Mahi Pono farm plan develops to full build-out as outlined in Section 4.2.1 of the EIS.

Comment 6: *The Rainforest is degrading. I am asking that the DEIS include a plan on how this crisis will be addressed.*

Response 6: We acknowledge your comments. As noted in Response #1 Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses

10238-04
Letter to Ms. Beverly Young
Page 6 of 6
September 3, 2021

invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Gentlemen:

Please find below my comments to:

[DEIS East Maui Water Lease](#)

[Project: Proposed Lease \(Water Lease\) for the Nahiku, Keanae, Honomanu and Huelo License Areas](#)

[The Economic impact to the residents of the Hana area](#)

[Background](#)

For years, to see cascading waterfalls and full stream flows, visitors needed to travel the Hana Road (note: the "Hana Road" as herein expressed is viewed as the narrow winding road to the Hana area, not as the entirety of Hana Highway which begins in Kahului) during periods of fairly considerable and consistent rainfall, which, as most of us Hana area residents know, is when the traveling is most treacherous, avoiding deep pot holes full of water; rocks, dirt and vegetation falling down onto the roads; rock slides and landslides inhibiting part of the width of the road or worst blocking the entire width of the road; limited visibility;; bridges, mostly being the lower ends of the roadways, being full

of water.

Recently, the scenic vistas, waterfalls cascading, streams flowing, along the Hana Road became revitalized over the last couple of years, coinciding with the demising of the sugar crops of HC&S and the lessening demand for diversions of East Maui streams. This revitalizing of scenic vistas has resulted in significant increase of day visitors to the Hana area correlating to significant increase of vital economic resources (day visitor spending) to the Hana area. (For this discussion, Hana area includes all communities, areas of residencies along the Hana Road, including the road to Kipahulu's Oheo Haleakala National Park area.)

This increase in road traffic is also the main root to the "traffic congestion problems" faced by the Hana based drivers traversing the Hana Road as well.

Noteworthy, the day visitor to the Hana area also contributes to the visitor economy of the island, another day's accommodations on the island, another day's car rental with the additional fuel revenue to cover the drive to and from the Hana area, the County's share of the inherent (fuel, accommodations, real property, vehicle) taxes, the workforce requirements to service these accommodations, service the vehicles rented, provision of meals for the additional days stayed on the island. Further, the revenues generated for tour van companies (located outside of the Hana Area) who book and transport visitors to and from Hana.

Need to be answered:

First: Identify the streams which are considered "scenic vistas".

(Fairly competent sources could be Tour drivers transporting day visitors to and from Hana along the Hana road.)

Second: Will proposed diversions reduce the attractiveness of the scenic vistas, the waterfalls cascading, the streams flowing, which currently attract many day visitors to the Hana area?

Third: Will proposed diversions reduce number of day visitors to the Hana area?

Fourth: What will be the economic effects of reduced day visitor traffic to the Hana area?

- (a) To Hana area residents?***
- (b) To Hana area businesses?***

Fifth: What will be the economic effects of reduced day visitor traffic to the Hana area?

- (a) To Maui Island economy?***
- (b) To tax revenues of County of Maui and to the State of Hawaii?***

Mahalo for your considerations of these concerns. Looking forward to your responses.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Bill Fuhrmann:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *For years, to see cascading waterfalls and full stream flows, visitors needed to travel the Hana Road (note: the “Hana Road” as herein expressed is viewed as the narrow winding road to the Hana area, not as the entirety of Hana Highway which begins in Kahului) during periods of fairly considerable and consistent rainfall, which, as most of us Hana area residents know, is when the traveling is most treacherous, avoiding deep pot holes full of water; rocks, dirt and vegetation falling down onto the roads; rock slides and landslides inhibiting part of the width of the road or worst blocking the entire width of the road; limited visibility; bridges, mostly being the lower ends of the roadways, being full of water.*

Recently, the scenic vistas, waterfalls cascading, streams flowing, along the Hana Road became revitalized over the last couple of years, coinciding with the demising of the sugar crops of HC&S and the lessening demand for diversions of East Maui streams. This revitalizing of scenic vistas has resulted in significant increase of day visitors to the Hana area correlating to significant increase of vital economic resources (day visitor spending) to the Hana area. (For this discussion, Hana area includes all communities, areas of residencies along the Hana Road, including the road to Kipahulu’s Oheo

10238-04

Letter to Mr. Bill Fuhrmann

Page 2 of 5

September 3, 2021

Haleakala National Park area.) This increase in road traffic is also the main root to the “traffic congestion problems” faced by the Hana based drivers traversing the Hana Road as well.

Response 1: It is recognized that waterfalls and stream flows are part of the scenic vistas that attract visitors to East Maui and that these visitors contribute to the economy in Hāna. Although data is not available on number of visitors to East Maui, it is noted that the years since HC&S has halted sugar cultivation has also coincided with record numbers of visitor arrivals to the State of Hawai‘i and island of Maui. Between 2014 and 2019, data from the State of Hawai‘i, Department of Business, Economic Development, and Tourism indicates that visitor arrivals to Maui have increased from 2.4 million visitors to 3.1 million visitors.

It is discussed throughout the EIS that the amount of water available for diversion through the EMI Aqueduct System should the Water Lease be issued, will be limited by the IIFS established under the CWRM D&O. The CWRM D&O limits the amount of water that can be diverted, and those limitations apply under all weather conditions, including when the natural flow is low due to dry weather. Hence, the amount of water that can be diverted during dry weather conditions would be substantially less than when sugar was being cultivated. We also note that in setting the IIFS, CWRM took into account “Aesthetic values such as waterfalls and scenic waterways.” This is reflected in Findings of Fact made by CWRM in the CWRM D&O as follows: “When setting IIFS, the information that is considered in connection with aesthetic values such as waterfalls and scenic waterways is the presence of scenic views, waterfalls and whether there is tourism in the area.” and “Aesthetics is a multi-sensory experience related to an individual’s perception of beauty. As a subjective value, aesthetics cannot be quantitatively determined. Elements, such as waterfalls and cascading plunge pools that appeal to an observer’s visual and auditory senses.” (CWRM D&O, FOF 70, 71) and numerous other FOF that addressed the aesthetic values of the specific streams.

With the limitations on the amount of water diverted, adverse impacts to tourism due to streamflow are not anticipated. Rather, tourism in East Maui represents a subset of the overall Maui tourism economy and trends in visitors to Hāna will correlate with trends in overall visitor arrivals to the State and island. Please note that this has been added to Section 4.9 of the Final EIS as shown in pages 4-311 to 4-312.

Comment 2: *Noteworthy, the day visitor to the Hana area also contributes to the visitor economy of the island, another day’s accommodations on the island, another day’s car rental with the additional fuel revenue to cover the drive to and from the Hana area, the County’s share of the inherent (fuel, accommodations, real property, vehicle) taxes, the workforce requirements to service these accommodations, service the vehicles rented, provision of meals for the additional days stayed on the island. Further, the revenues generated for tour van companies (located outside of the Hana Area) who book and transport visitors to and from Hana.*

Response 2: We acknowledge your comments. It is well known that Hawai‘i’s visitor economy is a major contributor to all the islands’ local economies as well as the overall State economy. As noted in Response #1 above, between 2014 and 2019, data from the State of Hawai‘i, Department of Business, Economic Development, and Tourism indicates that visitor arrivals to Maui have increased from 2.4 million visitors to 3.1 million visitors.

Comment 3: Need to be answered:

First: Identify the streams which are considered “scenic vistas”.

(Fairly competent sources could be Tour drivers transporting day visitors to and from Hana along the Hana road.)

Response 3: Please note that the entire Road to Hāna is categorized as a scenic vista. As discussed in Section 4.9 of the Draft EIS:

Several scenic view planes can be found within the vicinity of the License Area. Specifically, the License Area is located along the slopes of Haleakalā in East Maui, and affords views of the ocean to the north and the peak of Haleakalā to the south. The scenic drive along the Hāna Highway was recognized in 2000 when President Clinton designated the Hāna Millennium Legacy Trail. The following year it was listed in the National Register of Historic Places. The drive along Hāna Highway is notable for views of waterfalls, including those in streams flowing out of the License Area. The highway also features waysides, lookouts and trails discussed Section 4.7.1.

As noted in Response #1 above, CWRM took into account “Aesthetic values such as waterfalls and scenic waterways.” This is reflected in Findings of Fact made by CWRM in the CWRM D&O as follows: “When setting IIFS, the information that is considered in connection with aesthetic values such as waterfalls and scenic waterways is the presence of scenic views, waterfalls and whether there is tourism in the area.” and “Aesthetics is a multi-sensory experience related to an individual’s perception of beauty. As a subjective value, aesthetics cannot be quantitatively determined. Elements, such as waterfalls and cascading plunge pools that appeal to an observer’s visual and auditory senses.” (CWRM D&O, FOF 70, 71) and numerous other FOF that addressed the aesthetic values of the specific streams.

The streams that the CWRM D&O recognized as having opportunities for scenic views are Waikamoi, Puohokamoa, Ha’ipua’ena, Honomanū, Nua’ailua, Pi’ina’au, ‘Ōhi’a, Waiokamilo, Wailuānui, West Wailuāiki, East Wailuāiki, Kopili’ula, Waiohue, Hanawī, and Makapipi streams. Please note that this has been added to Section 4.9 of the Final EIS as shown in pages 4-311 to 4-312.

Comment 4: Second: Will proposed diversions reduce the attractiveness of the scenic vistas, the waterfalls cascading, the streams flowing, which currently attract many day visitors to the Hana area?

Response 4: The Proposed Action is not anticipated to have adverse impacts on scenic resources in the East Maui region subject to assessment in this EIS. As noted in Response #1 above, CWRM took into account “Aesthetic values such as waterfalls and scenic waterways.” This is reflected in Findings of Fact made by CWRM in the CWRM D&O as follows: “When setting IIFS, the information that is considered in connection with aesthetic values such as waterfalls and scenic waterways is the presence of scenic views, waterfalls and whether there is tourism in the area.” and “Aesthetics is a multi-sensory experience related to an individual’s perception of beauty. As a subjective value, aesthetics cannot be quantitatively

determined. Elements, such as waterfalls and cascading plunge pools that appeal to an observer's visual and auditory senses.” (CWRM D&O, FOF 70, 71) and numerous other FOF that addressed the aesthetic values of the specific streams. No significant impacts on visual resources in the region are anticipated because no new construction or land alteration is planned for the License Area. However, in the short-term, measuring from the current time, where diversions are lower due to reduced, but growing agricultural activity in Central Maui, against the time when Mahi Pono's diversified agriculture needs begin to use the maximum amount of water permitted, there will be a decrease in stream flows and waterfalls that can be viewed along Hāna Highway. However, these changes must be considered in a historical context as well: the impacts to such visual resources under the Proposed Action will be far less than the impacts over the years of sugarcane operations when vastly more water was diverted from East Maui than is planned under the Proposed Action.

Comment 5: *Third: Will proposed diversions reduce number of day visitors to the Hana area?*

Response 5: As noted in Response #1 above, with the limitations on the amount of water diverted, adverse impacts to tourism due to streamflow are not anticipated. Rather, tourism in East Maui represents a subset of the overall Maui tourism economy and trends in visitors to Hāna will correlate with trends in overall visitor arrivals to the State and island.

Comment 6: *Fourth: What will be the economic effects of reduced day visitor traffic to the Hana area?*

(a) To Hana area residents?

(b) To Hana area businesses?

Fifth: What will be the economic effects of reduced day visitor traffic to the Hana area?

(a) To Maui Island economy?

(b) To tax revenues of County of Maui and to the State of Hawaii?”

Response 6: As noted in Response #1 and Response #6 above, with the limitations on the amount of water diverted, adverse impacts to tourism due to streamflow are not anticipated. Rather, tourism in East Maui represents a subset of the overall Maui tourism economy and trends in visitors to Hāna will correlate with trends in overall visitor arrivals to the State and island.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

10238-04
Letter to Mr. Bill Fuhrmann

Subject: Water lease Opposition
Attachments: DEIS Water Lease Opposition.docx

To whom it may concern,

My name is Casey Morondos. I grew up in Hana but now reside in Makawao. I strongly disagree with The Proposed Water Lease for the Nahiku, Ke'anae, Honomanu, and Huelo License Draft Environmental Impact Statement other known as the "D.E.I.S." This million dollar business, Mahi Pono, still in its infancy has acquired 41,000 acres of sugarcane land and 15,000 acres of E.M.I (East Maui Irrigation) land. This new company created in late 2018, has a goal of ultimately having control of the water or filling their pockets either way. They claimed in their 2,700 page draft that the people and the environment would not be affected by the disappearance of our water. They have not provided any evidence that supports their claim. However there is plenty of evidence from years of desolation when A&B (Alexander & Baldwin), Mahi Pono's predecessor, had diverted away the wa Terry. This is Hawai'i where "Ola I ka Wai." Our water is our life! Despite several claims, our delicate eco-system has been severely un-balanced and is threatened once more to say goodbye to a group of already endangered species. not only will Nature suffer but also those who depend on the rivers and the ocean to feed there families.

This company has made a statement saying that there will be no impact on the environment when they divert all of the water. They are wrong. There are many different species that exist only in their fresh water habitat. Let me first explain the different areas within a river. There is "Ki'u Wai," the pool area where it is deep with little movement. There is "Wai Ko'ie'ie," the run where the water moves swiftly. "Kahena Hulili," the riffle is where the water is shallow but also fast moving. The "Waialele" or the waterfall is when water will fall vertically before continuing downstream. All of these which connect down to the "Muliwai" or the estuary. This is where the river connects to the ocean producing a salt/fresh water mix. Now within each of these parts of river strive different stream life. All of whom need more than a trickle of water to survive. Most commonly found species within these waters are of O'opu, 'Opae and snail variety. The "O'opu Nakea" lives in the Ki'o Wai and feeds off of fresh water Algae, small crustaceans and worms. Flowing water that reaches the oceans is crucial for any 'O'opu life cycle. The eggs are laid, hatched and the larvae will drift down into the ocean for 4 to 6 months before traveling back upstream to grow and respawn. The "Opae Kala'ole" is an endemic fresh water shrimp. They dwell within the Kahena Hulili or the riffle. Although if threatened, they have been known to escape by climbing the waterfall. Their diet consists of algae and animal matter. Hawaiians considered this a favorite food and often referred to their rivers as a " Natural Refrigerator." Within the Kahena Hulili, the water is shallow but also fast moving. This helps the leaves build up in shallow areas making it perfect hunting grounds for numerous stream insects. The "O'opu Nopili" also prefers the fast moving water. If thriving, these fishes are indicators of a healthy river. The "O'opu Nopili" also have to spawn in the muliwai. Within the Waialele or the waterfall travels the "O'opu Alamo'o." These O'opu have a special dorsal fin combined with adept climbing skills. This makes them perfect to travel vertically up any waterfall preferring the cleaner, undisturbed streams. They eat algae and small invertebrates. Finally all of these pieces

of river connects to a Muliwai or “hapa” wai. The estuary that plays a vital part in the O'opu survival as well as other fishes. The special mixture of salt and fresh water is essential for the respawn. Here is where the prawns live. The 'Opae Oeha'a thrives in the muliwai and it eats algae and animal matter. There are only three endemic neretid snails found in Hawai'i. The Hihiwai or the fresh water snail flourishes in fresh water but the eggs they lay will be washed out into the ocean. They will spend most of their juvenile life within the salt water but eventually pulling themselves back upstream with their strong, muscular foot. These were well known to be a delicacy of the olden Hawaiians. The shells of the Hihiwai has been found in refuse piles in the ruins of ancient Hawaiian settlements. The Auku'u bird or the Night Heron has also favored Hihiwai as a source of food. But they also eat other river inhabitants such as crustaceans, frogs and fish. These birds were once well known to populate O'ahu and its many rivers but has since disappeared since the many river modifications. All of these species have one common mortal need. The river must be flowing. There must be enough water in our streams in order to reach the ocean. Do not take away away their habitat. A 30 year lease would be too long for these species to be without water. Taking away the water would be to cause the very extinction of this wildlife, this form of sustenance. The greatest fertile land is on East Maui, not in Central Maui.

Another thing to worry about is the cultural loss that the Community will feel. As I have previously mentioned, all of these river creatures are rare delicacy. Although I have not mentioned the effects on the ocean life under the circumstances, let's not forget about the effects that further support my resounding disapproval. One main food source from the ocean is the 'Akule fish. Since the return of the water after the closure of the Sugar Mill, there has been a bounty of 'Akule. The communities often come together when the fishing boats get back and work side by side to remove the fishes from the net. By the time the nets are cleared, the fish is then equally separated and passed out for each family who stayed to help. This interaction helps to bring together the community while keeping our Cultural traditions alive. Another tradition that needs to also be upheld is the gathering of 'Opae and O'opu. The taste for these river delicacies have been passed down through our generations. Now without the water, we will lose this food source forever. They will not reappear after 30 years. Another issue included in the Draft Lease was the clause that allows private property to be accessed without permission to get to the river. This is a violation of rights. There is no way this should be allowed. Neither should they be able to divert from anyone's property either. A disturbing fact that Mahi Pono did not mention in inkling about saving any water for The Department of Hawaiian Homelands. How is residency being devoid of living water, not a cultural impact? They also falsified that if not granted the lease, Upcountry Maui would not get water. How do false facts lure an entire State into trusting that this company will have our well-being in mind? This is not the kind of company that I would trust to have absolute control of our water for 30 years.

I implore to the State, to BLNR, to anyone who has a position of power, to not allow this to happen. I know one letter wont make a difference but maybe my letter will spark

ideas which would better protect the East Maui Water from abuse. I have a suggestion of creating a Board of the Waters of Nahiku, Ke'anae, Honomanu and Huelo Ahupua'a. Each community will elect one spokesperson to sit on the board to represent their communities ideas. This Board of community members would be ideal to make any decisions concerning the water because their very likelihood depends on it. This way the public would be able to control who and where the water is going and how much to divert without any harm. The rights to our water should not be sold for the sole purpose of profit. The State defines water as a " Public Trust." For Hawaii's Water Resources to be controlled and regulated for the benefits of it's people. That does not mean to sell ownership to a company that was only created because of the want to buy land and water. They claim to be a farming company but have done little farming since their random poor into existence. Why isn't there rules that a company needs to be in business for a minimum of 5 years before applying with something as drastic as a 2,700 page draft asking for 30 years of control. Why make it so easy for a brand new company with big pockets and bad intentions to buy their way into power. Another requirement should be for the drafting company to give e the public enough time to thoroughly inspect their proposed document. The last and final request from me is that the BLNR prepare their own draft and have a public auction. This way the BLNR can control the terms. All the while the public can be fully aware of the details concerning our water. Everything I have presented would be a better solution. There is no benefits except for the pockets of Mahi Pono. Why not deny them their lease? There will be no extinction of any stream or ocean life. If the lease is denied, A&B will still have to rebate Mahi Pono approximately \$31 million dollars. This solidifies the fact that Mahi Pono's only interest is power and money. That is why I'm writing. I'm tired of our island and culture suffering because of greed and money. Above all else should come self-preservation to ensure the safety to uphold our culture, to preserve our Endemic creatures and for the safe-keeping of our people. Since when is "money" more important than culture? I plead with whoever this letter reaches to not give Mahi Pono any power over anything. Deny their request for the sake of our stream life. Let them collect from A&B and let ok ur streams, our creatures and our people thrive! Stop this before it is too late to fight for our water back. Do not let Mahi Pono and their private California Lawyer the satisfaction. Stand by our island and its Natives.

I hope this letter provides enough insights into why this lease is unacceptable. I do hope that my ideas will be considered at least. In my sincerity, I do hope my letter will make a difference. Do not turn your backs on us.

From the heart, Casey Morondos.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Casey Morondos:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *My name is Casey Morondos. I grew up in Hana but now reside in Makawao. I strongly disagree with The Proposed Water Lease for the Nahiku, Ke'anae, Honomanu, and Huelo License Draft Environmental Impact Statement other known as the "D.E.I.S."*

Response 1: We acknowledge your comments and understand that you disagree with the issuance of a Water Lease assessed within the EIS.

Comment 2: *This million dollar business, Mahi Pono, still in its infancy has acquired 41,000 acres of sugarcane land and 15,000 acres of E.M.I (East Maui Irrigation) land. This new company created in late 2018, has a goal of ultimately having control of the water or filling their pockets either way.*

Response 2: Please note as discussed in Section 1.1 of the Draft EIS, A&B sold majority of its former sugarcane lands in Central Maui to Mahi Pono and its objective is to transition as much of the former sugarcane land as possible to diversified agriculture. Under the Proposed Action, the utilization of waters delivered from the EMI Aqueduct System will be an essential element to

the success of any such diversified agricultural pursuits in Central Maui. Hence, without the water, Mahi Pono will be able to achieve this objective.

Comment 3: *They claimed in their 2,700 page draft that the people and the environment would not be affected by the disappearance of our water. They have not provided any evidence that supports their claim. However there is plenty of evidence from years of desolation when A&B (Alexander & Baldwin), Mahi Pono's predecessor, had diverted away the water. This is Hawai'i where "Ola I ka Wai." Our water is our life! Despite several claims, our delicate eco-system has been severely un-balanced and is threatened once more to say goodbye to a group of already endangered species. not only will Nature suffer but also those who depend on the rivers and the ocean to feed there families.*

Response 3: We acknowledge your comments. However, please note that nowhere in the Draft EIS is it state that environment or people would not be affected by the Proposed Action. Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it

relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown in pages 4-331 to 4-336.

With regards to endangered species, it is noted in Appendix C that that low-elevation portions of the License Area are already highly impacted by invasive plants. However, it is noted in Appendix C that high-elevation portions of the License Area are predominately dominated by native species and is very likely to contain habitat for several endangered or threatened species. Impacts related to flora and fauna as a result of the Proposed Action are discussed in Section 4.4 of the EIS. Please note that Section 4.4.1 and Section 4.4.2 have been revised in the Final EIS based on comments received on the Draft EIS to further outline the existing conditions of the License Area and more accurately reflect targeted mitigation measures based on feedback provided by the DLNR and USFWS. See pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS.

Comment 4: *This company has made a statement saying that there will be no impact on the environment when they divert all of the water. They are wrong. There are many different species that exist only in their fresh water habitat. Let me first explain the different areas within a river. There is "Ki'u Wai," the pool area where it is deep with little movement. There is "Wai Ko'ie'ie," the run where the water moves swiftly. "Kahena Hulili," the rifle is where the water is shallow but also fast moving. The "Wailele" or the waterfall is when water will fall vertically before continuing downstream. All of these which connect down to the "Muliwai" or the estuary. This is where the river connects to the ocean producing a salt/fresh water mix. Now within each*

of these parts of river strive different stream life. All of whom need more than a trickle of water to survive. Most commonly found species within these waters are of O'opu, 'Opae and snail variety. The "O'opu Nakea" lives in the Ki'o Wai and feeds off of fresh water Algae, small crustaceans and worms. Flowing water that reaches the oceans is crucial for any 'O'opu life cycle. The eggs are laid, hatched and the larvae will drift down into the ocean for 4 to 6 months before traveling back upstream to grow and respawn. The "Opae Kala'ole" is an endemic fresh water shrimp. They dwell within the Kahena Hulili or the riffle. Although if threatened, they have been known to escape by climbing the waterfall. Their diet consists of algae and animal matter. Hawaiians considered this a favorite food and often referred to their rivers as a "Natural Refrigerator." Within the Kahena Hulili, the water is shallow but also fast moving. This helps the leaves build up in shallow areas making it perfect hunting grounds for numerous stream insects. The "O'opu Nopili" also prefers the fast moving water. If thriving, these fishes are indicators of a healthy river. The "O'opu Nopili" also have to spawn in the muliwai. Within the Wailele or the waterfall travels the "O'opu Alamo'o." These O'opu have a special dorsal fin combined with adept climbing skills. This makes them perfect to travel vertically up any waterfall preferring the cleaner, undisturbed streams. They eat algae and small invertebrates. Finally all of these pieces of river connects to a Muliwai or "hapa" wai. The estuary that plays a vital part in the O'opu survival as well as other fishes. The special mixture of salt and fresh water is essential for the respawn. Here is where the prawns live. The 'Opae Oeha'a thrives in the muliwai and it eats algae and animal matter. There are only three endemic neretid snails found in Hawai'i. The Hihiwai or the fresh water snail flourishes in fresh water but the eggs they lay will be washed out into the ocean. They will spend most of their juvenile life within the salt water but eventually pulling themselves back upstream with their strong, muscular foot. These were well known to be a delicacy of the olden Hawaiians. The shells of the Hihiwai has been found in refuse piles in the ruins of ancient Hawaiian settlements. The Auku'u bird or the Night Heron has also favorited Hihiwai as a source of food. But they also eat other river inhabitants such as crustaceans, frogs and fish. These birds were once well known to populate O'ahu and its many rivers but has since disappeared since the many river modifications. All of these species have one common mortal need. The river must be flowing. There must be enough water in our streams in order to reach the ocean. Do not take away away their habitat. A 30 year lease would be too long for these species to be without water. Taking away the water would be to cause the very extinction of this wildlife, this form of sustenance. The greatest fertile land is on East Maui, not in Central Maui.

Response 4: Please note that nowhere is it stated that there will be no impacts if stream water is diverted. Please note that the HSHEP model in Appendix A estimates streamflow at all diversion locations based on watershed and rainfall characteristics and analyzes each reasonable alternative on stream flow in Section 3.4.3 and Section 4.2.1 of the Draft EIS. The combination of the lower and upper bounds used for the HSHEP model in Appendix A, provide the range at which we

would expect changes to the diversions to fall within and provides a way to comparatively discuss different flow restoration scenarios as by definition the changes must fall somewhere between 100% diversion and 0% diversion.

The two scenarios presented in Appendix A of the Draft EIS, the Proposed Action compliant with the CWRM D&O (Trutta Environmental Solutions' 2018 IIFS scenario) and No Action Alternative (30% remaining flow diversion) are examples of how different flow restoration scenarios result in different amounts of habitat restored. The HSHEP model is used to quantify these differences based on flow restoration changes at specific diversions.

As discussed in Section 3.4.3 of the Draft EIS, the HSHEP model requires specific diversion conditions at each diversion. Applying the model to the Reduced Water Volume alternative would require information regarding where stream flows are proposed to be increased over the Proposed Action and the amounts. Given such information, the HSHEP model is able to readily calculate the number of remaining Habitat Units (HU) in any given scenario. The appendices contained within the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report (Appendix A of the EIS) provides the necessary data to form a scenario that the HSHEP model can use to analyze and quantify the changes that occur. Hence, the HSHEP model and the appendices within the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report provides data that can assist decision makers understand how impacts could change across different diversions scenarios.

Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown in pages 4-61 to 4-62 of the Final EIS. The above excerpt and the updated text in pages 4-61 to 4-62 of the Final EIS present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd)

diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See pages 4-61 to 4-62 of the Final EIS.

With regards to 'o'opu, hīhīwai, and 'ōpae, please note that the HSHEP model included the report in Appendix A which is summarized in Section 4.2.1 of the EIS found that under the Proposed Action the habitat for species such as 'ōpae, 'o'opu, and hīhīwai would increase from what was available under historic diversion rates.

Comment 5: *Another thing to worry about is the cultural loss that the Community will feel. As I have previously mentioned, all of these river creatures are rare delicacy. Although I have not mentioned the effects on the ocean life under the circumstances, let's not forget about the effects that further support my resounding disapproval. One main food source from the ocean is the 'Akule fish. Since the return of the water after the closure of the Sugar Mill, there has been a bounty of 'Akule. The communities often come together when the fishing boats get back and work side by side to remove the fishes from the net. By the time the nets are cleared, the fish is then equally separated and passed out for each family who stayed to help. This interaction helps to bring together the community while keeping our Cultural traditions alive.*

Response 5: With regards to cultural impacts, Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au,

Waiokamilo, Wailuānui (Waikani Waterfall), Kopili‘ula, Pa‘akea, Kapā‘ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua‘aka‘a Tributary, and Waia‘aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo‘i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe‘e, Puohokamoa, Ha‘ipua‘ena, Punala‘u (Kōlea and Ulunui Tributaries), Honomanū, Nua‘ailua, Pi‘ina‘au, Palauhulu (Hauoli Wahine and Kano Tributaries), ‘Ōhi‘a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili‘ula, Pua‘aka‘a, Pa‘akea, Waia‘aka, Kapā‘ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, see pages 4-239 to 4-252 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared

for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Please note that many people at the EISPN public scoping meetings on February 22nd and 23rd, 2017 testified noting positive impacts seen from increased stream flow resulting from the cessation of sugar operations, please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See pages 4-239 to 4-252 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane

operations in 2016 due to less stream water being diverted. This is expected as it was discussed in Section 4.2.1 of the Draft EIS that the Proposed Action would increase the number of HU as compared to sugarcane operations. Please note that as of October 2020, an average of 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System. Hence it can be assumed that current water diversion rates from the License Area are comparable to the amount that would be diverted under the No Action alternative, which is estimated to be approximately 26.39 mgd. The HSHEP model estimated that approximately 79.8% of total HU would be available under the No Action alternative. However, please note that under the Proposed Action, the total HU would be less than projected under the No Action alternative.

However, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83 of the Final EIS.

Comment 6: *Another tradition that needs to also be upheld is the gathering of 'Opae and O'opu. The taste for these river delicacies have been passed down through our generations. Now without the water, we will lose this food source forever. They will not reappear after 30 years.*

Response 6: We acknowledge your comments. As noted in Response #4 above, please note that the HSheP model included the report in Appendix A which is summarized in Section 4.2.1 of the EIS found that under the Proposed Action the habitat for species such as ‘ōpae, ‘o‘opu, and hīhīwai would increase from what was available under historic diversion rates.

Comment 7: *Another issue included in the Draft Lease was the clause that allows private property to be accessed without permission to get to the river. This is a violation of rights. There is no way this should be allowed. Neither should they be able to divert from anyone’s property either.*

Response 7: Please note that there is nothing in the Draft EIS that has a clause allowing for access into private property. The EIS is an environmental disclosure document and does not authorize or mandate anything. Please note that the Water Lease is assumed to be drafted after the EIS process has commenced.

Comment 8: *A disturbing fact that Mahi Pono did not mention in inkling about saving any water for The Department of Hawaiian Homelands. How is residency being devoid of living water, not a cultural impact?*

Response 8: We respectfully disagree with your comment. Specific information regarding the Department of Hawaiian Home Lands’ (DHHL) future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL’s Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes

Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd as shown in pages 2-4 to 2-7 of the Final EIS. As explained in pages 2-4 to 2-7 of the Final EIS, the DHHL water reservation process involves several steps before a reservation amount is formally identified. The first step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following adoption of the Beneficiary Consultation Report and an authorization to the Chairman to seek a reservation of water, CWRM could act on a reservation request related to a proposed lease.

As explained in Section 2.1.1 of the Draft EIS, DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B/EMI, Mahi Pono, the Department of Land and Natural Resources' (DLNR) Land Division, and DHHL staff and consultants. The results of the Beneficiary Consultation were presented to the HHC on May 30, 2019, as agenda item G-2. The motion passed by the HHC to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation request was approved by the HHC related to the EMI Aqueduct System for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

While Mahi Pono's current farm plan assumes the full use of the water that can be diverted from East Maui streams after compliance with the CWRM D&O, Mahi Pono will be obligated to reduce elements of its farm plan, and thus the availability of crop, to accommodate the permanent reduction in available water resulting from DHHL's allocation. The Reduced Water Volume alternative described in Chapter 3 of the EIS provides an assessment of the impacts of less water being made available for the Proposed Action, including Maui Pono farm plan in the Central Maui agricultural fields. Specifically, consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture.

You are correct that Section 2.1.1 of the Draft EIS stated, with respect to the DHHL reservation, that "*Until that reservation is physically claimed, however, it will be available for use by the lessee.*" That statement has been clarified in the Final EIS as shown in pages 2-4 to 2-7 of the Final EIS, as it is uncertain whether the DHHL reservation amount would be available to the lessee until such time as it is needed by DHHL. Such temporary uses of the DHHL reservation water are not addressed under HRS § 171-58. We further acknowledge that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessor and the DHHL would be necessary to allow any temporary use of water reserved for DHHL.

Please note that as discussed in Section 2.1.2 of the Draft EIS, under the Proposed Action, at full buildout of the Mahi Pono farm plan, it is estimated that approximately 87.95 mgd will be diverted from the License Area and an additional 4.37 mgd in between Honopou Stream and Māliko Gulch to support uses described in the EIS. However, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

Comment 9: *They also falsified that if not granted the lease, Upcountry Maui would not get water. How do false facts lure an entire State into trusting that this company will have our well-being in mind? This is not the kind of company that I would trust to have absolute control of our water for 30 years.*

Response 9: Please note that the source of surface water for MDWS to serve Upcountry Maui comes either directly from the EMI Aqueduct System or from land owned by EMI. The MDWS' right to access this source on a long-term basis is contingent upon the issuance of the Water Lease. As discussed in Section 3.3 of the Draft EIS:

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. As a consequence, domestic and agricultural water needs in Upcountry Maui would need to be met by alternative water sources that would need to be developed by the MDWS. At this point in time, it is unknown whether sufficient groundwater resources exist in Upcountry Maui to meet these water demands. It is anticipated that the development of alternative water-source infrastructure would be prohibitively expensive, and depending upon the specific sources, or combination of sources, could result in significant direct adverse impacts to the environment.

Comment 10: *I implore to the State, to BLNR, to anyone who has a position of power, to not allow this to happen. I know one letter wont make a difference but maybe my letter will spark ideas which would better protect the East Maui Water from abuse. I have a suggestion of creating a Board of the Waters of Nahiku, Ke'anae, Honomanu and Huelo Ahupua'a. Each community will elect one spokesperson to sit on the board to represent their communities ideas. This Board of community members would be ideal to make any decisions concerning the water because their very likelihood depends on it. This way the public would be able to control who and where the water is going and how much to divert without any harm. The rights to our water should not be sold for the sole purpose of profit.*

Response 10: We acknowledge your comments. Please note that the terms and conditions of the Water Lease are at the discretion of the BLNR. Should the BLNR make this a term of the Water Lease, the lessee will comply with those terms and conditions.

Comment 11: *The State defines water as a “ Public Trust.” For Hawai'i's Water Resources to be controlled and regulated for the benefits of it's people. That does not mean to sell ownership to a company that was only created because of the want to buy land and water.*

Response 11: Regarding your comment about the Public Trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown in pages 1-25 to 1-27.

Comment 12: *They claim to be a farming company but have done little farming since their random poor into existence. Why isn't there rules that a company needs to be in business for a minimum of 5 years before applying with something as drastic as a 2,700 page draft asking for 30 years of control. Why make it so easy for a brand new company with big pockets and bad intentions to buy their way into power.*

Response 12: We respectfully disagree with your comment. Please note that Mahi Pono has been farming the Central Maui agricultural fields since they were sold A&B's former sugarcane land in December 2018 and has been expanding their agricultural operations since then. It is acknowledged that Mahi Pono is new entity that has just been recently formed with the goal of

operating a large diversified agriculture farm in Hawai'i. However, in its first 18 months of existence, Mahi Pono has hired over 200 workers from Maui, most of whom have farm experience on the island. In addition, Mahi Pono's management has significant experience cultivating diverse crops on more than 100,000 acres on the continental U.S. Also, the company has established market channels, and substantial financial resources. The Mahi Pono farm plan is discussed not only in the Executive Summary, but in detail in Section 2.1.4. and Section 4.7.4, as well as Appendix I. Water requirements for 2030 are discussed in Subsection 9.a of Appendix I, with details provided in Table 3, Section 3.a of Appendix I. This table includes average daily per-acre water requirements by crop. Production figures are discussed in Subsection 10.a, with details provided in Table 4, Section 4.a of Appendix I.

The Mahi Pono farm plan will evolve over time based on a number of factors, including the available supply of surface water, experience which will be gained on crops that grow well in Central Maui, crops that are profitable, the size of the market for profitable crops, etc.

Comment 13: *Another requirement should be for the drafting company to give the public enough time to thoroughly inspect their proposed document.*

Response 13: Please note that it is not within the EIS preparer's purview to decide the length of time for public comments. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai'i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 14: *The last and final request from me is that the BLNR prepare their own draft and have a public auction. This way the BLNR can control the terms. All the while the public can be fully aware of the details concerning our water.*

Response 14: Please note that BLNR determined that A&B was to prepare the EIS for the proposed Water Lease. As explained in Section 1.4 of the Draft EIS, in connection with A&B's May 2001 submittal to the BLNR requesting that the BLNR offer a long-term (30 year) water lease at public auction, A&B offered to perform the associated HRS, Chapter 343 environmental review. As part of the contested case hearing on the proposed Water Lease, NHLC, on behalf of Nā Moku, objected to A&B undertaking the environmental review process, and asserted that the BLNR was required to prepare conduct the environmental review. NHLC later orally withdrew its objection during oral arguments before the BLNR in May 2015. BLNR issued an order on April 14, 2016, directing A&B to scope the EIS, including the identification of the portions of the EIS that could proceed prior to the CWRM issuing a final IIFS decision, and those portions which could not. That scope was filed with the BLNR in June 2016. On July 8, 2016, the BLNR approved the scope and instructed that "A&B and EMI should proceed with the preparation of an

environmental impact statement (EIS) in as expeditious manner as possible.” The EIS recites this history in Section 1.3.3 of the Draft EIS and recognizes that the Water Lease will be awarded by public auction.

Comment 15: *Everything I have presented would be a better solution. There is no benefits except for the pockets of Mahi Pono. Why not deny them their lease? There will be no extinction of any stream or ocean life. If the lease is denied, A&B will still have to rebate Mahi Pono approximately \$31 million dollars. This solidifies the fact that Mahi Pono’s only interest is power and money.*

Response 15: We acknowledge your comments. However, please note that impacts of the No Action alternative are discussed in Section 3.4 of the EIS (Comparative Evaluation of Reasonable Alternatives) against different environmental resource categories.

Comment 16: *That is why I’m writing. I’m tired of our island and culture suffering because of greed and money. Above all else should come self-preservation to ensure the safety to uphold our culture, to preserve our Endemic creatures and for the safe-keeping of our people. Since when is “money” more important than culture? I plead with whoever this letter reaches to not give Mahi Pono any power over anything. Deny their request for the sake of our stream life. Let them collect from A&B and let our streams, our creatures and our people thrive! Stop this before it is too late to fight for our water back. Do not let Mahi Pono and their private California Lawyer the satisfaction. Stand by our island and its Natives.*

I hope this letter provides enough insights into why this lease is unacceptable. I do hope that my ideas will be considered at least. In my sincerity, I do hope my letter will make a difference. Do not turn your backs on us.”

Response 16: We acknowledge your comments and appreciate your participation in this EIS process.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC’s website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Huelo, Hawaii November 7, 2019

Thank you for allowing public comment on this Draft EIS. I am responding as a long-time resident of Huelo and an agronomist. I received a BS in Agronomy with High Honors from Michigan State University, took an additional 2 years of technical training in Scandinavia and Austria, farmed in the Mid-West for 25 years and worked with farmers in the tropics of Viet Nam. About 10 years ago I began an earnest study of climate change and Regenerative Agriculture as:

1. a solution to the carbon loss created by industrial agriculture
2. a mitigation mechanism to the extremes in climate that have begun.

I understand too well the threats of climate change to the lives of my three Hawaiian born grandchildren. I believe that we all owe it to future generations to do our best to protect them with the actions we take today. It is from this background that I respectfully ask you to include answers to the following questions in the final EIS regarding a 30-year water lease to a private company. We live on an island and I am not trying to demonize Mahi Pono – I am simply trying to look out for the public good.

Questions concerning Agricultural Best Practices

1. In the DEIS it is repeatedly stated that Mahi Pono will use best management practices BMP for their agriculture, yet they are using excessive tillage and laying thousands of acres bare in the Central Valley. This violates the two most important principals of Regenerative Agriculture as well as the two most important practices declared by the United Nations IPCC as BMP for mitigating climate change
 - Never use excessive tillage because it destroys soil structure, cuts Mycorrhizal fungi hyphae that protect the soil from erosion and collapses the pores that allow for good drainage and air infiltration

- Never allow soil (particularly in the tropics or sub tropics) to lie bare in the sun as it destroys microbial life and releases soil sequestered carbon

So my question is how is leaving thousands of acres bare and subject to wind and water erosion considered BMP? (Please note that the Bayer agricultural managers do not allow bare ground in their operation in Kihei specifically to protect the reef).

2. Although Mahi Pono won public support when they said that they would be farming organically if not regeneratively, it is obvious from the way that they are approaching their soil preparation that they will be using fertilizers and pesticides and that these petro-chemicals will be entering our near-shore ocean. The DEIS was inadequate in revealing the amount and types of fertilizers and pesticides they intend to use and the effect these chemicals will have on our near-shore reefs.
3. It has been proven that each 1% increase in soil organic matter increases the soils water holding capacity by an average of 25,000 gals per acre and an increase in the Central Valley of at least 5% organic matter should be achievable allowing an additional 125,000 gals of water to become stored in the soil and plant available per acre. The DEIS did not include how Mahi Pono intends to address the building of soil carbon as a response to climate change and as a water conserving mechanism.
4. Given that modern systems of buried irrigation can reduce water consumption by 25% with a reasonable ROI the DEIS did not include Mahi Pono's plan for using water conserving irrigating systems. The DEIS did not explain how if given a lease for water from State lands that it will be respectfully used and not squandered.
5. Given that the easiest way to increase available water on the island is to build additional reservoirs that collect the excessive rainfalls that are predicted to increase with climate change, the DEIS did not include Mahi Pono's plans for increasing the catchment possible through additional reservoirs.
6. Given that the DEIS repeats a concern attributed to the State BLNR that "wind-blown erosion will damage the near shore marine environment, air quality and tourism competitiveness" the DEIS did not include a plan for mitigating these forces. In fact, the photo in the Maui News on Nov 5, 2019 proves that Mahi Pono is not following BMP in regard to the safety of our reefs. The photo showed fields of bare ground with papayas being planted that will never provide ground cover.
7. The DEIS states in several places that the soil of the Central Valley is of excellent quality for agricultural production. According to a report by the scientists of Applied Ecological Services – one of the top ecological consultants in the world - only 12,000 acres out of the 36,000 acres farmed by HC and S is worthy of future diversified agriculture. The

study made a comparison of the soils types, soil depth, slope direction, evapo-transpiration rates, annual rainfall, temperatures, etc. to make its determinations. The DEIS did not explain why the Central Valley is considered to have excellent growing conditions while taking in all of these considerations. It simply stated an unsupported opinion. (The AES report can be made available if desired.)

8. The DEIS did not adequately include how the use of this water will increase not only local food production (as that can be exported) but how the use of this public water will increase food for local consumption. I have read the section on agriculture but putting numbers in a chart and then talking about different scenarios with those numbers does not adequately answer this question. In order for the public to truly comment on the DEIS we need more information on the plans and methods intended for use in the Central Valley.
9. The DEIS is not adequate because it does not provide specific data on water needs per acre per day for each crop that Mahi Pono is planning to grow.
10. The DEIS is not adequate because it does not provide specific data on the names and volumes of pesticides, herbicides, fungicides and petro-chemical fertilizers that Mahi Pono intends to use.

Questions concerning the ditch system and water use

11. Given that much of the irrigation water costs \$1500 per Acre Foot in California
 - 43,560 square feet per acre
 - One foot deep = 43,560 cubic feet = one-acre foot
 - One cubic foot = 7.48 gals of water
 - $43,560 * 7.48 = 325,828$ gals per Acre Foot
 - Equals roughly 326 thousand gals / acre foot (the unit by which water is sold in Hawaii)
 - $\$1500 / 326 = \$4.60 /$ thousand gals of water
 - The historical cost of public water to A and B was \$0.003/thousand gals
 - $\$4.60 / \$0.003 =$ over 1500 times less than the cost of water in California

The DEIS was inadequate because it did not include an explanation of why A and B and their affiliates should continue to pay so very little to the State for the use of this public asset.
12. The DEIS did not adequately address how native Hawaiians will benefit from the sale of public waters as is mandated in the State constitution.
13. The DEIS did not include an explanation of why the State of Hawaii should lease this public asset at a price that is a fraction of the fair market value rather than setting a

price that allows monies to be paid to the Hawaiians as is mandated by the Hawaiian Constitution.

14. During the June 7th, 2018 East Maui H2O Roundtable the experts from A and B declared to the group assembled that the water loss in the tunnels could not be measured. They said they had no idea of what seeped out of tunnels and was lost from the system. They deferred to a national average of all plumbing systems residential and commercial as 22.5% loss and used that in their calculations. At the same meeting were scientists from the USGS showing their Open File Report 2012-1115 *Measurements of Seepage Losses and Gains East Maui Irrigation Diversion System, Maui, Hawaii* done in 2012. This publicly available 23-page document is very explicit as to where the EMI ditch system is leaking. The DEIS did not include an explanation of where the leaks are and what will be done to maximize the efficiency of the system.
15. Given that with today's technology it is possible to remotely open and close diversions the DEIS did not include the reason that such a mechanism should not be mandated.
16. Given that with today's technology there are diversions that first feed the stream and then divert the excess water to the Central Valley the DEIS did not explain why this would not be the preferable method of diversion as it feeds the stream first and sends the excess to the Central Valley.
17. The DEIS did not include a list of technologies and contractors being considered for use in repairing the EMI system. It is true that fixing the tunnels seems problematic but with today's polymers that can be sprayed in 360 degrees by a traveling robot these tunnels can and should be repaired in exchange for a lease with favorable conditions.
18. Given that one of the biggest concerns with climate change is mosquito spread disease like Dengue Fever and Sleeping Sickness the DEIS did not address how Mahi Pono will prevent stagnant water around their diversions.

Questions concerning public oversight and liability

19. Given that this is a 2700 page document the DEIS did not include the names, titles and email addresses of all of those state officials that have fully read and digested this material on the behalf of the public interest
20. Since roughly 70% of the ditch system was built on State Land and is therefore owned by the State since the 1930s, the DEIS did not include the standards to which the ditch system on public lands must be restored and maintained as a part of the lease.
21. The DEIS did not include

- What will be the method of overseeing the use of these public trust waters , the health of the watershed and the maintenance of the State-owned ditch system?
 - What will be the consequences of mismanagement?
 - What is the legal structure to enforce such consequences?
 - How much will this monitoring cost the tax payers?
 - Will the lease monies cover this cost?
22. As stated above the use of excessive tillage and the lack of cover crops leaves the soil not only open to wind and water erosion but makes it a tremendous threat to our near shore reef health. Should we get 3 to 4 inches of rain in a single storm the silting that is inevitable on our precious reefs would be disastrous. The DEIS did not discuss how State agencies will protect the island of Maui from such a logical end? Will conservation practices be mandated as a stipulation for the lease?
23. The DEIS did not include an explanation of why a system of public auction should be used to place the value on this water as it is impossible for any other entity to compete without owning large sections of land making an auction not in the public interest.
24. The DEIS did not explain why a fair market value is not set for this public asset and then offered for lease at a fair rate (adjustable for inflation) as would be in the public interest.
25. There have been countless wild fires in the Central Valley this summer and the County of Maui has had to take responsibility for fighting them. When A and B owned the land I never saw a fire in the Central Valley and as I understand it they used a variety of three inter-related methods of dealing with brush fires:
- They maintained a fire truck on property
 - They maintained firebreaks
 - They kept certain reservoirs full of water and had a system for the emergency use of that water to squelch fires immediately
- The DEIS did not explain why the new land owner is not being responsible for fires on their land? What is their responsibility for containing fires on their land or reimbursing the County of Maui for fighting them?
26. The DEIS did not provide the policy number and amount of liability insurance that Mahi Pono carries to protect the public when one of the Central Valley fires causes property damage.
27. The DEIS did not spell out the process of applying for a lease for public waters so that other entities could also enter the public auction.

28. Many Maui residents fear housing development dependent on the use of agricultural water as is routinely done in California. The DEIS did not explain the mechanism for preventing the use of agricultural water for housing development.

Questions concerning the impact on Hawaiian Cultural Practices and Natural Resources

29. The DEIS did not include the amount of money that the State agencies spend protecting the reefs that are of utmost value to the Hawaiian culture.

30. Given that the Hawaiian culture is dependent on healthy reefs and that fertilizer run-off, wind-blown particulate matter and soil erosion from excessive rain are all extremely detrimental to the health of a reef the DEIS did not explain how this lease will protect our reefs. If Mahi Pono is enabled to continue practices that are known to hurt our reefs at the same time that the State spends millions of dollars to protect them then the State is working against itself. This was not addressed in the DEIS.

31. Given that in the past A&B did not protect the ditch system watershed from invasive species and thereby harmed State lands that are meant to support Hawaiian Cultural practices – the DEIS did not address how will this change under the leadership of Mahi Pono?

32. Given that the investment money from the Canadian pension fund is meant to support an ESG investment the DEIS did not address how will this lease further environmental, social and community good?

Thank you for your attention to detail on this very important public matter. I am not opposed to water being given to an entity that actually provides food for our local population while also improving the eco-systems of Maui. This project is an ESG investment for the Canadian pension fund which makes it mandatory that the project does social, environmental and social good. It is possible to make a profit while also benefiting the earth and its inhabitants. For the State to allow less is to neglect its responsibility to look out for the common good in this environment of the multiple threats of climate change.

Respectfully Yours,
Charlotte O'Brien

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke'anae, Honomanū and Huelo License Areas

Dear Ms. O'Brien:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements as prescribed in Hawai'i Administrative Rules, Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Thank you for allowing public comment on this Draft EIS. I am responding as a long-time resident of Huelo and an agronomist. I received a BS in Agronomy with High Honors from Michigan State University, took an additional 2 years of technical training in Scandinavia and Austria, farmed in the Mid-West for 25 years and worked with farmers in the tropics of Viet Nam. About 10 years ago I began an earnest study of climate change and Regenerative Agriculture as:*

- 1. a solution to the carbon loss created by industrial agriculture*
- 2. a mitigation mechanism to the extremes in climate that have begun.*

I understand too well the threats of climate change to the lives of my three Hawaiian born grandchildren. I believe that we all owe it to future generations to do our best to protect them with the actions we take today. It is from this background that I respectfully ask you to include answers to the following questions in the final EIS regarding a 30-year water lease to a private company. We live on an island and I am not trying to demonize Mahi Pono – I am simply trying to look out for the public good.

Response 1: We acknowledge your comments regarding your professional and personal background. Public comments are a required component of the EIS process.

Comment 2: Questions concerning Agricultural Best Practices

In the DEIS it is repeatedly stated that Mahi Pono will use best management practices BMP for their agriculture, yet they are using excessive tillage and laying thousands of acres bare in the Central Valley. This violates the two most important principals of Regenerative Agriculture as well as the two most important practices declared by the United Nations IPCC as BMP for mitigating climate change

- *Never use excessive tillage because it destroys soil structure, cuts Mycorrhizal fungi hyphae that protect the soil from erosion and collapses the pores that allow for good drainage and air infiltration*
- *Never allow soil (particularly in the tropics or sub tropics) to lie bare in the sun as it destroys microbial life and releases soil sequestered carbon*

So my question is how is leaving thousands of acres bare and subject to wind and water erosion considered BMP? (Please note that the Bayer agricultural managers do not allow bare ground in their operation in Kihei specifically to protect the reef).

Response 2: As a matter of context for our responses, it should be noted that the primary Proposed Action, which triggered the requirement to prepare an EIS, is the proposed lease of waters arising from State-owned lands. As explained in Section 2.1 of the Draft EIS:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the “right, privilege, and authority to enter and go upon” the Lease Area for the “purposes of developing, diverting, transporting, and using government owned waters” through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users.

The Central Maui agricultural fields are not State lands. The Central Maui agricultural fields are privately owned and have been under agricultural cultivation for approximately 100 years. Mahi Pono began farming these lands in 2019.

It is inaccurate to characterize Mahi Pono as having laid "thousands of acres bare in the Central Valley." While we concur that excessive tilling and allowing soil to "lie bare in the sun" for excessive periods of time destroys microbial life, Mahi Pono only clears sufficient acreage in anticipation of, and in preparation for, planned plantings by plowing fields, turning the soil, and incorporating soil amendments (i.e., compost). At the time of writing this response, there is over

a thousand acres that have been prepared for planting. Ideally, those prepared fields are planted soon after they are prepared. There may be short delays due to the timing at which plants are ready to be transplanted, but it is not Mahi Pono's practice to prepare fields that would not be planted within a month's time.

Wildfires have burned thousands of acres in the Central Maui agricultural fields and those fields may look bare, but that is not due to an agricultural practice of Mahi Pono's. The Mahi Pono farm team follows Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion and, thus, runoff associated with their current farming activities. As Mahi Pono incrementally increases the amount of farmed acreage over time and crops are planted (particularly the permanent orchard crops), ground disturbance will again be limited, as appropriate and consistent with farming BMPs.

Moreover, as Mahi Pono incrementally increases the amount of farmed acreage over time and crops are planted (particularly the permanent orchard crops), ground disturbance will be again be limited, as appropriate and consistent with farming BMPs. Towards this end, Mahi Pono has implemented several water saving strategies for the Central Maui agricultural fields and continues to evaluate additional methods, some of which are consistent with the specific measures you recited. Mahi Pono water saving strategies include the following:

- Planting windbreaks in the fields.
- Incorporating significant uses of weed mat along plant lines, which will reduce evapotranspiration and erosion.
- Mowing rather than plowing inter-rows to preserve organic matter and keep cover to prevent soil erosion.
- Operating within the terms of a Conservation Plan from NRCS, which includes swales and diversions for erosion protection,
- Practicing rotational grazing of livestock.
- Planting permanent tree crops that will develop canopies that will assist with soil moisture retention and reduce evapotranspiration.

Comment 3: *Although Mahi Pono won public support when they said that they would be farming organically if not regeneratively, it is obvious from the way that they are approaching their soil preparation that they will be using fertilizers and pesticides and that these petrochemicals will be entering our near-shore ocean. The DEIS was inadequate in revealing the amount and types of fertilizers and pesticides they intend to use and the effect these chemicals will have on our near-shore reefs.*

Response 3: Please note that Mahi Pono did not make any claim that it intended to operate an organic farm. Mahi Pono intends to use a limited amount of fertilizers and pesticides in accordance with all laws and regulations and only on an as-needed basis. As described in Section 2.1.4 of the Draft EIS, Mahi Pono's goals for its diversified farm plan will be guided by its core principles of using reasonable and environmentally responsible BMPs, planting non-GMO crops, and growing food for local consumption. In addition, since January 2020, Mahi Pono has also committed to foregoing the use of Round-Up and other glyphosate-based products within the Central Maui agricultural fields. This commitment is reflected in Section 4.12 of the Final EIS as shown in pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations. Mahi Pono's use of fertilizers and pesticides will follow BMPs approved by the State of Hawai'i DOH, the U.S. NRCS, the U.S. EPA, the State of Hawai'i Department of Agriculture (DOA) and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion and, thus, runoff. The State of Hawai'i DOA's Pesticide Branch also provides regulatory oversight over Mahi Pono's pesticide use. In accordance with this oversight, records of pesticide use must be kept and made available to the Pesticide Branch upon request at any time. In addition, Act 45, which was passed by the 2018 Hawai'i Legislature and effective January 1, 2019, required that all Certified Applicators of Restricted Use Pesticides (RUP) submit a report of the RUP that were applied each year. Please also see Response #11 below for more information on this topic.

Comment 4: *It has been proven that each 1% increase in soil organic matter increases the soils water holding capacity by an average of 25,000 gals per acre and an increase in the Central Valley of at least 5% organic matter should be achievable allowing an additional 125,000 gals of water to become stored in the soil and plant available per acre. The DEIS did not include how Mahi Pono intends to address the building of soil carbon as a response to climate change and as a water conserving mechanism.*

Response 4: In general, we acknowledge that increasing soil organic matter increases its water holding capacity; however, we question whether your water storage calculations can be generalized for the existing soil conditions in the former sugarcane fields and Mahi Pono's farm plan for those fields. As previously stated, Mahi Pono will only clear land in anticipation of, and in preparation for, planned planting by plowing fields, turning the soil, and incorporating soil amendments (i.e., compost). The specifics of field preparation will be determined by the crop to be planted and other factors. Since the success of the farm plan will be largely dependent upon the amount of water available to bring it into fruition, water conservation by building soil carbon is an important, but not the sole consideration for Mahi Pono.

We also concur that carbon building in soils, if practiced on a large enough scale worldwide, could affect the rate of climate change. Moreover, while any effort to increase soil carbon could

be considered a contribution toward slowing climate change, Mahi Pono's potential contribution on a worldwide scale would be incremental and negligible, at best.

Mahi Pono's plans for improving irrigation efficiency is stated throughout Chapter 5 of the Draft EIS. Mahi Pono expects to invest over \$20 million to increase the efficiency of its private Central Maui Field Irrigation System in Central Maui (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields).

As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. These new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Reducing water usage through effective irrigation ensures conservation of Hawai'i's natural resources. Please note that this information has been added to Section 2.1.4 of the Final EIS, as shown in page 2-29, as well as other sections when discussed.

Comment 5: *Given that modern systems of buried irrigation can reduce water consumption by 25% with a reasonable ROI the DEIS did not include Mahi Pono's plan for using water conserving irrigating systems. The DEIS did not explain how if given a lease for water from State lands that it will be respectfully used and not squandered.*

Response 5: While we acknowledge that buried irrigation can reduce water consumption, committing to one method of irrigation for an entire diversified farm plan would not necessarily optimize water conservation, crop productivity or cost effectiveness. Mahi Pono's plans for improving irrigation efficiency is repeatedly stated throughout Chapter 5 of the Draft EIS and in Response #4 above.

Regarding the EMI Aqueduct System, it is highly efficient. On the whole, the EMI Aqueduct System does not lose water over the entire length of the system, up to its terminus at Kamole-Weir. It is not until the EMI Aqueduct System transitions into the Central Maui Field Irrigation System used in the Central Maui agricultural fields that there starts to be losses due to seepage because its agricultural ditches and reservoirs are open and are not lined. Please note that this clarification has been made throughout the Final EIS as shown in pages 2-11, 2-27, 3-12, and 4-76. However, as discussed in Response #4, Mahi Pono will be making improvements to the Central Maui Field Irrigation System, which will enhance the efficiency and conservation of the use of irrigation water in the Central Maui agricultural fields.

In any event, the amount of water that can be diverted under the Water Lease is limited by the flow amounts permitted under the Commission on Water Resources Management (CWRM)

Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O). Under the CWRM D&O, flows were restored to numerous streams in East Maui, as discussed in more detail in Section 1.3.4 of the EIS. We also assume that the Water Lease, if issued, will require compliance with appropriate mitigation measures identified in the EIS. However, the terms of the Water Lease are at the discretion of the Board of Land and Natural Resources (BLNR) and would have to be agreed to by the lessee.

Comment 6: *Given that the easiest way to increase available water on the island is to build additional reservoirs that collect the excessive rainfalls that are predicted to increase with climate change, the DEIS did not include Mahi Pono's plans for increasing the catchment possible through additional reservoirs.*

Response 6: The Draft EIS discusses the potential "Added Storage Alternative" in Section 3.1.1.3 of the Draft EIS. Specifically, Section 3.1.1.3 of the Draft EIS states:

Currently, the EMI Aqueduct System has eight reservoirs, mostly along the lower ditch systems, and the Central Maui field irrigation system has 48 major reservoirs. The combined storage capacity of these existing reservoirs is approximately 1,344 mg (Akinaka, 2019). Most of these reservoirs, however, have not been used since the closure of sugar in 2016 and others have not been used because they do not meet dam safety requirements. As a result, many will require extensive upgrades to put them back into service. These upgrades could cost between \$50 – 100 million (Akinaka, 2019). Obtaining permits to upgrade and repair these reservoirs will also be challenging due to current dam safety requirements. Assuming that the existing reservoirs can be restored to their full capacity of 1,344 mg, and the amount of flow available for irrigation under the Proposed Action is approximately 92.32 mgd, then the existing reservoirs could provide about 16 days of storage capacity.

The existing reservoirs are fed by the EMI Aqueduct System so they can be filled when the amount of water delivered exceeds the amount used. The EMI Aqueduct System, however, is not designed to capture and convey high-volume freshet flows which overwhelm and bypass the diversions. If such freshet flows (in excess of the IIFS standards under the CWRM D&O) could be captured, it could significantly increase storage capacity.

If an additional storage volume of 1,200 mg is assumed, an additional two weeks of flow could be provided at the rate of 82.36 mgd. Combined with the storage capacity of the restored and existing reservoirs, a total of about a month of storage would be available, which would provide a substantial supply to weather

periods of low rainfall during the dry season. Moreover, since captured freshet flows would be used to replenish the restored and existing reservoirs between freshets, the period that stored water could be used could be extended even longer.

A single reservoir of this size (to hold 1,200 mg) could be located upstream of the Koolau Ditch within Hānawī Gulch. This area is preferable for the location of a reservoir to capture and store water because of its elevation and rainfall. The reservoir would be created by damming a ravine above the ditch so it can be fed by gravity flow and allow streamflow to continue in compliance with the CWRM D&O. Based on a rough estimate, a reservoir of this size would encompass about 30 acres with a 4,000 foot long dam structure standing approximately 150 tall at its highest point. (Akinaka, 2019). Construction of such a reservoir would be in the order of some \$300 million. (Akinaka, 2019). Dams are uniquely engineered structures that require knowledge and experience in dam safety, particularly how to safely handle water flows in and out of the structure through appurtenant features, as well as mitigating the hazards of water passing through the dam embankment itself (seepage). Dams sustain high hydrostatic water loads, which can result in failure of the embankment if they are not properly designed. (DLNR, The Hawai'i Dam and Reservoir Safety Program, FY 2017). It is very unlikely such a reservoir could be constructed as its environmental impacts would be considerable in terms of impacts to views and public safety concerns.

Hence, reservoirs could add potential water storage by capturing excessive flows. However, please note that the above discussion has been revised to more accurately describe the reservoirs associated with the EMI Aqueduct System and the Central Maui Field Irrigation System as shown in pages 3-11 to 3-14. Further, please note that neither the Applicant nor Mahi Pono is currently proposing to construct additional reservoirs to the current system as part of the Proposed Action as they are costly, complex to site, design and construct, and there are associated environmental impacts of constructing additional reservoirs.

Mahi Pono expects to invest money to improve its private Central Maui Field Irrigation System to increase the efficiency of its water use as discussed in Response #4 above. This investment should improve the overall delivery system and usage of the existing reservoirs. Rather than water flowing continuously throughout the agricultural fields, water will be delivered when needed, and stored in the existing reservoirs when additional water is available.

Comment 7: *Given that the DEIS repeats a concern attributed to the State BLNR that “wind-blown erosion will damage the near shore marine environment, air quality and tourism competitiveness” the DEIS did not include a plan for mitigating these forces. In fact, the photo in*

the Maui News on Nov 5, 2019 proves that Mahi Pono is not following BMP in regard to the safety of our reefs. The photo showed fields of bare ground with papayas being planted that will never provide ground cover.

Response 7: Presently, Mahi Pono is unable to irrigate the majority of the agricultural fields in Central Maui to provide groundcover due to the water limitations under the terms of its current water revocable permits. Moreover, it will not be able to do so in the future without the proposed Water Lease. This will render lands uncultivated or unused, due to lack of water. As a result, the land in Central Maui will revert to its natural arid condition which is susceptible to wind-blown erosion. The Draft EIS provided a table projecting the Mahi Pono water use for full development of the farm plan. To better explain how much water is available now and expected for the near term for agricultural groundcover, Section 2.1.4 of the Final EIS has been updated with more current water projections as shown in pages 2-30 and 2-32.

However, in order to implement Mahi Pono's full build-out farm plan, approximately 82.33 mgd is needed to irrigate the majority of the approximate 30,000 acres in Central Maui. Hence, as stated within Section 4.2.3 of the Draft EIS related to Coastal Waters, "[no] significant impacts on coastal waters in the region are anticipated as the Proposed Action will reduce wind-blown erosion that could occur if the Central Maui fields were not in cultivation, and which could damage nearshore environments."

Comment 8: *The DEIS states in several places that the soil of the Central Valley is of excellent quality for agricultural production. According to a report by the scientists of Applied Ecological Services – one of the top ecological consultants in the world - only 12,000 acres out of the 36,000 acres farmed by HC and S is worthy of future diversified agriculture. The study made a comparison of the soils types, soil depth, slope direction, evapo-transpiration rates, annual rainfall, temperatures, etc. to make its determinations. The DEIS did not explain why the Central Valley is considered to have excellent growing conditions while taking in all of these considerations. It simply stated an unsupported opinion. (The AES report can be made available if desired.)*

Response 8: As a matter of clarification, the Central Maui agricultural fields addressed by this EIS consists of approximately 30,000 acres, not 36,000 acres. Although we are not certain whether the Applied Ecological Services (AES) study you cite applies to these lands owned by Mahi Pono, the discussions of soils in the Draft EIS were prepared using references widely accepted for an EIS prepared pursuant to Hawai'i Revised Statutes (HRS) Chapter 343 and HAR Title 11, Chapter 200. Section 4.1.2 of the Draft EIS, three soil classification studies were discussed:

- The U.S. Department of Agriculture (USDA) (2001) Soil Survey Geographic (SSURGO) database and soil survey data gathered by Foote et al. (1972);
- The Hawai'i Land Study Bureau (LSB) Detailed Land Classification, Island of Maui (LSB bulletin no. 7, 1967) and depicted online at the Hawai'i LSB Locator-ARC GIS by the Hawai'i Statewide GIS Program, Office of Planning; and
- The Agricultural Lands of Importance to the State of Hawai'i (ALISH) Classification System, which was developed and compiled in 1977 by the State Department of Agriculture with assistance from the U.S. Department of Agriculture - Natural Resources Conservation Service (NRCS), and the College of Tropical Agriculture, University of Hawai'i.

Section 4.1.2 of the Draft EIS includes descriptions of these various soil classification systems with regard to agricultural potential in Central Maui. Specifically, Section 4.1.2 of the Draft EIS, with regards to Central Maui, states:

According to the LSB Detailed Land Classification, Island of Maui (1967), the agricultural fields of Central Maui that were previously cultivated in sugarcane have an overall productivity rating of A-Excellent (See Figure 4-15). The southern end of the agricultural fields, which is at the farthest reach of the Central Maui field irrigation system is largely rated E-Very Poor with patches of B-Good. The northeastern end of the agricultural fields west of Maliko Gulch includes land rated C-Fair and D-Poor.

According to the ALISH map, the agricultural fields of Central Maui are predominantly classified Prime Land (See Figure 4-16).

However, Section 4.1.2 of the EIS is not intended to assess their potential for diversified agriculture. Rather, this section of the EIS was intended to discuss impacts of the Proposed Action on soils in the three affected areas (East Maui, Upcountry Maui and Central Maui).

Section 4.7.4 of the Draft EIS includes a discussion summarizing a report by Plasch Econ Pacific LLC on Agricultural and Related Economic Impacts (June 2019). The report assesses the economic agricultural impacts of the Proposed Action and is included as Appendix I in the Draft EIS. In Section 5 of Appendix I of the Draft EIS, the agricultural productivity of the 30,000 acres in Central Maui was discussed based on the soil rating systems of the three aforementioned studies. Although this portion of the report was not summarized in Section 4.7.4 of the Draft EIS, it has been in the Final EIS, as excerpted in pages 4-295 to 4-297.

As shown in pages 4-295 to 4-297 and as documented in Appendix I of the Draft EIS, the overwhelming majority of the Central Maui agricultural fields are considered to be highly productive with irrigation water. However, with less water available, less acreage would be rated as high-quality farmland.

Hence, as mentioned in Section 4.7.4 of the Draft EIS:

Central Maui has some of the best agricultural conditions in the State for farming, including a large area in a compact configuration, high-quality soils, high solar radiation, a location near markets and shipping terminals, and potentially ample water at low delivery costs (assuming a new Water Lease with a reasonable use fee), and for lessees rents that will be comparatively low.

In addition to soil classifications for agricultural lands there are land use regulatory classifications of agricultural lands. The State of Hawai'i Land Use Commission designated approximately 22,000 acres of the 30,000 acres of Central Maui agricultural fields owned by Mahi Pono as Important Agricultural Lands (IAL). The designation of IAL is determined based upon a number of factors, but such lands: (1) Are capable of producing sustained high agricultural yields when treated and managed according to accepted farming methods and technology; (2) Contribute to the State's economic base and produce agricultural commodities for export or local consumption; or (3) Are needed to promote the expansion of agricultural activities and income for the future, even if currently not in production. See HRS § 205-42. The objective for the identification of IAL is to identify and plan for the maintenance of a strategic agricultural land resource base that can support a diversity of agricultural activities and opportunities that expand agricultural income and job opportunities and increase agricultural self-sufficiency for current and future generations. As such, the Central Maui agricultural fields are highly suitable for agricultural production and uses. We also note, as shown on Figure 5-2 of the Draft EIS, almost all of the Central Maui agricultural fields are designated by the State in the Agricultural District, and is also zoned by the County of Maui in the agricultural zoning district. See EIS Section 5.6 (Maui County Zoning).

Comment 9: *The DEIS did not adequately include how the use of this water will increase not only local food production (as that can be exported) but how the use of this public water will increase food for local consumption. I have read the section on agriculture but putting numbers in a chart and then talking about different scenarios with those numbers does not adequately answer this question. In order for the public to truly comment on the DEIS we need more information on the plans and methods intended for use in the Central Valley.*

Response 9: Unlike the previous monocrop, sugarcane, which was grown in the Central Maui agricultural fields almost entirely for export, the Mahi Pono farm plan is a diversified

agricultural plan, and a significant portion of agricultural products will be for local consumption. Mahi Pono considers Hawai'i to be its primary market. Local sales are preferred over exports because it saves on overseas shipping costs. Both local sales and exports, however, are beneficial to Hawai'i since local sales that displace imports reduce the financial drain on the State as a whole, while exports generate income for the State. As discussed in Section 6.a. of Appendix I and Section 4.7.4 in the Draft EIS, "*To the extent economically feasible, Mahi Pono and other farmers on its land will grow food crops for the Hawai'i market.*" This discussion in Section 4.7.4 of the EIS has been further clarified as shown on page 4-285.

The potential obstacles to reaching the Hawai'i market were discussed in the Draft EIS in Section 4.7.4):

Farmers in Central Maui are well-situated to supply the small Maui Island market. Compared to other farmers in Hawai'i, they can also compete reasonably well in supplying mainland markets, as long as their crops have long shelf-lives and so can be shipped by surface vessel. However, compared to farmers on O'ahu, they are at a disadvantage in supplying the Honolulu market. Furthermore, they are at a disadvantage in supplying mainland markets if their crops have short shelf-lives and so must be shipped by air. Also, farmers on Maui are at a disadvantage in competing against the low-cost producers who supply mainland markets.

Among other considerations, the Mahi Pono farm plan was developed to address the balance between the primary Hawai'i market and the remaining export market. But, the composition of those crops is only generally described based on present estimates and anticipated build out toward full development. As discussed in Section 2.1.4 of the Draft EIS regarding Mahi Pono's farm plan:

Mahi Pono's farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e. orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation. All of these things must be considered when developing an evolving and feasible diversified agricultural plan for Central Maui.

Another factor in developing the farm plan is to be sensitive to the existing local farming community. Mahi Pono does not want to displace local farmers by planting competing crops or artificially accelerating the ramp-up of operations, both of which could have the potential to drive local farmers out of the market.

Mahi Pono's goals for its diversified farm plan will be guided by its core principles of using reasonable and environmentally responsible "best management practices", planting non-GMO crops, and growing food for local consumption.

As stated in Section 4.7.4 of the Draft EIS, Mahi Pono expects that, at full development of its farm plan, its local sales, including those of its community farm tenants, will comprise roughly 65% of total sales generated from Central Maui, with exports being 35%.

Moreover, the Mahi Pono farm plan is discussed in detail in Section 2.1.4 and Section 4.7.4, as well as Appendix I (Subsection 8.a) of the Draft EIS. Water requirements for full operation of the Mahi Pono farm plan (anticipated to be in 2030) are discussed in Section 2.1.4, Subsection 9.a of Appendix I, with details provided in Table 3, Section 3.a (p. T-4) of Appendix I in the Draft EIS. These tables include average daily per-acre water requirements by crop.

Please note that the farm plan will continue to evolve over time based on a number of factors, including the available supply of surface water, experience, which will be gained on crops that grow well in Central Maui, crops that are profitable, the size of the market for profitable crops, etc. It is unclear from your comment what additional information on Mahi Pono's plans and methods intended for use in Central Maui you think is needed.

The approach to estimating impacts and the level of detail are consistent with EIS requirements.

Comment 10: *The DEIS is not adequate because it does not provide specific data on water needs per acre per day for each crop that Mahi Pono is planning to grow.*

Response 10: The Proposed Action under assessment in the EIS is the issuance of a Water Lease. As such, the primary analysis is on the direct impacts of the proposed water diversions and the total amount of water proposed to be diverted by the EMI Aqueduct System under the Water Lease. However, with respect to your comment requesting information on the water needs to support the Mahi Pono farm plan, note that Table 2-1 (Mahi Pono Farm Plan) of the Draft EIS provides estimates of water needs, in gallons per acre per day, for the planned crop and agricultural uses as noted above in Response #9. Also, as mentioned in Response #9 above, the farm plan will evolve over time, but Table 2-1 is the best information that exists at this time. We also note that Table 3-1 in Section 3.4.13 of the Draft EIS provides anticipated water uses for Mahi Pono's farm plan in the event that no Water Lease is issued (i.e., the No Action alternative).

Comment 11: *The DEIS is not adequate because it does not provide specific data on the names and volumes of pesticides, herbicides, fungicides and petro-chemical fertilizers that Mahi Pono intends to use.*

Response 11: As discussed in Response #3 above, pesticide use is regulated by both State and Federal law. Mahi Pono's use of these chemicals is compliant with all laws regulating pesticide use, and certified commercial applicators are utilized as required. Act 45 which was passed by the 2018 Hawai'i Legislature and effective on January 1, 2019 required that all Certified Applicators of Restricted Use Pesticides (RUP) submit a report of the RUP that were applied each year. This report as well as any other report required by law is publicly available from the respective government entity. The State of Hawai'i DOA's Pesticide Branch also provides regulatory oversight over Mahi Pono's pesticide use. In accordance with this oversight, records of pesticide use must be kept and made available to the Pesticide Branch upon request at any time. It is also noted that since January 2020 Mahi Pono committed to discontinuing use of Round-Up and other glyphosate-based herbicides. This information has been included in the Final EIS as shown in pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations.

Comment 12: *Questions concerning the ditch system and water use*

Given that much of the irrigation water costs \$1500 per Acre Foot in California

- *43,560 square feet per acre*
- *One foot deep = 43,560 cubic feet = one-acre foot*
- *One cubic foot = 7.48 gals of water*
- *$43,560 * 7.48 = 325,828$ gals per Acre Foot*
- *Equals roughly 326 thousand gals / acre foot (the unit by which water is sold in Hawaii)*
- *$\$1500 / 326 = \$4.60 /$ thousand gals of water*
- *The historical cost of public water to A and B was $\$0.003 /$ thousand gals*
- *$\$4.60 / \$0.003 =$ over 1500 times less than the cost of water in California*

The DEIS was inadequate because it did not include an explanation of why A and B and their affiliates should continue to pay so very little to the State for the use of this public asset.

Response 12: It is unclear whether the California water rate number that you cite is for water at the source or delivered to a farm. There is a big difference between these types of water charges. As an example, in 2020, the Central California Irrigation District charges \$13 per acre-foot to \$95 per acre-foot (4¢ per 1,000 gallons to 29.2¢ per 1,000 gallons) for water delivered to farms, depending on the volume used and season (Central California Irrigation District, February 25, 2020). Higher rates are charged when water supplies are low. In the case of the Proposed Action and the rate projected in the EIS, the water rate paid to the State was for raw water, available at the source. This figure does not take into account the added cost of operations and maintenance associated with the lessee's use of the EMI Aqueduct System, however the EMI Aqueduct

System is needed to collect and deliver the water to the end user(s). The comparable scenario in California would be to make water available at the river or stream, and make it the farmers' responsibility to get the water from the river or stream to their farms.

As discussed in Section 4.7.3 of the Draft EIS, the amount of rent that the State BLNR will charge the lessee under the Water Lease will be determined based upon an appraisal conducted prior to issuance of the Water Lease. However, for the purposes of the economic and fiscal impact analyses in the Draft EIS, a projected Water Lease payment was calculated based on the equivalent per unit cost under the 2019 revocable permit. That rate was \$230,964.24. Assuming 16.8 mgd diverted from the License Area under the revocable permit, as was diverted/anticipated to be diverted in 2019, the rent rate translates to \$0.038 per thousand gallons charged to the lessee under the Water Lease. Adjusting for the 2021 revocable permit, which was obtained after publication of the Draft EIS, the rental rate translates to approximately \$238,362 which estimates EMI water use will be approximately 32.3 mgd, is \$0.19 per 1,000 gallons (adjusted for 2018 dollars. See pages 4-277 and 4-283 of the Final EIS. Hence, the amount that the State has charged EMI / A&B for water at the source is consistent with and actually greater than the high end of the range of the rates charged by the Central California Irrigation District (Table 4 of Appendix H of the Draft EIS).

Comment 13: *The DEIS did not adequately address how native Hawaiians will benefit from the sale of public waters as is mandated in the State constitution.*

Response 13: Section 2.1.1 of the Draft EIS outlines two provisions addressed to Native Hawaiian populations:

First, state water leases shall contain reservations of water for the DHHL tracts of land, as described in HRS § 171-58(g) above. Second, thirty percent (30%) of the revenues derived from all water leases issued by the State are deposited into the Native Hawaiian Rehabilitation Fund pursuant to Hawai'i State Constitution Article XII, Section 1, and is used to fund programs as prioritized in the Native Hawaiian Development Program Plan adopted by the Hawaiian Homes Commission.

Hence, homestead projects for Native Hawaiians will receive a water reservation to support such projects (undertaken by DHHL). In addition, 30 percent of the revenue generated from the subject Water Lease, as well as all other State water leases issued, will be deposited into the Native Hawaiian Rehabilitation Fund and used to fund programs as prioritized by Native Hawaiian Development Program Plan. In addition, the Office of Hawaiian Affairs (OHA) also receives 20 percent of the revenue derived from the State's public lands trust as noted in Section IIA1(b) of Appendix H and Section 4.7.3.1 of the EIS.

The Proposed Action will benefit the Maui communities by allowing for continued use and maintenance of the EMI Aqueduct System, which supplies water to the MDWS Upcountry Maui Water System at Kamole-Weir. In addition, the Proposed Action will enable the continued provision of water by EMI to the MDWS at Nāhiku and for MDWS' Pi'iholo and Olinda Water Treatment Plants (WTP), which also source the MDWS Upcountry Maui Water System. The provision of water from EMI land to the MDWS is contractually contingent on EMI securing revocable permits and ultimately the Water Lease. Under the Proposed Action, water will continue to be delivered to MDWS domestic and agricultural uses to Upcountry Maui communities, which includes Native Hawaiian residents. In addition, the Mahi Pono farm plan will benefit the entire Maui community, including Native Hawaiians, by providing long-term jobs and supporting diversified agriculture and local food production and sustainability.

As further discussed in Response #22 below, the Applicant also recognizes that water is a public trust resource and that the Proposed Action (the issuance of a 30-year Water Lease by BLNR), requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai'i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine.

Comment 14: *The DEIS did not include an explanation of why the State of Hawaii should lease this public asset at a price that is a fraction of the fair market value rather than setting a price that allows monies to be paid to the Hawaiians as is mandated by the Hawaiian Constitution.*

Response 14: As explained above in Response #12 above and Section 4.7.3.1(d) of the Draft EIS, the Water Lease rent rate will be developed and determined by the BLNR based on an appraisal of the fair market value of the lease, which the State will commission. Regarding your comment about monies being paid to the Hawaiians, please see Response #13 above which states that 30 percent of the revenue generated from the subject Water Lease, as well as all other State water leases issued, will be deposited into the Native Hawaiian Rehabilitation Fund and the Office of Hawaiian Affairs (OHA) also receives 20 percent of the revenue derived from the State's public lands trust.

Comment 15: *During the June 7th, 2018 East Maui H2O Roundtable the experts from A and B declared to the group assembled that the water loss in the tunnels could not be measured. They said they had no idea of what seeped out of tunnels and was lost from the system. They deferred to a national average of all plumbing systems residential and commercial as 22.5% loss and used that in their calculations. At the same meeting were scientists from the USGS showing their Open File Report 2012-1115 Measurements of Seepage Losses and Gains East Maui Irrigation Diversion System, Maui, Hawaii done in 2012. This publicly available 23-page document is very*

explicit as to where the EMI ditch system is leaking. The DEIS did not include an explanation of where the leaks are and what will be done to maximize the efficiency of the system.

Response 15: The USGS report that you cite concluded that the open ditches and tunnels in the EMI Aqueduct System incur seepage losses but also gains from groundwater, especially in the tunnels. Thus, as cited in the CWRM D&O, FOF 723, "...it is not clear whether net seepage losses even occur in the EMI diversion system." For clarification, it is within the Central Maui Field Irrigation System that there are some irrigation system losses. Those losses have been estimated to be approximately 22.7% during the time of sugar cultivation. As discussed in Section 4.2.2 of the Draft EIS, these irrigation system seepage losses provide recharge for the Kahului and Pā'ia aquifers. However, Sections 2.1.4, 3.1.1.1, and 4.2.2 of the Final EIS has been revised to include updated information regarding the groundwater resources available to Mahi Pono as shown in pages 2-11, 2-27, 3-12, and 4-76. Clarification has been added throughout the Final EIS where system losses are discussed to note that these occur within the Central Maui agricultural fields, and not within the EMI Aqueduct System.

Regarding your comment about what will be done to maximize the efficiency of the EMI Aqueduct System, no specific improvements are planned, as the system is highly efficient as is. However, with regard to the Central Maui agricultural fields, Mahi Pono expects to invest in the improvement of its Central Maui Field Irrigation System as discussed in Response #6 above.

Comment 16: *Given that with today's technology it is possible to remotely open and close diversions the DEIS did not include the reason that such a mechanism should not be mandated.*

Response 16: We acknowledge your comments. Please note that the EIS does not mandate any action. Rather, the subject EIS is a disclosure and informational document prepared to disclose the effects of the Proposed Action on the economic welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the Proposed Action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects. In this case, the Proposed Action is for a 30-year State Water Lease. The State will award the Water Lease through a public auction, which will be conducted after acceptance of the EIS.

In response to your comment about technological changes to the EMI Aqueduct System, it would be extremely ineffective and cost-prohibitive to develop a reliable network that would provide the level of communication that could facilitate the installation of a remote diversion control system due to the remoteness of each intake. A more analog but still effective system of float devices along the major intakes that would automatically open and close gates based on water levels in the main ditch system would be a more reasonable alternative. Moreover, the diversion modifications required to comply with the significant increased flow requirements mandated

under the CWRM D&O are not being done remotely. Instead, those modifications are being done manually, and with oversight by CWRM to satisfy the increased stream flow requirements.

In addition, as discussed in Response #6 above, Mahi Pono expects to make investments in improving the efficiency of its water usage in the Central Maui agricultural fields.

Comment 17: *Given that with today's technology there are diversions that first feed the stream and then divert the excess water to the Central Valley the DEIS did not explain why this would not be the preferable method of diversion as it feeds the stream first and sends the excess to the Central Valley.*

Response 17: Working with the CWRM, appropriate changes to diversions in the EMI Aqueduct System have been made and will be made, once appropriate permits are secured, to ensure compliance with the CWRM D&O, and to ensure water is provided to the stream first before any excess is diverted. As stated in Section 2.1 of the Draft EIS:

Independent of the Proposed Action, on June 20, 2018, the CWRM issued its D&O setting IIFS for numerous streams and tributaries of streams in the License Area, which includes water originating and flowing from both State and privately owned lands within East Maui. The CWRM D&O establishes a quantity of water that must remain in each stream at specified locations. The CWRM D&O ordered full stream restoration for 10 streams and partial flow restoration on 12 additional streams (Please refer to Section 1.3.4). Therefore, the maximum amount of water that can be awarded through the Water Lease is what is available for diversion after the CWRM D&O is implemented. This is the premise of the Proposed Action.

Hence, the Proposed Action must comply with the CWRM D&O and meet the IIFS of the applicable streams. Thus, water can only be diverted from the streams subject to the CWRM D&O once the IIFS is met. Moreover, the EMI Aqueduct System will only divert enough water to meet the objectives of the Proposed Action as discussed in Chapter 2 of the EIS.

Comment 18: *The DEIS did not include a list of technologies and contractors being considered for use in repairing the EMI system. It is true that fixing the tunnels seems problematic but with today's polymers that can be sprayed in 360 degrees by a traveling robot these tunnels can and should be repaired in exchange for a lease with favorable conditions.*

Response 18: The EMI Aqueduct System is an efficient water delivery system that relies on gravity. Please note that Section 2.1.2 of the Final EIS has been expanded to include details regarding the "maintenance and repair" activities associated with the Proposed Action as shown

in page 2-7. Specifically, under the Proposed Action, "maintenance and repair" involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment. With regard to your comment about tunnel repair work, please note that the USGS study you cited in Comment #15 above indicates that "...measurements in tunnel reaches generally indicated seepage gains." (see Summary and Conclusion). Thus, repairs to tunnels would not improve the efficiency of the EMI Aqueduct System and no such repairs are needed.

Comment 19: *Given that one of the biggest concerns with climate change is mosquito spread disease like Dengue Fever and Sleeping Sickness the DEIS did not address how Mahi Pono will prevent stagnant water around their diversions.*

Response 19: Section 4.2.1 of the Draft EIS addressed the interplay between stream flows and mosquitos. Specifically, Section 4.2.1 of the Draft EIS states:

In addition to the species listed above, three native damselflies (Megalagrion xanthomelas, Megalagrion pacificum, and Megalagrion nesiotes) and an introduced mosquito (Culex quinquefasciatus) habitats were also modeled to see how the water diversions may impact their population sizes. (Trutta, p. 26, 2019) In general, restoration of stream flow should improve damselfly habitat and decrease mosquito habitat where these species use instream habitats. Restoration of baseflow, however, will likely also improve habitat conditions for a number of introduced predator and competitor species of the native damselflies and thus may not, in itself, increase damselfly populations. (Trutta, p. 58, 59, 60, 2019)

The instream amount of potential mosquito habitat was quantified using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model, as provided in Section 4.2.1 of the Draft EIS and Appendix A. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat. Thus, an increase in habitat was predicted to occur at diverted flows.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. Second, Hawaiian streams are naturally flashy (i.e., they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by the Division of Aquatic Resources,

regarding controlling introduced poecilid fishes (e.g., guppies and mosquitofish) which transmit parasites to native stream fish, it was hypothesized that increased streamflow would wash these species out of the streams. Unfortunately, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed.

While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, once established it may be difficult to control Culex mosquito by increased streamflow alone. Anecdotal observations made by Trutta Environmental Solutions staff members, support the continued presence of Culex mosquitoes under a wide range of stream flows as they reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i. Section 4.2.1 of the Final EIS has been expanded to include this discussion as shown in pages 4-58 to 4-61.

Moreover, additional analysis of the impacts of stream flow on mosquitoes has been added to Appendix C and Section 4.4.2 of the Final EIS has been revised to reflect this additional analysis as shown in pages 4-126 to 4-127, and pages 4-130 to 4-131.

Comment 20: Questions concerning public oversight and liability. *Given that this is a 2700 page document the DEIS did not include the names, titles and email addresses of all of those state officials that have fully read and digested this material on the behalf of the public interest*

Response 20: It is not known which individuals have fully read and digested the Draft EIS. However, as required by HRS Chapter 343 and HAR 11-200, Chapter 9 of the Draft EIS does include a list of all those governmental agencies, organizations and individuals that have, to the Applicant's knowledge, either participated in the EIS process and or received notifications regarding the EIS process. Moreover, as required by HRS Chapter 343 and HAR 11-200, the Final EIS includes a list of all those that provided comments in response to the early consultation efforts undertaken in November 2016, the two public scoping meetings held shortly after publication of the EIS Preparation Notice, and those who submitted comments on the EIS Preparation Notice, as well as on the Draft EIS, which are reproduced in Appendix N along with their respective response letters. The Office of Environmental Quality Control also published notification of the availability of the Draft EIS, and that notice and the Draft EIS itself, are available to the public to view on OEQC's website. It is possible that other State agencies / officials, organizations, and individuals who did not participate in the EIS process or receive notifications regarding the EIS have also reviewed the Draft EIS.

As discussed in Section 1.4 of the EIS, BLNR is the accepting authority for this Final EIS.

Comment 21: *Since roughly 70% of the ditch system was built on State Land and is therefore owned by the State since the 1930s, the DEIS did not include the standards to which the ditch system on public lands must be restored and maintained as a part of the lease.*

Response 21: Please note that the EMI Aqueduct System is not owned by the State. The EMI Aqueduct System is privately owned by East Maui Irrigation Company, LLC (EMI). EMI is jointly owned by Alexander & Baldwin (A&B), and Mahi Pono, LLC. The Collection Area, as described in Section 2.1.2 of the Draft EIS, for the EMI Aqueduct System covers approximately 50,000 acres, of which 33,000 acres are owned by the State (the License Area) and 17,000 acres are privately owned. The EMI Aqueduct System spans both the State-owned and EMI-owned lands and is an integrated system. In 1938, the Territory (now the State) of Hawai'i and EMI entered into an agreement (the "1938 Agreement"), which is further described in Section 3.3 of the Final EIS as shown on pages 3-24 to 3-25. The 1938 Agreement was entered into to facilitate and govern the continued auction of long term (30-year) water licenses of the State-owned portions of the Collection Area so that, regardless of who the successful bidder at auction may be, the EMI Aqueduct System could continue to be operated across both the State-owned and EMI-owned lands by EMI, the licensee (if not EMI), the State, or both, as the case may be.

To that end, the State and EMI each granted to the other "perpetual" easements to those portions of the EMI Aqueduct System located on the other's land. The duration of these "perpetual" easements was stipulated to last until the termination of the 1938 Agreement, which has not occurred. The 1938 Agreement is still in place and valid.

As discussed in the Section 2.1.2 of the Final EIS, under the Proposed Action, "maintenance and repair" involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment.

Comment 22: *The DEIS did not include*

- *What will be the method of overseeing the use of these public trust waters, the health of the watershed and the maintenance of the State-owned ditch system?*
- *What will be the consequences of mismanagement?*
- *What is the legal structure to enforce such consequences?*
- *How much will this monitoring cost the tax payers?*
- *Will the lease monies cover this cost?*

Response 22: Please see Response #21 regarding ownership of the EMI Aqueduct System (it is owned by EMI and not by the State). Regarding water being a public trust, we acknowledge that

the Proposed Action (the issuance of a 30-year Water Lease by BLNR), requires the BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai'i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. The dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of water that the Public Trust Doctrine requires to be left undiverted from the streams in the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to BLNR for the auction of the Water Lease. As such, we expect BLNR, in its decision-making regarding the requested issuance of the Water Lease, to follow the judicial guidance that has already been given regarding what is necessary for BLNR to comply with the requirements of the Public Trust Doctrine. Please note, finalization of this EIS does not result in issuance of the Water Lease; any decision on the Water Lease auction and issuance of the Water Lease would happen only after acceptance of this EIS, and through a separate process before the BLNR.

As discussed in Section 2.1 of the Draft EIS, HRS § 171-58(e) requires a watershed management plan in connection with a water lease. The BLNR "*shall prescribe the minimum content of a watershed management plan; provided that the watershed management plan shall require the prevention of the degradation of surface water and ground water quality to the extent that degradation can be avoided using reasonable management practices.*" Section 2.1 of the Draft EIS described the State's action with respect to the minimum content requirements of a watershed management plan at that time. However, this section of the Final EIS has been revised to take into account the BLNR's actions on October 11, 2019, after the publication of the Draft EIS, under agenda item D-2, whereby the BLNR approved the minimum content requirements for a watershed management plan as shown in pages 2-2 to 2-4. A copy of the BLNR-approved DLNR report is enclosed as Appendix O-1. The BLNR delegated authority to the DLNR staff to jointly develop watershed management plans with water lessees to ensure that the watershed management plan aligns with the goals of watershed protection to maintain watershed function and water yield and to restore or maintain a certain level of biological integrity that is the foundation of a healthy watershed.

Additionally, Chapter 4 of the Draft EIS addresses the existing environment, impacts and proposed mitigation measures of the Proposed Action. Section 4.4.1 of the Draft EIS discusses the mitigation measures proposed, which include, avoiding the introduction or transport of new invasive plant species using such measures as inspecting and washing all vehicles arriving from outside of the License Area prior to maintenance activities on cliff sides, near waterfalls, and in other native species-dominated areas. Designated locations for such washing may be set up. Furthermore, in the event construction materials are brought into the License Area, such materials arriving from outside of Maui should be washed and/or visually inspected for invasive materials and non-native species at designated locations and by a qualified botanist/entomologist. To the extent that materials can be purchased locally, they should be. Moreover, as discussed in

Section 3.2.2.2 of the Draft EIS, to the extent that the geographical extent of the License Area may be reduced, those areas would presumably be under the full control of a State agency and subject to whatever measures the State may require. Please note that Section 3.2.2.2 of the Final EIS has been expanded to include a more robust discussion regarding a modified (i.e. smaller) License Area as shown in pages 3-21 to 3-24.

Regarding your other questions about the consequences of mismanagement, the legal structures to enforce such consequences, costs to taxpayers, and costs of the Water Lease, these have yet to be determined and are at the discretion of BLNR. However, the Water Lease will be a legal contract and the Applicant, if awarded and accepts the Water Lease, will comply with all conditions therein.

Comment 23: *As stated above the use of excessive tillage and the lack of cover crops leaves the soil not only open to wind and water erosion but makes it a tremendous threat to our near shore reef health. Should we get 3 to 4 inches of rain in a single storm the silting that is inevitable on our precious reefs would be disastrous. The DEIS did not discuss how State agencies will protect the island of Maui from such a logical end? Will conservation practices be mandated as a stipulation for the lease?*

Response 23: Please note that the Water Lease terms and conditions, which are at the discretion of the BLNR, will only apply to the State-owned lands and government-owned waters of the License Area, and will not apply to Mahi Pono's agricultural fields in Central Maui. The farming of the Central Maui fields will not adversely impact the nearshore coastal waters within Central Maui. As explained in Section 4.2.3 of the Draft EIS, relating to Coastal Waters in near Central Maui:

No significant impacts on coastal waters in the region are anticipated as the Proposed Action will reduce wind-blown erosion that could occur if the Central Maui fields were not in cultivation, and which could damage nearshore environments.

In addition, regarding your comment about how Mahi Pono will implement conservation practices, Mahi Pono will follow the BMPs as discussed in Response #3 above.

Comment 24: *The DEIS did not include an explanation of why a system of public auction should be used to place the value on this water as it is impossible for any other entity to compete without owning large sections of land making an auction not in the public interest.*

Response 24: HRS § 171-58(c) calls for State water leases to be issued by public auction. HRS § 171-16(a) describes the requirements for notice of the public auction, which include the upset

price or rental to be charged (based upon an appraisal). It is our understanding that this is the process the State will be following for the subject Water Lease.

Comment 25: *The DEIS did not explain why a fair market value is not set for this public asset and then offered for lease at a fair rate (adjustable for inflation) as would be in the public interest.*

Response 25: As discussed above in Responses # 12, 14, and 24, and discussed several times in the EIS, the Water Lease will be issued after an appraisal done by the State and through a public auction. Through this process, BLNR will determine the Water Lease rental rate.

Comment 26: *There have been countless wild fires in the Central Valley this summer and the County of Maui has had to take responsibility for fighting them. When A and B owned the land I never saw a fire in the Central Valley and as I understand it they used a variety of three inter-related methods of dealing with brush fires:*

- *They maintained a fire truck on property*
- *They maintained firebreaks*
- *They kept certain reservoirs full of water and had a system for the emergency use of that water to squelch fires immediately*

The DEIS did not explain why the new land owner is not being responsible for fires on their land? What is their responsibility for containing fires on their land or reimbursing the County of Maui for fighting them?

Response 26: Mahi Pono has continued its relationship with the County of Maui Fire Department (MFD), and is committed to helping MFD deal with brush fires. This commitment includes maintaining a system of firebreaks and keeping water delivery trucks and other equipment available in the event of brush fires. Mahi Pono is also continuing to divert water to place in its reservoirs for fire suppression needs. Please refer to Response #7 above regarding the addition to the Final EIS, explaining that approximately 27 mgd was being diverted as of October 2019 for the County of Maui's take for its Kamole-Weir WTP and the KAP and use by Mahi Pono and its lessees for agricultural, industrial and fire suppression needs. However, the 27 mgd is not enough to continually store water in the reservoirs used for fire suppression needs as well as implement Mahi Pono's farm plan. In Section 4.14.1 of the Draft EIS, with regard to the agricultural fields of Central Maui, it states:

The Proposed Action will allow for the resumption of the relationship with the Maui County Fire Department which allows their use of water from the various reservoirs within the agricultural fields to fight fires.

Hence, under the Proposed Action, approximately 85.22 mgd of diverted stream water would be available to irrigate and cultivate crops in these fields. Irrigating and cultivating fallow fields reduces wildfire risks. Additionally, as Mahi Pono builds out its farm plan, there will be a greater presence of employees in these fields. These employees can more immediately identify any fires that start, and can more capably implement fire prevention measures.

Under the Proposed Action, water that is being stored in reservoirs in the Central Maui agricultural fields for irrigation purposes would also continue to serve a secondary purpose by providing as-needed water for fire suppression needs.

Comment 27: *The DEIS did not provide the policy number and amount of liability insurance that Mahi Pono carries to protect the public when one of the Central Valley fires causes property damage.*

Response 27: Mahi Pono's liability insurance is not within the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS. Please refer to Response #26 above for the measures that Mahi Pono takes to assist with the suppression of brush fires in Central Maui.

Comment 28: *The DEIS did not spell out the process of applying for a lease for public waters so that other entities could also enter the public auction.*

Response 28: It is our understanding that the State will be undertaking a public auction process for the proposed Water Lease pursuant to HRS § 171-58(c), (e) and (g). The Applicant is not aware of exactly how that process will be followed, as the process is under the purview of the State, but understands generally that there will be an appraisal and public auction component.

Comment 29: *Many Maui residents fear housing development dependent on the use of agricultural water as is routinely done in California. The DEIS did not explain the mechanism for preventing the use of agricultural water for housing development.*

Response 29: As stated throughout the Draft EIS, the Proposed Action is for the issuance of a long-term Water Lease from the State of Hawai'i. The State can impose various conditions when issuing the Water Lease. In order to proceed with the Water Lease, the lessee would have to agree to any lease conditions imposed by the State. Moreover, housing within the Central Maui

agricultural fields is not a "reasonably foreseeable" impact from the Proposed Action. See HAR § 11-200-2 (Definitions). Please note that no such housing or similar development is proposed.

Comment 30: *Questions concerning the impact on Hawaiian Cultural Practices and Natural Resources*

The DEIS did not include the amount of money that the State agencies spend protecting the reefs that are of utmost value to the Hawaiian culture.

Response 30: As stated in Response #27, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'ānae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B's former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS. Specifically as to the concerns raised in your comment, Section 4.2.3 and Section 4.6 of the EIS discuss the existing conditions of the nearshore coastal water resources, as well as cultural resources as applicable, and any associated impacts of the Proposed Action. The amount of money State agencies spend protecting reefs is beyond the scope of this EIS.

Comment 31: *Given that the Hawaiian culture is dependent on healthy reefs and that fertilizer run-off, wind-blown particulate matter and soil erosion from excessive rain are all extremely detrimental to the health of a reef the DEIS did not explain how this lease will protect our reefs. If Mahi Pono is enabled to continue practices that are known to hurt our reefs at the same time that the State spends millions of dollars to protect them then the State is working against itself. This was not addressed in the DEIS.*

Response 31: As discussed in Response #30 above, Section 4.2.3 and Section 4.6 of the EIS discuss the existing conditions of the nearshore coastal water resources, as well as cultural resources as applicable, and any associated impacts of the Proposed Action. Specifically, Section 4.2.3 of the Draft EIS, relating to Coastal Waters in near Central Maui, states:

No significant impacts on coastal waters in the region are anticipated as the Proposed Action will reduce wind-blown erosion that could occur if the Central Maui fields were not in cultivation, and which could damage nearshore environments.

Hence, the Proposed Action will not adversely impact the nearshore coastal waters within Central Maui. Conversely, under the No Action alternative, wind-blown erosion is anticipated to increase, adversely impacting the nearshore coastal waters within Central Maui. With regard to Mahi Pono's agricultural practices, Mahi Pono will follow BMPs as discussed in Responses #2 and 3 above.

Comment 32: *Given that in the past A&B did not protect the ditch system watershed from invasive species and thereby harmed State lands that are meant to support Hawaiian Cultural practices – the DEIS did not address how will this change under the leadership of Mahi Pono?*

Response 32: The State-owned lands addressed in this EIS for the proposed Water Lease is the License Area. EMI continues to take measures to mitigate the spread of foreign pests in the License Area and related lands by cleaning boots, equipment and machinery prior to entry along the EMI Aqueduct System. EMI staff is careful to clean machinery before relocating it to different sites within the License Area and outside the License Area.

To date, EMI has worked closely with the Maui Invasive Species Committee (MISC) to assist in mitigating non-native weeds along the EMI Aqueduct System and access roads. Typical procedures involve EMI staff notifying MISC of sightings and locations of non-native weeds, and then facilitating access to these areas for MISC to conduct appropriate treatment. Specifically, Section 4.4.1 of the Final EIS has been revised to reflect this discussion as shown in pages 4-121 to 4-124.

Moreover, pursuant to HRS § 171-58(e) a watershed management plan is required in connection with a water lease as discussed in Response #22 above.

Sections 4.4.1 and 4.4.2, as well as Appendix C, of the Draft EIS explained in detail what is recommended to prevent impacts from invasive species to critical status flora and fauna, which include resources used for Native Hawaiian cultural resources as detailed in Section 4.6 of the Draft EIS. Section 4.4.1 of the Draft EIS states:

However, to the extent that maintenance activities are undertaken within the License Area in pristine areas, such as on cliffsides, nears waterfalls, or in other native species dominated areas, the following avoidance and minimization measures are recommended:

- *A qualified biological monitor should be on site to ensure that no listed or candidate species are impacted.*

- *The monitor should have familiarity with the plants of the area, including special-status species, familiarity with natural communities of the area, including special-status natural communities, experience conducting floristic field surveys, and experience with analyzing impacts of development on native plant species and natural communities*
- *To avoid the introduction or transport of new invasive plant species into more pristine portions of the License Area during EMI Aqueduct System maintenance activities, all equipment and vehicles arriving from outside the License Area should be washed and inspected prior to any maintenance activities on cliff sides, near waterfalls, and in other native species-dominated areas in the License Area. Such washing and inspecting should be done at a designated location.*
- *Construction materials arriving from outside Maui should also be washed and/or visually inspected (as appropriate) for excessive debris, plant materials, and invasive or harmful non-native species (plants, amphibians, reptiles, and insects). When possible, any raw materials used in maintenance activities should be purchased from a local supplier on Maui to avoid introducing non-native species not present on the island. Inspection and cleaning activities should be conducted at a designated location. The inspector must be a qualified botanist/entomologist able to identify invasive species that are of concern relevant to the point of origin of the equipment, vehicle, or material.*

Section 4.4.2 of the Draft EIS states:

Nevertheless, to minimize potential impacts to fauna, the following measures should be implemented:

- *Regular on-site staff should be trained to identify special-status species with the potential to occur on-site and should know the appropriate measures to be taken if they are present.*
- *If a downed tree must be removed from a road, trail, or other passageway, it will be inspected for the presence of active bird nests, specifically the nest of an MBTA-protected species that may have been present prior to the tree falling. If an active nest is found, it should be protected in place until the chicks fledge.*
- *If tree trimming occurs in the 'i'iwi, Maui parrotbill and crested honeycreeper range (as defined in Section 5.2.5) from November to June, a qualified biologist should survey the trees for active nests of these species.*

- *If a Hawaiian goose is observed in the area during construction activities, all activities within 100 feet (30 m) of the species should cease, and work should not continue until the species leaves the area on its own accord.*
- *If a Hawaiian goose nest is discovered, all activities within 150 feet (46 m) of the nest should cease, and the USFWS should be contacted. Work should not resume until directed by the USFWS.*
- *If tree removal occurs during the bat breeding season (June 1 to September 15), direct impacts could occur to juvenile bats that are too small to fly but too large to be carried by a parent. To minimize this impact, no trees taller than 15 feet (4.6 m) should be trimmed or removed between June 1 and September 15.*
- *The use of barbless top-strand wire is recommended for all fence construction to avoid entanglement of Hawaiian hoary bat.*
- *A qualified biologist should work closely with the USFWS and monitor Endangered Species Act-listed damselflies to ensure activities do not have a negative impact...*

Nevertheless, to minimize potential impacts to invertebrate species, the following measures should be implemented:

- *A survey for potential larval host plants for Blackburn's sphinx moth (particularly tree tobacco) should be conducted by biologists before construction/vegetation clearing. Results of the survey should be provided to the USFWS.*
- *If host plants are found, surveys for Blackburn's sphinx moth should be performed according to the most recent USFWS guidance, and preferably during the wet season (January to April), roughly 4 to 8 weeks following a significant rainfall event. Results of the survey should be provided to the USFWS. Any necessary follow-up actions should be coordinated with the USFWS.*
- *A qualified biologist should work closely with the USFWS and monitor Endangered Species Act-listed damselflies to ensure activities do not have a negative impact.*

However, please note that Section 4.4.2 in the Final EIS has been revised to remove the mitigation related to tree removal and fencing, as those activities are generally not contemplated within the License Area in connection with the Proposed Action. See 4-129 to 4-131 of the Final EIS.

Comment 33: *Given that the investment money from the Canadian pension fund is meant to support an ESG investment the DEIS did not address how will this lease further environmental, social and community good?*

Response 33: The Draft EIS does address anticipated social impacts, including cultural impacts. Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures) of the Draft EIS provides a comprehensive description and impact analysis of the East Maui Lease Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts.

Specifically, the socio-economic impacts of the Proposed Action are addressed at length in Section 4.7 (Socio-Economic Characteristics) of the Draft EIS, and in further detail in Appendices G through I. Section 4.7 has subsections addressing impacts to populations and impacts (Section 4.7.1), impacts to social characteristics (Section 4.7.2), impacts to the economy and other fiscal considerations (Section 4.7.3), and impacts to the agricultural economy (Section 4.7.4). The potential socio-economic impacts of the alternatives to the Proposed Action considered by the Draft EIS are analyzed in Sections 3.4.11 (Social Characteristics), 3.4.12 (Economic and Fiscal Resources), and 3.4.13 (Agricultural and Related Economic Resources). Moreover, secondary and cumulative impacts are discussed in Section 4.16 of the Draft EIS. As stated in Section 4.16.1 of the Draft EIS:

The secondary impacts of the Proposed Action primarily relate to developing diversified agriculture in Central Maui, including the economic and social impacts of diversified agriculture and job creation on Maui's broader economy

and the County's tax revenues. These impacts are summarized in Section 4.7 Socio-Economic Characteristics based on a detailed evaluation in the Economic and Fiscal Impact Study (See Appendix H) and the Social Impact Assessment (See Appendix G).

As stated in Section 4.16.2:

The cumulative impact of the Proposed Action can be regarded as an additive impact overlaid on more than 100 years of history during which the EMI Aqueduct System was developed to provide water for the development of a sugar industry in Central Maui as well as for the later development of Upcountry Maui. This DEIS summarizes the pertinent history in Chapters 1 and 2 as a basis for understanding the events that have shaped the existing conditions described in Chapter 4. In addition, the following studies document the pertinent history related to the sugar industry in Maui and the EMI Aqueduct System and how they have shaped existing condition:

- *Archaeological LRFI (See Appendix E) discusses the historic context of the Proposed Action;*
- *CIA (See Appendix F) also provides a historic context and documents cultural resources and practices recalled by cultural informants;*
- *HSA (See Appendix D) documents the various characteristic components of the EMI Aqueduct System that provide the historic context for the functioning system; and*
- *SIA, which discusses history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono.*

Specifically, the Social Impact Assessment (SIA), provided as Appendix G of the Draft EIS, obtained input from several community members, many of whom have direct and long-term experience with the streams in the subject area. As discussed in Section 4 of Appendix G (Preliminary Community Issues), seven focus groups were convened in November 2018. Participants in these sessions included residents, farmers and ranchers, and people who are active in environment and sustainability efforts. These participants lived in Ke'anae, Wailuānuī, Huelo, Ha'ikū, Kula, Makawao and Pukalani. Sixty-four people signed in at these focus groups, but the actual number of participants is higher because some individuals arrived after the session started and did not sign in.

In addition, there were several interviews conducted in April 2019 to obtain feedback on the then-recent sale of A&B land holdings to Mahi Pono. The interviewees were diverse in interest and place of residence. Section 5 of Appendix G discusses the social impacts from an overall community perspective and on identified special social groups which are summarized in Section 4.7.2 of the EIS. Based on comments received to the Draft EIS, Appendix G added Section 6

discussing the social impacts from the “big picture” or cumulative perspective. Section 4.7.2 of the Final EIS has been revised accordingly as shown in pages 4-262 to 4-272 of the Final EIS. Relatedly, Appendix H (Economic and Fiscal Impact Study) and EIS Section 4.7.3 has been revised to include the current revocable permit rates as well as updates from Appendix I (Agricultural and Related Economics Impacts report), which is summarized in EIS Section 4.7.4 regarding farming in East Maui as shown in pages 4-288 to 4-293. Moreover, in addition to the above community outreach, the Cultural Impact Assessment (CIA) provided as Draft EIS Appendix F, includes input from three interviewees, as well as numerous declarations made during the CWRM D&O proceedings. Also, Cultural Surveys Hawai'i (CSH), which prepared the CIA, reached out to members of the community who provided comments on the Draft EIS related to the CIA and the CIA has been updated based on comments. The CIA now includes additional interviews and consultation with the Office of Hawaiian Affairs, Mr. Lafayette Young, Mr. Albert Perez, and Ms. Lucienne De Naie that identified cultural resources and potential impacts, as well as recommended mitigation measures which have been included in Section 4.6 as shown in pages 4-158 to 4-159 of the Final EIS.

Regarding your comment about the investment money from the Canadian pension fund to support an ESG investment, please note that the purpose of this EIS is not to determine whether or not the proposed Water Lease will meet the Canadian Pension Fund's (PSP) ESG policy. The purpose of the EIS is to identify impacts from the proposed Water Lease. The EIS, however, will inform PSP as to whether its ESG policy is being met. The PSP has an ESG policy. PSP also has an annual “Responsible Investing Report” which can be accessed at https://www.investpsp.com/media/filer_public/documents/PSP-2020-responsible-investment-report-en.pdf. The ESG policy sets out a policy to be followed. The policy does not address specific situations or have numeric standards. The specific situations are determined by PSP on a case by case basis. The ESG policy explains:

We recognize that the materiality of ESG factors varies across companies, industries, geography and time. Accordingly, we take a pragmatic view when applying our approach to responsible investing taking into account the asset class and type of investment. This approach is tailored to local, social, and legal environments, and to the commercial imperatives of the companies in which we invest.

The EIS appropriately and fully discloses the detriments and benefits of the proposed Water Lease across the social and environmental general ESG framework.

Comment 34: *Thank you for your attention to detail on this very important public matter. I am not opposed to water being given to an entity that actually provides food for our local population while also improving the eco-systems of Maui. This project is an ESG investment for the Canadian pension fund which makes it mandatory that the project does social, environmental*

and social good. It is possible to make a profit while also benefiting the earth and its inhabitants. For the State to allow less is to neglect its responsibility to look out for the common good in this environment of the multiple threats of climate change.

Response 34: We acknowledge your comments above and note that you are not opposed to water being given to an entity that provides food for the local population while also improving the ecosystems of Maui. As discussed in Response #9 above, at full development of its farm plan, Mahi Pono's local sales, including those of its community farm tenants, will comprise roughly 65% of total sales generated from Central Maui, with exports being 35%. Moreover, as discussed in Response #22, HRS § 171-58(e) requires a watershed management plan in connection with a water lease.

As noted in Response #33 above, this EIS will inform PSP as to whether its ESG policy is being met. The EIS appropriately and fully discloses the detriments and benefits of the proposed Water Lease across the social and environmental general ESG framework.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: COMMENTS on DEIS A&B Water Lease
Date: Friday, November 8, 2019 8:33:31 AM

ian.c.hirokawa@hawaii.gov
waterleaseeis@wilsonokamoto.com

Aloha kahou,

Below are my comments regarding the Draft Environmental Impact Statement (DEIS), September 2019, for the Proposed 30-year Water Lease for the Nahiku, Keanae, Honomanu and Huelo License Areas.

Mahalo,

Chris Gaarder, PO Box 1032, Hana, HI, 96713
chris@rainbowridgewest.com

- Please extend the comment period due to the lengthy nature of the document and the importance of this issue to the community. **TO ACHIEVE THIS, A&B SHOULD WITHDRAW ITS DEIS AND RESUBMIT IT FOR PUBLICATION IN THE ENVIRONMENTAL NOTICE WITHOUT ALTERATIONS.** This short delay is minor in comparison to the 30-year lease that is sought, and will ensure community members who have direct knowledge of the potential impacts of the proposed lease have an opportunity to offer their comments and strengthen the process.
- The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species, and does not address the impact of stream restoration on recently restored streams and muliwai. Cultural practitioners and aquatic experts need to address changes in 'o'opu, hihiwai and 'opae populations they have seen where flows have been restored recently, and this should be part of the environmental impact analysis.
- The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands and require a management plan and funding. How is it possible to analyze the environmental impact of a plan that doesn't exist? Where in the DEIS does it address the impact of potentially not managing the invasive species?
- The DEIS does not include analysis of an alternative to split the system into service area units. For example, Nahiku has a dedicated pipe from its source to the County Water system, using the ditch and tunnels only to support the pipe. A separate utility could possibly take over this portion of the lease area. The DEIS omits details which are needed to make these alternative analyses.
- The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for over 100 years as the "baseline condition". It does not address the impacts of operation and maintenance of the system which alter the natural baseline condition. The DEIS needs to focus on an option of no diverted streams and how that would benefit the East Maui ecosystems and communities.
- The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of demand, future rainfall and future water supplies. How do the uncertainties of the Mahi Pono agricultural needs, the same

uncertainties they describe in their vague agricultural plans, support the concept of a 30 year commitment?

- The DEIS needs to include a Watershed Management Plan. The methods of managing the watershed for the next 30 years, including access management, have a huge impact on the environment and should be addressed before the DEIS is reviewed. Limiting access needs to be addressed.
- In the Cultural Impact Analysis, Section 7.6 Impacts and Recommendations, the DEIS recommends professional analysis by cultural, ethnobotanical, scientific and/or biological experts as the way to address impact questions of various alternatives. Why was analysis not completed prior to the DEIS, rather than deferring these elements which have environmental impacts.
- The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.
- The DEIS needs to address the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Gaarder:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please extend the comment period due to the lengthy nature of the document and the importance of this issue to the community. TO ACHIEVE THIS, A&B SHOULD WITHDRAW ITS DEIS AND RESUBMIT IT FOR PUBLICATION IN THE ENVIRONMENTAL NOTICE WITHOUT ALTERATIONS. This short delay is minor in comparison to the 30-year lease that is sought, and will ensure community members who have direct knowledge of the potential impacts of the proposed lease have an opportunity to offer their comments and strengthen the process.*

Response 1: We acknowledge your comments noting for a time extension to allow for additional public comment. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai‘i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 2: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species, and does not address the impact of stream restoration on recently restored streams and muliwai.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not sufficiently analyze the impacts of diverting water on native aquatic species. Please note that the HSHEP model in Appendix A estimates streamflow at all diversion locations based on watershed and rainfall characteristics and analyzes each reasonable alternative on stream flow in Section 3.4.3 and Section 4.2.1 of the Draft EIS. The combination of the lower and upper bounds used for the HSHEP model in Appendix A, provide the range at which we would expect changes to the diversions to fall within and provides a way to comparatively discuss different flow restoration scenarios as by definition the changes must fall somewhere between 100% diversion and 0% diversion.

The two scenarios presented in Appendix A of the Draft EIS, the Proposed Action compliant with the CWRM D&O (Trutta Environmental Solutions' 2018 IIFS scenario) and No Action Alternative (30% remaining flow diversion) are examples of how different flow restoration scenarios result in different amounts of habitat restored. The HSHEP model is used to quantify these differences based on flow restoration changes at specific diversions.

As discussed in Section 3.4.3 of the Draft EIS, the HSHEP model requires specific diversion conditions at each diversion. Applying the model to the Reduced Water Volume alternative would require information regarding where stream flows are proposed to be increased over the Proposed Action and the amounts. Given such information, the HSHEP model is able to readily calculate the number of remaining Habitat Units (HU) in any given scenario. The appendices contained within the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report (Appendix A of the EIS) provides the necessary data to form a scenario that the HSHEP model can use to analyze and quantify the changes that occur. Hence, the HSHEP model and the appendices within the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report provides data that can assist decision makers understand how impacts could change across different diversions scenarios.

Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains

within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown in pages 4-61 to 4-62 of the Final EIS. The above excerpt and the updated text in pages 4-61 to 4-62 of the Final EIS present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See pages 4-61 to 4-62 of the Final EIS.

Comment 3: *Cultural practitioners and aquatic experts need to address changes in ‘o’opu, hīhīwai and ‘ōpae populations they have seen where flows have been restored recently, and this should be part of the environmental impact analysis.*

Response 3: We acknowledge your comments. Please note that many people at the EISPN public scoping meetings on February 22nd and 23rd, 2017 testified noting positive impacts seen from increased stream flow resulting from the cessation of sugar operations, please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See pages 4-239 to 4-252 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted. This is expected as it was discussed in Section 4.2.1 of the Draft EIS that the Proposed Action would increase the number of HU as compared to sugarcane operations. Please note that that as of October 2020, an average of 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System. Hence it can be assumed that current water diversion rates from the License Area are comparable to the amount that would be diverted under the No Action alternative, which is estimated to be approximately 26.39 mgd. The HSHEP model estimated that approximately 79.8% of total HU would be available under the No Action alternative. However, please note that under the Proposed Action, the total HU would be less than projected

under the No Action alternative. With regards to 'o'opu, hīhīwai, and 'ōpae, please note that the HSHEP model included the report in Appendix A which is summarized in Section 4.2.1 of the EIS found that under the Proposed Action the habitat for species such as 'ōpae, 'o'opu, and hīhīwai would increase from what was available under historic diversion rates.

Comment 4: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands and require a management plan and funding. How is it possible to analyze the environmental impact of a plan that doesn't exist? Where in the DEIS does it address the impact of potentially not managing the invasive species?*

Response 4: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

With regards to your comment about analyzing the environmental impact of a plan that does not exist, please note that it is not within the scope of the EIS to analyze the existing or forthcoming watershed management plan. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

With regards to your comment about where the Draft EIS discusses invasive species, it is noted in Appendix C that low-elevation portions of the License Area are already highly impacted by invasive plants. However, it is noted in Appendix C that high-elevation portions of the License Area are predominately dominated by native species and is very likely to contain habitat for several endangered or threatened species. Impacts related to flora and fauna as a result of the Proposed Action are discussed in Section 4.4 of the EIS. Please note that Section 4.4.1 and Section 4.4.2 have been revised in the Final EIS based on comments received on the Draft EIS to further outline the existing conditions of the License Area and more accurately reflect targeted mitigation measures based on feedback provided by the DLNR and USFWS. See pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS.

Comment 5: *The DEIS does not include analysis of an alternative to split the system into service area units. For example, Nahiku has a dedicated pipe from its source to the County Water system, using the ditch and tunnels only to support the pipe. A separate utility could possibly take over this portion of the lease area. The DEIS omits details which are needed to make these alternative analyses.*

Response 5: Please note that it is not within the scope of the EIS to analyze splitting the EMI Aqueduct System into service units. As noted in Response #4 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS. Moreover, please note that the EMI Aqueduct System is one integrated system that works by gravity and cannot be split into various servicing units.

With regards to Nāhiku, please note that following publication of the Draft EIS, the applicant received additional information from the MDWS regarding the source of the water that services the Nāhiku community. A copy of the MDWS letter is included in Appendix P to the Final EIS. Please note, the description of the Nāhiku water service from Section 2.1.3.3 of the Draft EIS, has been revised to take into account clarifications from the MDWS, as shown in pages 2-21 to 2-22 of the Final EIS.

According to MDWS, EMI's West Makapipi Tunnel 2, Well No. 4806-07, which is also known as the "Nāhiku Tunnel", is the sole source of water for the MDWS Nāhiku Water Service Area. It is our understanding that EMI developed and owns the Nahiku Tunnel that is the source of the

water. Per a 1973 Memorandum of Understanding with EMI and HC&S as amended, MDWS can draw only up to 20,000 gallons of water per twenty-four hour day to serve the Nāhiku community from properties owed by EMI and those under license from the State. EMI continues to deliver water to the Nāhiku community pursuant to a 2018 agreement which embodied the 1973 agreement as amended, which is premised upon EMI's continued receipt of permits or a lease from the State BLNR. Even though the agreement provides the MDWS a right to up to 20,000 gpd per twenty-four hour day, EMI has accommodated the needs of the Nāhiku community, which have ranged between approximately 8,345 (2018) to 40,925 (2007) gpd on a daily basis, although supply of amounts over 20,000 gpd on any given day is not required under the agreement.

Comment 6: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for over 100 years as the "baseline condition". It does not address the impacts of operation and maintenance of the system which alter the natural baseline condition. The DEIS needs to focus on an option of no diverted streams and how that would benefit the East Maui ecosystems and communities.*

Response 6: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the "No Action" alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from

the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate.

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown in pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 7: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of demand, future rainfall and future water supplies. How do the uncertainties of the Mahi Pono agricultural needs, the same uncertainties they describe in their vague agricultural plans, support the concept of a 30 year commitment?*

Response 7: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters.

However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment.

The uncertainties you state about the Mahi Pono farm plan are unclear. However, as discussed in Section 2.1.4 of the Draft EIS that the Mahi Pono farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, which includes the DHHL water reservation.

Comment 8: *The DEIS needs to include a Watershed Management Plan. The methods of managing the watershed for the next 30 years, including access management, have a huge*

impact on the environment and should be addressed before the DEIS is reviewed. Limiting access needs to be addressed.

Response 8: Please note that as discussed in Response #4 above, Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

Comment 9: *In the Cultural Impact Analysis, Section 7.6 Impacts and Recommendations, the DEIS recommends professional analysis by cultural, ethnobotanical, scientific and/or biological experts as the way to address impact questions of various alternatives. Why was analysis not completed prior to the DEIS, rather than deferring these elements which have environmental impacts.*

Response 9: The cultural, ethnobotanical, biological, and other scientific studies for the Draft EIS were performed prior to publication of the Draft EIS. It is typical in the preparation of EIS documents that the various technical consultants do not review the work of other consultants, but rather, the EIS preparer synthesizes the information from various sources within the EIS document. Since the Draft EIS was published the CIA consultant reviewed the studies prepared by the other consultants, as applicable to the CIA's recommendations, and determined that the CIA recommendations have been satisfied by the following studies: Appendix A (HSHEP), Appendix B (Assessment of Streams & Ocean Water Chemistry), Appendix C (Terrestrial Flora and Fauna Technical Report), Appendix D (Historical Structure Assessment), Appendix E (LRFI), Appendix G (Social Impact Assessment), Appendix H (Economic and Fiscal Impact Study), and Appendix I (Agricultural and Related Economic Impacts). Of these studies, the

HSHEP, Assessment of Streams & Ocean Water Chemistry, Terrestrial Flora and Fauna Technical Report, Historical Structure Assessment, Social Impact Assessment, and the LRFI address the recommendations made by the CIA. In light of the analyses and recommended mitigation measures developed by other consultant studies or recommended through community consultation have been added to Section 4.6 Final EIS as shown on pages 4-239 to 4-252.

Comment 10: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 10: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided in pages 4-61 to 4-67 of the Final EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 11: *The DEIS needs to address the role diverted streams have on mosquito populations in East Maui. Stagnant pools along diverted streams were breeding grounds for mosquitoes that carried Dengue fever virus to East Maui residents over the years.*

Response 11: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown in pages 4-58 to 4-61.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water

habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the *Culex* mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for *Culex* mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the *Culex* mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of *Culex* mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comment on The Proposed Lease (Water Lease) for the Nahiku, Keanae, Honomanu and Huelo License Areas
Draft Environmental Impact Statement
Date: Thursday, October 31, 2019 9:02:23 PM

Gentlemen,

I am concerned about the recent fires on Mahi Pono land. These fires are greatly affecting the health and property of Maui residents, yet the pension fund of Canadian firefighters has not set up proper precautions for such fires.

Please inform me where in the DEIS you have described in detail how water from the proposed water lease will be transported, stored, pumped and used for the purpose of avoiding and fighting such fires and how the safety of Maui firefighters is guaranteed.

Thank you,

Chris Mentzel

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Mentzel:

Thank you for comments dated October 31, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am concerned about the recent fires on Mahi Pono land. These fires are greatly affecting the health and property of Maui residents, yet the pension fund of Canadian firefighters has not set up proper precautions for such fires.*

Response 1: Please note that Section 4.10 of the Draft EIS describes conditions in Central Maui, including a recognition of wildfires (“wildfires in Central Maui on fallow fields formerly in sugar cultivation, have generated intense smoke and dust over relatively short periods of time until they have been extinguished.”) and projects that the transition from sugarcane to diversified agriculture may affect air quality from an increase in equipment emissions and in the very short-term, from dust from uncultivated land. As explained in the Section 4.10 of the Draft EIS, the diversified agricultural activities in Central Maui will be subject to HAR, § 11-60.1-33, Fugitive Dust, which states, in part: “11-60.1-33(a): No person shall cause or permit visible fugitive dust to become airborne without taking reasonable precautions.” And, § 11-60.1-33(b): “...no person shall cause or permit the discharge of visible fugitive dust beyond the property lot line on which the fugitive dust originates.” Given the expanse of the agricultural fields in Central Maui, extra precaution must be exercised near its boundaries. Particularly in these areas, mitigation measures will include keeping fallow land to a minimum, using cover crops to minimize exposed soil and

limiting vehicular speed during plowing activities and while traveling onsite. Also, water will be used to minimize dust during activities such as grading and grubbing, any gathered soil will be stabilized, any loading for soil will minimize the drop distance, and soil transport will use water or soil covering to control dust.

Comment 2: *Please inform me where in the DEIS you have described in detail how water from the proposed water lease will be transported, stored, pumped and used for the purpose of avoiding and fighting such fires and how the safety of Maui firefighters is guaranteed.*

Response 2: Please note that as described in Section 2.1 of the Draft EIS, the Proposed Action will allow for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water for uses described in the EIS.

Your comment regarding pumping and storage is unclear. We assume you are talking about the EMI Aqueduct System and the Central Maui Field Irrigation System. Section 3.1.1.1 of the Final EIS which has been corrected due to error in the Draft EIS as shown in pages 3-3 to 3-4 explains that the EMI Aqueduct System has six reservoirs that serve to supplement water delivery and the Central Maui Field Irrigation System has 35 major reservoirs. With regards to pumping, please see the table below, which has been added to Section 4.2.2 of the Final EIS as shown in page 4-75.

State Well No.	TMK Number	Installed Pump Capacity (MGD)	Typical Range of Chlorides (MG/L) from 2003 through 2014	CWRM Delineated Aquifer System
4825-001	(2) 3-8-004:001	20.448	225 to 350	Pā‘ia
5226-002	(2) 3-8-006:001	24.048	350 to 550	Kahului
5224-002	(2) 3-8-003:004	15.120	350 to 550	Pā‘ia
5323-001	(2) 3-8-001:006	20.016	No data	Pā‘ia
5424-001	(2) 3-8-001:007	5.760	400 to 700	Pā‘ia
5522-001	(2) 2-5-005:021	8.640	350 to 525	Pā‘ia
5422-001	(2) 2-5-005:054	10.080	350 to 525	Pā‘ia
5422-002	(2) 2-5-005:020	11.664	325 to 475	Pā‘ia
5321-001	(2) 2-5-005:019	30.240	400 to 1600	Pā‘ia
5520-001	(2) 2-7-004:032	10.080	900 to 1600	Ha‘ikū

Please note that the salinity levels fluctuate and therefore a range was provided.

Regarding your comment that a map should depict the historical and prospective areas that can be irrigated using well water, the available brackish groundwater will be used similar to how it was in the past with regards to how the groundwater is applied as discussed in Section 2.1.4:

...brackish water wells that can supplement surface water to approximately 17,200 acres of the plantation at the lower elevations (CWRM D&O, FOF 738). These brackish wells extract groundwater from the subsurface aquifers lying beneath the agricultural lands, and which are cyclically dependent on recharge derived from the irrigation of the overlying lands by water from the EMI Aqueduct System. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water. Groundwater, however, can be delivered to 7,000 acres at higher elevations via a shared pipeline that served as a penstock line for a hydroelectric unit (CWRM D&O, FOF 739). This pump station was designed and built to be an emergency water source for the high-elevation fields in the event of extreme drought.

Please note that a figure has been produced to correspond with the above text in Section 2.1.4 of the Final EIS as shown in page 2-24.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: corrected letter Maui /Kauai Water leases

Dear BLNR

Please refuse the request by Alexander and Baldwin, and Mahi Pono for any extension or continuation of any leases pertaining to the East Maui Area.

1. As you are aware, until East Maui is declared a Water Management Area by the State Water Commission, no water is legally transported to Central Maui until it is declared a Water Management Area.
2. Proper monitoring of stream levels in the 100 streams have not been done, started or completed. Only 4 streams are monitored, the most historical being Honopou Stream. This in itself should remove any possibility of future leases until water sources and levels are gathered.
3. Right to grow Taro has been destroyed by the destruction of the stream flow, the following growth within streams, that then creates so much debris that results flooding for the areas and the roadways along the stream. Taro is impacted by the low flow and the warming of the waters. Stream life must also be considered as well as near ocean water life.
4. The leases were created under hardship and under a temporary nature not intended for longterm and intensive use.
5. The ditches were built by enslaved and indentured servants, who were paid \$1 per day and then bought groceries from the AB store. This amounts to slavery and reparations must be made.
6. The original ditches did not consider the human, marine animal or plant life consequences or end results.
7. Leases are not intended to be permanent, and The State has every right to not renew the leases and tell the company to remove its water catchment systems and environmental destroyers. The State is Under charging for the current leases, \$9,000 a month for 25 million gallons per day , it is absolute thievery.

8. The EMI company took land via the mapping system, and has poorly maintained the ditch system using chemicals to kill “weeds”, without proper control.

AB would not have this request in, if they had not polluted the East Maui Aquafir, located at Hamakuapoko, where the applied chemicals, and the Feds shut the wells down. There are barely 20 years left on the filter systems as part of the Dow chemical settlement.

The Hawaiian people deserve the right to live above the right to a hotel to wash towels.

Say NO to EMI, AB and HCSC and Mahi Pono, for any future leases and return to land to the Hawaiian Trust. Streams, life, culture food sources through Taro and agricultural cultivation is vital , important and vital to a community. Small farmers will be burdened by the DLNR rules and will never be able to compete with corporate farming to necessitate needs and water use.

KIUC’s EA does not meet State requirements for a lease application. There are significant spiritual, cultural, environmental and public trust impacts that can only be addressed with an EIS.

Examples:

Residents had to abandon Taro fields on Powerhouse Rd because the stream ran dry.

Water was sold to downstream farmers by the diverter.

Susan Case of DLNR must be removed for showing favoritism to her family Case member.

Water was retained by diverter and placed in a pond, high in bauxite, which is above standard levels and then resold to downstream farmers.

The lease is not proper for valuation or Public Use Trust Doctrine.

- KIUC receipt of federal funds in 2017 for system upgrades requires an EIS for future lease approval
- KIUC’s use of the water is consumptive, meaning it is not returned to the stream of origin. Any consumptive use of water within conservation district land requires legislative approval.

- More than a dozen streams are diverted out of the Wailua watershed. But, Wai`ale`ale and Waikoko Streams are the only two streams accessible to the public; they are located in the Lihue-Koloa Forest Reserve. Proper monitoring of all the streams must be implemented for proper outflow patterns.

The stream above the diversion is classified by the Environmental Protection Agency as federally protected critical habitat for the endangered endemic Newcomb's Snail which requires an EIS.

KIUC is asking for 30 million gallons per day (MGD) with the stream getting 3.5 MGD, or less in dry conditions.

- The impacts of climate change is not addressed in the EA. What will rainfall patterns and stream flows be like 50-65 years from now?

We have been in a drought for the past 6 months and with 1 Billion people on Earth by 2039 We must protect the Public Water Trust say NO to this unlawful request for a lease that was originally granted under hardship and with deceit and false pretenses.

Thank you

Christina Hemming

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Hemming:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.¹

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please refuse the request by Alexander and Baldwin, and Mahi Pono for any extension or continuation of any leases pertaining to the East Maui Area.*

1. As you are aware, until East Maui is declared a Water Management Area by the State Water Commission, no water is legally transported to Central Maui until it is declared a Water Management Area.

Response 1: Your initial comment is acknowledged. However, for clarification, please note that the Board of Land and Natural Resources' (BLNR) decision on the proposed Water Lease is not the matter at hand. Any decision on the Water Lease will take place only after the EIS process is completed.

¹ Note, you submitted two comment letters on November 7, 2019. One by email of 2:53 pm, and one by email of 3:15 pm, which you named "corrected letter Maui/Kauai Water leases." Because the 3:15 pm email is designated as the "corrected" letter, that is the letter we are responding to and included in the Final EIS.

10238-04

Letter to Ms. Christina Hemming

Page 2 of 18

September 3, 2021

We respectfully disagree with your comment. Although it is not clear from your comment, we assume you are referring to Hawai'i Revised Statutes (HRS) § 174C-49, which provides conditions necessary before the Commission on Water Resource Management (CWRM) can issue a water use permit in a designated water management area, and specifically subsection (c) of that law, which addresses CWRM's authority to allow a water use permit holder to transport and use surface or groundwater beyond overlying land or outside the watershed from which it is taken. This law is not applicable to the proposed Water Lease. The License Area is not designated as a water management area. See <https://dlnr.hawaii.gov/cwrm/surfacewater/swma/>.

There is no requirement under HRS Chapter 174C or HRS Chapter 171 that requires the CWRM to designate a water management area before the BLNR can issue the proposed Water Lease.

HRS § 174C-49(c), which pertains to the issuance of permits in designated water management area, states:

The common law of the State to the contrary notwithstanding, the commission shall allow the holder of a use permit to transport and use surface or groundwater beyond overlying land or outside the watershed from which it is taken if the commission determines that such transport and use are consistent with the public interest and the general plans and land use policies of the State and counties.

We believe this clause was written to ensure the ability to transport water out of its lands of origin, for use elsewhere, even in the more restricted situation of a designated water management area. It does not preclude the transport of water in areas not designated as water management areas. Of note, there are systems across the Hawaiian islands that rely on transporting water out of their lands of origin to serve their users — many of them are County water systems that rely on groundwater wells to supply large service areas, beyond the lands on which the groundwater wells are located.

Comment 2: *Proper monitoring of stream levels in the 100 streams have not been done, started or completed. Only 4 streams are monitored, the most historical being Honopou Stream. This in itself should remove any possibility of future leases until water sources and levels are gathered.*

Response 2: Please note that there are not 100 streams diverted by the EMI Aqueduct System. Contrary to your statement that there are "hundreds" of streams, the total number of streams/tributaries within the License Area that could be diverted under the Proposed Action is

25 out of the 36 total streams (which includes its tributaries) as indicated by Table 1-3 in the Final EIS.

Regarding your comments about only 4 streams being monitored, EMI has gages located in several locations across the License Area. These gages only measure flows in the ditches. The establishment of in-stream gage stations typically fall under the responsibility of CWRM or the U.S Geological Survey (USGS) due to the highly technical knowledge required to establish control points to accurately measure streamflow. Similarly, it is not feasible to provide total diversion amounts by License Area or on a stream-by-stream basis. While the USGS used to have gauge stations at each of the License Area boundaries, due to cost cutting by the USGS, most of those gauge stations were removed, except for those at the Honopou boundary of the License Area. However, what is most important relative to stream protection is not how much water is diverted from a stream, but rather knowing that the IIFS is met, which does not require measurement of every stream. Moreover, CWRM's prior efforts to measure water flows for specific purposes involved the installation of water gages in certain streams, but such efforts proved entirely impractical due to the occurrences of flash flood conditions in the streams, which caused gage stations to wash away. As noted in the CWRM D&O, in addition to the measurements EMI takes on its ditch, at Honopou stream and Maliko gulch, there are a select few other known locations of gaging stations throughout the License Area, however, for the purpose of measuring the aggregate flow from entire License Area, the Honopou Stream measurement reading was used in the Draft EIS

Comment 3: *Right to grow Taro has been destroyed by the destruction of the stream flow, the following growth within streams, that then creates so much debris that results flooding for the areas and the roadways along the stream. Taro is impacted by the low flow and the warming of the waters. Stream life must also be considered as well as near ocean water life.*

Response 3: Your comment is acknowledged, however, it is unclear which streams you are referring to as your comment does not specifically identify which streams are having adverse impact to taro growing due to low flow and warming waters. However, as discussed in the Final EIS Section 1.3.4, under the CWRM D&O, CWRM ordered full restoration of water flow to streams that supply water to active taro farming areas. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waiānu, Kualani/Hāmau, and

Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on pages 1-19 to 1-23. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration statuts); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas,

10238-04

Letter to Ms. Christina Hemming

Page 5 of 18

September 3, 2021

not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Please note that the Cultural Impact Assessment (CIA) prepared by Cultural Surveys Hawai‘i (CSH) and Section 4.6 of the Final EIS has been updated to include a reformatting of the identified impacts, including those specifically related to taro farming and also identifies recommended mitigation measures as shown in pages 4-239 to 4-252.

Regarding your comment about stream life, please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts. The initial conclusion, as presented in Section 4.2.1 of the Draft EIS, was that “under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition.” However, please note that Section 4.2.1 of the Final EIS has been revised, and the HSHEP model report provided as Appendix A has been clarified as shown pages 4-56 to 4-67. Hence, under the Proposed Action, the number of HU within the entire License Area is decreased by an estimated 36.1% from a theoretical Natural Condition (i.e., a condition where no streams are diverted). However, under the Proposed Action, the number of HU is increased by approximately 27.4% in comparison to the Full Diversion condition. Habitat units (HU), as defined by the HSHEP report (Appendix A), as relative measures of stream habitat where each It is important to recognize that the accumulation of HU

for amphidromous species is additive, meaning that a single unit of stream may have a total HU in excess of the stream area quantified. In other words, if HU for multiple non-competitive species in a given area are added together, the combined HU could be greater than the area. This is important when considering the total HU for all eight amphidromous species in a stream as the total HU for all eight species may be greater than the total stream area.

Regarding your comment about “near ocean water life,” impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B of the EIS. Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species (‘O‘opu naniha (*Stenogobius hawaiiensis*), ‘O‘opu akupa (*Eleotris sandvicensis*) and ‘Ōpae ‘oeha‘a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83.

Comment 4: *The leases were created under hardship and under a temporary nature not intended for longterm and intensive use.*

10238-04

Letter to Ms. Christina Hemming

Page 8 of 18

September 3, 2021

Response 4: Your comment regarding leases being created under hardship and under a temporary nature is unclear. However, pursuant to HRS § 171-58, BLNR may issue a long-term Water Lease at public auction. Under HRS § 171-36, leases of public lands can be for terms up to 65 years, and under HRS § 171-1, "land" is defined to mean "all interests therein and natural resources including water, minerals, and all such things connected with land, unless otherwise expressly provided." Therefore, State leases are intended to be long-term. As explained in Section 1.3 of the EIS, the Applicant requested a long-term water lease from the state in 2001. However, due to lengthy legal proceedings, that request has yet to be acted upon. An EIS is required before BLNR can consider issuing the proposed Water Lease. Section 1.4 of the Draft EIS explains that in 2016, the BLNR ordered A&B to prepare an EIS for the proposed Water Lease.

Regarding your comment about "intensive use" as explained in Draft EIS Section 2.1.2, the License Area, has already been affected by increased stream flows resulting from less offstream diversions due to the closure of sugar operations in December 2016. As of October 2020, the EMI Aqueduct System was diverting an average of 23.3 mgd. As a result, very little surface stream water is currently being diverted relative to what would be allowed should the Water Lease be awarded per the Proposed Action. However, the amount of water that may be diverted should the Water Lease be issued is substantially less than the amount that was diverted during normal sugar production. For example, in 2006 it is estimated that the EMI Aqueduct System delivered approximately 156.69 mgd at Māliko Gulch, whereas under the CWRM D&O, it is estimated that the delivery at Māliko Gulch will be approximately 92.32 mgd (Akinaka, 2019). Hence, significantly less water will be diverted due to the return of stream water ordered under the CWRM D&O. Accordingly, considerably less East Maui surface water will be applied to the Central Maui agricultural fields than was applied in the past when these fields were cultivated in sugarcane.

Comment 5: *The ditches were built by enslaved and indentured servants, who were paid \$1 per day and then bought groceries from the AB store. This amounts to slavery and reparations must be made.*

Response 5: We respectfully disagree with your comment. The ditches were not built by enslaved and indentured servants. They were built by immigrant workers who migrated to Hawai'i seeking work and income on the sugar plantations. Of note, these immigrant workers were provided housing and other services by the plantations. The archeological literature review and field inspection (LRFI) report included as Appendix E to the EIS documents the 22-mile long Lowrie Ditch was engineered by a foreign expert, E. L. Van Der Neillen, and constructed by Japanese laborers.

The LRFI also reports that, in a 2006 study titled *He Mo'olelo No Maui Hikina - Kalialinui I Uka A Me Nā 'Āina O Lalo: A Cultural-Historical Study of East Maui - The Uplands of Kalialinui, and the Lands that Lie Below, Island of Maui "The Waikamoi Preserve"*, Maly and Maly note that, while some in the community have stated that the waters of East Maui were taken without permission, construction of the early ditch system was approved under the authority of King David Kalākaua per Civil Code Section 42 (Kingdom of Hawai'i 1859:15), with a condition of the original lease stating that water rights of native tenants of the land be protected.

The LRFI also recites details from the Hawaiian Annual and Almanac for 1878, confirming that the EMI Aqueduct System was built by employed men, not enslaved and indentured servants, who were provided food and shelter. "The digging of the ditch was a work of no small magnitude. A large gang of men, sometimes numbering two hundred, was employed in the work, and the providing of food, shelter, tools, etc., was equal to the care of a regiment of soldiers on the march." Based upon the historical facts, reparations are therefore not applicable here.

Comment 6: *The original ditches did not consider the human, marine animal or plant life consequences or end results.*

Response 6: It is unknown whether environmental factors were taken into consideration in the development of the EMI Aqueduct System more than 100 years ago and there was no legal requirement to do so at that time. Although it is not scientifically possible to fully document impacts that first took place more than a century ago as pre-diversion data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui, and the LRFI (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families.

As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS.

The Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System, and has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats.

As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS.

The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts.

Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century and have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. As explained in Sections 4.17 and 4.18 of the Final EIS (updated from Sections 4.16 and 4.17 of the Draft EIS), an assessment of cumulative impacts is provided in the EIS and the technical studies that were prepared to support the EIS. See pages 4-331 to 4-336 of the Final EIS.

Comment 7: *Leases are not intended to be permanent, and The State has every right to not renew the leases and tell the company to remove its water catchment systems and environmental destroyers. The State is Under charging for the current leases, \$9,000 a month for 25 million gallons per day, it is absolute thievery.*

Response 7: The issuance of the Water Lease, as well as its term, is at the discretion of the BLNR. Moreover, please note that the Water Lease rent rate will be determined by the BLNR, and that an appraisal will be conducted to guide their decision. Also, please note that your cited lease rent for the water is incorrect. As discussed in Section 4.7.3 of the Draft EIS, since the ultimate lease rent to be charged by the State is currently unknown, for the purposes of the economic and fiscal impact analyses in the Draft EIS, a projected Water Lease payment was calculated based on the equivalent per unit cost under the 2019 revocable permit. That rate was

\$230,964.24 which equates to over \$19,000 a month for approximately 16.8 mgd diverted from the License Area under the revocable permit. The Final EIS includes the rental charge under the 2021 revocable permits, which was obtained after publication of the Draft EIS, of \$238,362 which equates to nearly \$20,000 a month. See pages 4-277 and 4-283 of the Final EIS.

Comment 8: *The EMI Company took land via the mapping system, and has poorly maintained the ditch system using chemicals to kill “weeds”, without proper control.*

Response 8: Your comment about EMI taking land via the mapping system is unclear. Section 1.3.2 of the Draft EIS explains that the Kingdom of Hawai‘i granted A&B and their partners a license to divert water following the completion of the first ditch. However, please note that land title research is not within the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The potential environmental impacts of the proposed Water Lease are discussed in Chapter 4 of the EIS.

EMI has continually maintained the EMI Aqueduct System. It evaluates areas of the EMI Aqueduct System regularly to identify where maintenance / repair activities are necessary and adds them to a list of maintenance projects. Moreover, in response to comments received on the Draft EIS, EMI staff have been conducting sweeps to locate and remove unnecessary debris from the License Area. The “maintenance and repair” under the Proposed Action involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System.

Regarding your comment about the use of chemicals to kill weeds without proper control, we respectfully disagree with this. As noted in Section 4.12 of the Draft EIS, pesticides and herbicides are used in compliance with County, State and Federal regulations in connection with the maintenance of the EMI Aqueduct System and will continue to do so under the Proposed Action and associated alternatives. Moreover, in January of 2020 EMI committed to foregoing the use of Round-Up to maintain the EMI Aqueduct System and any trails and access roads. See

pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations of the Final EIS.

As it relates to the Central Maui agricultural fields, as described in the EIS at Section 4.12 and elsewhere in the EIS, the Mahi Pono farm team follows Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in regards to the use of agricultural chemicals. It should be noted that since January 2020 Mahi Pono has committed to foregoing the use of Round-Up and other glyphosate based products within the Central Maui agricultural fields. See pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations of the Final EIS.

Comment 9: *AB would not have this request in, if they had not polluted the East Maui Aquifer, located at Hamakuapoko, where the applied chemicals, and the Feds shut the wells down. There are barely 20 years left on the filter systems as part of the Dow chemical settlement.*

Response 9: We respectfully disagree with your comment regarding the purpose for the request of a long-term Water Lease. As described in Section 1.1 of the Draft EIS, the purpose of the Water Lease is to:

...enable the Board of Land and Natural Resources (BLNR)-awarded lessee the right, privilege and authority to enter and go upon State-owned lands for the purposes of developing, diverting, transporting and using government-owned waters. The requested Water Lease would allow the use of government-owned waters from the License Area (approximately 33,000 acres which includes lands within Nāhiku, Ke'anae, Honomanū, and Huelo) through the East Maui Irrigation Company, LLC (EMI) Aqueduct System. Use of that surface water would allow the continued provision of water to enable approximately 30,000 acres of farmland in Central Maui to remain in agriculture. The Water Lease would also allow the continuation of a supply of water to the County of Maui Department of Water Supply (MDWS), which in turn provides water for domestic and agricultural water needs in Upcountry Maui, including agricultural users at Kula Agriculture Park (KAP), and the planned 262-acre KAP expansion, . . .

Regarding your comment about pollution of the East Maui Aquifer at Hamakuapoko, if you are referring to the wells that were drilled in Hamakuapoko, please note that those wells were drilled by the County of Maui Department of Water Supply (MDWS). They are the MDWS' wells, not

A&B's. The wells are in fact not shut down, and do provide water to the MDWS Upcountry Maui Water Service Area under certain circumstances, as discussed in Section 2.1.3.1 of the EIS.

We acknowledge your comment regarding the Dow chemical settlement and that there are 20 years left on the filter systems. However, please note that this is not within the scope of the EIS. The referenced wells are owned and operated by the MDWS. Further, as discussed in Section 2.1.3.1 of the EIS, the chemicals found in the Hamakuapoko wells were from pineapple cultivation. A&B did not cultivate pineapple in Upcountry Maui.

Comment 10: *The Hawaiian people deserve the right to live above the right to a hotel to wash towels.*

Response 10: Your comment regarding Hawaiian people deserving the right to live above the right to a hotel to wash towels is unclear. The proposed Water Lease is not connected to the development of any hotels. Use of that surface water would allow the continued provision of water to enable approximately 30,000 acres of farmland in Central Maui to continue to fully transition to a diversified agricultural operation, and would also allow the continuation of a supply of water to the County of Maui Department of Water Supply (MDWS), which in turn provides water for domestic and agricultural water needs in Upcountry Maui, including agricultural users at Kula Agriculture Park (KAP), and the planned 262-acre KAP expansion, as well as for the Nāhiku community, and, for an interim period, to continue the provision of water for the historic uses discussed in Section 4.16 of the Final EIS as shown in page 4-331. Please note that cultural impacts to Native Hawaiian traditional and customary practices are discussed within Section 4.6 of the EIS.

Comment 11: *Say NO to EMI, AB and HCSC and Mahi Pono, for any future leases and return to land to the Hawaiian Trust. Streams, life, culture food sources through Taro and agricultural cultivation is vital , important and vital to a community. Small farmers will be burdened by the DLNR rules and will never be able to compete with corporate farming to necessitate needs and water use.*

Response 11: We acknowledge your comments. With respect to the Draft EIS, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes

and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts.

The Draft EIS also included and relied upon nine technical studies, some of which have been updated for clarity and/or based upon comments received on the Draft EIS. Appendix A, Assessment of The Environmental Impacts of Stream Diversions on 33 East Maui Streams Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model; Appendix B, East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry; Appendix C, Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease; Appendix D, Historical Structure Assessment (HAS) East Maui Aqueduct System; Appendix E, Archaeological Literature Review and Field Inspection (LRFI) for the Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas; Appendix F, Cultural Impact Assessment (CIA) for the Nāhiku, Ke‘anae, Honomanū and Huelo License Areas; Appendix G, A&B Proposed Water Lease for the Nāhiku, Ke‘anae, Huelo, and Honomanū Social Impact Assessment (SIA); Appendix H, Economic and Fiscal Impact Study Proposed Water Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Area; and Appendix I, East Maui Water Lease: Agricultural and Related Economic Impacts.

As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area in East Maui. These impacts are related to various aspects of the natural environment. For stream habitat impacts, there will be a reduction from natural flow conditions, which can be mitigated by adjustments in diversions to minimize entrainment or increases in stream flow. For native terrestrial flora and fauna resources, as well as historic and archeological resource, there is anticipated to be impacts from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; impacts to cultural resources and practices due to access or restriction of access can be mitigated by a myriad of recommendations proposed by CSH as discussed in Section 4.6; and community concerns and perceptions as discussed in Section 4.7.2 of the EIS can be mitigated by further public outreach and consultation.

Your comment about the difficulties small farmers face due to DLNR rules is unclear, but we note that under the Proposed Action, the Mahi Pono farm plan, which will be implemented on private lands (not under DLNR control), includes 800 acres for community farms.

Comment 12: KIUC's EA does not meet State requirements for a lease application. There are significant spiritual, cultural, environmental and public trust impacts that can only be addressed with an EIS.

Examples:

Residents had to abandon Taro fields on Powerhouse Rd because the stream ran dry.

Water was sold to downstream farmers by the diverter.

Susan Case of DLNR must be removed for showing favoritism to her family Case member.

Water was retained by diverter and placed in a pond, high in bauxite, which is above standard levels and then resold to downstream farmers.

The lease is not proper for valuation or Public Use Trust Doctrine.

- *KIUC receipt of federal funds in 2017 for system upgrades requires an EIS for future lease approval*
- *KIUC's use of the water is consumptive, meaning it is not returned to the stream of origin. Any consumptive use of water within conservation district land requires legislative approval.*
- *More than a dozen streams are diverted out of the Wailua watershed. But, Wai`ale`ale and Waikoko Streams are the only two streams accessible to the public; they are located in the Lihue-Koloa Forest Reserve. Proper monitoring of all the streams must be implemented for proper outflow patterns.*

The stream above the diversion is classified by the Environmental Protection Agency as federally protected critical habitat for the endangered endemic Newcomb's Snail which requires an EIS.

KIUC is asking for 30 million gallons per day (MGD) with the stream getting 3.5 MGD, or less in dry conditions.

- *The impacts of climate change is not addressed in the EA. What will rainfall patterns and stream flows be like 50-65 years from now?*

10238-04

Letter to Ms. Christina Hemming

Page 16 of 18

September 3, 2021

Response 12: Please note that the KIUC EA is not within the scope of assessment of this EIS and is subject to its own environmental compliance and documentation. This EIS assesses the potential impacts of the proposed Water Lease of the identified East Maui streams.

Comment 13: *We have been in a drought for the past 6 months and with 1 Billion people on Earth by 2039 We must protect the Public Water Trust say NO to this unlawful request for a lease that was originally granted under hardship and with deceit and false pretenses.*

Response 13: We acknowledge your comments. Climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is therefore extremely energy efficient. The Draft EIS also notes that the EMI Aqueduct System supplies water to two hydroelectric facilities, thereby providing renewable energy from a non-consumptive use of water. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown in pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

While the exact nature of how the climate will impact East Maui is unknown, it is expected that more intense, episodic periods of rainfall will occur. However, it is also possible that climate change may decrease the amount of rainfall within the License Area, which could decrease the

amount of stream flow. However, compliance with the restored streamflow standards mandated under the CWRM D&O will be required irrespective of the future impacts of climate change.

Regarding your comment about the future population, Section 4.7.1 of the Draft EIS, as updated in the Final EIS, describes the population and demographics of East, Upcountry, and Central Maui as well as anticipated projections. With respect to East Maui, Section 4.7.1 of the EIS explains that the region had a population of 11,890 residents in 2015, and that population is expected to increase, primarily within the Pā'ia-Ha'ikū Community Plan area, to 12,321 by 2035.

Regarding Upcountry Maui, the population as of 2017 was some 37,128 residents and 14,178 households within the Upcountry Maui Water System Service Area. The County of Maui projects those numbers to increase to 44,000 by 2035.

Regarding the Central Maui agricultural fields assessed under this EIS, no residences are located within the agricultural fields and no housing or other residential development is proposed in Central Maui under this EIS.

No significant impacts are anticipated as a result of the Proposed Action with regards to population and demographics in each of three regions. Conversely, it is anticipated that the No Action alternative would have an adverse impact on populations as it is assumed that the EMI Aqueduct System would not continue to deliver water to MDWS, which would have the effect of reducing supply to both MDWS customers in Upcountry Maui and in Nāhiku.

With respect to your comment about the "Public Water Trust" we acknowledge that the Proposed Action (the issuance of a 30-year Water Lease by BLNR), requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawaii constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. The dual roles of the BLNR and the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action, as shown in pages 1-25 to 1-27. Moreover, to clarify, finalization of this EIS does not result in issuance of the Water

10238-04
Letter to Ms. Christina Hemming
Page 18 of 18
September 3, 2021

Lease. Any decision on the Water Lease auction and issuance of the Water Lease would happen only after completion of this EIS, and through a separate process before the BLNR.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.² Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

² Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments for D EIS
Date: Wednesday, November 6, 2019 1:15:19 PM

To Whom it May Concern,

Ive been watching this unfold since the introduction of HB2501/SB 3001, which upon Ige's refusal to veto it in spite of volumes of public outcry, circumvented state court rulings that had determined A&B illegally diverted water for the then past 15 years. It boggles my mind that nearly 4 years later, how many hours of testimony given over the course of many legal shenanigans to continue this violation of the public trust and now a California company beholden to Canadian pension fund holders and a real estate company stand to be handed even more stolen water than the prior plantation crop of very water intensive sugarcane.

The state continually fails protecting the public's trust and rights by killing how many opu'u recently, not enforcing the court order against Wailuku Water Company to restore more water, allowing rocks to be removed from Iao after the serious flood, promoting over tourism without investing in infrastructure to keep the visitors safe, windmills, telescopes, I can go on but I only have until Nov 7th and Hana Library has only had its copy for about 2 weeks, a 2,700 page document! Permit an extension of the EIS comments, just withdraw this one, allow Hana folks a fair chance to process this info and make educated comments, then resubmit this EIS as is, that is more fair.

Ive read and heard countless testimonies from marine biologists and neighbors stating the observed harms to the aquatic life during diversions and enjoying the recent bounties of aquatic life when the diversions were finally released and mauka to makai connectivity restored again. Read their testimonies for more

details.

Why will this lease allow Mahi Pono and A&B the right to use or traverse over private property that borders a stream, which currently may not be diverted yet?

30 year lease is way too long, cmon now...see what happens after 5 years then give a new lease which maybe longer if they were good stewards.

Why can get they any lease without a watershed plan?

Why do they get a lease before DHHL folks in Keanae and Hana don't even have a plan for their own water? Address their needs first, legally you were supposed to already.

Make sure the kalo farmers and lineal descendants get their water needs met first before this California company does.

Why so much water being handed over without any evidence of needing? Just take what you need we are on an island...20 mpd should be plenty to start with and come up with your own sources of water like most us other farmers have to. And charge them market rate too.

The public has stated loud and clear, repeatedly, go ask the legislative staff how many phone calls and emails their offices got every step of the way, reminding them that water is a public right and the state exists to protect the public and the public rights, not create special rules for a real estate company and a Canadian pension fund, which is who Mahi Pono answers to, not Maui tax payers. A good compromise until the water rights are returned to the rightful owners, is to have the county be in charge and have the county lease the water.

I hope I properly explained my request for an extension for folks to continuing commenting on this very lengthy EIS and my request the state reject or amend the lease application for a less damaging impact on our islands health. And my request the county lease the water for now. I tried to be as brief as possible, mahalo for your time.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Davis:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Ive been watching this unfold since the introduction of HB2501/SB 3001, which upon Ige's refusal to veto it in spite of volumes of public outcry, circumvented state court rulings that had determined A&B illegally diverted water for the then past 15 years. It boggles my mind that nearly 4 years later, how many hours of testimony given over the course of many legal shenanigans to continue this violation of the public trust and now a California company beholden to Canadian pension fund holders and a real estate company stand to be handed even more stolen water than the prior plantation crop of very water intensive sugarcane.*

Response 1: We acknowledge your comments and understand that you have been following this particularly situation for quite some time now. With regards to your comment about the public trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B’s 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the

requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown in pages 1-25 to 1-27.

With regards to your comment about Mahi Pono being handed more water than prior to sugarcane operations, please note that this is not true. As discussed in Draft EIS Section 2.1.2 (East Maui/License Area) and 2.1.4 (Central Maui Field System), the long-term average delivery of water by the EMI Aqueduct System up until 1986 had been approximately 165 mgd (prior to any use of water by the MDWS or HC&S on the agricultural fields). This measurement was taken at Māliko Gulch. Under the Proposed Action, it is estimated that approximately 87.95 mgd will be diverted from the License Area and an additional 4.37 mgd in between Honopou Stream and Māliko Gulch to support uses described in the EIS. However, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

Comment 2: *The state continually fails protecting the public's trust and rights by killing how many opu'u recently, not enforcing the court order against Wailuku Water Company to restore more water, allowing rocks to be removed from Iao after the serious flood, promoting over tourism without investing in infrastructure to keep the visitors safe, windmills, telescopes,...*

Response 2: With regards to you comment about public trust, as noted in Response #1 above, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown in pages 1-25 to 1-27.

With regards to the Wailuku Water Company, removing rocks being removed from Iao, and investing in infrastructure, please note that these issues are not within scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing

EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 3: *...I can go on but I only have until Nov 7th and Hana Library has only had its copy for about 2 weeks, a 2,700 page document! Permit an extension of the EIS comments, just withdraw this one, allow Hana folks a fair chance to process this info and make educated comments, then resubmit this EIS as is, that is more fair.*

Response 3: We acknowledge your comments noting for a time extension to allow for additional public comment. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai'i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 4: *Ive read and heard countless testimonies from marine biologists and neighbors stating the observed harms to the aquatic life during diversions and enjoying the recent bounties of aquatic life when the diversions were finally released and mauka to makai connectivity restored again. Read their testimonies for more details.*

Response 4: We acknowledge your comments. Please note that many people at the EISPN public scoping meetings on February 22nd and 23rd, 2017 testified noting positive impacts seen from increased stream flow resulting from the cessation of sugar operations, please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See page 4-168 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted. This is expected as it was discussed in Section 4.2.1 of the Draft EIS that the Proposed Action would increase the number of HU as compared to sugarcane operations. Please note that that as of October 2020, an average of 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System. Hence it can be assumed that current water diversion rates from the License Area are comparable to the amount that would be diverted under the No Action alternative, which is estimated to be approximately 26.39 mgd. The HSHEP model estimated that approximately 79.8% of total HU would be available under the No Action alternative. However, please note that under the Proposed Action, the total HU would be less than projected under the No Action alternative.

Comment 5: *Why will this lease allow Mahi Pono and A&B the right to use or traverse over private property that borders a stream, which currently may not be diverted yet?*

Response 5: Your comments are unclear. Please note that nowhere in the EIS is it stated that Mahi Pono or EMI would traverse over private property to divert stream water. As noted in Response #2 above, the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas, which are owned by the State, for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS.

Comment 6: *30 year lease is way too long, cmon now...see what happens after 5 years then give a new lease which maybe longer if they were good stewards.*

Response 6: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui,

amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 7: *Why can get they any lease without a watershed plan?*

Response 7: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

Comment 8: *Why do they get a lease before DHHL folks in Keanae and Hana don't even have a plan for their own water? Address their needs first, legally you were supposed to already.*

Response 8: Specific information regarding the Department of Hawaiian Home Lands' (DHHL) future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd as shown in pages 2-4 to 2-7. As explained in pages 2-4 to 2-7 of the Final EIS, the DHHL water reservation process involves several steps before a reservation amount is formally identified. The first step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following adoption of the Beneficiary Consultation Report and an authorization to the Chairman to seek a reservation of water, CWRM could act on a reservation request related to a proposed lease.

As explained in Section 2.1.1 of the Draft EIS, DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B/EMI, Mahi Pono, the Department of Land and Natural Resources' (DLNR) Land Division, and DHHL staff and consultants. The results of the Beneficiary Consultation were presented to the HHC on May 30, 2019, as agenda item G-2. The motion passed by the HHC to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation request was approved by the HHC related to the EMI Aqueduct System for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

While Mahi Pono's current farm plan assumes the full use of the water that can be diverted from East Maui streams after compliance with the CWRM D&O, Mahi Pono will be obligated to reduce elements of its farm plan, and thus the availability of crop, to accommodate the permanent reduction in available water resulting from DHHL's allocation. The Reduced Water Volume alternative described in Chapter 3 of the EIS provides an assessment of the impacts of less water being made available for the Proposed Action, including Maui Pono farm plan in the Central Maui agricultural fields. Specifically, consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture.

You are correct that Section 2.1.1 of the Draft EIS stated, with respect to the DHHL reservation, that "*Until that reservation is physically claimed, however, it will be available for use by the lessee.*" That statement has been clarified in the Final EIS as shown in pages 2-4 to 2-7, as it is uncertain whether the DHHL reservation amount would be available to the lessee until such time as it is needed by DHHL. Such temporary uses of the DHHL reservation water are not addressed under HRS § 171-58. We further acknowledge that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessor and the DHHL would be necessary to allow any temporary use of water reserved for DHHL.

Please note that as discussed in Section 2.1.2 of the Draft EIS, under the Proposed Action, at full buildout of the Mahi Pono farm plan, it is estimated that approximately 87.95 mgd will be diverted from the License Area and an additional 4.37 mgd in between Honopou Stream and Māliko Gulch to support uses described in the EIS. However, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

Comment 9: *Make sure the kalo farmers and lineal descendants get their water needs met first before this California company does.*

Response 9: We acknowledge your comments. please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water

needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for taro were identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown in pages 1-19 to 1-23. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration statuts); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamo Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be

minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in the included pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 10: *Why so much water being handed over without any evidence of needing? Just take what you need we are on an island...20 mpd should be plenty to start with and come up with your own sources of water like most us other farmers have to. And charge them market rate too.*

Response 10: Please note that the Proposed Action is requesting the maximum amount of water available after compliance with the CWRM D&O to divert for uses described in the EIS which is estimated to be approximately 88 mgd from the License Area. However, please note that Section 2.1.4 of the Final EIS has been revised to reflect Mahi Pono's current and near-term expected water use as shown in pages 2-30 and 2-32, which details average water being diverted from East Maui streams through the EMI Aqueduct System and how that water will be used. It important to note that as with any agricultural project of this scale, actual water usage varies over time, and

will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet the needs of the approved water uses, including the MDWS and of Mahi Pono's agricultural operations in Central Maui.

Although the Proposed Action will divert more water than under current conditions and when compared to the amount of water being diverted immediately prior to the cessation of sugarcane operations, the Proposed Action is not anticipated to result in significant adverse impacts as discussed throughout Chapter 4. The Proposed Action cumulatively will result in the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4 albeit to a lesser extent and conditions are not anticipated to significantly change under the Proposed Action.

Comment 11: *The public has stated loud and clear, repeatedly, go ask the legislative staff how many phone calls and emails their offices got every step of the way, reminding them that water is a public right and the state exists to protect the public and the public rights, not create special rules for a real estate company and a Canadian pension fund, which is who Mahi Pono answers to, not Maui tax payers. A good compromise until the water rights are returned to the rightful owners, is to have the county be in charge and have the county lease the water.*

Response 11: We acknowledge your comments. Please note that the Applicant will comply with applicable regulatory requirements.

Comment 12: *I hope I properly explained my request for an extension for folks to continuing commenting on this very lengthy EIS and my request the state reject or amend the lease application for a less damaging impact on our islands health. And my request the county lease the water for now. I tried to be as brief as possible, mahalo for your time.*

Response 12: We acknowledge your comments. With regards to your request for an extension, as noted in Response #3, note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai'i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

With regards to your comment about the County leasing the water, please note that Section 3.1.2 of the Draft EIS contemplates alternative ownership of the EMI Aqueduct System which has been supplemented based on the County's TIG Report as shown in pages 3-19 to 3-20. As

10238-04
Letter to Ms. Christine Davis
Page **11** of **11**
September 3, 2021

discussed in both the Draft EIS and the Final EIS, this alternative continues to appear speculative and not consistent with the objectives of the Proposed Action.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 11, 2019 9:43:03 PM

Dear Mr. Matsukawa,

A&B's proposal to further divert the streams of East Maui is abominable, par for their course, as is BLNR's sycophantic capitulation in carrying their baseline water... crystallizing in this mockery Draft(neglect to mention of)Environmental Impact Study in corporatacracy. Your DEIS is a shallow and transparent cesspool, predictably lacking in depth and due diligence, composed by dilettantes and petite monstrous bourgeoisie due swift and just response at the end of cleansing fire.

#HowDareYou?

#NuffAlready! East Maui streams should not be diverted for agriculture (and especially not to these criminal cabals with wanton disregard for all but their silken lined pocketbooks bottom lines, while our streams die dry and our watersheds drown in the silt, cattle crap, and toxic runoff from their decades of dirty dealing) in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

This is abundantly clear under the Hawaii State Constitution and the UNDRIP. Waters are only muddied by the under regulated flow of special interest monies and powers.

Thank you for this DEIS that makes it so clear why BLNR and the hands that feed y'all your steaming plates of trash needs to be destroyed. We will not allow this Hewa to continue.

Sincerely,
Christopher Kasak

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Kasak:

Thank you for comments dated October 11, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *A&B’s proposal to further divert the streams of East Maui is abominable, par for their course, as is BLNR’s sycophantic capitulation in carrying their baseline water... crystallizing in this mockery Draft(neglect to mention of)Environmental Impact Study in corporatacracy. Your DEIS is a shallow and transparent cesspool, predictably lacking in depth and due diligence, composed by dilettantes and petite monstrous bourgeoisie due swift and just response at the end of cleansing fire.*

#HowDareYou?

#NuffAlready!

Response 1: We acknowledge your comments however, we respectfully disagree that the EIS is ‘a shallow and transparent cesspool.’ The Draft EIS included a "Content Checklist" identifying each element under HAR § 11-200-17 and where within the text of the Draft EIS information on each particular element could be found. Please note that the Content Checklist has been updated

based on updated discussions and additions added to the Final EIS as shown subsequently after the front cover.

Comment 2: *East Maui streams should not be diverted for agriculture (and especially not to these criminal cabals with wanton disregard for all but their silken lined pocketbooks bottom lines, while our streams die dry and our watersheds drown in the silt, cattle crap, and toxic runoff from their decades of dirty dealing) in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 2: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was

ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 3: *This is abundantly clear under the Hawaii State Constitution and the UNDRIP. Waters are only muddied by the under regulated flow of special interest monies and powers.*

Thank you for this DEIS that makes it so clear why BLNR and the hands that feed y'all your steaming plates of trash needs to be destroyed. We will not allow this Hewa to continue.

Subject: DEIS Water Lease

To Mr. Earl Matsukawa,

THIS EIS IS NOT COMPLETE

Aloha nō, Please accept my comments and concerns regarding the EIS draft(Water Lease).

I am currently in land preservation, a kalo farmer, fisherman, gatherer and cultural practitioner. Wai affects every part of my daily life and I feel that every scope of management must be met in this EIS for the purposes of safeguarding life in the land and it's inhabitants. Although the EIS was very extensive, It is not complete and I am glad that our hui was able to work together in understanding it.

NOT ENOUGH INPUT FROM THOSE WHO UTILIZE STREAMS AND SPEAK FOR THOSE WITH NO VOICE.

There are major differences in productivity within the last few years. I have seen first hand how a once dry river bed, to a thriving stream can bring life and harmony to our watersheds, farmers, fishermen, and marine life. When HC&S released the water back to the 10 streams in East Maui a few years ago, a circle of life began to show itself. More water for a sustainable watershed, more for farmers, more water for 'Opae and 'O'opu to swim up river and down to the ocean, more fresh runoff to feed our reef systems which bring in Akule for our fishermen and more wai to feed our aquifers, and wetlands. The EIS draft has not brought up these important points.

SAFETY

Stream flow is important in the aspect of safety. I have noticed how dangerous it is when a river is diverted. How it begins to create a cause for disaster when it is left untouched for too long. What happens is these river beds grow trees, and they breed sediment and silt while slowly becoming much more narrow. When the storms come around, water will always find its natural course and pulse through these dry river beds like an explosion sending walls of landslides, rock, and debris down to the sea damaging roadways, homes

and coastal shorelines. I have seen water climb out of these sediment filled riverbeds and spread throughout the open land causing destruction and panic. The result at sea level is a mass amount of coral bleaching and a build up of silt in our wetlands. The wetlands are kidneys of our islands. When they are clogged up with mass amounts of silt, they forms unnatural little mounds that clog the islands natural course.

Where are the mitigation points in this EIS draft to safeguard our communities? Not to mention the millions of taxpaying dollars that are spent to our Police, Fire Departments and other departments like Electric, County Of Water, etc.... when these storm surges cause blackouts and sewage spills.

TRAIL MANAGEMENT

It was said in the draft that trails would not be managed for the safety of people.

Trails must be managed for the purpose of clearing our dry river beds to mitigate runoff. HRS 264 also states that all private roadways and historic trails must be protected on State Land. This means all trails must be managed. Cultural practices, and gathering rights must be respected and acknowledged. Mitigation purposes must be allowed for invasive species to managed for preservation and restoration of our watersheds. The EIS needs to show how the proposed water lease protects rights-of-way and access to other public lands. HRS 171-35 (Lease provisions) requires leases to protect rights of way and access to other public lands.

The EIS draft again fails to show proper management to laws set in place to protect our trails and roadways. We need precise documentation of our rights of ways.

CULTURAL SITES

This EIS draft has failed to comply with specific archeological components to truly identify cultural sites thru ground based techniques. It was stated in the EIS draft to SHPD as “involving no ground altering activities”. This is such a major denial and blatant disregard to historical preservation, and Kanaka identity. Many of these river systems are covered with terraces, ancient lo’i kalo patches and trails, along with heiau.

This EIS needs to meet the peoples concerns and should not be brushed off. The resurgence of Kanaka belief systems and practices are growing everyday, and they have a right to restore, return and revive their stories written in sand and stone.

IN CLOSING

I feel that this EIS Draft definitely does not put in to factor the seriousness of these concerns and really down plays the affects this will have to our communities, their cultural and religious rights, and our future generations opportunities to come as well.

THE PEOPLE HAVE SPOKEN, AND NOW IT IS DOCUMENTED THAT WE DO NOT CONSENT. THIS EIS DESERVES DILIGENCE AND TRUE STEWARDSHIP MANAGEMENT. IT IS NOT COMPLETE

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Cody Nemet Tuivaiti:

Thank you for comments via three separate but nearly identical emails sent between 11:31 pm on November 6, 2019 and 1:05 am on November 7, 2019, regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

We note that your comments in each of your three emails are nearly verbatim and for all intents and purposes, are substantively the same in content. Your email of November 7, 2019 at 1:05 a.m. is comprehensive of the comments from your other two emails. Therefore, the following responses are provided to your comments from your November 7, 2019 email at 1:05 a.m. relating to the Draft EIS:

Comment 1: *THIS EIS IS NOT COMPLETE*

Aloha nō, Please accept my comments and concerns regarding the EIS draft (Water Lease).

Response 1: We acknowledge your comments but respectfully disagree with your comment that the EIS is not complete. The Draft EIS fully complied with all relevant requirements, including the content requirements set forth in HAR §11-200-16 and § 11-200-17, and the Draft EIS even includes a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement. The Draft EIS meets the necessary content requirements and for that reason we disagree with your comment that the Draft EIS is not complete. Please note that the Content Checklist has been updated as shown subsequently after the front cover based on updated discussions and additions added to the Final EIS.

Comment 2: *I am currently in land preservation, a kalo farmer, fisherman, gatherer and cultural practitioner. Wai affects every part of my daily life and I feel that every scope of management must be met in this EIS for the purposes of safeguarding life in the land and it's inhabitants. Although the EIS was very extensive, It is not complete and I am glad that our hui was able to work together in understanding it.*

Response 2: We acknowledge and understand that you are currently in land preservation, a kalo farmer, fisherman, gatherer, and cultural practitioner, and that wai (water) affects your daily life.

Your comment about “every scope of management must be met in this EIS” is unclear. Nowhere is that mentioned in the content requirements for a Draft EIS as discussed in our response to your Comment #1, above. However, although not mentioned as a content requirement, several areas of management are discussed in the Draft EIS. Specifically, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under Hawai‘i Revised Statutes (HRS) § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the Board of Land and Natural Resources (BLNR) approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report prepared by the Department of Land and Natural Resources (DLNR) has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. Specifically, one of the content requirements calls for “adaptive management” which seeks (i) to establish measurable objectives, including performance metrics to measure and report the degree to which management actions have been successful in achieving goals and objectives; (ii) monitoring performance metrics to track success; and (iii) establishment of a systematic process to review results and employ adaptive management approaches to improve results where needed.

Moreover, as discussed in the Section 2.1.2 of the Final EIS and as shown on page 2-7, under the Proposed Action, with respect to the East Maui License Area, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System. Moreover, EMI has established a number of standard operating procedures to address the clean-up of trash and debris within the License Area. Besides

recognizing unnecessary debris in the field during routine maintenance tasks, EMI has conducted specific identification and removal operations of debris that has been observed from previous field work. EMI also has in place a practice of removing any equipment and excess materials it brings into the License Area to perform work on the EMI Aqueduct System as soon as the job(s) is completed.

Note that Section 2.1.4 of the EIS discusses the Mahi Pono farm plan and how the estimated amount of diverted water is planned to be used, or managed, including for the acreages and types of various crops. Section 2.1.4 of the Final EIS has been revised to include additional information on Mahi Pono's farm plan as well as a description of current farming activity and water uses, as shown on pages 2-30 and 2-32.

Section 4.4 of the EIS discusses flora and fauna within the License Area and Central Maui, and recommends mitigation measures that are essentially management measures for EMI staff and Mahi Pono staff to protect native and special status species. These measures have been further updated based on comments received from the United States Fish and Wildlife Service (USFWS) to the Draft EIS as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131.

Comment 3: *NOT ENOUGH INPUT FROM THOSE WHO UTILIZE STREAMS AND SPEAK FOR THOSE WITH NO VOICE.*

Response 3: As discussed below, substantial effort was made to solicit broad public and governmental agency input to the EIS, including from those who utilize the streams.

Chapter 9 of the Draft EIS documents both the legally required and voluntary consultation efforts that were undertaken for the EIS. Initially, early consultation (aka pre-assessment consultation) was started in November 2016 with the mailing of letters to numerous parties seeking comments on the Proposed Action for EIS. Subsequently, the EIS Preparation Notice (EISPN) was prepared pursuant to HAR § 11-200-11.2(1) and published on February 8, 2017. Then, during the public comment period for the EISPN, Wilson Okamoto Corporation held two voluntary public EIS scoping meetings (one in Kahului on Feb. 22, 2017, and another at the Ha'ikū Park and Community Center in Pā'ia on Feb. 23, 2017). See Appendix K-1 and K-2 and L-1 and L-2 for transcripts of the scoping meetings, and Appendix J and M for early consultation letters, and letters commenting on the EISPN. Moreover, Appendix N of the Final EIS reproduces the comments and responses for the Draft EIS.

The Draft EIS was prepared after taking into consideration all of the information that was obtained through early consultation, comments received through the EISPN public comment

process, and the two voluntary public scoping meetings. Following publication of the Draft EIS on September 23, 2019 and a 45-day public comment period, over 400 comments were received.

In addition to the required and voluntary consultation efforts undertaken for the EIS, the EIS includes studies that involved consultation efforts for research purposes, including the Social Impact Assessment (SIA) and the Cultural Impact Assessment (CIA). The SIA in Appendix G of the Draft EIS, obtained input from several community members, many of whom have direct and long-term experience with the streams in East Maui, and documents the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono which is summarized in Section 4.7.2 of the EIS. As discussed in Section 4 of Appendix G (Preliminary Community Issues), seven focus groups were convened in November 2018. Participants in these sessions included residents, farmers and ranchers, and people who are active in environment and sustainability efforts. These participants lived in Ke‘anae, Wailuānui, Huelo, Ha‘ikū, Kula, Makawao and Pukalani. Sixty-four people signed in at these focus groups, but the actual number of participants is higher because some individuals arrived after the session started and did not sign in. In addition, there were several follow-up interviews conducted in April 2019 to obtain feedback on the then-recent sale of A&B land holdings to Mahi Pono. The interviewees were diverse in interest and place of residence.

The CIA in Appendix F of the Draft EIS documents input from three interviewees, as well as numerous declarations made by various individuals during the Commission on Water Resource Management (CWRM) contested case proceedings. Cultural Surveys Hawai‘i (CSH), which prepared the CIA, had reached out to 136 parties in the preparation of the CIA prior to the publication of the Draft EIS, as documented in Section 4.6, but ultimately only three individuals agreed to be interviewed. CSH also reached out to members of the community who provided comments on the Draft EIS related to the CIA. CSH contacted 10 parties, including you, for additional consultation on the CIA. These consultation efforts are summarized in Section 4.6 of the Final EIS. Of those 10 parties contacted, only 4 responded. Although you had expressed concerns of a cultural nature, you did not respond to CSH's requests for an interview or more information. Please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See pages 4-239 to 4-252 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted.

Comment 4: *There are major differences in productivity within the last few years. I have seen first hand how a once dry river bed, to a thriving stream can bring life and harmony to our watersheds, farmers, fishermen, and marine life. When HC&S released the water back to the 10 streams in East Maui a few years ago, a circle of life began to show itself.*

Response 4: We acknowledge your comments. Notably, several commenters on the Draft EIS offered characterizations similar to yours of stream recovery following restoration of flows. As noted in Response #3 above, the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See pages 4-239 to 4-252 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted. As discussed in Section 4.2.1 of the Draft EIS, the proposed Water Lease is projected to increase the number of HU as compared to sugarcane operations. The initial conclusion, as presented in Section 4.2.1 of the Draft EIS, was that "under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition." However, please note that Section 4.2.1 of the EIS has been revised, and the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model provided as Appendix A has been clarified. Under the Proposed Action, the number of habitat units (HU) within the entire License Area is decreased by an estimated 36.1% from a theoretical Natural Condition (i.e. a condition where no streams are diverted). This is considered theoretical because even under the No Water Lease scenario, the EMI Aqueduct System would continue to divert 30% of the water available at the Honopou Stream boundary after compliance with Interim Instream Flow Standards (IIFS) established under the CWRM Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O). However, under the Proposed Action, the number of HU is increased by approximately 27.4% in comparison to the Full Diversion condition that existed when the diverted water was used for sugar cultivation.

Please note that as of October 2020, an average of 23.3 million gallons a day (mgd) was being diverted from East Maui streams through the EMI Aqueduct System. Hence it can be assumed that current water diversion rates from the License Area are comparable to the amount that would be diverted from the License Area under the No Action alternative, which is estimated to be approximately 26.39 mgd.

Regarding the 10 streams you mention, we interpret that to mean those ordered for full flow restoration under the CWRM D&O, including: Honopou (Puniawa Tributary), Huelo (Puolua), Hanehoi, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), Waiokamilo, Wailuānui (Waikani Waterfall), Waiohue, West Wailuāiki, and Makapīpī. The CWRM D&O explains that these streams were suitable for full flow restoration because they were identified as supplying active taro farming areas.

The Proposed Action described in Section 2.1 of the Draft EIS states that its premise is compliance with the CWRM D&O, meaning there will be no diversions from these 10 streams. As discussed in Response #5 below, the Draft EIS included analyses of instream habitat impacts resulting from diversions using the HSHEP model by Trutta Environmental Solutions. Trutta's report in Appendix A of the EIS addresses the impacts of streamflow diversion on the native amphidromous stream species. It ultimately concluded based on a combination of field surveys and habitat modeling, that streamflow restoration under the CWRM D&O would improve instream habitat conditions for native amphidromous stream animals and would improve habitat over a wide range of streams from a regional perspective when compared to stream diversions during sugarcane operations.

Comment 5: *More water for a sustainable watershed, more for farmers, more water for 'Opae and 'O'opu to swim up river and down to the ocean, more fresh runoff to feed our reef systems which bring in Akule for our fishermen and more wai to feed our aquifers, and wetlands. The EIS draft has not brought up these important points.*

Response 5: While we generally concur with your comment on the benefits of water as streamflow, we offer our responses below in the context of the Draft EIS for the streams in East Maui.

Regarding your comment about a sustainable watershed, please refer to our Response #2 above, explaining that a watershed management plan will be developed prior to the issuance of the Water Lease.

Regarding your comment about more for farmers, as mentioned in our preceding Response #4, note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming from streams within the License Area, as discussed in Section 1.3.4 of the Draft EIS. It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), provided as Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for taro were identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by

blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown in pages 1-19 to 1-23. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration status); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis included in Appendix I of the EIS (East Maui Water Lease: Agricultural and Related Economic Impacts report), and summarized in Section 4.7.4, taro farms in East Maui (from Honopou to Nāhiku), including use of water from streams not subject to the CWRM D&O, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). This estimate is update from the Draft EIS, where the analysis was based upon known landowners who have about 45 acres in East Maui that are suitable for growing taro. Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā, and would rely primarily on the taro streams ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. This acreage is assumed for the Proposed Action and all associated alternatives since nearly all potential new taro cultivation is assumed to draw water from fully restored taro streams which will have the same flows under all alternatives. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O "*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*" (CWRM D&O at iv).

Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to

cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops.

The above discussion has been added to Section 4.7.4 of the Final EIS as shown in pages 4-288 to 4-293.

Regarding your comment about more water for ‘opae and ‘o‘opu, please note that the HSHEP model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts, including habitat for those species. Specifically, ‘O‘opu nākea (*Awaous stamenius*); ‘O‘opu alamo’o (*Lentipes concolor*); ‘O‘opu naniha (*Stenogobius hawaiiensis*); ‘O‘opu nōpili (*Sicyopterus stimpsoni*); ‘O‘opu akupa (*Eliotris sandwicensis*); ‘Ōpae kala‘ole (*Atyoida bisulcata*); ‘Ōpae ‘oeha‘a (*Macrobrachium grandimanus*);. However, it is important to recognize that the accumulation of HU for amphidromous species is additive, meaning that a single unit of stream may have a total HU in excess of the stream area quantified. In other words, if HU for multiple non-competitive species in a given area are added together, the combined HU could be greater than the area. This is important when considering the total HU for all of the amphidromous species in a stream as the total HU for all of the measured species may be greater than the total stream area. Please note that Section 4.2.1 of the Final EIS has been revised as shown in pages 4-61 to 4-67 to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals’ habitats. In summary, due to an increase in streamflow under the Proposed Action when compared to historical diversion rates during sugarcane operations, ‘opae and ‘o‘opu are anticipated to have an increase in stream HU. However, these HU will likely decrease from current conditions as more water is gradually diverted as the Mahi Pono farm plan develops to full build-out as outlined in Section 4.2.1 of the EIS.

Your comment about “*more fresh runoff to feed our reef systems which bring in Akule for our fishermen*” may be acceptable as a broad generalization, but the scale of impact that streamflow restoration in East Maui will have on reefs and marine life is negligible. A stream and ocean water chemistry assessment (titled East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry) was conducted by Sea Engineering, Inc. (SE) and Marine Research Consultants, Inc. (MRC) in 2018, which was summarized in Section 4.2.3 and included in the Draft EIS as Appendix B. The collected data presented in Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, because the nutrient concentrations in the ocean do not change substantially due to stream diversions as

proposed under the Water Lease, there is no pathway for fishing to be negatively impacted. This analysis means that impacts to ocean fish from the Proposed Action are negligible.

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat

flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawā and Paʻakea) have connectivity flow restoration ordered. Paʻakea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83.

Regarding your comment about aquifers, Section 4.2.2 of the Draft EIS discusses groundwater and impacts associated with the Proposed Action in East Maui, Upcountry Maui, and Central Maui. However, we assume that in your comment that you are referring to the aquifers in East Maui. As it relates to East Maui, Section 4.2.2 of the Draft EIS states:

The Proposed Action is limited to the issuance of the Water Lease for the subject License Area, which would enable the lessee to continue operation of the EMI Aqueduct System that has been in operation for over a century. The Proposed Action continues the use of the system for the transport of surface water, and allows the lessee or its permittees, to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System. In general, the Proposed Action will maintain existing conditions, in compliance with the CWRM D&O and any reservations in favor of the DHHL. No significant impacts on groundwater in the region are anticipated. Groundwater levels are expected to be greater than historic levels due to increased recharge from stream restoration actions under the CWRM D&O.

However, please note that Section 4.2.2 has been revised to take into account the updated sustainable yield numbers and a USGS 2019 climate change study as shown in page 4-71 for East Maui and page 4-76 for Central Maui.

Moreover, it is recognized that Hawaiʻi's fresh water originates from the forest, which capture and absorb hundreds of inches of rain each year, allowing for slow infiltration and replenishment of our aquifers and streams. Based upon this understanding, as discussed in the DLNR report provided as Appendix O-1 of the EIS, the legislature added sub-section (e) to HRS § 171-58, requiring the incorporation of a watershed management plan into all water lease agreements to help protect freshwater resources (surface and groundwater). In addition to sustaining ground and surface water supplies, healthy forests reduce erosion by holding soil in place, improve water quality, and provide habitat for unique and endangered plants and animals. Focusing on watershed management plans that target mauka protection actions (fencing, removal of hooved

animals from important watershed forests, invasive weed control, etc.) that benefit native forests is essential if water lessees are going to have a reliable long-term supply of fresh water.

Regarding your comment about wetlands, please note that there are not any wetland environments within the License Area. This was established by CWRM during its IIFS deliberations which took into account wetland environments to maintain and restore along those streams that contained wetlands at the headwaters of specific streams. Conclusion of Law (COL) 35 of the CWRM D&O notes that "[a]ll streams except for Waiaaka and Ohia Streams have palustrial wetlands in the upper watershed of the hydrological unit and have not been affected by diversions." Hence it is anticipated that under the Proposed Action that these identified wetlands would continue to be unaffected.

Comment 6: *SAFETY. Stream flow is important as well in the aspect of safety. I have noticed how dangerous it is when a river is diverted. How it begins to create a cause for disaster when it is left untouched for too long. What happens is these river beds grow trees, and they build sediment and silt while slowly becoming much more narrow. When the storms come around, water will always find its natural course and pulse through these dry river beds like an explosion sending walls of landslides, rock, and debris down to the sea damaging roadways, homes and coastal shorelines. I have seen water climb out of these sediment filled riverbeds and spread throughout the open land causing destruction and panic. The result at sea level is a mass amount of coral bleaching and a build up of silt in our wetlands. The wetlands are kidneys of our islands. When they are clogged up with mass amounts of silt, they form unnatural little mounds that clog the islands natural course.*

Response 6: We are unable to determine from your description what stream channels you are referring to and where along the course of those stream channels the impacts you discussed have supposedly occurred and when. While there is some foundation for relating siltation to upstream flooding and the sudden release of stream obstructions, without specific information that can tie those events to a stream diversion, your assertions are speculative as opposed to establishing causality. Adverse impacts due to the conveyance of diverted water from a stream channel associated with failure of the streambanks or stream channel could be mitigated by standard streambank restoration practices. However, the kinds of flows that you seem to be referring to tend to be associated with 10-, 50- & 100-year storm events. Hence, during these high flow events it is common for sediment transport to occur. Sediment transport in streams is a function of stream power (i.e., the ability of the streamflow to pick up and move instream sediment). The torrential flows in East Maui streams have sufficient stream power to move large boulders and everything smaller. Stream diversions do decrease stream power by removing water from the stream, but this is primarily at low flows. The diversions are quickly overtopped during high flow events and thus sufficient flushing flows have always occurred in East Maui streams.

As noted in Response #5 above, there are no wetland environments in the License Area. As for coral bleaching, Section 4.3.1 of the EIS acknowledges that sediment flows into the ocean may be stressful for marine life and coral reefs. "However, because of the continuous wave energy in shore areas in East Maui, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species." See also Response #5, explaining that due to the continuous wave energy in the near shore areas of East Maui, studies for the EIS concluded that the nearshore areas below the License Area in East Maui do not constitute important habitats for coral reef communities and marine species.

Comment 7: *Where are the mitigation points in this EIS draft to safeguard our communities? Not to mention the millions of taxpaying dollars that are spent to our Police, Fire Departments and other departments like Electric, County Of Water, etc.... when these storm surges cause blackouts and sewage spills.*

Response 7: Your comment assumes a causal relationship between stream diversion and flooding events, which is not established. As discussed in Response #6 above, please note that floods are caused by heavy rainfall associated with tropical rainstorms. In Hawai‘i, streams originate in steep mountains and flow relatively quickly to the ocean, often triggering flash floods in coastal areas. Coastal plains and stream flood plains in the vicinity of the License Area are susceptible to flooding, which can be exacerbated where development impedes or prevents infiltration of the water into the ground. As discussed in Section 2.1 of the EIS, the Proposed Action involves the issuance of a 30-year Water Lease, which would grant the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water for uses described in the EIS. No development is planned in the License Area as part of the Proposed Action.

With regard to your comment "*where are the mitigation points in the EIS... to safeguard the communities*" please refer to Section 4.3.3 of the Draft EIS which discussed flood and tsunami hazards:

According to the FEMA Flood Insurance Rate Maps (FIRM), the License Area is predominantly designated as Zone "X", "Areas determined to be outside the 0.2% annual chance floodplain." (See Figure 4-28) A number of adjacent parcels along the makai edge of the License Area lie in areas designated as Zone "A", "Areas subject to inundation by the 1-percent-annual-chance flood event generally determined using approximate methodologies." However, flooding in East Maui generally caused by freshets.

With regard to maintenance of the streams within the License Area, the streams are on State land which falls under the purview of the DLNR.

Regarding your comment about tax dollars going to various agencies to respond to blackouts and sewage spills, this is outside the scope of the EIS because the Proposed Action, the issuance of the Water Lease, is not expected to cause any blackouts or sewage spills. There are no public power generating facilities nor sewage treatment plants within the License Area. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water for uses described in the EIS. The environmental impacts of the potential Water Lease, and where appropriate proposed mitigation measures, are included through Chapter 4 of the EIS.

Specifically, the EIS discusses the Proposed Action's impacts on public services and facilities in Section 4.14.1 of the EIS:

The Proposed Action is limited to the issuance of the Water Lease for the subject License Area, which would enable the lessee to continue operation of the EMI Aqueduct System that has been in operation for over a century. The Proposed Action continues the use of the system for the transport of surface water, and allows the lessee or its permittees, to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System. In general, the Proposed Action will maintain existing conditions, in compliance with the CWRM D&O and any reservations in favor of DHHL. No significant impacts on public services in the region are anticipated as the Proposed Action will not generate the need for additional services.

Comment 8: *TRAIL MANAGEMENT. It was said in the draft that trails would not be managed for the safety of people. Trails must be managed for the purpose of clearing our dry river beds to mitigate runoff. HRS 264 also states that all private roadways and historic trails must be protected on State Land. This means all trails must be managed.*

Response 8: We respectfully disagree with your comment that the Draft EIS states that the trails would not be managed for the safety of people. Nowhere in the EIS is this stated. To the contrary, Section 2.1 of the Draft EIS provides that the Proposed Action involves the issuance of a 30-year Water Lease that would grant the lessee the "*right, privilege, and authority to enter and go upon*" the License Area for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water for uses described in the EIS. Under the Water Lease, the lessee would also have the right to enter

upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System.

Hence, the Proposed Action would maintain roads and trails associated with the EMI Aqueduct System, many of which are used by the public. The reference to roads is assumed to mean unpaved roads within the License Area used to maintain the EMI Aqueduct System, as opposed to any roads under HRS Chapter 264 (Highways) which would be outside of the scope of this EIS.

With regard to the historic trails and roads that are within the License Area, Section 4.5 of the Final EIS as well as Appendix E (Archaeological Literature Review and Field Inspection) have been revised to include the current inventory of roads and trails in the License Area as shown in pages 4-147 to 4-149. CSH completed a geographic analysis of trails and roads that appear within the License Area as depicted on maps between 1869 and 1992 and available to the public domain. The majority of roads and trails within the License Area are associated with access to the EMI Aqueduct System and these road and “ditch trails” are likely contemporary with the construction of the EMI Aqueduct System.

Figure 4-39 has been added to the Final EIS to correspond with the above text (Figure 48 in Appendix E).

Furthermore, the various public recreational facilities, hiking trails, and hunting areas in the License Area, including access points, are identified in Section 4.8 of the EIS and Figures 4-37 and 4-38 of the Draft EIS (Figure 4-40 and 4-41 in the Final EIS). However, please note that Section 4.8 of the Final EIS has been updated to include more recreational facilities and an accurate discussion regarding access into the License Area as it relates to recreational activities as shown in pages 4-305 to 4-309.

Comment 9: *Cultural practices, and gathering rights must be respected and acknowledged. Mitigation purposes must be allowed for invasive species to managed for preservation and restoration of our watersheds.*

Response 9: With regard to cultural practices and gathering rights, the CIA prepared by CSH was included as Appendix F to the EIS, and it identified several native Hawaiian traditional and customary practices related to the License Area. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS presents the following with respect to possible impacts:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These

species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as 'o'opu) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision. . . .

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS, and it was acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the

streams in the historic taro-growing areas in East Maui. Moreover, based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, see pages 4-239 to 4-252 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

Regarding your comment about mitigation measures for invasive species, please note that Sections 4.4.1 and 4.4.2 of the EIS discuss mitigation measures addressing impacts from invasive species. Specifically, as it relates to invasive species, it is noted in the Terrestrial Flora and Fauna Technical Report for the Proposed East Maui Water Lease report (EIS Appendix C) that that low-elevation portions of the License Area are already highly impacted by invasive plants. However, it is noted in Appendix C that high-elevation portions of the License Area are predominately dominated by native species and is very likely to contain habitat for several endangered or threatened species. Impacts related to flora and fauna as a result of the Proposed Action are discussed in Section 4.4.1 and Section 4.4.2 of the EIS, which have been revised in the Final EIS based on comments received on the Draft EIS to further outline the existing conditions of the License Area and more accurately reflect targeted mitigation measures based

on feedback provided by the DLNR and USFWS. See pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS

Moreover, to date, EMI has worked closely with the Maui Invasive Species Committee (MISC) to assist in mitigating non-native weeds along with the EMI Aqueduct System and access roads. Typical procedures involve EMI staff notifying MISC of sightings and locations of non-native weeds, and then facilitating access by MISC to these identified areas to conduct appropriate treatment methods. EMI has committed to continuing to work with MISC in order to institute more stringent protocols for equipment sanitization and protection of the License Area.

Also note that, as discussed in Response #2 above, a watershed management plan will also be required in connection with the proposed Water Lease, as required by statute. Note that the minimum content requirements for watershed management plans under the category of "Goals" specifically address invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. Section 2.1 of the EIS has been revised as shown on pages 2-2 to 2-4 to provide this updated information regarding the content requirements for a watershed management plan.

Comment 10: *The EIS needs to show how the proposed water lease protects rights-of-way and access to other public lands. HRS 171-35 (Lease provisions) requires leases to protect rights of way and access to other public lands. The EIS draft again fails to show proper management to laws set in place to protect our trails and roadways. We need precise documentation of our rights of ways.*

Response 10: HRS § 171-35 does not require a lessee to protect rights of way and access to other public lands. To the extent that HRS § 171-35 (Lease provisions; generally) applies to a water lease, it gives the BLNR discretion on whether and how to address reservations of rights of way and access to other public lands. The section of the law you cited provides as follows:

Every lease issued by the board of land and natural resources shall contain:

- 1. The specific use or uses to which the land is to be employed;*
- 2. The improvements required; provided that a minimum reasonable time be allowed for the completion of the improvements;*
- 3. Restrictions against alienation as set forth in § 171-36;*
- 4. The rent, as established by the board or at public auction, which shall be payable not more than one year in advance, in monthly, quarterly, semiannual, or annual payments;*

5. *Where applicable, adequate protection of forests, watershed areas, game management areas, wildlife sanctuaries, and public hunting areas, reservation of rights-of-way and access to other public lands, public hunting areas, game management areas, or public beaches, and prevention of nuisance and waste; and*
6. *Such other terms and conditions as the board deems advisable to more nearly effectuate the purposes of the state constitution and of this chapter.*

Your comment about precise documentation of right of ways is unclear. With regard to trails in the License Area, however, as discussed in Response #8 above, Section 4.5 of the Final EIS as well as Appendix E (Archaeological Literature Review and Field Inspection) have been revised to include the current inventory of roads and trails in the License Area as shown in pages 4-147 to 4-149. CSH completed a geographic analysis of trails and roads that appear within the License Area as depicted on maps between 1869 and 1992 and available to the public domain. The majority of roads and trails within the License Area are associated with access to the EMI Aqueduct System and these road and “ditch trails” are likely contemporary with the construction of the EMI Aqueduct System.

Figure 4-39 has been added to the Final EIS to correspond with the above text (Figure 48 in Appendix E).

Comment 11: *CULTURAL SITES. This EIS draft has failed to comply with specific archeological components to truly identify cultural sites thru ground based techniques. It was stated in the EIS draft to SHPD as “involving no ground altering activities”. This is such a major denial and blatant disregard to historical preservation, and Kanaka [Maoli] identity. Many of these river systems are covered with terraces, ancient lo’i kalo patches and trails, along with heiau.*

Response 11: We respectfully disagree with your comment. Correspondence from the DLNR State Historic Preservation Division (SHPD) dated January 27, 2017 and October 6, 2017 are appended to the Draft EIS Appendix E (Archaeological Literature Review and Field Inspection report) (LRFI report), confirming SHPD's position on this issue. Issuance of the Water Lease is not anticipated to affect any historic property, aviation artifacts, or burial site. As discussed in Draft EIS Section 4.5 (Historic and Archaeological Resources) the Proposed Action does not involve any new construction or significant ground disturbance within undisturbed areas within the License Area. The Proposed Action continues the use of the EMI Aqueduct System for the transport of surface water, and allows the lessee or its permittees, to maintain and repair existing access roads and trails long-used as part of the EMI Aqueduct System.

The archaeological LRFI report prepared by CSH included an analysis of the natural and built environment of the License Area, a comprehensive review of traditional and historic background information of the region, a review of previous archaeological studies and findings in the region, and a field inspection of the License Area focused on inspecting the areas nearest to the EMI Aqueduct System infrastructure and access roads. Based on the research and analysis conducted for the LRFI, neither the Water Lease, nor the alternatives, is expected to have impacts archaeological historic properties within the License Area because none of these actions include significant related ground disturbance, or any significant ground disturbance within undisturbed areas.

If, through future implementation of the Proposed Action or the alternatives, ground disturbance subject to County, State, and/or Federal permits is required, then CSH recommends consultation with the SHPD to determine historic preservation requirements. The LRFI also provides cultural resource management recommendations based on the extensive research and analysis conducted during the study. For example, CSH recommends that any persons who are required to enter the License Area as part of the Proposed Action or alternatives be made aware of the potential for discovery of undocumented surface historic properties such as walls, trails, terraces, mounds, and/or caves. These structures should be avoided, protected, and reported to the SHPD. The SHPD will determine if additional mitigation is required. This recommendation is in line with recommendations that were made for the Waikamoi Preserve during a cultural-historical study of East Maui (Maly and Maly 2006).

Regarding your comment that many of the river systems are covered with terraces, ancient lo'i kalo patches and trails, along with heiau, please note that you did not list any specific river systems or locations in your comment and we are unable to confirm if there are such features along any specific river system. Moreover, the EIS and the Appendix E of the EIS does not deny that there are historic properties within the License Area.

Comment 12: *This EIS needs to meet the peoples concerns and should not be brushed off. The resurgence of Kanaka belief systems and practices are growing everyday, and they have a right to restore, return and revive their stories written in sand and stone.*

Response 12: The EIS is being prepared to meet and even voluntarily exceeds the process and content requirements established by HRS Chapter 343 and HAR Title 11 Chapter 200 for the stated Proposed Action. As discussed in Response #3 above, extensive consultation was done for this EIS. The EIS documents and addresses many concerns brought up during community outreach and public review periods. Please note that, as discussed in Response #3 above, in addition to the required and voluntary procedural consultation efforts for the EIS, the EIS includes studies that involved consultation efforts for research purposes, including the Social

Impact Assessment (SIA) and the Cultural Impact Assessment (CIA). The SIA in Appendix G of the Draft EIS, obtained input from several community members, many of whom have direct and long-term experience with the streams in East Maui, and documents the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono which is summarized in Section 4.7.2 of the EIS. As discussed in Section 4 of Appendix G (Preliminary Community Issues), seven focus groups were convened in November 2018. Participants in these sessions included residents, farmers and ranchers, and people who are active in environment and sustainability efforts. These participants lived in Ke‘anae, Wailuānui, Huelo, Ha‘ikū, Kula, Makawao and Pukalani. Sixty-four people signed in at these focus groups, but the actual number of participants is higher because some individuals arrived after the session started and did not sign in.

In addition, there were several follow-up interviews conducted in April 2019 to obtain feedback on the then-recent sale of A&B land holdings to Mahi Pono. The interviewees were diverse in interest and place of residence.

The CIA in Appendix F of the Draft EIS documents input from three interviewees, as well as numerous declarations made during the Commission on Water Resource Management (CWRM) contested case proceedings. Cultural Surveys Hawai‘i (CSH), which prepared the CIA, also has reached out to members of the community who provided comments on the Draft EIS related to the CIA. CSH contacted 10 parties, including yourself, for additional consultation on the CIA, the efforts of which are summarized in Section 4.6 of the Final EIS. Of those 10 parties contacted, only 4 responded, and you were excluded as you chose not to respond. Please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See pages 4-239 to 4-252 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted.

Moreover, Chapter 9 of the EIS includes a list of all those governmental agencies (state, federal and county), organizations and individuals that have either participated in the EIS process and or received notifications regarding the EIS process. Concerns expressed by the public have not been brushed off. Appendices M and N reproduce comments and responses for all those that participated in the EIS process.

Comment 13: *IN CLOSING. I feel that this EIS Draft definitely does not put in to factor the seriousness of these concerns and really down plays the affects this will have to our communities, their cultural and religious rights, and our [the] future generations opportunities to come as well.*

Response 13: We respectfully disagree with your comment that the EIS does not factor in the seriousness of concerns of the nature raised in your comment letter, and we disagree that the EIS downplays the effects the Proposed Action will have on East Maui communities. Please note as discussed in Response #12 above that community concerns were well documented and addressed. Moreover, following receipt of your Draft EIS comments, you were invited to participate in an additional CIA interview to be conducted by CSH, which is summarized in Section 4.6 and Appendix F of the Final EIS. You were invited to participate so that you could elaborate more on your concerns. However, you did not respond or choose to participate. Anticipated impacts from the proposed Water Lease are documented in the nine technical studies that were prepared in conjunction with the EIS (see EIS Appendix A - I), and are discussed throughout Chapter 4 of the EIS.

Comment 14: *WE DO NOT CONSENT. THIS EIS DESERVES DILIGENCE AND TRUE STEWARDSHIP MANAGEMENT. IT IS NOT COMPLETE.*

Response 14: We respectfully disagree with your comment that the EIS is not complete or diligently prepared. This EIS process started in 2016 and has been conducted with diligence. As discussed in Response #1 above, in terms of specific contents, the Draft EIS fully complies with the content requirements set forth in HAR § 11-200-16 and §11-200-17, and includes a content checklist directing the reader to the specific sections of the Draft EIS addressing each content requirement. Similarly, the Final EIS has been prepared in compliance with all appropriate laws and regulations.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on the September 23, 2019 Huelo, Honomanu, Ke'anae and Nahiku Water Leases Draft EIS
Date: Thursday, November 7, 2019 10:43:05 PM

To: Alexander & Baldwin November 7, 2019
Consultant: Wilson Okamoto Corporation

Attention: Mr. Earl Matsukawa
Re: Comments on the September 23, 2019 Huelo, Honomanu, Ke'anae and Nahiku Water Leases Draft EIS

Aloha e Mr. Matsukawa,

My name is Daniel Kanahale. I am a historic researcher and a Kanaka Maoli who is familiar with the Hawaii Historic Review process. I am also active in the Aha Moku o Maui.

I am very disappointed that the Draft EIS for the East Maui Water Lease Areas did not conduct any Archaeological Inventory work on these historically rich public lands.

The archaeological review apparently was the result of only 3 days of fieldwork by 5 people conducted under HAR 13-13-282. It was described as an inspection of the License area's access road network and an inspection on foot of 21 intake areas.

From the map, fig 47, provided in Appendix E Historical Review, it looks like 8 of these intake points are on EMI land and not technically in the "License Area." This illustrates to me why the EIS needs to have an actual AIS with field work of the entire area where the EMI ditch system operates, whether it is on state land or EMI land, as well as identify sites on private lands that may be at risk of being impacted by high water levels.

While SHPD initially required there be Archaeological Review through preparation of an AIS, the EIS consultants informed SHPD that the proposed lease would not involve any ground altering work, and that the potential of abandoning diversions on five streams would not result in any flooding greater than periodic naturally occurring events. Based upon that information, SHPD withdrew the request for an AIS. It seems clear that if a lease is granted, there will be ground disturbing work that goes along with the operation of the ditch system. Under the state EIS rules this would be seen as a "secondary impact of the action." In other words, if the primary Action occurs, other activities are very likely to take place. In this case, those activities will involve clearing of roads and trails; modifications of some of the intakes on state lands and EMI lands, installation of gauges and other possible activities. The brief 3 day field inspection of 21 intakes and nearby trails cannot be said to be representative of the presence or absence of historic properties surrounding the hundreds of intakes and 62 miles of trails found in the EMI system.

I have friends active in the the Hamakualoa and Ko'olau Aha Moku o Maui where the License area is located. These folks are aware of numerous pre-contact historic sites along many of the steams that are diverted by EMI. Some are on State land. Some are on EMI land. EMI acquired many Land Commission Award parcels to benefit from the LCA kuleana water rights. Have you reached out to Aha Moku Councils members who have generational knowledge of these areas? This needs to done bcause there are historic sites that have not been documented.

The EIS needs to include a discussion of secondary and cumulative impacts of the proposed lease action on historic sites, including historic trails that may be found on State or EMI land. What happens on State land can also affect historic properties, such as lo'i kalo on EMI lands and kuleana holdings that lie in the areas between the various levels of the ditch system.

Appendix E refers to impacts that could be caused to lands upcountry if the Leases were not granted and new wells

needed to be drilled in the Upcountry area. It should also acknowledge that if the leases ARE granted, ground altering activities will be conducted in the License area AND on EMI lands and these carry the risk of impacts to historic sites if no survey has been done to identify these sites and mitigate impacts.

EIS cannot properly evaluate the secondary and cumulative impacts on historic sites without including an AIS that is reviewed and accepted by SHPD.

The EIS also needs to provide an inventory of historic roads and trails that exist on the State License area and on EMI lands. Such trails are historic properties protected under our state laws and also in our Community plans. We know that the lands of the License area are now and were in the past a resource for the Hawaiian communities who lived along these streams. This means that there were trails and roads used to access the upper areas of the streams.

EIS content requirements require that the EIS consider not just the proposed action, but also secondary and cumulative impacts that could result from the proposed action. The DEIS may discuss a lease, but the granting of that lease will result in many other activities that have the potential to impact historic sites that have not been documented.

Thank you for the opportunity to offer comments on the DEIS.

Me ka ha'aha'a,

Daniel Kanahale

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Kanahahele:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *My name is Daniel Kanahahele. I am a historic researcher and a Kanaka Maoli who is familiar with the Hawaii Historic Review process. I am also active in the Aha Moku o Maui.*

Response 1: We acknowledge your comments and understand that you are a historic researcher that is familiar with the Hawai‘i Historic Review process.

Comment 2: *I am very disappointed that the Draft EIS for the East Maui Water Lease Areas did not conduct any Archaeological Inventory work on these historically rich public lands.*

The archaeological review apparently was the result of only 3 days of fieldwork by 5 people conducted under HAR 13-13-282. It was described as an inspection of the License area’s access road network and an inspection on foot of 21 intake areas.

From the map, fig 47, provided in Appendix E Historical Review, it looks like 8 of these intake points are on EMI land and not technically in the “License Area.” This illustrates to me why the

EIS needs to have an actual AIS with field work of the entire area where the EMI ditch system operates, whether it is on state land or EMI land, as well as identify sites on private lands that may be at risk of being impacted by high water levels.

Response 2: Please note that there is no requirement under HRS Chapter 343 that an EIS include an archaeological inventory survey. Kaleikini v. Yoshioka, 128 Hawai‘i 53, 283 P.3d 60 (2012) (holding that, with respect to the EIS done for the Honolulu rail project, "although the final EIS did not include an AIS, it was nonetheless sufficient to enable the decision-maker to consider fully the environmental factors involved" and upholding the acceptance of the EIS.). The DEIS, as required under HRS Chapter 343, includes extensive information about archaeological, historic, and cultural resources, including the following three technical studies: Historical Structure Assessment, Archaeological Literature Review and Field Inspection, and Cultural Impact Assessment. A Chapter 6E-7 and 6E-42 historic preservation review letter dated 25 January 2017 (Log No. 2017.00026; Doc. No. 1701GC08) sent from the SHPD to the DLNR Land Division requested that, pursuant to HAR §13-284-5(b)(5)(A and C), an archaeological inventory survey (AIS) and architectural inventory survey would be required prior to issuance of the lease and that these surveys also be preceded by inventory plans.

Additional information regarding the Proposed Action was provided to the SHPD including the understanding that the proposed Water Lease will not involve any ground disturbance and that the potential impact of flooding from abandoning the diversion on five streams will not be greater than periodic naturally occurring events. A subsequent Chapter 6E-8 historic preservation review letter (Log No. 2017.00026; Doc. No. 1706MBF11) sent from the SHPD to the DLNR Land Division updated the previous correspondence to no longer request or require an AIS plan or AIS for the Lease Area in conjunction with the Proposed Action.

An archaeological literature review and field inspection (LRFI) was prepared to determine the likelihood that historic properties (any building, structure, object, district, area, or site over 50 years old) may be affected by the project and, based on findings, consider cultural resource management recommendations. The LRFI is intended to facilitate the project's planning and support the project's environmental review compliance.

The archaeological literature review and field inspection report included an analysis of the natural and built environment of the License Area, a comprehensive review of traditional and historic background information of the region, a review of previous archaeological studies and findings in the region, and a field inspection of the License Area focused on inspecting the areas nearest to the EMI Aqueduct System infrastructure and access roads. The investigation did not include an inventory of all historic properties that may be present within the License Area, but

has provided cultural resource management recommendations based on the extensive research and analysis conducted during the study.

Furthermore, in response to comments received on the Draft EIS, discussions regarding the legendary Pōhaku of Wahinepe'e has been added to Appendix E of the EIS, and summarized in Section 4.5 of the Final EIS as shown on page 4-138.

Comment 3: *While SHPD initially required there be Archaeological Review through preparation of an AIS, the EIS consultants informed SHPD that the proposed lease would not involve any ground altering work, and that the potential of abandoning diversions on five streams would not result in any flooding greater than periodic naturally occurring events. Based upon that information, SHPD withdrew the request for an AIS. It seems clear that if a lease is granted, there will be ground disturbing work that goes along with the operation of the ditch system. Under the state EIS rules this would be seen as a "secondary impact of the action." In other words, if the primary Action occurs, other activities are very likely to take place. In this case, those activities will involve clearing of roads and trails; modifications of some of the intakes on state lands and EMI lands, installation of gauges and other possible activities. The brief 3 day field inspection of 21 intakes and nearby trails cannot be said to be representative of the presence or absence of historic properties surrounding the hundreds of intakes and 62 miles of trails found in the EMI system.*

Response 3: The Proposed Action constitutes the issuance of one long term (30 years) Water Lease from the BLNR for the continued "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease will enable the lessee to continue to go on lands owned by the State in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow continued operation of the EMI Aqueduct System to deliver water to the County of Maui DWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users as the Kula Agricultural Park (KAP), as well as for the Nāhiku community. It will also allow the continued provision of water to approximately 30,000 acres of agricultural lands in Central Maui.

For the Proposed Action, "maintenance and repair" involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the continued operation and maintenance of the EMI

Aqueduct System. Hence, the Proposed Action will not require any significant ground disturbance and the potential impact of flooding from abandoning the diversions will not be greater than periodic naturally occurring events. Moreover, the Proposed Action will not include partial or total destruction or alteration of any known historic properties, detrimental alteration of the surrounding environment, detrimental visual, spatial, noise or atmospheric impingement, increasing access with chance of resulting damage, nor neglect resulting in deterioration or destruction. As such, the Proposed Action will have no impact to archaeological historic properties.

Comment 4: *I have friends active in the the Hamakualoa and Ko'olau Aha Moku o Maui where the License area is located. These folks are aware of numerous pre-contact historic sites along many of the steams that are diverted by EMI. Some are on State land. Some are on EMI land. EMI acquired many Land Commission Award parcels to benefit from the LCA kuleana water rights. Have you reached out to Aha Moku Councils members who have generational knowledge of these areas? This needs to done bcause there are historic sites that have not been documented.*

Response 4: Chapter 9 of the EIS contains all consultation efforts during this EIS process. Particularly, two aha moku members, one each from the Aha Moku o Hamakua Loa/Hamakua Poko and Aha Moku o Kaupo, participated during the EISPN process and commented on the EISPN and were encouraged to continue to participate throughout the entire EIS process. Additionally, the Aha Moku o Maui, Inc. was contacted and one member provided an interview as part of the Cultural Impact Assessment (Appendix F) for the EIS.

Of the recognized members of the Aha Moku Council who participated in the CIA, Mr. Nakanekua provided a discussion of Pākanaloha Heiau. The location and description of Pākanaloha Heiau is addressed in the LRFI in Section 2.4 (Walker Site 84). The heiau is located outside of the license area, on Ke'anae Peninsula. The field inspection did not include an inventory of historic properties or inspection of historic properties outside of the license area.

No other recognized members of the Aha Moku Council provided information on specific historic properties during consultation for the CIA.

In response to comments on the Draft EIS, a discussion regarding the archeological field survey and historic structure assessment has been added to Appendix E of the EIS and summarized in Section 4.5 of the Final EIS as shown in on pages 4-138 to 4-139.

As shown in the included attachment, there has been very little archaeological work within the License Area to date, and thus, very little archeological resources are known to exist within the License Area. However, based on the rich history of the region, it is assumed that archaeological

resources do exist within the License Area. However, it is recommended that any persons who are required to enter the License Area as part of the Proposed Action or Alternatives be made aware of the potential for discovery of undocumented surface historic properties such as walls, trails, terraces, mounds, and/or caves. These structures should be avoided, protected, and reported to the SHPD. The SHPD will determine if additional mitigation is required.

Comment 5: *The EIS needs to include a discussion of secondary and cumulative impacts of the proposed lease action on historic sites, including historic trails that may be found on State or EMI land. What happens on State land can also affect historic properties, such as lo'i kalo on EMI lands and kuleana holdings that lie in the areas between the various levels of the ditch system.*

Response 5: Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter

3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown in pages 4-331 to 4-336. With regard to the historic trails and roads that are within the License Area, Section 4.5 of the Final EIS as well as Appendix E (Archaeological Literature Review and Field Inspection) have been revised to include the current inventory of roads and trails in the License Area as shown in pages 4-147 to 4-149. CSH completed a geographic analysis of trails and roads that appear within the License Area as depicted on maps between 1869 and 1992 and available to the public domain. The majority of roads and trails within the License Area are associated with access to the EMI Aqueduct System and these road and "ditch trails" are likely contemporary with the construction of the EMI Aqueduct System.

Figure 4-39 has been added to the Final EIS to correspond with the above text (Figure 48 in Appendix E).

Comment 6: *Appendix E refers to impacts that could be caused to lands upcountry if the Leases were not granted and new wells needed to be drilled in the Upcountry area. It should also acknowledge that if the leases ARE granted, ground altering activities will be conducted in the License area AND on EMI lands and these carry the risk of impacts to historic sites if no survey has been done to identify these sites and mitigate impacts.*

Response 6: Appendix E is the Archaeological Literature Review and Field Inspection. The Proposed Action is the issuance of a Water Lease by the BLNR. The Applicant is not proposing

to drill any wells in Upcountry Maui. As previously discussed above, the Proposed Action, including maintenance and repair of the EMI Aqueduct System, does not involve ground disturbing activity within the License Area (Maui Pono will continue to engage in agriculture in the Central Maui agricultural fields which have been continuously disturbed through historical agricultural uses for over 100 years). As discussed in the Section 2.1.2 of the Final EIS as shown on page 2-7 of the Final EIS, under the Proposed Action, "maintenance and repair" within the License Area involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment, as has been the case for many years.

Moreover, as mentioned in Response # above, it was determined that an AIS was not needed by SHPD as the Proposed Action will not involve any ground disturbance and that the potential impact of flooding from abandoning the diversion on five streams will not be greater than periodic naturally occurring events. Thus an LRFI was prepared to support the project's environmental review compliance.

The Proposed Action will not will not include partial or total destruction or alteration of any known historic properties, detrimental alteration of the surrounding environment, detrimental visual, spatial, noise or atmospheric impingement, increasing access with chance of resulting damage, nor neglect resulting in deterioration or destruction. As such, the Proposed Action will have no impact to archaeological historic properties.

Comment 7: *EIS cannot properly evaluate the secondary and cumulative impacts on historic sites without including an AIS that is reviewed and accepted by SHPD.*

Response 7: As noted in Response #5 above, note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown in pages 4-331 to 4-336.

Comment 8: *The EIS also needs to provide an inventory of historic roads and trails that exist on the State License area and on EMI lands. Such trails are historic properties protected under our state laws and also in our Community plans. We know that the lands of the License area are now*

and were in the past a resource for the Hawaiian communities who lived along these streams. This means that there were trails and roads used to access the upper areas of the streams.

Response 8: As mentioned above in Response #5, Section 4.5 of the Final EIS as well as Appendix E (Archaeological Literature Review and Field Inspection) have been revised to include the current inventory of roads and trails in the License Area as shown in pages 4-147 to 4-149. CSH completed a geographic analysis of trails and roads that appear within the License Area as depicted on maps between 1869 and 1992 and available to the public domain. The majority of roads and trails within the License Area are associated with access to the EMI Aqueduct System and these road and “ditch trails” are likely contemporary with the construction of the EMI Aqueduct System.

Figure 4-39 has been added to the Final EIS to correspond with the above text (Figure 48 in Appendix E).

Comment 9: *EIS content requirements require that the EIS consider not just the proposed action, but also secondary and cumulative impacts that could result from the proposed action. The DEIS may discuss a lease, but the granting of that lease will result in many other activities that have the potential to impact historic sites that have not been documented.*

Response 9: Correct. EIS content requirements do call for an EIS to consider secondary and cumulative impacts as a result of the Proposed Action. The terms “secondary impacts” and “cumulative impacts” are defined above in Response # above. Secondary and Cumulative impacts are discussed in Section 4.16 of the EIS. As stated in Section 4.16.1 of the Draft EIS:

The secondary impacts of the Proposed Action primarily relate to developing diversified agriculture in Central Maui, including the economic and social impacts of diversified agriculture and job creation on Maui’s broader economy and the County’s tax revenues. These impacts are summarized in Section 4.7 Socio-Economic Characteristics based on a detailed evaluation in the Economic and Fiscal Impact Study (See Appendix H) and the Social Impact Assessment (See Appendix G).

As stated in Section 4.16.2:

The cumulative impact of the Proposed Action can be regarded as an additive impact overlaid on more than 100 years of history during which the EMI Aqueduct System was developed to provide water for the development of a sugar industry in Central Maui as well as for the later development of Upcountry Maui.

This DEIS summarizes the pertinent history in Chapters 1 and 2 as a basis for understanding the events that have shaped the existing conditions described in Chapter 4. In addition, the following studies document the pertinent history related to the sugar industry in Maui and the EMI Aqueduct System and how they have shaped existing condition:

- *Archaeological LRFI (See Appendix E) discusses the historic context of the Proposed Action;*
- *CIA (See Appendix F) also provides a historic context and documents cultural resources and practices recalled by cultural informants;*
- *HSA (See Appendix D) documents the various characteristic components of the EMI Aqueduct System that provide the historic context for the functioning system; and*
- *SIA, which discusses history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono.*

The cumulative history of the environment is reflected in the following studies:

- *Terrestrial Flora and Fauna Technical Report (See Appendix C), which describes the present composition of flora and fauna in the License Area and the agricultural fields of Central Maui that reflect the history of how they have been changed by human activity; and*
- *Assessment of the Environmental Impact of Stream Diversions on 33 East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (See Appendix A) which, likewise, documents the stream habitats of East Maui as they have been shaped by human activity.*

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: **East Maui Water Lease Draft-EIS** - Comments

Aloha,
Attached are my comments on the East Maui Water Lease DRAFT-EIS.
Hopefully, they will be helpful when preparing the Final-EIS.

There is both a PDF version and a MSWord version.

Best wishes, Prof. Richard "Dick" Mayer

RE: East Maui Water Lease Draft-EIS

Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomano, + Huelo License Areas

INITIAL COMMENTS

1. In the Executive Summary, page 1- 20, it is stated that BLNR on July 8, 2016 requested/instructed that A&B and EMI should proceed with the preparation of an Environmental Impact Statement. A copy of that document should be provided so that it may be determined whether the Final-EIS meets the requirements of the BLNR.
2. Was the **Final-EIS** intended to be prepared for an auction bid by A&B and EMI only? Alternatively, **was it meant to be generic**, applicable and available for anyone who makes a bid at the lease auction?

SPECIFIC CONCERNS

OWNERSHIP AND MANAGEMENT

3. The Draft-EIS has capitalized "**EMI** Aqueduct System". This implies that EMI owns the aqueduct system. What proof is there of this ownership. Would it not be more correct to say "**East Maui's** aqueduct system" which has multiple owners?
4. Page 1 - 2 in section 1.3.1 there is an assertion made that **EMI is the owner of the EMI aqueduct system**. Provide proof that this is true, especially for the lands that are within the state lease area which I believe are owned by the State and could be utilized by anyone winning the lease in competitive bidding at an auction. The **aqueduct System on State lands does NOT belong to EMI**.
5. The draft EIS implies that the East Maui aqueduct system belongs to either A&B, EMI, or Mahi Pono. Provide detailed proof of ownership of the three separate sections of the East Maui aqueduct system: **a)** The portion within the four state-owned lease areas; **b)** the portion crossing the land now jointly owned by A&B and Mahi Pono; and finally, **c)** the portion of the system running from the A&B Mahi Pono lands to the Kamole Weir water treatment plant.

6. Even though Mahi Pono (at present a 50% owner of EMI) is registered in the United States (Delaware), seemingly it is not owned by an American entity. All of the Mahi Pono lands are ultimately owned by a foreign entity, which has established a domestic USA firm to merely own this investment. An additional complication in the ownership matter is that Mahi Pono is managed/operated by California interests, named Trinitas and Pamona Farming. There should be a clear explanation of the **management and financial relationships** among all of these entities: Hawaii's A&B and EMI, Canada's PSP, California's Trinitas and Pamona Farming, and Delaware's Mahi Pono.
7. Include in the Final-EIS any documents **that prove that the land under East Maui's aqueduct system** was transferred to A&B or EMI from the Kingdom. or Republic? or Territory? or State of Hawaii?
8. At the beginning of the Final-EIS, there should be a section devoted to the **ownership of Mahi Pono**. This should include the exact relationship between the investment company PSP, the California group known as Trinitas, the many, many LLC companies with Mahi Pono in their title and who are now the owners of numerous parcels of land throughout Central and North Maui.
9. The description should include both the financial relationships among these parties and entities as well as the decision-making management hierarchy among them. There should also be a very clear indication about how A&B's REIT (Real Estate Investment Trust) is linked to all of this. Apparently, the sales agreement between the two companies A&B & Mahi Pono leaves some question about the level of land ownership, easements, and other interest being maintained and retained by A&B.
10. Because the sales agreement that was publically displayed in December-2018 left many sections undisclosed, include the ENTIRE sales agreement between A&B REIT and Mahi Pono.
11. Describe the risks to the 2,550 Maui residents who will become dependent on the Mahi Pono farm plan, if MAHI PONO determines that it is **unprofitable to maintain its farming operations**.
12. Will the value of the marketed crops and animal products be **adequate to support this larger population, while providing investor PSP with an adequate profit?**
13. Is the **1938 agreement** the Territory of Hawaii and A&B **still relevant** today? If yes, then the 1938 agreement should be attached as an appendix and there should be an explanation as to how it is still relevant. It is referred to in the Executive Summary, page 1- 6 in the 3 middle paragraphs. On the other hand, is it only a part of the historical record, and not relevant to the auction?

14. Given the fact that Mahi Pono is owned by an international entity and that the profits from this entity will leave not only Maui, but the whole United States, what is the financial impact of a lease issued to a **non-Hawaii entity**, as compared to having the water lease obtained at auction: **a) by a Hawaii-based company, or b) by a public Maui Water Authority?**
15. In Section 3.4.20 Public Water Systems: Central Maui, it is **asserted that Central Maui receives its water from the East Maui aqueduct system**. The **potable water** used in Central Maui that is delivered by the Maui Department of Water Supply does not come from the aqueduct system. It is also false to say that the EMI aqueduct system is privately owned. Much of the so-called East Maui aqueduct system is on the State lease land and is NOT privately owned.
16. The last paragraph on page 4 - 140 is very important. The paragraph is important because it points to a fairly widely held belief that the **lease could be held by a public utility such as a Water Authority or by the Maui County Department of Water Supply**. (See the Maui Board of Water Supply TIG report of October-2019.) The paragraph's last sentence makes a very important point by asking who should get the profits from the sale of water delivered to central Maui.

FINANCES

17. The Executive Summary, page 3 – 17, mentions that the cost of water to the County is now **\$0.06 MGD and that it could rise**. This could have serious effects on the ability of the County to provide water for the UpCountry region. What is the range of the maximum potential rise and how will it be calculated/negotiated?
18. Water prices are a matter of considerable interest to the UpCountry farmers who now utilize this potable water to irrigate their farms. There seems to be no way to provide farmers with non-potable water. Consequently, any rise in the rates paid by the County water department could have significant impacts. Address them in the Final-EIS.
19. On page 3-18 at the end of the next-to-last paragraph, it states that the **City of Honolulu would get a \$120,000 in tax revenues**. Please explain why they, and not Maui County, would get the funds.
20. The leaseholder will have an obligation to deliver water to the DHHL lands. Since it will be expensive to build an adequate water line from East Maui's aqueduct system to the Department of Hawaiian Homelands land in Keokea and Waiohuli, there should be a provision in the lease that will set aside funding over the years from the **license fees to construct the necessary pipeline to transmit that water** (over 10 MGD) across Kula. Please describe how that could work.

21. A missing part of the large Draft Environmental Impact Statement is any consideration of **Mahi Pono's (or any other successful bidder's) need to withdraw (cease operations) from using the East Maui water over the 30-year lease period.** It could be for reasons that are financial, agricultural, labor problems, or something else such as a sale of the Mahi Pono owned lands to some entity not interested in farming.

What would be the impact: a) on the East Maui watershed, b) the Maui County Department of Water Supply's commitment to the UpCountry water needs, c) the Hawaiian Homelands, and d) the agricultural lands now owned by Mahi Pono.

AGRICULTURE AND WATER SOURCES

22. Various numbers are utilized throughout the document to explain the size of Mahi Pono's agricultural activities. There should be a clear table that explains the different land areas that are contained in the Mahi Pono purchase. For example, out of the 41,000 acres how much of it is "**Important Agricultural Land**"? How much is classified with a **Land Productivity** of A, B, C, D, or E? How much will be irrigated by water from **East Maui's aqueduct system, versus water coming from Na Wai Eha or central Maui wells?** How much land will actually be farmed?

23. **Groundwater** from wells in Central Maui is discussed. Clarify. Does the **groundwater** from Central Maui wells also include water on the west side of Mahi Pono's land traditionally irrigated primarily from the Na Wai Eha watershed?

24. On page 4 – 5, it states that 4.9 MGD of water is delivered from **four UpCountry Wells** (Ha'iku, Po'okela and the 2 Kapakalua Wells). These wells are an important back-up source for UpCountry. How do these wells decrease UpCountry's dependence on East Maui's aqueduct system water?

25. On page 4 – 153, it states that 7.1 million gallons per day of UpCountry Maui's water comes from the East Maui irrigation aqueduct system. This is misleading since less than half of it is coming from the lease areas that are being analyzed in the EIS document. The rest is coming from other Mahi Pono lands, not the subject of this EIS. Correct this statement.

WATER USE

26. The last two paragraphs on page 4 - 140 are very important. The first of these paragraphs misleads when it says that the EMI Aqueduct System supports the two water treatment plants known as Olinda and Piiholo. That is not accurate. Both of these plants get water from lands now owned by Mahi Pono, but are NOT connected to the aqueducts coming from the East Maui lease areas.

27. Pages 4 - 148. There needs to be an explanation as to why the **Maui Water Department needs so much more water after 2008** than in 2006. Going from 3.23 MGD to 7.1 MGD in such a short time frame. Does the 7.1 MGD count the water delivered from Piiholo and Olinda? Kula Ag Park?

WORKERS AND HOUSING

28. **Sugar plantation workers** were unionized, had very high level of technical skills, maintaining machinery, driving huge trucks, etc. and were **highly paid**. What will Mahi Pono do to recruit workers who can afford to live on Maui? What are the proposed salary rates? Moreover, if **workers are paid adequate living wages**, will those salary rates allow the leaseholder to have profitable agricultural operations? Discuss the labor situation at length.

29. Page 4 – 169. There is an estimate that there will be **more workers** needed than was the case with sugarcane, and that in addition to the employees there will be indirect employment (those servicing the Mahi Pono employees).

790 farm jobs plus 350 additional indirect jobs → 1,140 workers. At least 2,550 family members.

There needs to be robust discussion/analysis about how Mahi Pono will get workers given the Maui's existing very **low unemployment rate**. How many workers will need to be imported?

30. A very important consideration that has been left out entirely is **housing** for all of the new imported employees and their families. Not only will workers find it difficult to find a house, but they also will add to the pressure on the existing labor force who are seeking affordable housing.

31. **4 – 144, plus 4 - 145** refer to **labor problems and housing issues**. This should be a valuable and important part of the environmental impact statement. Unfortunately, there is no indication of how these issues will be handled (mitigated) in the future. There is a now shortage of workers on Maui and there is a very significant shortage of affordable housing for these employees. These very important impacts have NOT been mitigated, nor even addressed.

WATER USE AND CONSUMERS

32. Reviewers of the Final-EIS will need to know **who might be consuming the water** being delivered from East Maui. For example, the Maui Water Department, Mahi Pono for the use on its agricultural fields, the Kula agricultural Park and it's future extension, Hawaiian Homelands (both UpCountry in Keokea and in Central Maui at Pulehunui), Nahiku residents. **Anyone else?** Only then can we know the impacts that these waters would have.

33. Provide a detailed listing of those entities that would have access to the water and **what they will be paying for that water**. At what **rates per 1,000 gallons will water be sold to each**? The same rate for each purchaser?
34. Be very specific as to whether there are any other potential users of the water. For example, A&B for use on its agricultural properties? Or A&B for use on **any non-agricultural development project**? Any other entity that might utilize the water for future non-agricultural developments?
- To determine all the potential environmental impacts and if Mahi Pono gets the East Maui lease at auction, **is A&B expecting to receive any water**? If yes, will the water be used for any non-agricultural development?
35. Describe the **impacts and implications if Mahi Pono decide that it no longer wants or needs the water** for agricultural uses. Could it be used for other purposes?
36. **Would the aqueduct system continue to be maintained** which may be necessary for both the Maui County Department of Water supply and for the Hawaiian homelands?
37. The paragraph at the top of page 4 - 58 makes it clear that CWRM considered it important to **allow water to be utilized on the IAL lands in Central Maui**. It did not make any provision for the use of water for any other Central Maui lands. The Final-EIS should differentiate between the IAL lands, and other Mahi Pono lands and water needs/uses in Central Maui.
38. In the Executive Summary, near the top of page 2 – 4, it indicates that the **DHHL staff has identified a need in the future for over 11 million GPD**. What effect will DHHL's needs (which by law must be satisfied) have on the Central Maui agricultural operations and on Mahi Pono's profitability?
- Describe the **specific impact that would take place when DHHL indicates that they wish to have the required 11 million gallons of water per day** for their use in Keokea and Pulehunui. What will be the effect at that time on the agricultural operations of Mahi Pono?
39. The discussion at the bottom of page 3 - 19 is **intended to significantly scare UpCountry farmers**. Since the majority of the water used in the UpCountry area does not come from the East Maui lease areas, the threat is not as dire as stated in the Draft. Please correct.
40. At present, about 17,000 acres of EMI lands are owned **50/50 by Mahi Pono and A&B**. How long will this last? What will happen after Mahi Pono becomes a 100% owner and how would that affect the water lease? Will A&B, (now a Real Estate Investment Trust (REIT), retain **any rights to the water**? Will A&B receive any discounted rates for the use of that water? Will they be able to use the water for non-agricultural purposes?

East Maui Water Lease Draft-EIS Dick Mayer Page 7

41. It seems that the estimate for the **future payments by Mahi Pono** to the Department of Land and Natural Resources for the water is **absurdly low**. On page 4 - 150, they are estimating the cost to be \$0.10 per thousand gallons, giving the State an annual revenue of **only** about \$268,000 in 2030.
This figure might make agricultural production very profitable, but it would deny DHHL the funds needed to bring water to the Hawaiian Homelands areas. That would be a serious negative impact, but would make Mahi Pono's investor very profitable.
42. On **page 4-150 and PDF pages 1777 + 1780**. It is unclear how the number \$846,700 was calculated or obtained. What is the referenced "Special Land Development Fund"? How is it different from the annual cost for the water lease?
43. On page 4 – 153, it is stated that there are 830 businesses in UpCountry Maui, generating an annual payroll of \$232 million. This seems very, very high. Consequently, an accurate source should be provided for these numbers, not just "Gale Cengage Learning".
44. On page 1793, 2nd paragraph, last word should be **billion**, not **million**.

MISCELANEOUS

45. The executive summary states in the second paragraph that no construction activity will be required. It seems that this is incorrect since there will be considerable construction activity to reconfigure many of the diversions, to close down a number of the diversions and to repair the ditch system where it leaks, and to restore reservoirs and irrigation systems. **Construction has impacts; what are they?** How will they be mitigated?
46. Because water has high value, indicate the potential for building **new reservoirs, water tanks and lining the existing reservoirs** throughout Central Maui. These one-time costs may provide considerable benefits and reduce negative impacts over the length of the lease and even thereafter.
47. It is mentioned several times that the food supply will be for **local** consumption. However, nowhere is it defined **what local means**. Does it mean Maui Island? Maui County? Or the State of Hawaii? Or something else?
48. The EIS states that there will be **250 acres** utilized for a **utility-scale solar PV operation**. The Solar PV developer AES has stated publicly that there will be about **500 acres** needed for that project. Please explain the difference.
49. There is a recommendation to form a **Core Working Group** made up of residents and communities that will be affected by this lease. The Final-EIS should make provision for how this group will be formed and how the leaseholder will utilize its input. Will their recommendations be merely studied or actually implemented? Will the leaseholder commit to financially helping to facilitate the Core Working Group's activities?

50. Executive Summary, page x. Will the leaseholder assist getting the **Core Working Group** into action as well as helping the Keanae and Wailua communities to move past historical impacts?

51. On the third line of the Executive Summary page xiii, the use of the word "**commercial**" raises a number of questions that are not examined elsewhere. Why is it being used here? What are the implications?

52. There are several references at the end of chapter 3 to the fact that the federal government's regulations allowing **herbicides and pesticides** means that there will be no environmental impacts. This is false since the federal government has permitted the use of toxic herbicides that have been shown (in several court cases) to cause severe health problems and the death of individuals.

I am an example of that problem. Having used Monsanto's herbicide Roundup, I was diagnosed with stage 4 Non-Hodgkin's lymphoma, and I (and 40,000 other people) am now a plaintiff in a lawsuit against Monsanto for damages. The federal government's blessing and herbicide approval does not eliminate negative impacts that must be evaluated in the Final-EIS.

There needs to be a strong statement in the Final-EIS that makes it very clear that Monsanto's **herbicide Roundup** or its generic versions will NEVER be used in the East Maui watershed. This overused chemical has been proven to be a cause of cancer. I am a personal victim.

53. Section 3.4.19 **Traffic**. There is a ridiculous assertion that there will be no traffic impact. However, the Draft-EIS also makes the claim that there will be an additional 2,550 individuals, if the lease is issued. How can it then assert that there will be no traffic impact? There certainly will be, and it needs to be discussed because Maui's roads are already crowded.

54. Somewhere in the introductory chapters of the environmental impact statement there should be a clear statement that these auctioned "**public waters**" are for potentially private use and sale. They are governed by the State of Hawaii's "**public use**" doctrine. Implications and impacts of that doctrine on the lease of these waters needs to be clearly explained and legally defended.

55. With regard to 3.4.1 Public Services and Facilities, it is stated that there will be no impacts. Since we now have full employment on Maui Island, it can be presumed that the impacts will come from the additional 2,550 additional residents resulting from the Mahi Pono operations. Such a large number of **additional Maui Island residents will have numerous public services and facility impacts**, ranging from schools, playgrounds, traffic, potable water needs, wastewater, solid waste, to both police and fire protection.

56. Figure 4-1 on PDF 115 only has the green areas indicated. The developed areas in blue are not disclosed. Show the "Developed open space."

57. Chapter 5 I was the Vice-Chairman of the General Plan Advisory Committee that developed the Countywide Policy Plan and the Maui Island Plan. In Chapter 5, the East Maui Water Lease Draft Environmental Impact Statement makes a mockery of the goals and objectives that are found in the two plans.

Whenever there is a policy or objective in the table that would violate the two plans, the Draft-Environmental Impact Statement merely states that the goal or objective is "**N/A**" (**Not Applicable**). There are dozens of instances of this avoidance of compliance with the Maui Island Plan and the Countywide Policy Plan. Do you see even ONE instance where they show any impact? The tables are majorly incorrect, misleading and dishonest

If the Final-EIS persists in indicating that either or both the Maui Countywide Policy Plan or the Maui Island Plan do not have any negative impacts from an East Maui Water Lease, then it will be challenged vigorously as being a whitewash and unresponsive to the Maui County General plan.

The policies and objectives of the two plans will be seriously impacted and violated. The fact that water has been removed from East Maui for over a century, coupled with the fact that less water will now be withdrawn, does not mean there will be no or a low level of impacts. The Final-EIS should make that clear and also indicate how those impacts will be mitigated. Impacts need to be addressed.

59. In Appendix G on page 106, there is a very useful recommendation to form a Core Working Group. The paragraph headed by the word "Transparency", discusses a long-standing problem with skepticism over the water withdrawals that have been held in the past. The exact statement reads as follows, "The proposed action has elicited skepticism and distrust over many decades, and these feelings prevent willingness for participating in mediation and collaboration. While developing trust among the various groups will be challenging, the first step is transparency. Being open about intent, plans and activities can begin to establish credibility and open the door to dialogue."

This is an insightful recommendation and needs to be followed up, earlier rather than later. Many issues will arise over the succeeding months and years, before and after the lease is issued. There needs to be an excellent relationship between the leaseholder and the broader Maui community. The leaseholder should not be afraid to create the recommended Core Working Group that will serve not just as a "yes" sounding board. It should be a group that can critique operations, evaluate lease compliance and provide useful advice that must be handled appropriately by the leaseholder.

60. Missing from the Draft-EIS is a comprehensive analysis of the effects on Maui's economy of having a water lease controlled by an off-island entity. If the water lease is obtained by a non-Maui or non-Hawaii entity whether it be based in California or Montreal, there are significant impacts to Maui's economy that need to be understood, analyzed, and if necessary, mitigated.

Presumably, the use of the water from the lease areas will generate very sizable profits. If these profits are going to be shipped elsewhere as now happen so often with Maui's many off-island, owned hotels, there would be negative impacts by comparison to having that water utilized and operated by a Water Authority or some other institution that is locally based. Revenues and profits would circulate and multiply on-island.

Because of this impact of exported, disappearing profits, the Final-EIS must describe how those funds could remain in Maui and benefit the residents of Maui, solving problems such as affordable housing, highways, infrastructure, etc. Profits draining away from our tourist industry have resulted in local residents being unable to afford a home. Similarly, an off-island leaseholder could do similar damage to its own employees who would have difficulty purchasing or even renting a home.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Professor Richard Mayer:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *In the Executive Summary, page 1- 20, it is stated that BLNR on July 8, 2016 requested/instructed that A&B and EMI should proceed with the preparation of an Environmental Impact Statement. A copy of that document should be provided so that it may be determined whether the Final-EIS meets the requirements of the BLNR.*

Response 1: The Board of Land and Natural Resources' (BLNR) order instructing A&B to prepare an EIS does not inform the decision as to whether the Final EIS meets the legal requirements that BLNR must consider in determining whether the Final EIS is acceptable. Nevertheless, a copy of the BLNR order, as well as the submitted scope of work that was approved, is enclosed as Attachment #1 in response to your request. The determination on acceptance of the Final EIS is based on the minimum content requirements pursuant to Hawai‘i Revised Statutes (HRS) Chapter 343 and HAR Title 11, Chapter 200. Both the Draft EIS and the Final EIS provide a content checklist showing compliance with the minimum content requirements and where that information is presented in the EIS.

Comment 2: *Was the **Final-EIS** intended to be prepared for an auction bid by A&B and EMI **only**? Alternatively, was it meant to be generic, applicable and available for anyone who makes a bid at the lease auction?*

Response 2: The EIS was prepared to support the application for the issuance of a long-term Water Lease of the State's License Area streams through the EMI Aqueduct System for the purpose of providing water to the County of Maui Department of Water Supply (MDWS) for its Upcountry Maui Water System, and to Central Maui for agricultural purposes, described in the EIS as the Proposed Action. Moreover, the Water Lease will ensure that the Nāhiku community served by MDWS continues to have a reliable source of potable water for domestic needs. The EIS also contemplates the environmental effects of variations on the Proposed Action, including scenarios where the amount of water permitted for lease is insufficient for the Mahi Pono farm plan as proposed. Thus, the EIS analyzes proposed uses of the water, but is not necessarily tied to a specific Water Lease lessee (although the EIS explains how A&B, on May 14, 2001, requested that the State offer at public auction a long-term water lease under HRS Section 171-58 for the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System). Any party who intends to use the water in a manner consistent with the EIS analysis could, presumably, bid on the Water Lease at public auction.

Comment 3: *The Draft-EIS has capitalized "**EMI** Aqueduct System". This implies that EMI owns the aqueduct system. What proof is there of this ownership. Would it not be more correct to say "**East Maui's** aqueduct system" which has multiple owners?*

Response 3: The EMI Aqueduct System is owned and operated by the East Maui Irrigation Company, LLC. Please note that the 1938 Agreement between A&B / EMI (referred to as "the Company") and the Territory of Hawai'i, which has been added to the Final EIS as Appendix R, acknowledges EMI's ownership of the EMI Aqueduct System. Pursuant to the 1938 Agreement, the Territory of Hawai'i (now the State) granted perpetual easements to EMI for the placement of the EMI Aqueduct System. See EIS Section 3.3.

As described in Section 2.1.2 of the Draft EIS, the EMI Aqueduct System spans both State-owned and EMI-owned lands and is an integrated system. The Collection Area for the EMI Aqueduct System covers approximately 50,000 acres, of which 33,000 acres are owned by the State and 17,000 acres are privately owned. See Draft EIS Figure 1-1 (EMI Aqueduct System Collection Area). As mentioned above, under the 1938 Agreement, the State and EMI each granted to the other "perpetual" easements to those portions of the EMI Aqueduct System located on the other's land. The duration of these "perpetual" easements was stipulated to last until the termination of the 1938 Agreement. The 1938 Agreement is still in place and valid.

The State may, but is not obligated to, terminate the 1938 Agreement only if the licenses are offered at auction but EMI fails to bid. EMI may, but is not obligated to, terminate the 1938 Agreement if the State fails to offer the licenses at auction. Thus, if no license is offered at auction, the 1938 Agreement provides that EMI may still collect water derived from the EMI-owned portions of the Collection Area and, utilizing the easement granted to it in the 1938 Agreement, transport it across the portions of the EMI Aqueduct System that transverse State lands.

The 1938 Agreement defines the “Territory” to include its “successors” (i.e., the State). EMI has not failed to bid at any auction of licenses, so the condition precedent for the State to have the right to terminate has not occurred. While the State has not yet offered the licenses at auction, EMI has not exercised its right to terminate and is instead a proponent of the Proposed Action which would lead to the licenses being offered at auction for the purpose of the continued integrated operation of the EMI Aqueduct System. Neither party has terminated the 1938 Agreement. Please note that this clarification has been added to Section 3.3 of the Final EIS as shown in pages 3-24 to 3-25.

Comment 4: *Page 1 - 2 in section 1.3.1 there is an assertion made that **EMI is the owner of the EMI aqueduct system.** Provide proof that this is true, especially for the lands that are within the state lease area which I believe are owned by the State and could be utilized by anyone winning the lease in competitive bidding at an auction. The aqueduct System on State lands does NOT belong to EMI.*

Response 4: Regarding your comment about proof of ownership for the EMI Aqueduct System, please refer to Response #3 above and Appendix R of the Final EIS. Therefore, anyone who is successful in obtaining a water lease at auction would require permission from EMI to use the EMI Aqueduct System if their proposed use includes utilizing the system. Regarding your comment about the “lease area” being owned by the State, you are correct. The “lease area” or what is referred to as the License Area within the EIS, is approximately 33,000 acres owned by the State under the jurisdiction of the Department of Land and Natural Resources (DLNR).

Comment 5: *The draft EIS implies that the East Maui aqueduct system belongs to either A&B, EMI, or Mahi Pono. Provide detailed proof of ownership of the three separate sections of the East Maui aqueduct system: a) The portion within the four state-owned lease areas; b) the portion crossing the land now jointly owned by A&B and Mahi Pono; and finally, c) the portion of the system running from the A&B Mahi Pono lands to the Kamole Weir water treatment plant.*

Response 5: As discussed in Response #3 above, the EMI Aqueduct System is completely owned by EMI including across the sections you reference in Comment #5 above. See Appendix

R to the EIS. Your comment does not offer any examples of this alleged implication of other ownership, therefore we cannot respond with greater specificity than has already been provided in our prior responses.

Comment 6: *Even though Mahi Pono (at present a 50% owner of EMI) is registered in the United States (Delaware), seemingly it is not owned by an American entity. All of the Mahi Pono lands are ultimately owned by a foreign entity, which has established a domestic USA firm to merely own this investment. An additional complication in the ownership matter is that Mahi Pono is managed/operated by California interests, named Trinitas and Pamona Farming. There should be a clear explanation of the **management and financial relationships** among all of these entities: Hawaii's A&B and EMI, Canada's PSP, California's Trinitas and Pamona Farming, and Delaware's Mahi Pono.*

Response 6: The management and financial relationships among the entities you listed are beyond the scope of the EIS, as those issues are not relevant to the analysis of environmental impacts. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'ānae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 7: *Include in the Final-EIS any documents **that prove that the land under East Maui's aqueduct system** was transferred to A&B or EMI from the Kingdom. or Republic? or Territory? or State of Hawaii?*

Response 7: Regarding Comment #7, please refer to Response #3 above. The 1938 Agreement has been appended to the Final EIS as Appendix R. As discussed above, the EMI Aqueduct System is owned by EMI. However, the EIS acknowledges that the some of the lands underlying the EMI Aqueduct System are owned by the State. Pursuant to the 1938 Agreement, the Territory of Hawai'i (now the State) granted perpetual easements to EMI for the placement of the EMI Aqueduct System.

Comment 8: *At the beginning of the Final-EIS, there should be a section devoted to the **ownership of Mahi Pono**. This should include the exact relationship between the investment company PSP, the California group known as Trinitas, the many, many LLC companies with Mahi Pono in their title and who are now the owners of numerous parcels of land throughout Central and North Maui.*

Response 8: Please refer to Response #6 above. Examination of the ownership of Mahi Pono is not within the scope of the EIS. The relevant trigger for the preparation of this EIS is the use of State land, i.e., use of government waters and land, for the purposes described in the EIS. The environmental impacts of the proposed Water Lease analyzed in the EIS. Moreover, as explained in Section 1.1 of the EIS, Mahi Pono is affiliated with Canada's Public Sector Pension (PSP) Investment Board and California-headquartered Pomona Farming. "Mahi Pono" as used in the EIS, refers to MP Central A, LLC, MP Central B, LLC, MP CPR, LLC, MP East A, LLC, MP East B, LLC, MP West, LLC, and MP EMI, LLC (either individually or collectively).

Comment 9: *The description should include both the financial relationships among these parties and entities as well as the decision-making management hierarchy among them. There should also be a very clear indication about how A&B's REIT (Real Estate Investment Trust) is linked to all of this. Apparently, the sales agreement between the two companies A&B & Mahi Pono leaves some question about the level of land ownership, easements, and other interest being maintained and retained by A&B. Because the sales agreement that was publically displayed in December-2018 left many sections undisclosed, include the ENTIRE sales agreement between A&B REIT and Mahi Pono.*

Response 9: Please refer to Response #6 above. To examine the ownership of Mahi Pono and its financial relationships, as well as its management hierarchy is not within the scope of the EIS. Similarly, A&B's status as a REIT is not relevant to the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System. Should the BLNR issue the proposed Water Lease, the lessee will be required to comply with its terms irrespective of internal financial or management matters.

Regarding your comment about the sales agreement between A&B and Mahi Pono and some questions about land ownership, please note that all of the land subject to assessment under this EIS that was previously owned by A&B in sugar cultivation is now owned by Mahi Pono. The sales agreement itself is not material or relevant to the EIS and does not impact or change the anticipated environmental impacts of the Proposed Action.

Comment 10: *Describe the risks to the 2,550 Maui residents who will become dependent on the Mahi Pono farm plan, if MAHI PONO determines that it is **unprofitable to maintain its farming operations.***

Response 10: Regarding your comment about "risks" to 2,550 Maui residents, we assume you are referring to the estimated number of people who will be supported by the projected 1,140 jobs generated from full operation of the Mahi Pono farm plan. Please note that these numbers are based on the analysis conducted for the Economic and Fiscal Impact Study report included as Appendix H, as well as the Agricultural and Related Economic Impacts report included as Appendix I, and summarized in Sections 4.7.3 and 4.7.4 respectively. At full operations, the Mahi Pono farm plan is anticipated to generate 790 direct jobs and 350 indirect jobs. It is further estimated that the combined direct and indirect jobs would support approximately 2,550 residents of the State. However, Mahi Pono, as with any other business operation, will scale its staffing appropriately. The risks, therefore, would be similar to that of any other business. Potentially slightly less, however, as evident by the dramatic impact of the COVID-19 pandemic on the Maui's tourist economy, and the fact that food demand remains more constant even during extraordinarily turbulent periods in the economy.

Please note that in its first 18 months of existence Mahi Pono has hired over 200 workers, all of whom were living on Maui when hired. They were attracted by the type of work, wages and benefits.

Based on past hiring, nearly all future employees are expected to come from Maui. Also, attracting workers should be easier than in the recent past because of the long-term adverse economic effects of COVID-19 on tourism and Maui's economy. It may take years to rebuild the economy, and the Mahi Pono farm plan will contribute significantly to this rebuilding.

Comment 11: *Will the value of the marketed crops and animal products be adequate to support this larger population, while providing investor PSP with an adequate profit?*

Response 11: Mahi Pono anticipates that revenues from selling crops and animals are expected to be sufficient to cover wages, expenses, taxes, etc., and provide a return to investors.

Comment 12: *Is the 1938 agreement the Territory of Hawaii and A&B still relevant today? If yes, then the 1938 agreement should be attached as an appendix and there should be an explanation as to how it is still relevant. It is referred to in the Executive Summary, page 1- 6 in the 3 middle paragraphs. On the other hand, is it only a part of the historical record, and not relevant to the auction?*

Response 12: The 1938 Agreement is still relevant and in effect and a copy has been provided as Appendix R to the Final EIS. As discussed in Response #3 above, according to the terms of the 1938 Agreement, the Territory (now the State) may, but is not obligated to, terminate the 1938 Agreement only if the licenses are offered at auction and EMI fails to bid. EMI may, but is not

obligated to, terminate the 1938 Agreement only if the State fails to offer the licenses at auction. Thus, if no license is offered at auction, the 1938 Agreement provides that EMI may still collect water derived from the EMI-owned portions of the Collection Area and, utilizing the easement granted to it in the 1938 Agreement, transport through the length of the EMI Aqueduct System that transverses the Collection Area.

The 1938 Agreement defines the “Territory” to include its “successors” (i.e., the State). EMI has not failed to bid at any auction of licenses, so the condition precedent for the State to have the right to terminate has not occurred. While the State has not yet offered the licenses at auction, EMI has not exercised its right to terminate and is instead a proponent of the Proposed Action which would lead to the licenses being offered at auction for the purpose of the continued integrated operation of the EMI Aqueduct System. Neither party has terminated the 1938 Agreement.

Comment 13: *Given the fact that Mahi Pono is owned by an international entity and that the profits from this entity will leave not only Maui, but the whole United States, what is the financial impact of a lease issued to a non-Hawaii entity, as compared to having the water lease obtained at auction: a) by a Hawaii-based company, or b) by a public Maui Water Authority?*

Response 13: Please note that the lessee of the proposed Water Lease will pay lease rent to the State. Moreover, the Office of Hawaiian Affairs (OHA) should receive 20 percent of the Water Lease rents while the Department of Hawaiian Home Lands (DHHL) should receive 30 percent of the water lease rents. The DHHL funds are deposited into the Native Hawaiian Rehabilitation Fund pursuant to Hawai‘i State Constitution Article XII, Section 1, and is used to fund programs as prioritized in the Native Hawaiian Development Program Plan adopted by the Hawaiian Homes Commission. The financial impacts of the Water Lease as contemplated under the Proposed Action are discussed in detail in the analysis conducted for the Economic and Fiscal Impact Study report included as Appendix H and is summarized in Section 4.7.3 of the EIS. These are the expected impacts of the Proposed Action, regardless of whether the Water Lease lessee is a Hawai‘i entity or otherwise. Specifically, Section 4.7.3 discusses the impacts of the Proposed Action, including a discussion of operational costs, revenue, employment and earnings related to the EMI Aqueduct System; agricultural operations in Upcountry Maui, Central Maui, and East Maui (i.e., taro cultivation); and the impact on public/domestic water supplies (and related issues) in Nāhiku and Upcountry Maui.

Specifically, Section 4.7.3.1 of the Draft EIS as it relates to EMI states:

Total operational costs for EMI labor, fringe benefits, materials, professional services, taxes, Water Lease, and other expenses are projected to be \$2.3 million

per year. This would translate to \$0.068 per kgal. A currently unknown factor in EMI's operating cost is the annual Water Lease payment to DLNR. For the purposes of the economic impacts analysis, the Water Lease payment has been calculated based on the equivalent per unit cost under the existing 2019 revocable permit. The revocable permit rent payment set in November 2018 for calendar year 2019 was \$230,964.24, which represents an increase from the rent that was previously paid. Assuming 16.8 MGD is diverted under the 2019 revocable permit, the Water Lease rent rate would translate to \$0.038 per thousand gallons. This rate of \$0.038 is assumed as the basis for the future annual lease payment to the DLNR. However, the actual Water Lease rental amount will be based on an appraisal conducted prior to issuance of the Water Lease. Should the Water Lease amount be higher or lower, the operational costs of the EMI Aqueduct System would be adjusted accordingly.

Direct spending by EMI, excluding the long-term Water Lease payments to the State from the operational costs, is forecasted to be \$1.4 million. Total direct spending and indirect sales is estimated at \$3.2 million, of which \$2.6 million would be on Maui.

EMI is expected to employ a staff of 17 people with a payroll of \$0.8 million. Total direct and indirect jobs was 24, with an associated payroll of \$1.1 million. The direct and indirect jobs associated with EMI operations would support an estimated 54 residents.

Fiscal impacts under the Proposed Action assume that the rate the MDWS pays to EMI will increase because EMI's per unit operating cost will increase as the fixed costs will be spread out over a lower volume of water diverted and possible higher Water Lease payments to the State compared to historic payments. It is estimated that EMI's operating cost under the Proposed Action would be \$0.068 per kgal, which is higher than the current MDWS payment to EMI of \$0.06 per kgal. The actual rate the MDWS will pay to EMI in 2030 will be subject to a future agreement between the parties. However, for the purposes of the fiscal impacts analysis, the 2030 water service fee rate is estimated to be \$0.10, which has been calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, EMI would receive an estimated \$268,000 in 2030 from the MDWS.

The amount paid to the State Special Land Development Fund for the Water Lease would be based on an appraisal conducted prior to issuance of the Water

Lease. Assuming the amount of the Water Lease is based on the equivalent per unit cost under the existing revocable permits, the annual payment to the Special Land Development Fund would be \$846,700. Of this, \$169,300 would be disbursed to OHA and \$254,000 would be set aside for the DHHL. GET revenue would be estimated at \$37,000 while payroll tax would be \$45,400 per year.

However, please note that the above has been revised to take into account the rates charged under the current revocable permits, as approved by the BLNR in November 2020 as shown in pages 4-277 and 4-283.

As it relates to East Maui:

The taro farms and other farms in East Maui that depend on stream flows would produce at full development about 1.0 million pounds per year of taro, and about 400,000 pounds per year of other crops. The resulting direct sales would be about \$1.4 million per year. Indirect sales generated by the purchase of goods and services would be about \$1.5 million per year. Thus, total direct and indirect sales would be about \$2.9 million per year (with rounding), of which about \$2.3 million would be on Maui and \$500,000 on O'ahu. Profits from farm operations and indirect sales would be about \$300,000.

Full development of the taro farms and other farms in East Maui that depend on stream flows would result in about 14 jobs and generate about 7 indirect jobs, for a total of about 21 jobs. The payroll is expected to reach about \$500,000 for the direct jobs and \$800,000 for all direct and indirect jobs. The direct and indirect jobs provided will support an estimated 47 residents, most of which would be on Maui.

Given the small population of Nāhiku and the lack of commercial land uses, the economic impacts to Nāhiku under the Proposed Action, where water continues to be provided to the community, are considered negligible.

In terms of fiscal impacts, the taro farms and other farms in East Maui that depend on stream flows would generate approximately \$67,000 per year in State taxes at full development. For the County of Maui, property taxes will total about \$100 per year. The City and County of Honolulu will derive about \$300 per year from the excise tax surcharge. Given the small population of Nāhiku and the lack of commercial land uses, the fiscal impacts to Nāhiku under the Proposed Action,

where water continues to be provided to the community, are considered negligible.

However, please note that the above has been updated to take into account the updated East Maui farming analysis based on comments received to the Draft EIS as shown in pages 4-288 to 4-293, recognizing modest increases in potential taro and truck farming in East Maui.

As it relates to Upcountry Maui:

Under the Proposed Action it is assumed that MDWS will continue to have access of up to 7.1 mgd through the EMI Aqueduct System. The County of Maui projects that the population in the Upcountry Maui Service Area will grow to approximately 43,700 in 2030, translating to an estimated 16,700 households. Assuming a median household income of \$77,400, households in the Upcountry Maui Service Area are anticipated to have a collective income of \$1.3 billion and consumption expenditures of \$710.0 million. Residential property values within Upcountry Maui are estimated to grow to \$2.7 billion.

Assuming proportional growth in line with population, there will be an estimated 1,100 businesses in Upcountry Maui in 2030, employing 6,700 individuals. Total payroll would be estimated at \$304.9 million, while direct sales associated with these businesses would be \$1.1 billion. Commercial property values within Upcountry Maui are estimated to grow to \$180.9 million.

In total, direct sales from residents' consumption expenditures and Upcountry Maui businesses are estimated at \$1.6 billion and residential and commercial property value is approximately \$2.9 billion.

Fiscal impacts to Upcountry Maui arise from the assumption that the MDWS will need to develop 7.95 mgd of new water sources to meet future demands through 2030 (even with the continued supply of 7.1 mgd from the EMI Aqueduct System under the Proposed Action). The Brown and Caldwell analysis indicates that incremental basal wells would be a strategy to meet future demands assuming no reduction in surface water flows. Under the Brown and Caldwell analysis, the life-cycle unit cost of developing and operating wells is \$34 per kgal. It is noted that the life-cycle unit cost to develop new water for Upcountry Maui customers is high. In comparison, a similar analysis conducted for the Central Maui Water System showed a unit cost of less than \$10 per kgal, or less than one third the cost of Upcountry Maui water development (Brown and Caldwell, 2014). The total

life-cycle cost for 7.95 mgd of new wells is \$1.2 billion. The life-cycle cost is expressed as the net present value of all the costs incurred over 25 years, including capital, operating, and maintenance costs.

As previously mentioned, the rate that the MDWS pays to EMI will increase by 2030 because it is assumed that EMI's per unit operating cost will increase under the Water Lease. The actual rate the MDWS will pay to EMI will be subject to a future agreement between the two entities. However, for the purposes of this analysis, the 2030 water service fee rate is estimated to be \$0.10, which has been calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, the MDWS would pay an estimated \$268,900 per year to EMI.

Water service rates vary by class of users (i.e., residential, commercial, agricultural, etc.). The average the MDWS water service rate Countywide is \$4 per kgal. Inasmuch as the same water rates are charged across the nine water systems in Maui County, there are many factors that determine the water service rate. Therefore, it is difficult to predict what the water service rate would be in 2030. However, it is noted that the life-cycle unit cost to develop new water for Upcountry customers of \$34 per kgal far exceeds the current average water service rate of \$4 per kgal. It is assumed that the MDWS would seek a variety of funding sources to cover the cost to develop new wells. This may include County capital improvement program funds as well as State and/or Federal funds.

Nevertheless, due to the significant cost of new water source development, it would be reasonable to expect that water service rates would increase in the future to offset the costs of new water sources. As noted above, the County's water rate structure is uniform for all customers; water rates are not dependent on the service area a customer is located in (Brown and Caldwell, 2014). Therefore, under the MDWS' current rate structure, the increases would apply Countywide because rates do not vary by service area.

However, please note that the above has been revised to take into account the rates charged under the current revocable permits, as approved by the BLNR in November 2020 as shown in pages 4-277 and 4-283.

As it relates to Central Maui:

At full operations, the Mahi Pono farm plan will cause a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops. Annual sales are expected to reach \$155.9 million. The pastures would support a cattle herd of about 7,300 cow-and-calf animal units, produce over 4,300 calves per year, and generate revenues of about \$4.8 million per year. The solar farm would generate about 82,125 mW of electricity per year, with revenues of about \$8.2 million per year. Combined farm and energy revenues would reach \$168.9 million per year in direct sales (far exceeding the 2006 revenues from sugar production of \$101 million, and the \$116 million average for the 2008 to 2013 period).

Purchases of goods and services by farmers and the families of employees would generate indirect sales and, in turn, these suppliers would generate more indirect sales by their purchase of goods and services. The indirect sales are estimated at about \$160.7 million per year. Total direct and indirect sales would be about \$329.5 million per year, of which about \$273.3 million would be on Maui and about \$56.2 million on O'ahu. Profits from farm operations, energy operations, and indirect sales would be about \$33 million.

At full operations farm employment is expected to reach about 790 jobs (about 160 more than provided by sugar operations in 2006). The jobs would be typical of those provided by diversified-crop farming and ranching-managing soils and pests, operating and maintaining irrigation systems, planting crops, pruning trees, harvesting crops, sorting and washing crops, packing crops, trucking crops to markets and shipping terminals, moving cattle among pastures, maintaining fences, marketing, accounting, etc.

The purchase of goods and services by farmers and ranchers and by the families of their employees would generate an estimated 350 jobs. In total, about 1,140 direct and indirect jobs would be supported, including about 1,000 jobs on Maui. Payroll is estimated at \$45.3 million for all direct and indirect jobs. The direct and indirect jobs would support an estimated 2,550 residents.

Regarding fiscal impacts at full operations, diversified agricultural operations in Central Maui would generate an estimated \$4.5 million in State tax revenues by 2030. Property taxes paid by to the County of Maui would be about \$800,000 per

year, and the City and County of Honolulu would derive about \$140,000 per year from the excise tax surcharge.

However, please note the above has been updated to include a statement about COVID-19 and potential impacts on the economy as it relates to the Proposed Action as shown on page 4-287.

Regarding your comment about a public water authority having ownership of the EMI Aqueduct System, please note that Section 3.1.2 of the Draft EIS considered alternative ownership of the EMI Aqueduct System which has been updated in the Final EIS as shown in pages 3-19 to 3-20 to acknowledge the County of Maui, Board of Water Supply Temporary Investigative Group (TIG) Report dated October 17, 2019 that was made available after the publication of the Draft EIS..

Comment 14: *In Section 3.4.20 Public Water Systems: Central Maui, it is asserted that Central Maui receives its water from the East Maui aqueduct system. The potable water used in Central Maui that is delivered by the Maui Department of Water Supply does not come from the aqueduct system. It is also false to say that the EMI aqueduct system is privately owned. Much of the so-called East Maui aqueduct system is on the State lease land and is NOT privately owned.*

Response 14: As explained in the EIS, the term "Central Maui" as used in the EIS refers to the approximately 30,000 acres of agricultural lands (formerly in sugarcane) in Central Maui that Mahi Pono is using and will use to implement its diversified farm plan. Specifically, this is mentioned in Chapter 4, which states:

For the purposes of this DEIS, Central Maui is comprised of the approximately 30,000 acres of agricultural land that had been cultivated with sugarcane for over a century utilizing water from the EMI Aqueduct System. Geographically, what is referred to as Central Maui encompasses approximately 36,000 acres, but approximately 6,000 acres is comprised of uncultivated areas, including roads, gulches, and patches of uncultivated land as shown in Figure 4-1.

The above statement has been added to the Executive Summary to clarify the context of the Central Maui reference as shown in pages iii to iv. Similarly, the Executive Summary also clarifies what the EIS defines as East Maui and Upcountry Maui. Furthermore, added clarifications have been made to indicate that when Central Maui is being discussed, it is in reference to the approximately 30,000 acres of agricultural fields owned by Mahi Pono. With that fundamental understanding, which is consistent throughout the EIS, the statement in Section

3.4.20 is correct in that neither the Proposed Action nor the alternatives are expected to have a significant adverse effect on public water systems because the EMI Aqueduct System does not serve public water needs in Central Maui. The Proposed Action contemplates the use of East Maui stream water to support the Mahi Pono farm plan in the Central Maui agricultural fields. As such, the public water system in Central Maui will not be affected by the Proposed Action. For clarification, we also note that the section you referenced, Section 3.4.20, is within Chapter 3, the chapter that addresses alternatives to the Proposed Action. Specifically, Section 3.4 provides a "Comparative Evaluation of Reasonable Alternatives."

Regarding your comment about the EMI Aqueduct System being privately owned, please refer to Response #3 above.

Comment 15: *The last paragraph on page 4 - 140 is very important. The paragraph is important because it points to a fairly widely held belief that the lease could be held by a public utility such as a Water Authority or by the Maui County Department of Water Supply. (See the Maui Board of Water Supply TIG report of October-2019.) The paragraph's last sentence makes a very important point by asking who should get the profits from the sale of water delivered to central Maui.*

Response 15: Regarding your comment about the last paragraph on page 4-140 of the Draft EIS, this paragraph reports on comments made at a focus group meetings held in Upcountry Maui in November 2018 in conjunction with the preparation of the Social Impact Assessment (SIA) (see Appendix G), where participants expressed their comments on and concerns related to the Proposed Action. However, it is important to note that this focus group was convened before Mahi Pono became the owner of the agricultural fields in Central Maui in December 2018. As discussed in the Draft EIS Section 4.7.2, follow up focus group meetings were held in April 2019:

In April 2019, Earthplan, contacted community leaders who helped convene the November 2018 focus group meetings and other community leaders who may provide insight not represented in the November 2018 focus group meetings, to gather input in light of the sale to Mahi Pono and Mahi Pono's stated intention to pursue diversified agriculture in Central Maui. .

The Draft EIS further reported that:

From November 2018 to April 2019, perceptions of the participants generally changed from being pessimistic to being optimistic with the change in land

ownership from A&B to Mahi Pono. However, some concerns raised in the November 2018 focus group meetings still persist today. .

Hence, at the November 2018 meetings various communities expressed distrust with A&B, which was no longer farming sugar at that time. However, following the change in ownership to Mahi Pono, and Mahi Pono's plan for a diversified farming operation on the former sugar lands in Central Maui, this perception had changed. This has been added to the discussion in Section 4.7.2 as shown on page 4-259.

Moreover, Section 4.7.2 of the Draft EIS also explains that participants in the November 2018 focus group expressed concern about A&B not obtaining the Water Lease. Specifically, Section 4.7.2 of the Draft EIS states:

Participants doubted that the MDWS could adapt to changes if the EMI Aqueduct System were to curtail or discontinue providing water and services as is currently occurring. They said that the MDWS is already experiencing difficulty in maintaining the Upcountry Maui Water System now, and that any challenge would likely not be met. Residents were concerned that if domestic water was limited in any way, then the MDWS would need to pump water from wells. This would be more costly than receiving water from the EMI Aqueduct System and the MDWS would likely pass this cost to the water users. Likewise, well development would also cost money and water users would end up paying through water fees.

Regarding your comment about the TIG Report, we are aware of this report and received a copy through a public comment letter submitted on the Draft EIS. Specifically, the County of Maui Board of Water Supply (BWS), formed a Temporary Investigative Group (TIG) to explore options for ensuring public access to water, including the feasibility of purchasing and maintaining the EMI Aqueduct System. The TIG prepared a TIG Report that includes its own valuation of the EMI Aqueduct System, which was not based on an appraisal, and recommends that the County take immediate steps to secure ownership and control of the EMI Aqueduct System. The TIG Report was made public on October 16, 2019, after the publication of the Draft EIS. The Draft EIS included a discussion in Chapter 3 (the chapter dealing with alternatives to the Proposed Action) of alternative ownership of the EMI Aqueduct System at Section 3.1.2. In light of the TIG Report, Section 3.1.2 has been updated accordingly in the Final EIS as shown in pages 3-19 to 3-20. Acquisition of the EMI Aqueduct System by the County or any other public entity remains purely speculative at this time. The EMI Aqueduct System is not for sale or lease, and forced acquisition of the system is projected to be prohibitively expensive, resulting in substantial costs to the public. Moreover, should the County bid for the Water Lease, it would

need to utilize the water in a fashion consistent with the analysis in this EIS (or complete the necessary environmental review for any use that is not considered in this EIS).

You comment about profit is unclear. However, the summary of the November 2018 SIA focus group meetings in the Draft EIS includes a sentence explaining that focus group participants at that time asserted that profits made by use of a public trust should be invested in public need. As stated in Response #13 above, whomever is awarded the Water Lease from the State will be required to pay lease rent to the State. OHA should receive 20 percent of the Water Lease rents while the DHHL should receive 30 percent of the water lease rents, which funds are deposited into the Native Hawaiian Rehabilitation Fund pursuant to Hawai'i State Constitution Article XII, Section 1, and is used to fund programs as prioritized in the Native Hawaiian Development Program Plan adopted by the Hawaiian Homes Commission.

It should also be noted that EMI is expected to employ a staff of 17 people with a payroll of \$0.8 million. Total direct and indirect jobs was 24, with an associated payroll of \$1.1 million. The direct and indirect jobs associated with EMI operations would support an estimated 54 residents.

Relatedly, as discussed in Section 4.7.3 of the EIS, it should be noted that the "profits" from the use of the East Maui water in Central Maui will, at full operations, support about 790 jobs (about 160 more than provided by sugar operations in 2006). The purchase of goods and services by farmers and ranchers and by the families of their employees would generate an estimated 350 jobs. In total, about 1,140 direct and indirect jobs would be supported, including about 1,000 jobs on Maui. Payroll is estimated at \$45.3 million for all direct and indirect jobs. The direct and indirect jobs would support an estimated 2,550 residents. Regarding fiscal impacts at full operations, diversified agricultural operations in Central Maui would generate an estimated \$4.5 million in State tax revenues by 2030. Property taxes paid by to the County of Maui would be about \$800,000 per year, and the City and County of Honolulu would derive about \$140,000 per year from the excise tax surcharge.

Comment 16: *The Executive Summary, page 3 – 17, mentions that the cost of water to the County is now \$0.06 MGD and that it could rise. This could have serious effects on the ability of the County to provide water for the UpCountry region. What is the range of the maximum potential rise and how will it be calculated/negotiated?*

Response 16: We are confused by your comment. The Executive Summary of the Draft EIS is found in pages iii - xiv. Page 3-17 is within Chapter 3, which is the alternatives analysis, and specifically within the discussion of impacts to economic and fiscal resources within Upcountry Maui under the various alternatives. The discussion of the anticipated economic and fiscal impacts within Upcountry Maui under the Proposed Action are found in Chapter 4, and

specifically Section 4.7.3.1, which recognizes that the actual rate the MDWS will pay to EMI in 2030 for water delivery will be subject to a future agreement between the parties. We note, however, that the rate EMI has charged the MDWS has not changed since 1973, notwithstanding increases in the costs of owning and operating the EMI Aqueduct System.

There are many factors that could affect the cost of water delivered to the County of Maui. The cost of water to the County of Maui will depend, in large part, on the amount of the lease payment for the Water Lease and the costs of complying with the conditions of the Water Lease to be established by the BLNR. An appraisal to determine the fair market value of the Water Lease will be conducted prior to issuance of the Water Lease. Our expectation is that the DLNR, on behalf of the BLNR, will commission, or approve the commissioning of, the appraisal. The cost of water to the County of Maui also depends on the operational costs of running the EMI Aqueduct System, including all costs of complying with applicable regulations and laws and any conditions imposed on the Water Lease.

The Economic and Fiscal Impact Study (Appendix H) prepared for the Draft EIS estimated the water service fee to be paid by the MDWS would be \$0.10 per kgal. That is in contrast to the current MDWS rate paid to EMI of \$0.06 per kgal. This increase is based on EMI's per unit operating cost increasing because fixed costs to operate the EMI Aqueduct System will be spread out over a lower volume of water diverted. The Economic and Fiscal Impact Study estimated EMI operating costs under the Proposed Action to be \$0.068 per kgal, which is based on an assumed Water Lease payment to the BLNR based on the equivalent per unit cost under the 2019 revocable permits. Specifically, Section 4.7.3 of the Draft EIS states:

It is estimated that EMI's operating cost under the Proposed Action would be \$0.068 per kgal, which is higher than the current MDWS payment to EMI of \$0.06 per kgal. The actual rate the MDWS will pay to EMI in 2030 will be subject to a future agreement between the parties. However, for the purposes of the fiscal impacts analysis, the 2030 water service fee rate is estimated to be \$0.10, which has been calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, EMI would receive an estimated \$268,000 in 2030 from the MDWS.

The amount paid to the State Special Land Development Fund for the Water Lease would be based on an appraisal conducted prior to issuance of the Water Lease. Assuming the amount of the Water Lease is based on the equivalent per unit cost under the existing revocable permits, the annual payment to the Special Land Development Fund would be \$846,700. Of this, \$169,300 would be disbursed to OHA and \$254,000 would be set aside for the DHHL. GET revenue would be estimated at \$37,000 while payroll tax would be \$45,400 per year.

However, please note that this discussion in Section 4.7.3 of the Final EIS has been updated to take into account the latest equivalent per unit cost under the latest revocable permits as shown in pages 4-277 and 4-283.

Comment 17: *Water prices are a matter is of considerable interest to the UpCountry farmers who now utilize this potable water to irrigate their farms. There seems to be no way to provide farmers with non-potable water. Consequently, any rise in the rates paid by the County water department could have significant impacts. Address them in the Final-EIS.*

Response 17: The range of potential impacts due to increased water delivery fees is addressed in the EIS. For clarification, as discussed in the EIS, water delivered through the EMI Aqueduct System does provide non-potable water to MDWS which is supplied to the Kula Agricultural Park (KAP). See EIS Section 2.1.3.2 (*"The MDWS also serves KAP with non-potable water from diversions of the same streams that serve the Kamole-Weir WTP through the Wailoa Ditch"*).

However, water sourced from the EMI Aqueduct System is also treated to potable quality by the MDWS for use in its Upcountry Maui Water System. Fiscal and economic impacts associated with the Proposed Action, including a discussion of potentially increased rates, are discussed in Section 4.7.3 and Section 4.7.4 of the Draft EIS. Impacts under the range of potential alternatives are also assessed in the EIS within Chapter 3 and economic, fiscal, agricultural economic impacts, specifically within Sections 3.4.12 and 3.4.13. For example, should no Water Lease be issued, it is projected that the MDWS would need to replace the water delivered by the EMI Aqueduct System with another water source, such as development of new wells. The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. The Draft EIS in Section 4.7.3.3.b cited a 2014 Brown and Caldwell report estimating a total life-cycle cost for 7.95 mgd of new wells as \$1.2 billion. The life-cycle cost is expressed as the net present value of all the costs incurred over 25 years, including capital, operating, and maintenance costs. This estimate was included in Appendix H (Economic and Fiscal Impact Study). It was a consideration in the discussion of the No Action alternative in Section 3.3 of the Draft EIS which stated that *"the development of alternative water-source infrastructure would be prohibitively expensive, and depending upon the specific sources, or combination of sources, could result in significant direct adverse impacts to the environment."*

Regarding your comment about any potential increase in MDWS water rates, we recognize that some Upcountry farmers get their water from the MDWS system. The potential for increasing MDWS rates is discussed in Response #16 above. There are many factors that could affect the cost of water sold to the County of Maui. The cost of water to the County of Maui will depend,

in large part, on the amount of the lease payment for the Water Lease established by the BLNR. The cost of water to the County of Maui also depends on the operational costs of running the EMI Aqueduct System, including all costs of complying with applicable regulations and laws and any conditions imposed on the Water Lease.

Comment 18: *On page 3-18 at the end of the next-to-last paragraph, it states that the City of Honolulu would get a \$120,000 in tax revenues. Please explain why they, and not Maui County, would get the funds.*

Response 18: The General Excise Tax (GET) is a State tax that flows to the State General Fund. However, the State legislature authorized counties to adopt a surcharge on the GET up to 0.5 percent, and such funds will remain in the County where the GET is generated. As of this writing, the County of Maui has not adopted a GET surcharge. However, the City and County of Honolulu adopted a surcharge of 0.5 percent, effective from January 1, 2007 to December 31, 2030. Economic impacts that occur on Maui will generate indirect impacts elsewhere, including on the island of O‘ahu. At full farm operations in Central Maui, the farms and the families of their employees will purchase various goods and services, thereby generating indirect sales. Most of the indirect sales will be on Maui, but some will be on O‘ahu since Honolulu is the primary supply center in the State. These indirect sales will be subject to State excise tax. Because the County of Maui has not adopted a GET surcharge, the County of Maui does not collect an excise-tax surcharge.

For clarification, p. 3-18 of the Draft EIS does not recite that Honolulu would receive \$120,000 in tax revenues. Under the Proposed Action, at full operations of the Mahi Pono farm plan it is projected that the City and County of Honolulu would derive about \$140,000 per year from the excise tax surcharge.

Comment 19: *The leaseholder will have an obligation to deliver water to the DHHL lands. Since it will be expensive to build an adequate water line from East Maui’s aqueduct system to the Department of Hawaiian Homelands land in Keokea and Waiohuli, there should be a provision in the lease that will set aside funding over the years from the license fees to construct the necessary pipeline to transmit that water (over 10 MGD) across Kula. Please describe how that could work.*

Response 19: Specific information regarding the DHHL's future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd as shown in pages 2-4 to 2-7. As explained in pages 2-4 to 2-7, the DHHL water reservation process involves several steps before a reservation amount is formally identified. The first step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following adoption of the Beneficiary Consultation Report and an authorization to the Chairman to seek a reservation of water, CWRM could act on a reservation request related to a proposed lease.

As explained in Section 2.1.1 of the Draft EIS, DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B/EMI, Mahi Pono, the DLNR's Land Division, and DHHL staff and consultants. The results of the Beneficiary Consultation were presented to the HHC on May 30, 2019, as agenda item G-2. The motion passed by the HHC to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation request was approved by the HHC related to the EMI Aqueduct System for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

Please note that there is no requirement of State water leases to deliver water to DHHL lands. The EMI Aqueduct System can collect and transport East Maui stream waters to its endpoint, at

Kamole-Weir. However, as noted in Response #13, 30% of the revenues derived from all water leases issued by the State are deposited into the Native Hawaiian Rehabilitation Fund pursuant to Hawai'i State Constitution Article XII, Section 1, and is used to fund programs as prioritized in the Native Hawaiian Development Program Plan adopted by the HHC.

Comment 20: *A missing part of the large Draft Environmental Impact Statement is any consideration of Mahi Pono's (or any other successful bidder's) need to withdraw (cease operations) from using the East Maui water over the 30-year lease period. It could be for reasons that are financial, agricultural, labor problems, or something else such as a sale of the Mahi Pono owned lands to some entity not interested in farming.*

What would be the impact: a) on the East Maui watershed, b) the Maui County Department of Water Supply's commitment to the UpCountry water needs, c) the Hawaiian Homelands, and d) the agricultural lands now owned by Mahi Pono.

Response 20: The scenario you describe is vague and highly speculative, and is outside of the purpose and objectives of the Proposed Action. However, we note that Chapter 3 of the EIS and the underlying studies discuss alternatives to the Proposed Action, including the alternative of "No Action." The "No Action" scenario means one where no Water Lease is issued. Chapter 3 and the underlying studies assess the anticipated impacts in East Maui, Upcountry Maui, and Central Maui, under the no Water Lease scenario. The "No Action" scenario described in the EIS assumes that Mahi Pono would continue to farm the Central Maui agricultural fields to the extent feasible, whereas the scenario you posit entails a period of leasing of water and Central Maui farming, followed by an unidentified event that causes Mahi Pono to stop farming. However, it is expected that any Water Lease issued by the State will authorize the use of water for particular purposes. We further note that the Central Maui agricultural fields owned by Mahi Pono (and from which you anticipate their withdrawal), are designated by the State and County for agricultural uses (see Draft EIS, Section 5.1.3 State Land Use District and Section 5.5 Maui County Zoning) and the vast majority of those lands (some 22,000 acres) are designated as Important Agricultural Lands (IAL) by the State Land Use Commission (see EIS Section 5.1.4). Therefore, some manner of agricultural uses on those lands is anticipated no matter who owns the lands.

Regarding impacts to the East Maui watershed, the lessee under the Water Lease would remain subject to the terms of the Water Lease, including any requirements related to a watershed management plan. Regarding impacts to MDWS, as noted in Response #17 above, the existing water delivery agreements with the MDWS are contingent upon the issuance of the Water Lease. As for impacts to DHHL, we fail to see how any change in activities in the Central Maui agricultural fields would have any effect on DHHL's right to see a water reservation.

Comment 21: *Various numbers are utilized throughout the document to explain the size of Mahi Pono's agricultural activities. There should be a clear table that explains the different land areas that are contained in the Mahi Pono purchase. For example, out of the 41,000 acres how much of it is "Important Agricultural Land"? How much is classified with a Land Productivity of A, B, C, D, or E? How much will be irrigated by water from East Maui's aqueduct system, versus water coming from Na Wai Eha or central Maui wells? How much land will actually be farmed?*

Response 21: Mahi Pono's total land holdings are not within the scope of the EIS. Please refer to Response #6 above which describes the scope of the EIS. Hence, as described in Response #14 above, the lands subject to assessment within this EIS owned by Mahi Pono are the approximate 30,000 acres of land termed the Central Maui agricultural fields throughout the EIS, as these are the Mahi Pono agricultural lands that can be served by water sourced from the proposed Water Lease.

Regarding your comment about how much of the Central Maui agricultural fields are designated as IAL, approximately 22,000 acres of the Central Maui agricultural lands are designated as IAL as discussed within Section 5.1.4 of the EIS (the Draft EIS projected approximately 23,000 acres in IAL and that has been revised in the Final EIS). The IAL lands are depicted in Figure 5-4 of the Draft EIS (revised to Figure 5-5 of the Final EIS).

Regarding your comment about how much of this acreage is classified within the respective land productivity classifications, as discussed in Section 5 of Appendix I and Section 4.7.4 of the Draft EIS, the overwhelming majority of the Central Maui agricultural fields (approximately 80%) are rated by the UH Land Study Bureau (LSB) as having the highest Overall Productivity Rating of "A" (on a scale of "A" to "E" with "E" being the lowest soil rating), and a little over 11% has a "B" rating. In other words, about 27,567 acres (90.9%) are high-quality lands rated A or B. The Agricultural Lands of Importance to the State of Hawai'i (ALISH) Classification System, developed and compiled in 1977 by the State Department of Agriculture with assistance from the U.S. Department of Agriculture - Natural Resources Conservation Service (NRCS), and the College of Tropical Agriculture, University of Hawai'i. Approximately 25,669 acres of the Central Maui agricultural fields are classified under the ALISH system as "Prime", which means "agricultural land which is land that is best suited for the production of crops because of its ability to sustain high yields with relatively little input and with the least damage to the environment."

Regarding your question about how much of this land is irrigated by the EMI Aqueduct System, all 30,000 acres of the Central Maui agricultural fields are irrigated by the EMI Aqueduct

System. The Central Maui agricultural fields that are subject to assessment under this EIS are not irrigated by West Maui Ditch System. As discussed in Appendix I, water from the West Maui Ditch System is not used to irrigate fields east of Maui Veterans Highway - the Central Maui agricultural fields are all east of Maui Veterans Highway.

Regarding the use of well water, Draft EIS Section 2.1.4 (Central Maui Field System) explains:

In addition to the surface water imported from the EMI Aqueduct System to the Central Maui field irrigation system, the irrigation infrastructure includes fifteen brackish water wells that can supplement surface water to approximately 17,200 acres of the plantation at the lower elevations (CWRM D&O, FOF 738). These brackish wells extract groundwater from the subsurface aquifers lying beneath the agricultural lands, and which are cyclically dependent on recharge derived from the irrigation of the overlying lands by water from the EMI Aqueduct System. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water. Groundwater, however, can be delivered to 7,000 acres at higher elevations via a shared pipeline that served as a penstock line for a hydroelectric unit (CWRM D&O, FOF 739).

Draft EIS Figure 2-5 (Central Maui Infrastructure Map) identifies the wells in the Central Maui agricultural fields. However, please note that Section 2.1.4 has been revised in the Final EIS to more accurately describe the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono and clarifies that only 10 of the 15 wells are available for use by Mahi Pono, as shown in pages 2-24 to 2-25.

The reference to 15 brackish wells was derived from the CWRM D&O, FOF 738, as that was the number of brackish wells that A&B utilized during its sugar cane operations. However, one of the 15 wells referred to, State Well No. 5128-002, does not serve the Central Maui agricultural fields and four of the other brackish wells are on lands that are not owned by Mahi Pono. As such, Mahi Pono only has access to 10 brackish wells that can serve the Central Maui agricultural fields. Draft EIS Figure 2-5 has been revised, as shown on page 2-24 to more accurately depict the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono to support its farm plan for the Central Maui agricultural fields.

Regarding your comment about how much of the land will actually be farmed, the Mahi Pono farm plan projects that all of the approximate 30,000 acres of the Central Maui agricultural fields will be farmed as discussed in Section 2.1.4 of the EIS. Specifically, Section 2.1.4 of the Draft EIS states:

Water Lease Limited to CWRM D&O Farm Plan

The Mahi Pono farm plan assumes the following:

- *The total surface water available for use after system losses is estimated to be approximately 65.88 mgd.*
- *Surface water can be supplemented by a brackish groundwater amount equal to 20 percent of surface water. Taking into account the CWRM D&O, it is estimated that there could be up to 16.47 mgd of brackish groundwater used in the Central Maui agricultural fields. (Plasch, 2019)*
- *Under the CWRM D&O, the total water available for use on the Central Maui agricultural fields after system losses is approximately 82.35 mgd*
- *That total amount of water will be delivered to approximately 30,000 acres.*
 - Of those 30,000 acres:*
 - *Approximately 15,950 acres would be used for farming, including 12,850 acres for orchard crops and 3,100 acres for other crops.*
 - *Approximately 13,800 acres would be used for pasture, of which about 4,700 acres would be irrigated.*
 - *Approximately 250 acres would be used for green energy, such as a solar farm.*

Because there is insufficient surface water to support the entire farm plan, brackish groundwater will also be used...

This farm plan would consist of the following:

- *Approximately 20,650 acres of irrigated farm land, including 12,850 of orchard crops, 600 acres of tropical fruit, 1,200 acres of row and annual crops, in addition to a community garden and limited non-GMO energy crops.*
- *Approximately 13,800 acres of cattle pasture, comprised of 4,700 acres of irrigated pasture, and 9,100 acres of unirrigated pasture. This should fit the proposed model of grass-finishing on irrigated pasture. The unirrigated acreage is less than 10,000 acres, which helps ensure that that the entire area devoted to unirrigated pasture will remain productive.*

However, please note that Table 2-1 in the Draft EIS (which provides the components of the farm plan and proposed water usage) has been slightly revised in the Final EIS (as Table 2-2) to address rounding errors as shown on page 2-29.

Comment 22: *Groundwater from wells in Central Maui Is discussed. Clarify. Does the groundwater from Central Maui wells also include water on the west side of Mahi Pono's land traditionally irrigated primarily from the Na Wai Eha watershed?*

Response 22: The groundwater wells located west of Maui Veterans Highway are not included in the analysis. The Water Lease assessed in the EIS would provide water to the 30,000 acres of agricultural lands in Central Maui. Other farm areas that may be owned or operated by Mahi Pono are not relevant because the Water Lease would not provide any water to those areas. As defined in the EIS, Central Maui fields (about 30,000 acres) are east of Maui Veterans Highway. The fields west of the highway are not included in the analysis because they are serviced by a separate and distinct water system that includes surface water from the West Maui Ditch System and groundwater wells west of the highway. There is no connection between that water system and the EMI Aqueduct System or the groundwater wells east of the highway.

Comment 23: *On page 4 – 5, it states that 4.9 MGD of water is delivered from four UpCountry Wells (Ha'iku, Po'okela and the 2 Kapakalua Wells). These wells are an important back-up source for UpCountry. How do these wells decrease UpCountry's dependence on East Maui's aqueduct system water?*

Response 23: Page 4-5 of the Draft EIS is a figure showing the USGS Upcountry Topography Map; it does not contain the text you commented on. However, Draft EIS pages 4-61 and 4-63 (Section 4.2.2) includes a discussion of Upcountry Maui's groundwater sources accounting for 4.9 mgd:

Upcountry Maui is within the MDWS's Central Maui Aquifer Sector [fn1] which includes four aquifer systems: Pā'ia, Kahului, Kama'ole, and Makawao aquifers.... 10-20 percent of water delivered through the Upcountry Maui Water System comes from a series of basal aquifer wells: the Ha'ikū Well, Po'okela Well, and the two Kaupakalua wells. The rest comes from surfaced water sources. These four wells account for a total of 4.9 mgd of water delivered. In times of emergency, the Upcountry Maui Water System can draw up to 1.5 mgd from the Hāmākua Poko Wells (CWRM D&O, FOF 809). However, there is concern over this water due to the presence of pesticides from former pineapple production.

Footnote 1: Note that this aquifer sector is also the source for the irrigation wells serving the agricultural lands in Central Maui.

However, please note that the above has been revised based on additional consultation with the MDWS after publication of the Draft EIS (provided as Appendix P) as shown in pages 2-13 to 2-

20, wherein MDWS clarified that it has only one Kaupakalua well (not two, as stated in the Draft EIS).

Moreover, please note that Section 2.1.3.1 of the EIS provided information regarding the Upcountry Maui Water System, which includes information regarding the wells that serve the Upcountry Maui Water System. Specifically, Section 2.1.3.1 of the Draft EIS notes 10-20% of the water delivered to the Upcountry Maui Water System is provided by wells. Information in the Draft EIS regarding the wells was taken from the CWRM D&O. However, following publication of the Draft EIS, we received additional information from the MDWS which resulted in edits to Section 2.1.3.1 as shown in pages 2-13 to 2-20. Specifically, as it relates to wells that serve the Upcountry Maui Water System, more detail was added to accurately describe the wells and their service areas. Hence, as described in Section 2.1.3.1 of the EIS and as shown in pages 2-13 to 2-20, although the Upcountry Maui Water System is supplied by water from wells, well water only accounts for a small percentage of the total water being delivered and is not adequate to meet the current total demands on the Upcountry Maui Water System.

Comment 24: *On page 4 – 153, it states that 7.1 million gallons per day of UpCountry Maui’s water comes from the East Maui irrigation aqueduct system. This is misleading since less than half of it is coming from the lease areas that are being analyzed in the EIS document. The rest is coming from other Mahi Pono lands, not the subject of this EIS. Correct this statement.*

Response 24: We respectfully disagree with your comment that this is misleading or that any correction is needed. Pursuant to the CWRM D&O, FOF 551, average daily use by MDWS from the Wailoa Ditch is 7.1 mgd which includes water delivered to the Kamole-Weir Water Treatment Plant (WTP) and the Kula Agricultural Park as discussed in Section 2.1.3.1 of the EIS. This is approximately more than half of the total surface water (13 mgd) delivered to Upcountry Maui. Specifically, Section 2.1.3.1 of the Draft EIS states:

The Upcountry Maui Water System relies on three surface water sources, which accounts for approximately 80-90 percent (13 mgd) of water delivered through the Upcountry Maui Water System (CWRM D&O, FOF 799). One of the three surface water sources is delivered directly by the EMI Aqueduct System, through the Wailoa Ditch. Average daily use by the MDWS from the Wailoa Ditch is about 7.1 mgd, which includes water processed by the Kamole-Weir Water Treatment Plant (WTP) (discussed in further detail below) and non-potable water for the KAP, which receives water from Reservoir 40.

As noted in Response #23 above, Section 2.1.3.1 has been revised in the Final EIS pursuant to additional information provided by MDWS (see pages 2-13 to 2-20), but the revisions do not

alter the analysis regarding the extent to which the Upcountry Maui Water System relies on water from the EMI Aqueduct System. Moreover, it is appropriate to note that the other two surface water sources for MDWS to convey water to Upcountry Maui are situated on private land owned by EMI as discussed in Section 2.1.3.1, separate and apart from the License Area, thus are not waters covered by the Water Lease. In total, the delivery by the EMI Aqueduct System, and the two other sources situated on EMI land but not supplied directly through the proposed Water Lease, average 13 mgd or all of the total surface water delivered to MDWS.

Comment 25: *The last two paragraphs on page 4 - 140 are very important. The first of these paragraphs misleads when it says that the EMI Aqueduct System supports the two water treatment plants known as Olinda and Pi'iholo. That is not accurate. Both of these plants get water from lands now owned by Mahi Pono, but are NOT connected to the aqueducts coming from the East Maui lease areas.*

Response 25: As a starting point, we must clarify that p. 4-140 is within the section of the Draft EIS (Section 4.7.2) that reports on the findings of the SIA and the related focus group meetings conducted in preparation for the SIA. Section 4.7.2 of the EIS does not provide a description of the Upcountry Maui Water System. A description of the Upcountry Water System is provided in Section 2.1.3.1, which is titled Upcountry Maui Water System. That said, you are correct that the Olinda and Pi'iholo WTPs do not receive water conveyed by the EMI Aqueduct System or water from the proposed Water Lease, but rather from systems situated on private land owned by EMI as discussed in Response #24 above. Please note that the paragraphs you mention are based on statements made by participants in the November 2018 Focus Group Meetings conducted for the SIA. Hence, it appears that some of the participants are unaware of how the MDWS Upcountry Maui System operates. The purpose of Section 4.7.2 was to discuss the perceptions of the community in regards of the Proposed Action.

Comment 26: *Pages 4 - 148. There needs to be an explanation as to why the **Maui Water Department needs so much more water after 2008** than in 2006. Going from 3.23 MGD to 7.1 MGD in such a short time frame. Does the 7.1 MGD count the water delivered from Pi'iholo and Olinda? Kula Ag Park?*

Response 26: The citation of the County of Maui's need for 7.1 mgd was based on the CWRM D&O, FOF 551, which stated that the EMI Aqueduct System typically delivers 7.1 mgd of water to the MDWS for use in Upcountry Maui. In 2006, the cited delivery amount of an average of 3.23 mgd was based on the MDWS annual reports. Potential reasons for the lower 2006 deliveries from the EMI Aqueduct System include lesser demand in Upcountry Maui, or more yield from groundwater sources or the Waiokamoi system. The 7.1 mgd figure does not include

Piiholo and Olinda; the figure does include water delivered to the KAP.

Comment 27: *Sugar plantation workers were unionized, had very high level of technical skills, maintaining machinery, driving huge trucks, etc. and were **highly paid**. What will Mahi Pono do to recruit workers who can afford to live on Maui? What are the proposed salary rates? Moreover, if **workers are paid adequate living wages**, will those salary rates allow the leaseholder to have profitable agricultural operations? Discuss the labor situation at length.*

Response 27: Regarding your comment about what Mahi Pono will do to recruit workers, based on past hiring, nearly all future employees are expected to come from the island of Maui. Moreover, Mahi Pono will pay wages and provides benefits sufficient to attract and retain workers, which will require wages sufficient for workers to afford housing on Maui. In its first 18 months of existence Mahi Pono had hired over 200 workers, all of whom were living on Maui when hired as discussed in Response #10 above. They were attracted by the type of work, wages and benefits.

As discussed below in Response #29, Mahi Pono will pay wages and provide benefits sufficient to attract and retain workers. Under the circumstances, these wages should be sufficient for workers to obtain housing.

Regarding your comment about whether or not the living wages provided to Mahi Pono employees would allow for profitable agricultural operations, this is discussed in detail in Section 4.7.4 of the EIS which includes labor and payroll expenses. Specifically, Section 4.7.4 of the Draft EIS describes economic impacts during the estimated 10-year development period of the Mahi Pono farm plan, and the impacts once the farm plan is fully implemented.

During the development period: an average of 210 workers would be needed over the assumed 10-year development period to convert former sugarcane fields to fields for diversified crops and pasture, construct agricultural buildings, and install one or more solar farms. Jobs would include equipment operators, soil specialists, irrigation specialists, planters, truck drivers, construction workers, supervisors, etc. Also, the various jobs would range over a variety of skill levels, including entry-level, semi-skilled, skilled, management, and professional positions. Most of these temporary jobs are expected to be filled by residents of Maui and other the islands. In addition to the direct jobs, about 120 indirect jobs would be generated by purchases of goods and services. Indirect jobs will include those at companies supplying farming equipment, irrigation systems, fencing, chemicals, building materials, repair services, etc. Other indirect jobs would include those involved with supplying goods and services to families, and would range over a variety of skill levels.

Thus, direct-plus-indirect employment during the development period would average about 330 jobs, of which about 290 jobs would be on Maui. Actual employment would vary over time. The payroll during development would average about \$8.8 million for the direct jobs and \$14.5 million for all direct and indirect jobs. During the development period, the direct and indirect jobs would support an estimated 730 residents living in about 310 homes, of which about 640 residents and 280 homes would be on Maui.

Once the farm plan is fully operational, as explained in Section 4.7.4:

At full development, farm employment is expected to reach about 790 jobs (about 160 more jobs than provided by sugar operations in 2006). The jobs would be typical of those provided by diversified-crop farming and ranching; e.g., managing soils and pests, operating and maintaining irrigation systems, planting crops, pruning trees, harvesting crops, sorting and washing crops, packing crops, trucking crops to markets and shipping terminals, moving cattle among pastures, maintaining fences, marketing, accounting, etc. The increase in employment would be gradual, with most jobs filled by former sugarcane workers, skilled workers from Maui and other islands, recent graduates of agricultural programs at Hawai'i high-schools and colleges, and unskilled workers who would receive on-the-job training.

The purchase of goods and services by farmers and ranchers, and by the families of their employees, would generate an estimated 350 indirect jobs. Indirect jobs would include those at companies providing agricultural supplies and equipment, office supplies and equipment, repair services, trucking services, veterinarian services, etc. Other indirect jobs would include those involved with supplying goods and services to employees and their families. Thus, direct-plus-indirect employment would totaled about 1,140 jobs, with about 1,000 jobs on Maui. Both the direct and indirect jobs would range over a variety of skill levels, including entry-level, semi-skilled, skilled, and management positions. The payroll would be about \$28.5 million for the direct jobs and \$45.3 million for all direct and indirect jobs. The direct and indirect jobs would support an estimated 2,550 residents living in about 1,100 homes, with about 2,290 residents and 1,010 homes on Maui.

Comment 28: Page 4 – 169. There is an estimate that there will be **more workers** needed than was the case with sugarcane, and that in addition to the employees there will be indirect employment (those servicing the Mahi Pono employees).

790 farm jobs plus 350 additional indirect jobs →1,140 workers. At least 2,550 family members.

*There needs to be robust discussion/analysis about how Mahi Pono will get workers given the Maui's existing very **low unemployment rate**. How many workers will need to be imported?*

Response 28: At full operations of the Mahi Pono farm plan, currently estimated to occur around 2030, an estimated 790 farming and crop-processing jobs will be provided in Central Maui (direct jobs) (about 160 more jobs than provided by HC&S sugar operations in 2006). As explained in Section 4.7.4.d:

The increase in employment would be gradual, with most jobs filled by former sugarcane workers, skilled workers from Maui and other islands, recent graduates of agricultural-schools and colleges, and unskilled workers who would receive on-the-job training.

Moreover, as noted in Appendix I of the EIS, approximately an additional 228 indirect jobs on Maui and will be generated by the purchase of goods and services, for a total of approximately 1,018 new jobs on Maui. Hiring workers will be spread out over a number of years as fields are planted, orchards mature, processing facilities are built, etc. Assuming 10 years to reach full operations, direct employment on Maui will increase by an average of about 80 jobs per year, while total direct and indirect jobs will increase by an average of about 100 jobs per year. The latter figure is less than 8% of the 1,270 annual job increase projected for the years 2020 to 2030 by the State for the County of Maui (DBEDT, "Population and Economic Projections for the State of Hawai'i to 2045", June 2018).

Moreover, as discussed in Response #27 and #10 above, based on past hiring, nearly all future employees are expected to come from Maui. While Maui has had a low unemployment rate in the past, attracting workers should be easier than in the recent past because of the long-term adverse economic effects of COVID-19 on tourism and Maui's economy. It may take years to rebuild the economy, and the Mahi Pono farm plan will contribute significantly to this rebuilding.

Comment 29: *A very important consideration that has been left out entirely is **housing** for all of the new imported employees and their families. Not only will workers find it difficult to find a house, but they also will add to the pressure on the existing labor force who are seeking affordable housing.*

Response 29: Since most farm workers are expected to come from Maui, few homes will be required for workers new to the island. See Responses #10, 27 and 28 above. In any case, Mahi

Pono will pay wages and provide benefits sufficient to attract and retain workers. Under the circumstances, these wages should be sufficient for workers to obtain housing.

Comment 30: *4 – 144, plus 4 - 145 refer to labor problems and housing issues. This should be a valuable and important part of the environmental impact statement. Unfortunately, there is no indication of how these issues will be handled (mitigated) in the future. There is a now shortage of workers on Maui and there is a very significant shortage of affordable housing for these employees. These very important impacts have NOT been mitigated, nor even addressed.*

Response 30: Please note that the discussions presented on Draft EIS pages 4-144 and 4-145 are concerns / perspectives offered by participants in conjunction with the SIA and are not consistent with the economic and fiscal projections that are within the EIS. Participants in the SIA focus groups appreciated that many new agricultural jobs would result from the Mahi Pono farm plan, but expressed concerns about potential difficulty in filling the new jobs due to Maui's then-low unemployment rate, and expressed concerns about high labor costs, unionization and housing costs. Please see Responses # 10, 27, and 28 for our responses to employment and housing concerns. The appropriate technical reports that address these topics are the Economic and Fiscal Impact Study (Appendix H), and the East Maui Water Lease: Agricultural and Related Economic Impacts (Appendix I).

Comment 31: *Reviewers of the Final-EIS will need to know **who might be consuming the water** being delivered from East Maui. For example, the Maui Water Department, Mahi Pono for the use on its agricultural fields, the Kula agricultural Park and its future extension, Hawaiian Homelands (both UpCountry in Keokea and in Central Maui at Pulehunui), Nahiku residents. **Anyone else?** Only then can we know the impacts that these waters would have.*

Response 31: Regarding your comment about who might be consuming the water being delivered from East Maui, please note that as discussed throughout the EIS and specifically in Section 2.1 of the Draft EIS, the water will be delivered to MDWS for use in Upcountry Maui and at KAP including the future 262-acre expansion, as well as the Central Maui agricultural fields. The impacts of these uses are discussed throughout Chapter 4 of the EIS. Section 4.16 of the Final EIS also identifies the historic uses of limited amounts of water expected through an interim period. See page 4.331 of the Final EIS. Such uses are also discussed as part of Mahi Pono's current water usage in Final EIS Section 2.1.4. The Proposed Action will also ensure the continued water delivery to the Nāhiku community served by MDWS, as the agreement to provide water to MDWS is contingent upon the issuance of the Water Lease. Furthermore, in Section 2.1.1 of the Draft EIS states that the Water Lease is also subject to the DHHL rights to reserve water sufficient to support current and future homestead needs. Specific information regarding the DHHL's future water reservation, including the anticipated amount of the DHHL

reservation, was discussed in Section 2.1.1 of the Draft EIS, as updated in the Final EIS. Please see Response #19 above.

Comment 32: *Provide a detailed listing of those entities that would have access to the water and what they will be paying for that water. At what rates per 1,000 gallons will water be sold to each? The same rate for each purchaser?*

Response 32: Regarding your comment about the list of entities that would have access to the water, this includes those discussed in Response #31 above. However, the Mahi Pono farm plan does contemplate that approximately 800 of the 30,000 acres be leased out as a “community farm.” At this time, however, it is not known who these community farm entities will be.

Regarding your comment about the cost of water, there are many factors which could affect the cost of water delivery as discussed in Response #16 above. Water delivery costs will depend, in large part, on the amount of the lease payment for the Water Lease to be established by the BLNR, as well as the operational costs of running the EMI Aqueduct System, including all costs of complying with applicable regulations and laws, and any conditions imposed on the Water Lease.

Comment 33: *Be very specific as to whether there are any other potential users of the water. For example. A&B for use on its agricultural properties? Or A&B for use on **any non-agricultural development project**? Any other entity that might utilize the water for future non-agricultural developments?*

Response 33: As discussed in Response #31 above, the end users of the water from the Water Lease are identified in the EIS. In addition to the irrigation water needs, the Mahi Pono farm plan includes agricultural buildings to support its agricultural operations such as washing and packing areas, storage, and related uses accessory to agriculture. In addition to these agriculturally related developments, and the potential solar farm(s), for an interim period the EMI Aqueduct System is currently providing approximately 1.1 mgd of water to several entities located in proximity to the Central Maui agricultural fields that have historically received water dating back to HC&S’ sugar operations, information about which has been added to Section 4.16 and Section 2.1.4 of the Final EIS as shown page 2-30 and page 4-331. At full operations of the Mahi Pono farm plan, the water diverted under the proposed Water Lease will not be used to for any of the remaining A&B properties that were not sold to Mahi Pono, unless received through the MDWS, like other MDWS customers.

Comment 34: *To determine all the potential environmental impacts and if Mahi Pono gets the East Maui lease at auction, is A&B expecting to receive any water? If yes, will the water be used for any non-agricultural development?*

Response 34: As discussed in Response #31 and Response #33 above, other than for the historic uses and only for an interim period, A&B will not receive any water from the proposed Water Lease, unless received through the MDWS, like any other MDWS customer. Mahi Pono is committed to using water from the proposed Water Lease for the purpose of supporting the development of the Mahi Pono farm plan which is discussed in detail in Section 2.1.4 of the EIS.

Comment 35: *Describe the impacts and implications if Mahi Pono decide that it no longer wants or needs the water for agricultural uses. Could it be used for other purposes?*

Response 35: This is not within the scope of the EIS. The EIS addresses the anticipated impacts of the Proposed Action, i.e., the proposed Water Lease. Please refer to Response #6 above regarding the scope of the EIS. However, it is expected that the Water Lease, if issued, will be issued conditioned upon identified and approved uses of the water, and the lessee would have to comply with those requirements in order to retain its rights under the Water Lease. Moreover, it is assumed that Mahi Pono will not “decide that it no longer wants or needs the water for agricultural uses” due to the substantial investments that it has made.

Comment 36: *Would the aqueduct system continue to be maintained which may be necessary for both the Maui County Department of Water supply and for the Hawaiian homelands?*

Response 36: As described in the EIS as a part of the Proposed Action, as well as the associated alternatives discussed in Chapter 3 including the No Action (aka no Water Lease) alternative, the EMI Aqueduct System would be continued to be maintained. As discussed in Section 2.1.2 of the Final EIS, under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment.

Please note, however, that under the No Action alternative (described in Section 3.3 EIS and further assessed through Section 3.4 of the EIS), in which no Water Lease is issued to the Applicant, there would be no reservation of water for DHHL and no obligation to provide water to the County.

For clarification, as discussed above in Response # 19, there would be no obligation on the Applicant to deliver water to DHHL and the water reservation applies only in the case that the Water Lease is issued. Chapter 3 of the Draft EIS also anticipates that under the No Action alternative, water delivery via the EMI Aqueduct System to MDWS would cease (see Section 3.4.20) as would water service for the Nāhiku community (see Section 3.4.20).

Comment 37: *The paragraph at the top of page 4 - 58 makes it clear that CWRM considered it important to **allow water to be utilized on the IAL lands in Central Maui**. It did not make any provision for the use of water for any other Central Maui lands. The Final-EIS should differentiate between the IAL lands, and other Mahi Pono lands and water needs/uses in Central Maui.*

Response 37: We acknowledge the CWRM's comment about water for IAL lands in Central Maui. However, the CWRM D&O acknowledged that it is reasonable and beneficial to use a portion of East Maui stream water for the development of diversified agriculture on Maui's central plains. The CWRM quotation on page 4-58 of the Draft EIS provides in full:

Yet, we believe it to be reasonable and beneficial to use a portion of East Maui stream water for the development of diversified agriculture on Maui's central plains. Diversified agriculture has and should continue to provide economic benefits and can now make a larger contribution to Hawai'i's food sustainability. We are also concerned that leaving these lands in an un-cultivated state will increase wind-blown erosion that will damage Maui's near shore marine environment, air quality, and tourism competitiveness. The Commission's intent in this decision is to ensure that a sufficient amount of offstream water is available to support the cultivation of diversified agricultural crops on the lands designated as IAL in Central Maui.

And see CWRM D&O, Executive Summary, p. vi.

CWRM did not say or in fact limit the use of water to only IAL. Farmland that is not designated IAL will stay in agriculture, consistent with its State and County zoning designations (see Figure 5-2 of the Draft EIS). Also, the various crops will be grown on fields that are determined to be optimal for overall farm operations, regardless of the IAL designation. Since water will not be available to irrigate all of the farmland, some of the fields will be used for unirrigated pastures, as depicted in Figure 2-6 of the Draft EIS. Current IAL lands in Central Maui are presented in Figure 5-4 of the Draft EIS as discussed in Response #21 above.

Comment 38: *In the Executive Summary, near the top of page 2 – 4, it indicates that the DHHL staff has identified a need in the future for over 11 million GPD. What effect will DHHL's needs (which by law must be satisfied) have on the Central Maui agricultural operations and on Mahi Pono's profitability?*

Describe the specific impact that would take place when DHHL indicates that they wish to have the required 11 million gallons of water per day for their use in Keokea and Pulehunui. What will be the effect at that time on the agricultural operations of Mahi Pono?

Response 38: Your citation to the Executive Summary is unclear because you point to page 2-4, which is not part of the EIS Executive Summary. Page 2-4 is within Draft EIS Section 2.1.1, which is the section that discusses the DHHL water reservation. As discussed in Response #19 above, DHHL's rights to a water reservation were discussed in Section 2.1.1 of the EIS, along with the anticipated amount of the DHHL reservation, as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the HHC actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd as shown in pages 2-4 to 2-7.

As noted in the Draft EIS Executive Summary, the Proposed Action seeks to divert the maximum allowed under the CWRM D&O and will comply with the IIFS set by the CWRM D&O ("The maximum amount of water that can be awarded through the Water Lease is what is available for diversion after implementation of the CWRM D&O."). The same section of the Executive Summary acknowledges that "The Water Lease is also subject to the rights of the

DHHL to reserve water sufficient to support current and future homestead needs as provided by Section 221 of the Hawaiian Homes Commission Act."

Consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture. Based on the multipliers used to conduct the analysis for the Agricultural and Related Economic Impacts report appended as Appendix I of the EIS, the estimated changes to the Mahi Pono farm plan that would result from an 11 mgd reduction in the supply of surface water would be as follows:

- Land Use, Central Maui
 - Crops: decreased by 1,906 acres (11 mgd \times 173.31 acres/mgd)
 - Irrigated pasture: decreased by 161 acres (11 mgd \times 14.62 acres/mgd)
 - Unirrigated pasture: increased by 2,067 acres (11 mgd \times 187.93 acres/mgd)
- Sales (Mahi Pono and tenants): decreased by \$18.4 million per year (11 mgd \times \$1.673 million/mgd)
- Employment (Mahi Pono and tenants): decreased by 93 jobs (11 mgd \times 8.447 jobs/mgd)
- Payroll (Mahi Pono and tenants): decreased by \$3.33 million per year (11 mgd \times \$0.303 million/mgd)

The above has been added to Section 2.1.4 as Footnote 6, to Section 4.7.3 as Footnote 16, and to Section 4.7.4 as Footnote 17 as shown on page 4-287 and 4-304.

Hence, operating profits of Mahi Pono and its tenants would decrease by an estimated \$1.8 million per year (10% of sales) and agricultural operations would be impacted as described above based on an 11 mgd reduction of available water.

Comment 39: *The discussion at the bottom of page 3 - 19 is intended to significantly scare UpCountry farmers. Since the majority of the water used in the UpCountry area does not come from the East Maui lease areas, the threat is not as dire as stated in the Draft. Please correct.*

Response 39: The discussion at the bottom of page 3-19 of the Draft is intended to disclose the impact of the No Action alternative on Upcountry Maui, and the EIS includes an analysis of the various impacts that the termination of water service to MDWS could entail. No corrections are needed. As discussed in Response #24 above, the EIS assumes under the Proposed Action that

approximately an average of 7.1 mgd is conveyed to MDWS at Kamole-Weir WTP from the EMI Aqueduct System via the Wailoa Ditch as discussed in Section 2.1.3.1 of the EIS. This is approximately more than half ($\approx 54\%$) of the total surface water (13 mgd) delivered to the Upcountry Maui Water System. The 13 mgd accounts for approximately 80-90% of total water delivered to the entire Upcountry Maui Water System (CWRM D&O, FOF 799).

Regarding your comment about the discussion at the bottom of page 3-19, this is in reference to the No Action alternative impacts to Upcountry farming activities, including the KAP. Specifically, Section 3.4.13 of the Draft EIS at page 3-19 states:

Under the No Action alternative, farming activity in Upcountry Maui is expected to be near zero (reduced from approximately 1,520 acres and about 15.1 million pounds of crops per year under the Proposed Action). Without water through the EMI Aqueduct System, the County would have to develop new water sources, which is expected to take several years. In the interim, it is expected that farming in Upcountry would end, and even once new water sources are developed to supply Upcountry Maui, it is not expected that significant farming would return to the area because better farming conditions exist in Central Maui. A significant drop in sales is estimated, from \$31.8 million/year direct and indirect sales under the Proposed Action to about zero under the No Action alternative.

The reason the analysis comes to this conclusion is because the agreements MDWS has with EMI are contingent upon issuance of the Water Lease (or other suitable approvals for water use, such as revocable permits). Hence, under the No Action alternative, MDWS would no longer receive water from the EMI Aqueduct System, and no longer be entitled to diverted water from EMI's land (the Upper and Lower Waikamoi Flumes) to supply Upcountry Maui for its domestic and agricultural water demands as discussed in Section 3.3 of the EIS. Specifically, Section 3.3 of the Final EIS states in relevant part (revised from the Draft EIS to take into account that the Nāhiku community is not served by the EMI Aqueduct System):

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate for Upcountry Maui and Nāhiku. As a consequence, domestic and agricultural water needs in Upcountry Maui would need to be met by alternative water sources that would need to be developed by the MDWS.

Comment 40: *At present, about 17,000 acres of EMI lands are owned 50/50 by Mahi Pono and A&B. How long will this last? What will happen after Mahi Pono becomes a 100% owner and*

*how would that affect the water lease? Will A&B, (now a Real Estate Investment Trust (REIT)), retain **any rights to the water**? Will A&B receive any discounted rates for the use of that water? Will they be able to use the water for non-agricultural purposes?*

Response 40: Regarding your comments above, please note that those issues are not within the scope of the EIS as previously explained in Response #6 above. The scope of the EIS is to assess the impacts of the proposed Water Lease. Regarding your comment about A&B retaining rights to water or receiving water at discounted rates, please note that A&B has no such rights, and will not receive any water diverted from the EMI Aqueduct System for any of its properties as discussed in Response #33 above, unless provided through the MDWS, like any other MDWS customer.

Comment 41: *It seems that the estimate for the **future payments by Mahi Pono** to the Department of Land and Natural Resources for the water is **absurdly low**. On page 4 - 150, they are estimating the cost to be \$0.10 per thousand gallons, giving the State an annual revenue of **only** about \$268,000 in 2030.*

This figure might make agricultural production very profitable, but it would deny DHHL the funds needed to bring water to the Hawaiian Homelands areas. That would be a serious negative impact, but would make Mahi Pono's investor very profitable.

Response 41: It seems you misunderstood the discussion on page 4-150 of the Draft EIS. The EIS does not state that the State would receive annual revenue of \$268,000 in 2030. The numbers you refer to in your Comment #41 above are in reference to the revenue that EMI would generate based on the amount that MDWS would pay to EMI for the water delivery under the assumptions discussed in the Draft EIS. Specifically, Section 4.7.3.1. of the Draft EIS states in relevant part:

It is estimated that EMI's operating cost under the Proposed Action would be \$0.068 per kgal, which is higher than the current MDWS payment to EMI of \$0.06 per kgal. The actual rate the MDWS will pay to EMI in 2030 will be subject to a future agreement between the parties. However, for the purposes of the fiscal impacts analysis, the 2030 water service fee rate is estimated to be \$0.10, which has been calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, EMI would receive an estimated \$268,000 in 2030 from the MDWS.

Hence under the Proposed Action, as described in the Draft EIS, EMI is expected to generate approximately \$268,000 in the year 2030 from MDWS payments for the delivery of water by EMI. However, please note that the above has been revised to take into account the charges for

the most recent revocable permits for 2021, as approved by the BLNR in November 2020 as shown in pages 4-277 and 4-283.

Assuming your comment relates to the amount of revenue to be earned by DHHL from the proposed Water Lease, the amount estimated to be disbursed to DHHL from the Water Lease rental payments is approximately \$128,100 annually.

However, those numbers are educated projections because the actual Water Lease rental payments are as yet unknown (but for the purposes of the Final EIS are projected, based upon the fees for the 2021 revocable permits, as \$427,000). As discussed above in Response #13, the amount that the State (and therefore DHHL and OHA) will receive as Water Lease rental payments will ultimately be determined by appraisal.

Comment 42: *On page 4-150 and PDF pages 1777 + 1780. It is unclear how the number \$846,700 was calculated or obtained. What is the referenced “Special Land Development Fund”? How is it different from the annual cost for the water lease?*

Response 42: The \$846,700 figure was estimated based EMI’s past State Special Land Development Fund payments for the revocable permits. This number was adjusted for 2030 dollars. The State Special Land Development Fund is administered by the DLNR where all land rents the State receives for land that is either leased or used under a revocable permit. Hence, the annual cost of the Water Lease would be distributed to this fund, along with all the other leases or revocable permits in the State. However, please note that this figure has been adjusted to take into account the charges for the most recent revocable permits for 2021, as approved by the BLNR in November 2020 as shown in pages 4-277 and 4-283.

Comment 43: *On page 4 – 153, it is stated that there are 830 businesses in UpCountry Maui, generating an annual payroll of \$232 million. This seems very, very high. Consequently, an accurate source should be provided for these numbers, not just “Gale Cengage Learning”.*

Response 43: Gale Cengage Learning is a publicly available data source available through the Hawai‘i State Public Library System. It provides business data in selected geographic locations utilizing comprehensive and reliable datasets, including Simmons National Consumer Study, American Community Survey, Experian Mosaic consumer lifestyle segmentation data. Gale Cengage Learning’s “Business Summary Report” provides a listing of individual business names, locations, and other information, which was aggregated for the Upcountry Maui area. This source is a noted reference in the Economic and Fiscal Impact Study provided as Appendix H to the EIS. To provide context for the 830 businesses in Upcountry Maui reported by Gale

Cengage Learning, it is noted that the 2018 Maui County Databook reported that there were 4,618 businesses in Maui County with annual payroll of \$2.5 billion in 2016.

Comment 44: *On page 1793, 2nd paragraph, last word should be billion, not million.*

Response 44: You are correct. The household income in the Upcountry Water System area had a collective income of approximately \$1.0 billion in 2010. The correct information has been included in the Final EIS.

Comment 45: *The executive summary states in the second paragraph that no construction activity will be required. It seems that this is incorrect since there will be considerable construction activity to reconfigure many of the diversions, to close down a number of the diversions and to repair the ditch system where it leaks, and to restore reservoirs and irrigation systems. **Construction has impacts; what are they? How will they be mitigated?***

Response 45: We respectfully disagree with your comment. Issuance of the proposed Water Lease does not entail any construction activity in the East Maui License Area. The Water Lease would continue to use the existing EMI Aqueduct System. Routine maintenance and repair activities specific to the Proposed Action include the continuation of the regular maintenance of the system, as has been the case for decades. Please note, the EMI Aqueduct System does not "leak" as you stated in your comment. Modifications to diversions required under the CWRM D&O will be undertaken irrespective of the proposed Water Lease.

Comment 46: *Because water has high value, indicate the potential for building **new reservoirs, water tanks and lining the existing reservoirs** throughout Central Maui. These one-time costs may provide considerable benefits and reduce negative impacts over the length of the lease and even thereafter.*

Response 46: The options you mention above are discussed in Chapter 3 of the EIS. Specifically, Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that had been raised in scoping, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were well-discussed, but ultimately not assessed to the same

degree as (a) through (d). However, based on comments received on the Draft EIS, the alternate/supplemental water analysis in Chapter 3 has been further expanded within the spectrum of alternatives presented in the Draft EIS.

Specifically, Section 3.1.1.3 discusses the added storage alternative. However, adding more reservoirs or water tanks to supplement the existing and available water sources is considered prohibitively expensive which could limit the Mahi Pono farm plan and cause water costs to increase. Moreover, depending upon varying factors, there may be adverse environmental impacts associated with developing additional water sources as shown in pages 3-11 to 3-14.

Regarding your comment about lining the existing reservoirs in Central Maui, this would reduce the amount of recharge that occurs in the Central Maui aquifers from the use of diverted East Maui water for irrigation purposes on the Central Maui fields. Improving existing reservoirs in the Central Maui fields would lessen the amount of water that seeps into the ground at these reservoirs. However, that water is not necessarily lost. It can be stated that seepage at the reservoirs is not deemed as a waste of water due to its contribution to recharging the aquifer. The seepage occurring at the reservoirs helps to recharge the Central Maui Aquifer through infiltration. This seepage allowed HC&S to sustain pumping of the aquifers significantly greater than the SY for the aquifer set by CWRM. Due to the lessened amount of diverted water available to Mahi Pono as compared to the previous amounts of water that HC&S was using, the recharge to the Central Maui Aquifer will be substantially lessened.

Thus, under the Proposed Action, it is assumed that at full operation of the Mahi Pono farm plan that system losses in the Central Maui Field Irrigation System (i.e., water lost to seepage and evaporation, and including other water uses, such as water used for reservoirs, fire protection, dust control, and hydroelectric uses) would add to the recharge amount that occurs in Central Maui, as discussed in Section 4.2.2 of the EIS.

Thus, lining the reservoirs would reduce the ability to use groundwater wells to supplement the surface water diverted from East Maui. In other words, lining the Central Maui reservoirs would increase the need and dependence on the water diverted from East Maui.

Comment 47: *It is mentioned several times that the food supply will be for **local** consumption. However, nowhere is it defined **what local means**. Does it mean Maui Island? Maui County? Or the State of Hawaii? Or something else?*

Response 47: Food for local consumption means crops grown for Hawai'i residents and visitors. Section 4.7.4 of the Final EIS has been revised accordingly to clarify, as shown on page 4-285

Comment 48: *The EIS states that there will be 250 acres utilized for a utility-scale solar PV operation. The Solar PV developer AES has stated publicly that there will be about 500 acres needed for that project. Please explain the difference.*

Response 48: As described in Section 2.1.4 of the Draft EIS (page 2-18), the Mahi Pono farm plan contemplates approximately 250 acres within the Central Maui agricultural fields being used for renewable energy, potentially for the development of solar farms. However, the AES solar farm you referred to is not within the Central Maui agricultural fields and is not part of the Mahi Pono farm plan described in the EIS. The AES solar project you are referring to is proposed for fields located in West Maui and is outside of the scope of this EIS.

Comment 49: *There is a recommendation to form a Core Working Group made up of residents and communities that will be affected by this lease. The Final-EIS should make provision for how this group will be formed and how the leaseholder will utilize its input. Will their recommendations be merely studied or actually implemented? Will the leaseholder commit to financially helping to facilitate the Core Working Group's activities?*

Response 49: The SIA, as well as Section 4.7.2 of the EIS, recommends that there be community outreach by the Applicant in connection with issuance of the Water Lease. However, terms of the Water Lease are at the discretion of the BLNR. Should the BLNR make this a requirement of the Water Lease, the Applicant will comply with all conditions of the Water Lease.

Comment 50: *Executive Summary, page x. Will the leaseholder assist getting the Core Working Group into action as well as helping the Keanae and Wailua communities to move past historical impacts?*

Response 50: Please refer to Response #49 above. Should the BLNR make this a requirement of the Water Lease, the Applicant will comply with all conditions of the Water Lease.

Comment 51: *On the third line of the Executive Summary page xiii, the use of the word "commercial" raises a number of questions that are not examined elsewhere. Why is it being used here? What are the implications?*

Response 51: Commercial uses would be those related to the MDWS system in Upcountry Maui as EMI conveys water to MDWS to supply its Upcountry Maui Water System. This is examined specifically in Section 4.7.3 of the EIS as it relates to economic and fiscal impacts. As mentioned in Response #43 above there are an estimated 830 businesses in Upcountry Maui.

Comment 52: *There are several references at the end of chapter 3 to the fact that the federal government's regulations allowing **herbicides and pesticides** means that there will be no environmental impacts. This is false since the federal government has permitted the use of toxic herbicides that have been shown (in several court cases) to cause severe health problems and the death of individuals.*

I am an example of that problem. Having used Monsanto's herbicide Roundup, I was diagnosed with stage 4 Non-Hodgkin's lymphoma, and I (and 40,000 other people) am now a plaintiff in a lawsuit against Monsanto for damages. The federal government's blessing and herbicide approval does not eliminate negative impacts that must be evaluated in the Final-EIS.

*There needs to be a strong statement in the Final-EIS that makes it very clear that Monsanto's **herbicide Roundup** or its generic versions will NEVER be used in the East Maui watershed. This overused chemical has been proven to be a cause of cancer. I am a personal victim.*

Response 52: We acknowledge your comments regarding the use of Round-Up. Pesticide use is regulated by both State and Federal law. In January of 2020 EMI committed to foregoing using Round-Up to maintain the EMI Aqueduct System and any trails and access roads. Mahi Pono's use of these chemicals is compliant with all laws regulating pesticide use, and certified commercial applicators are utilized as required. Act 45 which was passed by the 2018 Hawai'i Legislature and effective on January 1, 2019 required that all Certified Applicators of Restricted Use Pesticides (RUP) submit a report of the RUP that were applied each year. This report as well as any other report required by law is publicly available from the respective government entity. The State of Hawai'i DOA's Pesticide Branch also provides regulatory oversight over Mahi Pono's pesticide use. In accordance with this oversight, records of pesticide use must be kept and made available to the Pesticide Branch upon request at any time. It is also noted that since January 2020 Mahi Pono committed to discontinuing use of Round-Up. This information has been included in the Final EIS as shown in pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations.

Comment 53: *Section 3.4.19 **Traffic**. There is a ridiculous assertion that there will be no traffic impact. However, the Draft-EIS also makes the claim that there will be an additional 2,550 individuals, if the lease is issued. How can it then assert that there will be no traffic impact? There certainly will be, and it needs to be discussed because Maui's roads are already crowded.*

Response 53: Please note that the Proposed Action is not anticipated to result in a population increase. As explained in Response #10 above, it is assumed the majority of the Mahi Pono employees will be from the island of Maui. With regards to traffic, it is unclear to which region

you are referring to. Traffic conditions and impacts are discussed within Section 4.13 of the EIS. With regards to Central Maui, Section 4.13 states:

Traffic generation for diversified agricultural operations contrasts sharply against the large-scale monocrop sugar operations. Whereas the scale of sugar operations was massive and highly coordinated, diversified agriculture involves a multitude of smaller scale operations that are dispersed over time according to specific crop requirements. Unlike a monocrop, diversified crops would not necessarily share the same time frame for planting, tending, harvesting, processing and distribution. Therefore, traffic associated with those activities would be much more dispersed seasonally, over the work week and on a daily basis. Moreover, such traffic would largely be using an internal roadway network that was designed to minimize conflicts by vehicles used in sugar operations with the public roadway system.

At full operation, Mahi Pono expects to have some 790 farm employees. This compares to approximately 640 for HC&S. It is not certain if Mahi Pono's distribution of employees between the fields and a processing center near the former sugar mill in Puunene will be similar to former sugar employees between the fields and the mill. But, the expanse of the fields and the internal roadway system to the mill suggests that the impacts to public roads will not be significant.

Therefore, it is anticipated that traffic associated with the proposed diversified agricultural operations in Central Maui will not adversely affect peak-hour traffic conditions on public roadways. Nevertheless, should any traffic conflicts or traffic volume concerns on public roadways by diversified agricultural operations be identified in the future, measures can be taken to assess and address such concerns. Such measures may include signal timing adjustments to establish a minimum time between activation of signals stopping traffic along public streets or the addition of turning lanes.

Hence, in Central Maui, where if anywhere, there would be a traffic impact associated with the Proposed Action, such traffic impact would be contained to the agricultural fields and the internal roadway network there. Moreover, any increase in traffic is anticipated to be dispersed unlike traffic conditions during sugarcane operations. Thus, the Proposed Action is not anticipated to have adverse impacts to peak-hour traffic. Draft EIS Section 3.4.19 provides an assessment of traffic under the various alternatives to the Proposed Action.

Comment 54: *Somewhere in the introductory chapters of the environmental impact statement there should be a clear statement that these auctioned “public waters” are for potentially private use and sale. They are governed by the State of Hawaii’s “public use” doctrine. Implications and impacts of that doctrine on the lease of these waters needs to be clearly explained and legally defended.*

Response 54: This is clearly noted throughout Chapter 2 of the EIS. Section 2.1 of the Draft EIS states in relevant part:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users.

Several other sections within the EIS acknowledge that the water proposed for the Water Lease is government owned water.

Regarding your comment about the implications of the "public use doctrine" we assume you are referring to Hawai'i's Public Trust Doctrine. We acknowledge that the Proposed Action (the issuance of a 30-year Water Lease by BLNR), requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai'i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. The dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease. As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action as shown in pages 1-25 to 1-27.

Comment 55: *With regard to 3.4.1 Public Services and Facilities, it is stated that there will be no impacts. Since we now have full employment on Maui Island, it can be presumed that the impacts will come from the additional 2,550 additional residents resulting from the Mahi Pono operations. Such a large number of **additional Maui Island residents will have numerous public services and facility impacts**, ranging from schools, playgrounds, traffic, potable water needs, wastewater, solid waste, to both police and fire protection.*

Response 55: Please note that the Proposed Action is not anticipated to result in a population increase. As discussed in Response #10 above, it is assumed the majority of this 2,550 people will be from the island of Maui. Hence, no adverse impacts are expected to Public Service and Facilities under the Proposed Action. We also note that in its first 18 months on Maui, Mahi Pono had hired over about 200 workers, all of whom were living on Maui when hired. They were attracted by the type of work, wages and benefits.

Based on past hiring, nearly all future employees are expected to come from Maui. Also, attracting workers should be easier than in the recent past because of the long-term adverse economic effects of COVID-19 on tourism and Maui's economy. It may take years to rebuild the economy, and the Mahi Pono farm plan will contribute significantly to this rebuilding.

For clarification, Section 3.4.1 of the EIS (the section you cited) is within the alternatives analysis provided in Chapter 3. The impacts of the proposed Water Lease on Public Services and Facilities, as well as Infrastructure and Utilities is provided in Sections 4.14 and 4.15 of the EIS, respectively.

Comment 56: *Figure 4-1 on PDF 115 only has the green areas indicated. The developed areas in blue are not disclosed. Show the "Developed open space."*

Response 56: Figure 4-1 depicts the Central Maui Land Cover Map. The "Developed Open Space" depicted on Figure 4-1 are the roads that comprise of the internal road system within the Central Maui agricultural fields.

Comment 57: Chapter 5. *I was the Vice-Chairman of the General Plan Advisory Committee that developed the Countywide Policy Plan and the Maui Island Plan. In Chapter 5, the East Maui Water Lease Draft Environmental Impact Statement makes a mockery of the goals and objectives that are found in the two plans.*

Whenever there is a policy or objective in the table that would violate the two plans, the Draft-Environmental Impact Statement merely states that the goal or objective is "N/A" (Not Applicable). There are dozens of instances of this avoidance of compliance with the Maui Island Plan and the Countywide Policy Plan. Do you see even ONE instance where they show any impact? The tables are majorly incorrect, misleading and dishonest

Response 57: We respectfully disagree with your comment. The Proposed Action is not applicable or relevant to many of the goals, objectives, or policies of the Countywide Policy Plan or the Maui Island Plan, and therefore "N/A" is properly noted in those instances. Moreover,

you did not identify any specific goals or objectives that are relevant and that you deem violated by the proposed Water Lease. We further note that the County of Maui Planning Department, in its comment letter on the Draft EIS, wrote that "the proposal is consistent with County long-range plans, such as the Maui Island Plan and our community plans, which include policies and actions to support agriculture, sustainable local food source, conservation, open space and business. In addition, they call for the protection of the environment, near shore waters and water source/aquifers." The Proposed Action does not specifically relate to every single policy and objective as is the case with any project, however, the Proposed Action is supportive of numerous policies and objectives in the plans discussed in Chapter 5.

Comment 58: *If the Final-EIS persists in indicating that either or both the Maui Countywide Policy Plan or the Maui Island Plan do not have any negative impacts from an East Maui Water Lease, then it will be challenged vigorously as being a whitewash and unresponsive to the Maui County General plan.*

The policies and objectives of the two plans will be seriously impacted and violated. The fact that water has been removed from East Maui for over a century, coupled with the fact that less water will now be withdrawn, does not mean there will be no or a low level of impacts. The Final-EIS should make that clear and also indicate how those impacts will be mitigated. Impacts need to be addressed.

Response 58: We respectfully disagree with your comment regarding the Maui Countywide Policy Plan and the Maui Island Plan. As discussed in Response #57 above, the Proposed Action is not applicable or relevant to several of the objectives and policies listed in the various plans discussed within Chapter 5. Moreover, the County of Maui Planning Department determined that the proposed Water Lease is consistent with County long-range plans, such as the Maui Island Plan and community plans, which include policies and actions to support agriculture, sustainable local food source, conservation, open space and business. In addition, they call for the protection of the environment, near shore waters and water source/aquifers.

Several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions." HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From

that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) report documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System. This has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. . The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown in pages 4-331 to 4-336.

Comment 59: *In Appendix G on page 106, there is a very useful recommendation to form a Core Working Group. The paragraph headed by the word "Transparency", discusses a long-standing problem with skepticism over the water withdrawals that have been held in the past. The exact statement reads as follows, "The proposed action has elicited skepticism and distrust over many decades, and these feelings prevent willingness for participating in mediation and collaboration. While developing trust among the various groups will be challenging, the first step is transparency. Being open about intent, plans and activities can begin to establish credibility and open the door to dialogue."*

This is an insightful recommendation and needs to be followed up, earlier rather than later. Many issues will arise over the succeeding months and years, before and after the lease is issued. There needs to be an excellent relationship between the leaseholder and the broader Maui community. The leaseholder should not be afraid to create the recommended Core Working Group that will serve not just as a "yes" sounding board. It should be a group that can critique operations, evaluate lease compliance and provide useful advice that must be handled appropriately by the leaseholder.

Response 59: Your reference is to "Recommended Mitigation" section of the SIA. Please refer to Response #49 above. Should the BLNR make this a requirement of the Water Lease, the Applicant will comply with all conditions of the Water Lease.

Comment 60: *Missing from the Draft-EIS is a comprehensive analysis of the effects on Maui's economy of having a water lease controlled by an off-island entity. If the water lease is obtained by a non-Maui or non-Hawaii entity whether it be based in California or Montreal, there are significant impacts to Maui's economy that need to be understood, analyzed, and if necessary, mitigated.*

Response 60: Regarding your comment about the economic impacts of the Water Lease, these impacts are discussed in detail in the analysis conducted for the Economic and Fiscal Impact Study report attached as Appendix H to the EIS and is summarized in Section 4.7.3 of the EIS as noted in Response #13 above. Specifically, Section 4.7.3 discusses the impacts of the Proposed Action, including a discussion of operational costs, revenue, employment and earnings related to the EMI Aqueduct System; agricultural operations in Upcountry Maui, Central Maui, and East Maui (i.e., taro cultivation); and the impact on public/domestic water supplies (and related issues) in Nāhiku and Upcountry Maui. These economic impacts are anticipated to be the same no matter whether the lessee is a Hawai'i entity or not.

Comment 61: *Presumably, the use of the water from the lease areas will generate very sizable profits. If these profits are going to be shipped elsewhere as now happen so often with Maui's*

many off-island, owned hotels, there would be negative impacts by comparison to having that water utilized and operated by a Water Authority or some other institution that is locally based. Revenues and profits would circulate and multiply on-island.

Because of this impact of exported, disappearing profits, the Final-EIS must describe how those funds could remain in Maui and benefit the residents of Maui, solving problems such as affordable housing, highways, infrastructure, etc. Profits draining away from our tourist industry have resulted in local residents being unable to afford a home. Similarly, an off-island leaseholder could do similar damage to its own employees who would have difficulty purchasing or even renting a home.

Response 61: Regarding your comment about the economic impacts of the Water Lease, these are discussed in detail in the analysis conducted for the Economic and Fiscal Impact Study report attached as Appendix H to the EIS, and in the East Maui Water Lease: Agricultural and Related Economic Impacts report provided as Appendix I, and are summarized in Section 4.7.3 and Section 4.7.3 of the EIS. Please also see Response #13 above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

**ORDER RE ALEXANDER & BALDWIN, INC.'S AND EAST MAUI
IRRIGATION COMPANY, LIMITED'S SUBMISSION OF ENVIRONMENTAL
IMPACT STATEMENT SCOPE OF WORK FILED JUNE 9, 2016**

On June 9, 2016, Alexander & Baldwin, Inc. (A&B) and East Maui Irrigation Company, Limited (EMI) filed a Submission of Environmental Impact Statement Scope of Work (Scope of Work) in response to the Order for A&B to Commence the Environmental Review Process and Deferring Decision on Petitioners' Motion to Establish Scope of Reconvened Contested Case Proceedings filed on April 14, 2016 (Board's Order). Petitioner, Nā Moku Aupuni O Ko'olau Hui, filed a Response to A&B and EMI's Scope of Work on June 17, 2016.

The Board of Land and Natural Resources (Board) notes that the Scope of Work sets forth the information requested in the Board's Order. A&B and EMI should proceed with the preparation of an environmental impact statement (EIS) in as expeditious manner as possible. A&B and EMI should copy the Board on any notices that are sent out in connection with the EIS.

SO ORDERED this 8th day of July, 2016.

SUZANNE D. CASE¹
Presiding Officer
Board of Land and Natural Resources

¹ The Board members have delegated authority to Suzanne Case to sign this Order on behalf of the Board.

--------------------	--

I. INTRODUCTION

I. INTRODUCTION

A. BACKGROUND

In May 2001, Alexander & Baldwin, Inc. and East Maui Irrigation Company, Ltd. (EMI) (also collectively referred to as A&B) filed an Application for the Sale of Lease at Public Auction (“A&B Lease Application”) with the Board of Land and Natural Resources (BLNR) seeking a long-term 30-year lease for the “*right, privilege, and authority to enter and go upon*” the Nāhiku, Ke‘anae, Honomanū, and Huelo license areas “*for the purpose of developing, diverting, transporting, and using government-owned waters*”. Compliance with the requirements of Chapter 343, Hawaii Revised Statutes (HRS) is necessary prior to the BLNR’s consideration of the long-term lease request. By order dated April 14, 2016, the BLNR directed A&B, to provide to the Board, a scope of work for the preparation and processing of an environmental review document pursuant to Chapter 343, HRS. See **Appendix “A”**. In preparing the scope of work, A&B has assumed that an Environmental Impact Statement (EIS) process instead of an Environmental Assessment process would be the appropriate means of addressing the requirements of Chapter 343, HRS, for the proposed lease request. The trigger for compliance with Chapter 343, HRS environmental review is the use of state lands. It is assumed that the BLNR will be the Accepting Authority for the EIS.

It is noted that the BLNR’s order required specific content requirements to be incorporated in the scope of work, as follows:

1. The scope of work should distinguish those portions of the EIS that can be undertaken prior to the Commission on Water Resource Management’s (CWRM) decision on the petition to amend the Interim Instream Flow Standards (IIFS) from those that require a decision from the CWRM prior to completion.
2. The scope of work should demonstrate compliance with requirements contained in Hawai‘i Administrative Rules, Section 11-200-17.
3. The scope of work should include a tentative schedule for commencement and completion of various portions of the scope of work.

With respect to the EIS schedule noted in Item No. 3, above, the order states that to the degree that A&B’s decision to transition away from sugar cane cultivation affects the ability of, or timing for A&B to complete portions of the environmental review document, that should be noted in the scope of work.

This report sets forth the scope of work for the preparation and processing of an EIS, as required by the BLNR.

B. HISTORY OF WATER LEASES

The A&B Lease Application seeks to continue the operation by A&B subsidiary, EMI, of the East Maui aqueduct system which is an integrated system of diversions, ditches, intakes, and tunnels that collects water from streams located on the rainy windward slopes of East Maui and transports it to A&B's sugar cane fields in Central Maui, as well as to the Maui County Department of Water Supply for the domestic water needs of Upcountry Maui and the irrigation needs of small farms throughout Upcountry as well as in the Kula Ag Park. The watersheds from which it collects water total approximately 50,000 acres, of which EMI owns approximately 17,000 acres. Approximately 33,000 acres in the Huelo, Honomanū, Ke'anae, and Nāhiku watersheds are owned by the State of Hawai'i and have historically been leased to EMI for the purposes of developing, diverting, transporting and using the government-owned waters.

The aqueduct system was constructed in phases beginning in 1876 in accordance with agreements between EMI's predecessor entities and the Kingdom of Hawai'i and later the Territory of Hawai'i. Major milestone completion dates of the current system include the original 17-mile ditch in 1878, Koolau Ditch in 1904, the Haiku Ditch in 1914, the Kauhikoa Ditch in 1915, and the Wailoa Ditch in 1923. Since 1938, the relationship between the government of Hawai'i and EMI with regard to the coordinated operation of the Ditch System on government and EMI owned lands has been based on an agreement (the "1938 Agreement") dated March 18, 1938 between the Territory of Hawai'i and EMI. The 1938 Agreement provided a framework for a transition from a patchwork of previously issued water leases with differing lease and rental terms, to the subsequent issuance by the Territory, following public auction, of long-term water lease for each of the four (4) watersheds that comprise the current license areas.

The four (4) license areas and their respective most recent long-term lease terms are listed in **Table 1**. After the expiration of the terms of the long-term lease, revocable permits were issued. The revocable permits are issued by the BLNR and administered by the Department of Land and Natural Resources' (DLNR) Land Division.

Table 1. License Areas and Final Lease Before Conversion to Revocable Permits

License Area	General Lease Number	Term
Nāhiku	GL 3505	1955-1976
Ke‘anae	GL 3349	1950-1971
Honomanū	GL 3695	1962-1986
Huelo	GL 3578	1960-1981

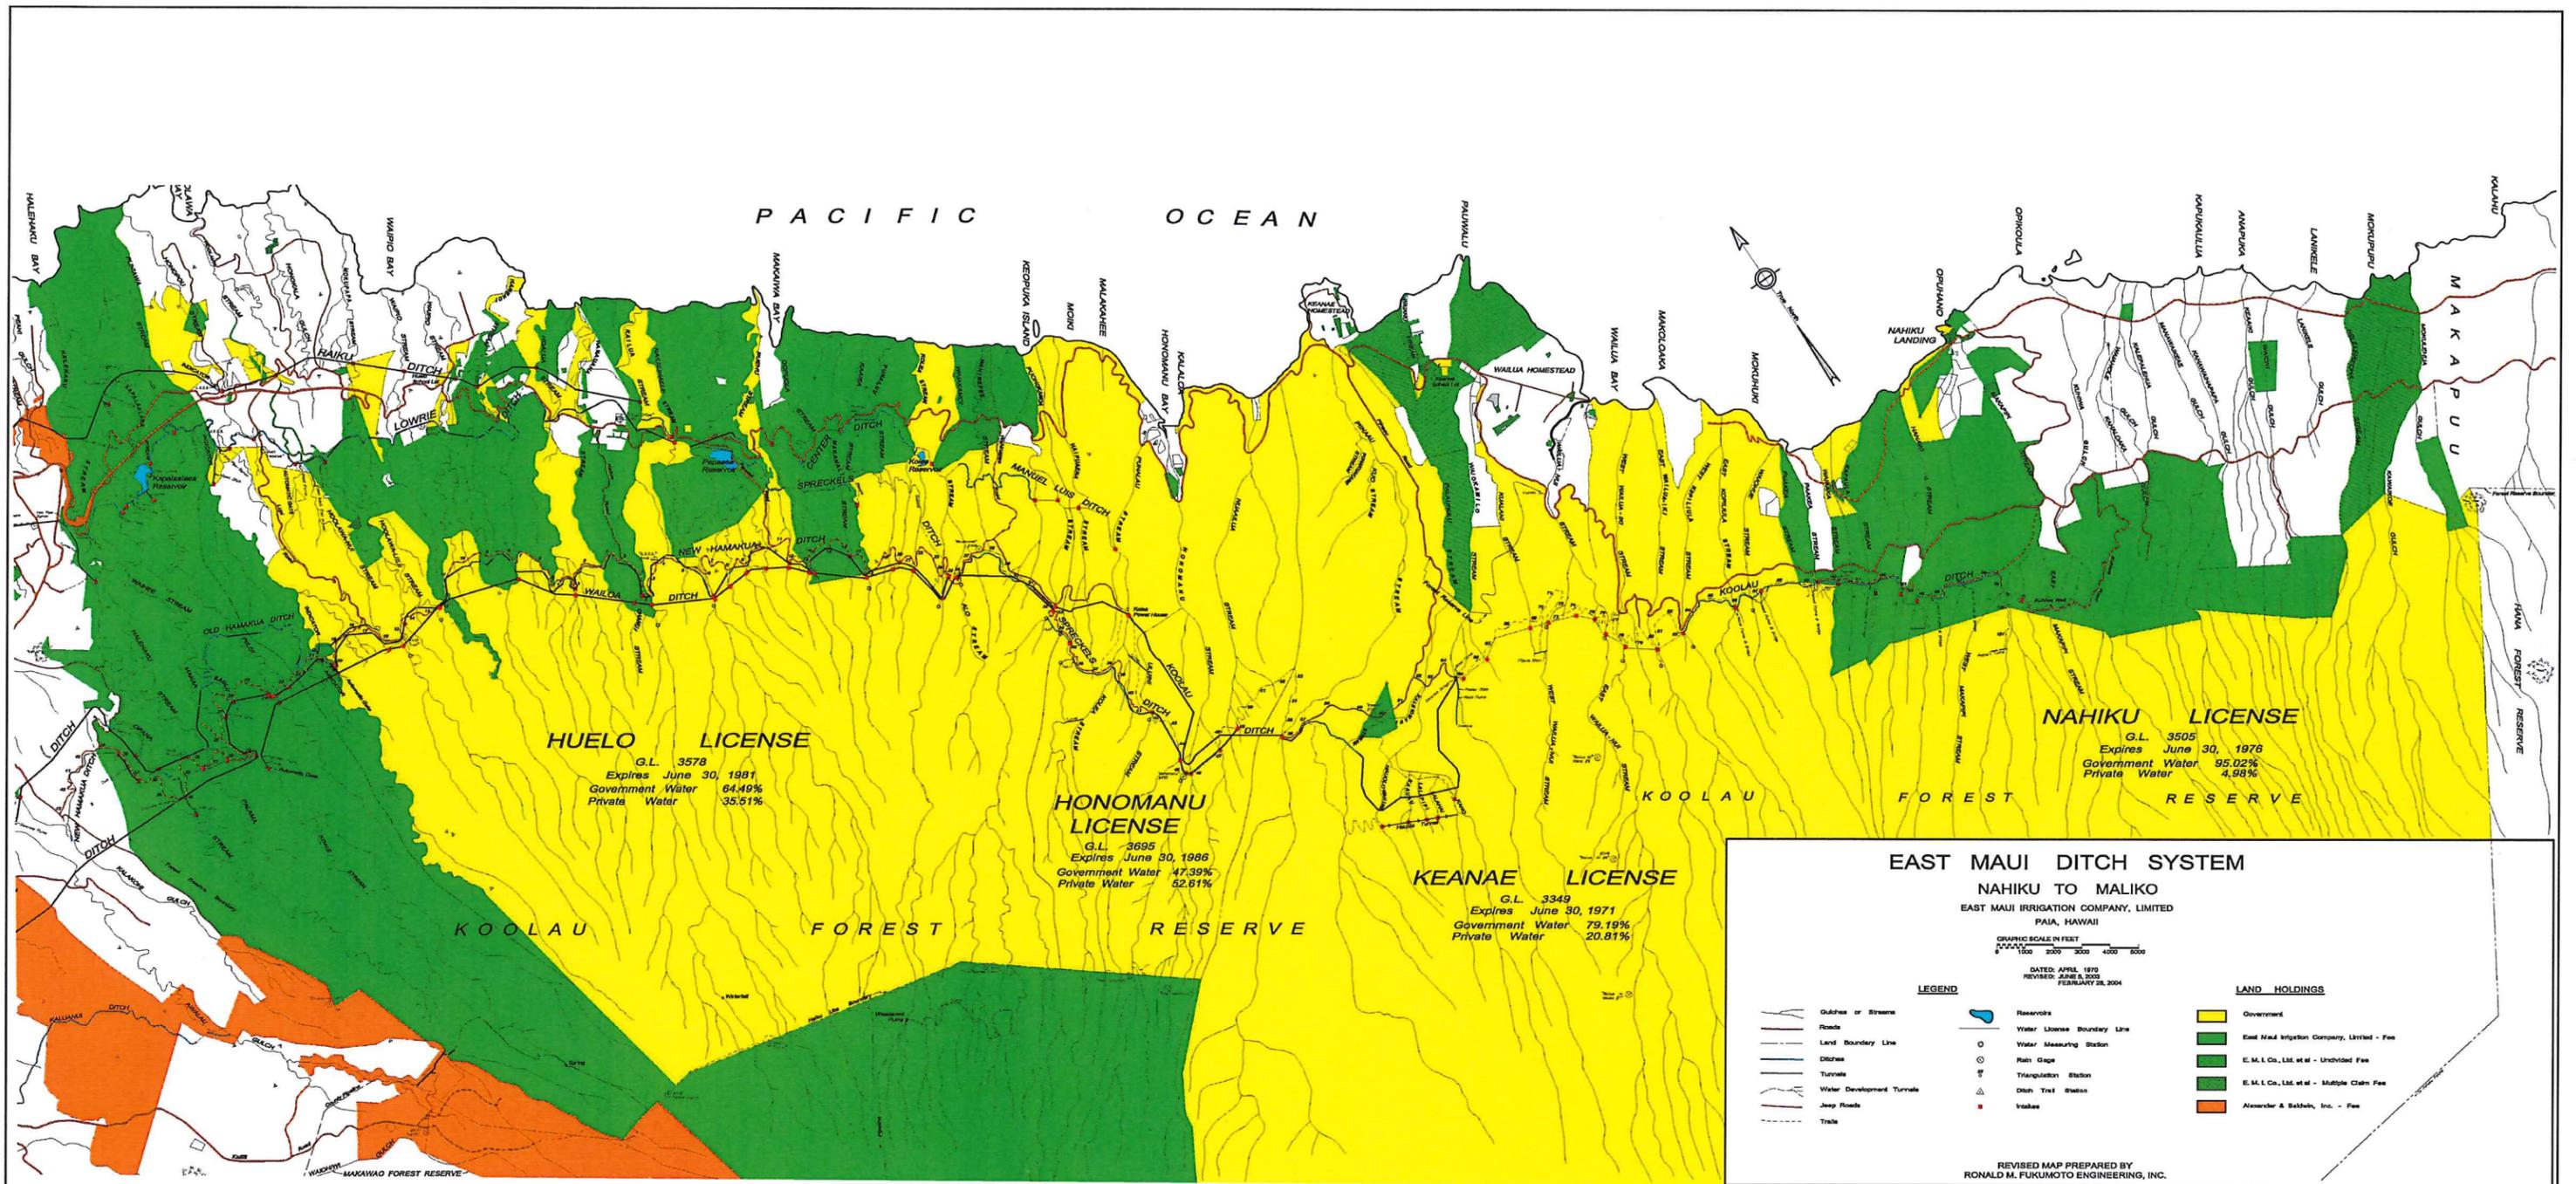

The location of the four (4) license areas are illustrated in **Figure 1** and described in **Table 2** below.

Table 2. License Areas

License Area	Tax Map Key	Area	Revocable Permit No.
Nāhiku	(2)1-2-04:05, 07	10,111.220 acres, more or less	S-7266
Ke‘anae	(2)1-1-02:02 (por.)	10,768.000 acres, more or less	S-7265
Honomanū	(2)1-1-001:44	3,381.000 acres, more or less	S-7263
Huelo	(2)1-1-001:05 (2)2-9-014: 01, 05, 11, 12, 17	8,752.690 acres, more or less	S-7264

As noted previously, the A&B Lease Application was filed with the BLNR in May 2001, seeking a long-term, 30-year lease rather than continuing with year-to-year revocable permits. Shortly thereafter, Na Moku Aupuni O Koolau Hui, Inc. (“Na Moku”) and Maui Tomorrow requested a contested case hearing, with Native Hawaiian Legal Corporation (NHLC) filing on behalf of petitioners Na Moku, Elizabeth Lapenia, Beatrice Kekahuna, and Marjorie Wallett. (In May 2007, Elizabeth Lapenia withdrew from the case and is no longer represented in it.) Concurrently, the Petitioners filed with the Commission on Water Resources Management (CWRM) a Petition to Amend the Interim Instream Flow Standard (IIFS) for 27 Streams in East Maui.

CWRM has not issued a final decision on the IIFS for the 27 streams, which is the subject of a contested case proceeding. The BLNR has not reconvened the contested case hearing for the A&B Lease Application pending the outcome of the IIFS proceedings.

C. STREAMS WITHIN LICENSE AREAS

There are 40 streams within the four (4) license areas. Of these 40 streams, A&B currently diverts water from 36 of these streams, but is in the process of permanently abandoning all of its diversions on and restoring water to five (5) of these 36 streams. In light of this restoration action, A&B requests to continue to divert water from 31 streams. See **Table 3**. The EIS shall assess the impacts of the “*right, privilege, and authority to enter and go upon*” the license areas “*for the purpose of developing, diverting, transporting, and using government-owned waters*” for the 31 streams.

Table 3. License Area Streams

License Area	No.	Stream Name	Subject to Petition to Amend IIFS?	Notes on Diversion
Nahiku License Revocable Permit No. S-7266	1	Makapipi	Yes	
	2	Hanawi	Yes	
	3	Kapaula	Yes	
Keanae License Revocable Permit No. S-7265	4	Waiaaka	Yes	
	5	Paakea	Yes	
	6	Puakea	No

	10	East Wailua-iki	Yes	
	11	West Wailua-iki	Yes	
	12	East and West Wailuanui	Yes	Planned for full and permanent restoration
	13	Waikani*	Yes	Not diverted
	14	Kualani	Yes	Not diverted (stream is tributary of Waiokamilo)
	15	Waiokamilo	Yes	Fully restored in 2007
	16	Palauhulu	Yes	Planned for full and permanent restoration
	17	Waianu/Ohia	Yes	Not diverted
Honomanū License - Revocable Permit No. S-7263	18	Piinaau	Yes	Planned for full and permanent restoration
	19	Nuaailua	Yes	
	20	Honomanū	Yes	
	21	Kolea/Punalau	Yes	
Huelo License	22	Haipuaena	Yes	
	23	Puohokamoa	Yes	

License Area	No.	Stream Name	Subject to Petition to Amend IIFS?	Notes on Diversion
Revocable Permit No. S-7264	24	Wahinepee	Yes	
	25	Alo	Yes	
	26	Waikamoi	Yes	
	27	Kolea	No	
	28	Punaluu	No	
	29	Kaaiea	No	
	30	Oopuola	No	
	31	Puehu	No	
	32	Nailiilihaele	No	
	33	Kailua/Ohanui	No	
	34	Hanauana	No	
	35	Hoalua	No	
	36	Puolua/Hanehoi	Yes	Planned for full and permanent restoration
	37	Waipio	No	
	38	Mokupapa	No	
	39	Hoolawa-Liili/Hoolawa-Nui	No	
40	Honopou	Yes	Planned for full and permanent restoration	
* Waikani is listed on this table because a Petition to amend the IIFS for Waikani has been filed. Waikani, however, is a waterfall on the Wailuanui Stream.				

D. FORMAT FOR DOCUMENTING THE EIS SCOPE OF WORK

The EIS scope of work described in this report reflects the process-oriented nature of Chapter 343, HRS environmental review documents. Therefore, while the scope of work presented herein seeks to be as comprehensive as possible in terms of defining actions to be managed and implemented by the EIS preparer, input received from agencies, organizations, and the public during various phases of document preparation and review may be recognized and incorporated into the EIS by the EIS preparer and Accepting Authority.

The EIS scope of work presented in this report addresses topic areas consistent with the BLNR's order and is organized by section headings, as summarized in **Table 4**.

Table 4. Summary of Report Organization

Report Chapter	Subject Matter
Chapter II	Scope of Work for the EIS Preparation Notice (EISPN) and Attendant Consultation/Scoping Process
Chapter III	Scope of Work for the Preparation of the Draft EIS
Chapter IV	Scope of Work for the Preparation of the Final EIS
Chapter V	Preliminary Time Schedule for the EIS Process

**II. SCOPE OF WORK FOR THE
ENVIRONMENTAL IMPACT
STATEMENT PREPARATION
NOTICE (EISPN) AND
ATTENDANT
CONSULTATION/SCOPING
PROCESS**

II. SCOPE OF WORK FOR THE ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE (EISPN) AND ATTENDANT CONSULATION/SCOPING PROCESS

A. ENVIRONMENTAL IMPACT STATEMENT PREPARATION NOTICE DEFINING THE PROPOSED ACTION

The preparation of the Draft and Final EIS documents is guided by the provisions of Hawaii Administrative Rules (HAR), Title 11, Department of Health, Chapter 200, Environmental Impact Statement Rules. The initial document preparation phase of the EIS process is the preparation of the EIS Preparation Notice (EISPN). The EISPN addresses the content requirements of an Environmental Assessment and serves as a mechanism for soliciting early input from agencies, citizen groups and individuals. In this instance, comments received on the EISPN would serve to identify key issues which would be addressed in the Draft EIS and Final EIS.

The EISPN will identify the proposed action to be assessed during the EIS process. In this case, the proposed action is a long-term 30-year lease for the *“right, privilege, and authority to enter and go upon”* the license areas *“for the purpose of developing, diverting, transporting, and using government-owned waters”* from the 31 streams in the Nāhiku, Ke‘anae, Honomanū, and Huelo license areas. The lease will not allow more water to be diverted than allowed by the IIFS decisions, currently pending before the CWRM, and as may be further modified in the future.

As noted previously, the petition to amend the IIFS for 27 streams is pending with the CWRM. Pursuant to a court ruling made in response to the appeal of a 2003 BLNR decision in the contested case hearing for the A&B Lease Application, the BLNR may wait for the CWRM to act on the IIFS petitions and rely on CWRM’s determination as to the minimum instream flows necessary to protect traditional and customary practices of native Hawaiians, rather than conducting its own independent investigation of these issues as part of the lease process. Any disposition of water by the BLNR in connection with the lease application would be subject to the amended IIFS established by CWRM. Accordingly, the environmental review process under Chapter 343, HRS cannot be properly completed until the CWRM issues a final decision on the petitions to amend the IIFS.

The timing of a final decision from the CWRM on the petitions to amend the IIFS is unknown. A preliminary time schedule for the EIS process as it relates to CWRM's decision on the petitions to amend the IIFS is discussed in Chapter V. As noted in Chapter V, there are some portions of the EIS process that may be undertaken prior to the CWRM decision on the amended IIFS while other tasks will require a decision from CWRM prior to EIS completion.

In the event the EISPN is published prior to the CWRM decision on the amended IIFS, the proposed action described in the EISPN shall state that the amount of water to be diverted will be dependent on the pending petitions to amend the IIFS and that the Draft EIS and supporting technical studies will assess the impacts of the water lease, taking into account the water availability set forth by the CWRM decision on amending the IIFS for the 27 streams. The EISPN should identify the parameters, such as the CWRM decision, that will define the proposed action that will be assessed in the Draft EIS.

B. IDENTIFICATION OF ISSUES TO BE ADDRESSED IN THE ENVIRONMENTAL IMPACT STATEMENT

Issues identification may not be limited to the EISPN review process, but may also include a public scoping process which may consist of meetings with interested and affected stakeholders. Issues identification may also be defined through review of testimony and filings with the CWRM. Other means of soliciting input for purposes of identifying issues to be addressed in the EIS document include review of testimony and documents associated with related water use matters affecting East Maui Streams. Irrespective of the method of identifying issues and concerns, the EIS preparer shall utilize best efforts to thoroughly identify issues which should be addressed in the EIS document.

It is noted that issues identification is a work element which is not limited to a specific phase of the EIS process (i.e., issues identification extends beyond the EISPN phase of work). For example, as technical studies are prepared and their respective findings are disclosed in the Draft EIS, comments on the studies may lead to new questions and comments which should be addressed in the Final EIS.

With respect to this EIS Scope of Work, an initial list of issue topics which are deemed appropriate for consideration in the EIS are summarized in **Table 5**. The issue categories and topics listed in **Table 5** follow, in part, the analytical framework for defining instream flow standards. It is expected that this list will be expanded once the EISPN and Draft EIS processes are initiated.

Table 5. Preliminary List of Issues to be Addressed in the EIS

Issue Category	Topics to be Addressed in EIS
Existing Conditions	<ul style="list-style-type: none"> • Existing and Surrounding Land Use • Topography and Soil Characteristics • Climate • Hazardous Materials/Substances
Hydrogeology	<ul style="list-style-type: none"> • Groundwater Interaction • Surface-Water Flows
Fish/Wildlife Habitat	<ul style="list-style-type: none"> • Native Vertebrates • Invertebrates • Invasive Species • Abundance • Diversity • Distribution • Species Sustainability
Ecosystem Maintenance	<ul style="list-style-type: none"> • Estuaries • Wetlands • Riparian areas • Nearshore Waters
Water Quality	<ul style="list-style-type: none"> • Water Quality Standards • Total Maximum Daily Load
Natural Hazards	<ul style="list-style-type: none"> • Flooding • Tsunami Exposure
Historic Resources	<ul style="list-style-type: none"> • Archaeology • Cultural Resources
Hawaiian Rights	<ul style="list-style-type: none"> • Traditional and Customary Rights and Practices • Taro Cultivation • Appurtenant Rights
Non-Instream or End Uses of Diverted Water	<ul style="list-style-type: none"> • Water Delivery Systems • Domestic/Municipal Use • Agricultural Uses • Agricultural Productivity • Present vs. Future Uses • Economic Impacts
Aesthetics	<ul style="list-style-type: none"> • Scenic Views
Recreation	<ul style="list-style-type: none"> • Swimming • Nature Study • Fishing • Hiking
Public Services	<ul style="list-style-type: none"> • Police • Fire • Medical Services
Economy	<ul style="list-style-type: none"> • Employment and Personal Income • Fiscal Impacts
Infrastructure	<ul style="list-style-type: none"> • Roadways • Wastewater Systems (Private and Municipal) • Water Systems (Private and Municipal)

Issue Category	Topics to be Addressed in EIS
	<ul style="list-style-type: none"> • Drainage System • Diversion Infrastructure • Other Utilities (Electrical, Communication)

C. PREPARATION OF THE EISPN DOCUMENT

The EIS preparer shall develop the EISPN in accordance with HAR, Title 11, Chapter 200, Sections 11-200-10 and 11-200-15. In this regard, the EISPN shall meet the requirements for content compliance, as summarized in **Table 6**.

Table 6. Summary of Content Requirements of the EISPN

HAR, Title II, Section 200 Reference	Content Requirement
11-200-10 (1)	Identification of applicant or proposing agency
11-200-10 (2)	Identification of approving agency, if applicable
11-200-10 (3)	Identification of agencies, citizen groups, and individuals consulted in making the assessment
11-200-10 (4)	General description of the action’s technical, economic, social, and environmental characteristics
11-200-10 (5)	Summary description of the affected environment, including suitable and adequate regional, location and site maps such as Flood Insurance Rate Maps, Floodway Boundary Maps, or United States Geological Survey topographic maps
11-200-10 (6)	Identification and summary of impacts and alternatives considered
11-200-10 (7)	Proposed mitigation measures
11-200-10 (8)	Agency determination or, for draft environmental assessments only, an anticipated determination
11-200-10 (9)	Findings and reasons supporting the agency determination or anticipated determination
11-200-10 (10)	Agencies to be consulted in the preparation of the EIS, if an EIS is to be prepared
11-200-10 (11)	List of all permits and approvals (State, federal, county) required

Inasmuch as the EISPN serves as notice that an EIS will be prepared and will be used as a scoping document, the content requirements set forth in **Table 6** will not be fully addressed. The EISPN document shall indicate, preliminarily, studies to be completed and issues to be analyzed in further detail in the Draft EIS.

D. CONSULTED PARTIES

The EIS preparer shall identify agencies, stakeholders, and community groups that will be consulted during the preparation of the EIS. The Office of Environmental Quality Control provides guidance on agencies and organizations that should receive copies of the Draft EIS and Final EIS. It is noted that A&B will be consulting with the Department

of Hawaiian Home Lands (DHHL) early in the process with respect to water reservations pursuant to Section 171-58(g), HRS, which states:

The department of land and natural resources shall notify the department of Hawaiian home lands of its intent to execute any new lease, or to renew any existing lease of water rights. After consultation with affected beneficiaries, these departments shall jointly develop a reservation of water rights sufficient to support current and future homestead needs. Any lease of water rights or renewal shall be subject to the rights of the department of Hawaiian home lands as provided by section 221 of the Hawaiian Homes Commission Act.

**III. SCOPE OF WORK FOR
THE PREPARATION OF THE
DRAFT ENVIRONMENTAL
IMPACT STATEMENT**

III. SCOPE OF WORK FOR THE PREPARATION OF THE DRAFT ENVIRONMENTAL IMPACT STATEMENT

A. DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS) CONTENT REQUIREMENTS

The EIS preparer shall prepare the Draft EIS in accordance with requirements set forth in Hawaii Administrative Rules (HAR), Title 11, Chapter 200, Section 11-200-16 and Section 11-200-17. Importantly, the Draft EIS “*shall fully declare the environmental implications of the proposed action and shall discuss all relevant and feasible consequences of the action.*”

Content requirements of the Draft EIS document are summarized in **Table 7**.

Table 7. Summary of Content Requirements of the Draft EIS

HAR, Title 11, Section 200 Reference	Content Requirement Summary
11-200-17(b)	Draft EIS Summary Sheet
11-200-17(c)	Table of Contents
11-200-17(d)	Statement of Purpose and Need
11-200-17(e)	Project Description
11-200-17(f)	Alternatives to the Proposed Action
11-200-17(g)	Description of the Environmental Setting
11-200-17(h)	Relationship of the Proposed Action to Land Use Plans, Policies and Controls
11-200-17(i)	Discussion of Probable Impacts
11-200-17(j)	Relationship between Local Short-Term Uses of the Environment and Maintenance/Enhancement of Long-Term Productivity
11-200-17(k)	Description of Irreversible and Irrecoverable Commitments of Resources
11-200-17(l)	Discussion of Probable Adverse Environmental Effects
11-200-17(m)	Discussion of Mitigation Measures to Address Adverse Impacts
11-200-17(n)	Summary of Unresolved Issues
11-200-17(o)	Listing of Governmental Agencies, Organizations and Individuals Consulted in Preparing the Draft EIS
11-200-17(p)	Comments Received and Responses Made During the Consultation Process

With respect to the Draft EIS's section on "Alternatives to the Proposed Action" (Section 11-200-17(f)), the EIS preparer shall consider the outcome of the CWRM's decision on the IIFS. While the decision of the CWRM on the IIFS will dictate the framework for conducting the analysis of alternatives in the EIS, the EIS preparer shall nonetheless, examine, at a minimum, the "No Diversion Alternative", among others.

With respect to the Draft EIS's section on "Relationship of the Proposed Action to Land Use Plans, Policies, and Controls" (Section 11-200-17(h)), the EIS preparer shall, at a minimum, consider the following:

- Hawaii State Plan
- Hawaii State Functional Plans
- Hawaii State Land Use Designations
- Maui Countywide Policy Plan
- Maui Island Plan

- County of Maui Zoning
- Hawaii Coastal Zone Management Program

B. ELEMENTS OF THE DRAFT EIS REQUIRING CWRM DECISION ON INTERIM INSTREAM FLOW STANDARDS

In preparing the Draft EIS, the EIS preparer shall consider those environmental, socio-economic, public services and infrastructure parameters for which the CWRM's decision to amend the IIFS is needed. For those elements requiring a CWRM decision, the completion of the Draft EIS will be deferred until such decision is rendered. **Table 8** summarizes, preliminarily, parameters to be analyzed in the Draft EIS, and identifies those elements for which a CWRM decision on the IIFS is required.

Table 8. Preliminary List of Draft EIS Issues and Dependency on CWRM Decision on IIFS

Issue Category	Topics to be Addressed in EIS	CWRM Decision Required to Complete EIS Analysis?
Existing Conditions	Existing and Surrounding Land Use	No
	Topography and Soil Characteristics	No
	Climate	No
	Hazardous Materials/Substances	No
Hydrogeology	Groundwater Interaction	Yes
	Surface-Water Flows	Yes
Fish/Wildlife Habitat	Native Vertebrates	Yes
	Invertebrates	Yes
	Invasive Species	Yes
	Abundance	Yes
	Diversity	Yes
	Distribution	Yes
	Species Sustainability	Yes
Ecosystem Maintenance	Estuaries	Yes
	Wetlands	Yes
	Riparian areas	Yes
	Nearshore Waters	Yes
Water Quality	Water Quality Standards	Yes
	Total Maximum Daily Load	Yes
Natural Hazards	Flooding	Yes
	Tsunami Exposure	No
Historic Resources	Archaeology	No
	Cultural Resources	Yes
Hawaiian Rights	Traditional and Customary Rights and Practices	Yes
	Taro Cultivation	Yes
	Appurtenant Rights	Yes
Non-Instream or End Uses of Diverted Water	Water Delivery Systems	Yes
	Domestic/Municipal Use	Yes
	Agricultural Uses	Yes
	Agricultural Productivity	Yes
	Present vs. Future Uses	Yes
	Economic Impacts	Yes
Aesthetics	Scenic Views	Yes
Recreation	Swimming	Yes
	Nature Study	Yes
	Fishing	Yes
	Hiking	No

Issue Category	Topics to be Addressed in EIS	CWRM Decision Required to Complete EIS Analysis?
Public Services	Police	No
	Fire	No
	Medical Services	No
Economy	Employment and Personal Income	Yes
	Fiscal Impacts	Yes
Infrastructure	Roadways	No
	Wastewater Systems (Private and Municipal)	No
	Water Systems (Private and Municipal)	Yes
	Drainage System	No
	Diversion Infrastructure	Yes
	Other Utilities (Electrical, Communication)	No

In addition to the assessment parameters listed in **Table 8**, the EIS preparer shall undertake an analysis of cumulative and secondary impacts. Cumulative impact is defined as:

The impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

A secondary impact is defined as:

Effects which are caused by the action and are later in time or farther removed in distance, but are still reasonable foreseeable. Indirect effects may include growth inducing effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems. Including ecosystems.

In the context of the water lease request, secondary impacts of the noninstream uses of the diverted water should also be assessed. For example, future County domestic and agricultural water demands needed to implement anticipated growth pursuant to the Maui Island Plan may be viewed as an impact “later in time” or “further removed in distance”, but still reasonably foreseeable.

C. TECHNICAL STUDIES TO BE INCORPORATED IN THE EIS

Specific topics to be addressed in the EIS may require specialized studies to ensure that current conditions, impact analysis and proposed mitigation measures are appropriately considered by qualified specialists in their respective fields of study. Such specialists, for example, may include biologists, hydrologists, archaeologists, engineers, cultural specialists, and economists. The foregoing list of specialists are not exhaustive. For this reason, the EIS preparer shall assess the issues identified, as described previously, to determine whether specific technical studies are needed to address current conditions, analysis of impacts and potential mitigation measures.

With respect to the EIS for the lease application submitted by A&B, relevant studies which have been previously completed, are summarized in **Table 9**.

Table 9. Technical Studies Previously Completed Which Hold Relevance to the EIS Scope of Work

Instream Flow Standard Assessment Reports prepared for: Honopou, Hanehoi, Piinaau, Waiokamilo, Waialuanui, Waikamoi, Puohokamoa, Haipuaena, Punalau, Honomanu, Nuaailua, Ohia, West Wailuaiki, East Wailuaiki, Kopiliua, Waiohue, Paakea, Waiaaka, Kapaula, Hanawi, and Makapipi streams
D. SWCA Environmental Consultants Studies	
1.	John I. Ford, Steven W. Carothers, Robert A. Kinzie III, <i>Status of Native Hawaiian Macrofauna in East Maui Streams and Biological Considerations For the Amendment of Interim Instream Flow Standards in Selected Streams (IIFS)</i> , SWCA White Paper, June 2009
E. Cultural Studies	
1.	County of Maui Planning Department, <i>Kalo Kanu O Ka'āina: A Cultural Landscape Study of Ke'anae and Wailuanui, Island of Maui</i> , July 1995
2.	Kepā Maly and Onaona Maly, <i>Wai O Ke Ola: He Wahi Mo'olelo No Maui Hikina</i> , 2002

The EIS preparer shall review the technical studies listed in **Table 9**, as well as other studies which may hold relevance to the EIS process. The EIS preparer shall determine whether the studies are current and whether they appropriately address the issues identified. Additionally, the EIS preparer shall determine whether other technical studies should be undertaken to ensure that proper analysis of issues are completed.

Preliminarily, **Table 10** provides a listing of additional technical studies which may be deemed warranted for the EIS.

Table 10. Additional Technical Studies to Support the EIS

Study	Consultant/Expert	CWRM Decision Required to Complete Technical Study? ^a
Biological Resources Survey	Biologist	Yes
Water Quality Study	Environmental Consultant	Yes
Surface and Groundwater Hydrology Assessment	Hydrologist	Yes
Agricultural Impact Assessment	Agricultural Economist	Yes
Archaeological Inventory Survey or Assessment	Archaeologist	No
Cultural Impact Assessment	Cultural Resources Expert	Yes
Diversion Infrastructure Assessment	Civil and/or Structural Engineer	Yes
Economic Impact Analysis	Economist	Yes
^a Where appropriate, preliminary work may be initiated for the foregoing studies, but completion of the studies would require CWRM's IIFS decision.		

Again, the full range of technical studies required for the EIS will be determined upon completion of the EISPN. The scope of analysis for each of the preliminarily identified studies listed in **Table 10** will need to be developed to address issues and concerns documented through the EISPN and related scoping efforts. For example, to the extent that the cultural reports previously prepared may have not addressed specific issues raised by comments to the EISPN, additional cultural impact analysis would be warranted. If the EIS preparer and cultural specialist determine that a newly prepared Cultural Impact Assessment is needed based on issues raised, then such new report would be prepared and incorporated in the Draft EIS.

**IV. SCOPE OF WORK FOR
THE PREPARATION OF THE
FINAL ENVIRONMENTAL
IMPACT STATEMENT**

IV. SCOPE OF WORK FOR THE PREPARATION OF THE FINAL ENVIRONMENTAL IMPACT STATEMENT

The Final EIS shall be prepared in accordance with Hawaii Administrative Rules (HAR), Title 11, Chapter 200, Section 11-200-18. In summary, the EIS preparer will incorporate in the Final EIS, the following:

- The Draft EIS will be revised to incorporate substantive comments received during the consultation and review process.
- Reproduction of all letters received containing substantive questions, comments or recommendations.
- A list of persons, organizations, and public agencies commenting on the Draft EIS.
- The responses of the applicant or proposing agency to each substantive question, comment, or recommendation received in the review and consultation process.

Additionally, the EIS preparer shall prepare the Final EIS in a format which allows the reader to easily distinguish changes made to the text of the Draft EIS.

**V. PRELIMINARY TIME
SCHEDULE FOR THE
ENVIRONMENTAL IMPACT
STATEMENT PROCESS**

V. PRELIMINARY TIME SCHEDULE FOR THE ENVIRONMENTAL IMPACT STATEMENT PROCESS

A. OVERALL TIMEFRAME FOR THE PREPARATION AND PROCESSING OF THE ENVIRONMENTAL IMPACT STATEMENT

The overall timeframe for the preparation and processing of the EIS will, in part, depend on when the CWRM issues its decision with respect to the Petitions to Amend the IIFS. In this regard, two (2) timeline scenarios for the EIS preparation and processing have been developed. The scenarios presented herein are not intended to obligate the EIS preparer to complete the process within the timeframes noted. They are however, intended to provide project stakeholders a general understanding of tasks and milestones which govern the overall process timeline.

Two (2) timelines scenarios presented are as follows:

- **Scenario 1:** Timeline Assuming the CWRM Completes IIFS Decision-Making before the EIS Process is Initiated
- **Scenario 2:** Timeline Assuming the CWRM Completes IIFS Decision-Making after the EIS Process is Initiated

The formulation of the two (2) timeline scenarios assumes that there would be no appeal filed on the CWRM's decision. If an appeal is filed on the IIFS decision, the timeline scenarios would be based on the final IIFS decision once the appeal process has been completed.

1. Scenario 1 Timeline: Assumes CWRM Completes IIFS Decision-Making Before EIS Process is Initiated

The Scenario 1 Timeline is presented in **Figure 2**. The "Task" column in **Figure 2** reflects the major action items and milestones in the EIS preparation process. The "Months from Start" row at the top of the timeline indicates the estimated number of months associated with each of the tasks. The number of months assigned to each task is a best estimate only, but is considered reasonable in the context of the Chapter 343, HRS process. It is noted that the timeline presented is

Task	Dependent on CWRM Decision	Months from Start																					
		1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22

CWRM DECISION ON IIFS - PRIOR TO INITIATION OF EIS PROCESS

Source: Munekiyo Hiraga

Figure 2 Proposed Lease for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas
 Scenario 1: CWRM Decision On IIFS Occurs Before the EIS Process Has Been Initiated

intended to be illustrative of the general process and would be further defined through the EIS process. For example, the specific technical studies and time required to prepare each would be defined by the EIS preparer and qualified technical consultant.

As noted above, Scenario 1 assumes that the CWRM completes its IIFS decision-making before the EIS process is started. Therefore, all of the technical studies which would be undertaken in support of the EIS can be initiated at the outset of the EIS preparation process. Under this scenario, the total duration to commence and complete the EIS is approximately 22 months.

2. **Scenario 2 Timeline: Assumes CWRM Completes IIFS Decision-Making After the EIS Process is Initiated**

The Scenario 2 Timeline is presented in **Figure 3**. The timeline's format is similar to Scenario 1, with the exception that the schedule is bifurcated as follows:

- Actions/milestones of the EIS which can be completed prior to the CWRM's decision-making on the IIFS
- Actions/milestones of the EIS which would be completed after the CWRM's decision-making on the IIFS.

The red vertical bar in the schedule reflects the undetermined time wherein the CWRM's decision on the IIFS is pending. Once the CWRM's action on the IIFS is completed, the EIS process can resume. Under this scenario, about eight (8) months of EIS work can be initiated before work would stop, pending the CWRM's decision. Once the CWRM completes its decision-making on the IIFS, an additional 19 months of work is estimated. If the CWRM decision occurs during the initial eight (8) months of EIS processing, the technical studies dependent on the CWRM decision can be initiated sooner.

As noted previously, the timeline is intended to be illustrative of the overall process and details with respect to the time required to prepare the technical studies and which studies (or portions thereof) would be initiated prior to the CWRM decision would be made by the EIS preparer and technical consultants.

It is noted that depending on the timeframe in which the CWRM IIFS decision is issued, there may be circumstances where some of the EIS work and technical studies undertaken prior to the IIFS decision may need to be reexamined or updated (i.e., if the IIFS decision takes longer than anticipated/assumed which impacts the applicability of the findings of the studies).

The variance in time between Scenario 1 and Scenario 2 is attributed to the unknown timeframe in which the IIFS decision will be made and the assumption that there will be EIS technical studies which cannot be initiated or completed until after the CWRM's IIFS decision process is completed.

3. **Timeline Qualifications**

The timelines presented for Scenario 1 and Scenario 2 represent a best estimate based on general parameters for EIS processing. The illustrative timelines assume that the EIS preparer and the DLNR will coordinate and resolve issues that may arise during the preparation and processing of the EIS in a timely manner. However, it is noted that there are several factors that can influence the timeline. Such factors may include:

- Significant comments from agencies, stakeholders, or members of the public during the review of the EISPN or Draft EIS that require additional coordination or the need for additional technical studies
- Findings from technical studies that lead to new questions or comments which should be addressed in the Final EIS
- The decision of HC&S to transition away from sugar cane cultivation may affect the overall timeline for the EIS. The repurposing of lands currently used for sugar cane production to alternative agricultural uses should be considered as part of the EIS's analysis of "non-instream or end uses of diverted water" section. Accordingly, the overall EIS timeline may be affected pending A&B's determination of alternative agricultural end use plans.

4. **Pre-EIS Time Requirements**

While **Figure 2** and **Figure 3** provide general guidance with regard to timeline parameters for the EIS, additional time which should be considered in the overall process is the time required for the procurement of the EIS consultant and qualified subconsultants required to prepare the various technical studies. The

procurement process and timeline has not yet been determined. However, a reasonable estimate of time to complete this pre-EIS phase of the process is 3 to 4 months.

**ORDER FOR A&B TO COMMENCE THE ENVIRONMENTAL REVIEW
PROCESS AND DEFERRING DECISION ON PETITIONERS' MOTION TO
ESTABLISH SCOPE OF RECONVENED CONTESTED CASE PROCEEDINGS**

On January 9, 2015, Petitioner Nā Moku Aupuni O Ko'olau Hui (Nā Moku) filed a Motion to Establish Scope of Reconvened Contested Case Proceedings (Petitioner's Motion). Alexander & Baldwin, Inc. and East Maui Irrigation Company, Ltd. (collectively A&B) filed a Memorandum in Opposition to Petitioner's Motion to Establish Scope of Reconvened Contested Case Proceedings on March 27, 2015. Petitioners filed a Supplemental Memorandum in Support of Motion to Establish Scope of Reconvened Contested Case Proceedings on March 27, 2015. A&B filed a Response to Petitioners' Supplemental Memorandum in Support of Motion to Establish Scope of Reconvened Contested Case Proceedings on April 10, 2015. Nā Moku filed a Reply in Support of Petitioner's Motion to Establish Scope of Reconvened Contested Case Proceedings on April 10, 2015.

The Board of Land and Natural Resources (Board) held oral arguments on Petitioner's Motion on May 8, 2015. During the oral argument, Nā Moku agreed to withdraw its objection to A&B doing an environmental assessment, which objection had originally been asserted at the May 25, 2001 meeting of the Board. The parties also agreed that the Board would defer decision making on the motion until further notice and to facilitate discussion between the parties regarding the lawsuit pending in circuit court¹ (2015 lawsuit) and an environmental assessment.

¹ *Carmichael, et al., v. Board of Land and Natural Resources, et al.*, Civ. No. 15-1-0650-04 RAN.

On June 15, 2015, the parties submitted a status report to the Board regarding the initiation of discussions between the parties. Nā Moku re-confirmed the withdrawal of its objection to A&B preparing the environmental review documents in connection with its application for a lease. The parties also agreed on a framework for initiating work on the environmental review process. The parties were still in discussion regarding the disposition of the 2015 lawsuit. Nā Moku was to request the BLNR to defer action on Petitioner's Motion while the parties continue discussions on beginning the environmental review process prior to the Commission on Water Resource Management's (CWRM) final decision on the petitions to amend interim instream flow standards (IIFS) in east Maui. No further filings were received from the parties.

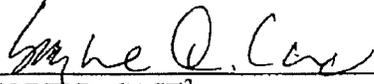

Petitioner's Motion argued that the contested case should be reconvened for the Board to require the timely preparation of an environmental assessment to disclose the impacts of the diversion of water from the four license areas (Honomanu, Keanae, Huelo and Nahiku) pursuant to revocable permits S-7263 (Honomanu), S-7264 (Huelo), S-7265 (Keanae) and S-7266 (Nahiku). Petitioner's Motion also urged to Board to reconvene the contested case in order for the Board to address its obligations pursuant to Hawaii Revised Statutes chapter 171.

During oral argument it became apparent that the key issue was the commencement of the environmental review process. Based on the records in this case and the argument presented to the Board, the Board orders A&B to commence the environmental review process in support of A&B's application for a lease of water from the license areas of Honomanu, Keanae, Huelo and Nahiku. The Board will defer decision making on Petitioner's Motion at this time.

Within sixty (60) days of this order A&B must provide to the Board a scope of work for the preparation of an environmental assessment or an environmental impact statement. The scope of work should distinguish those portions that can be undertaken prior to CWRM's final

decision on the petitions to amend IIFS in east Maui from those that require a decision from the CWRM prior to completion.² The scope of work should address, at a minimum, the content requirements contained in Hawaii Administrative Rules § 11-200-10 for an environmental assessments or § 11-200-17 for an environmental impact statement. Accompanying the scope of work should be a tentative schedule for commencement and completion of the various portions of the scope of work.

SO ORDERED this 14th day of April, 2016.

SUZANNE D. CASE³
Presiding Officer
Board of Land and Natural Resources

² The Board notes that on January 5, 2016 A&B announced that it would be transitioning out of farming sugar and would instead pursue a diversified agricultural model for its HC&S plantation on Maui. To the degree that the decision to transition away from sugar cane cultivation affects the ability of or timing for A&B to complete portions of the environmental review documents that should be noted in the scope of work.

³ The Board members have delegated authority to Suzanne Case to sign this Order on behalf of the Board.

Re: Comments on the A & B Water Lease Draft EIS

Dear Mr. Hirokawa & Mr. Matsukawa,

I am writing to you on behalf of myself and many other fishermen and gatherers from East Maui who either don't have time or don't have any kind words to say regarding the Draft EIS for the "proposed water lease for Nahiku, Ke'anae, Honomanu and Huelo areas."

My Father and Grandfather were fishing practitioners from East Maui. My Father taught us how to fish in the ocean. My Mother is a gatherer of opihi, limu, kupe'e, hihiwai and opae, like her parents taught them and they have taught us, now finally with the Opae, hihiwai & o'opu returning.

I am also writing to ask for an extension because by the time this 2700+ page draft eis reached Hana Library, almost 3 weeks had gone by. This may make most peoples comments seem like we're not addressing something because you may or may not have addressed it in another chapter.

However, the parts that I did read earlier in the book didn't address and please address this:

1. How will you address DHHL (Department of Hawaiian Home Lands) water needs in the future? Keanae and Hana has Hawaiian Home Lands and are planning to use them soon for 200 plus young families who need a place to live. Many are living with Parents or Grandparents.
2. What about Upper Nahiku? They are mostly on water catchment and some have mentioned not being able to maintain their water line soon due to age. There are many who can use County water or just water from their own streams.
3. When Hana builds more homes, taro patches, farms, there really should be water available from these streams or wells for the future of Hana. East Maui water should feed East Maui people first and foremost. You have no future plans to sustain East Maui in the future. Some families are moving, or thinking about moving home due to the fires in CA and other contiguous states.
4. It is not natural for water from rivers to cross lands horizontally. What should be done is letting the water go through its natural cycle to the ocean so all animal/sea life & river life can live and grow and sustain people.

5. Nowhere in the pages I was allowed to read in the short time allowed, did I see how the lack of water will affect Hana people. Hana still lives as the old days and with cost of living so high, rely on the ocean and streams to subsist their way of life. People here still rely on fishing, hunting and gathering in streams and the ocean. It's a way of life to survive the high cost of living here. The akule has returned since some streams were returned. Fish ponds are flourishing. Muliwai have more fish spawning. These fish migrate and their reaches are far. Hana people also gather opae, o'opu and hihiwai. Even though you mention speaking to Hana people, you never mention this. **THE MOKU OF HANA RELY ON THESE STREAMS RUNNING TO THE OCEAN AND BEING ABLE TO GATHER FOOD FROM THE RIVERS. WE ALSO HAVE WATERCRESS PATCHES HERE AND THERE THAT RELY ON THE STREAMS.**
6. We truly feel that the water should not be taken from East Maui, at least not with full consultation with the people of East Maui, who is your public, who the State is supposed to take care of. Please look it up in the Public trust doctrine.
7. Mahi Pono does not have a clear enough farm plan to warrant taking any water yet. The acreage it is farming is minimal and a normal water meter can feed enough water to the plants. I'm sure A & B didn't get rid of all of their water meters. Until such time as they show that there is a need for more, no water should be taken. We are all for farming and feeding our own people, but hear that most of the farmed food will be exported. Why, when we import over 80% of our produce? It makes no sense at all.
8. The lease, if any, should not run longer than 5 years. That gives them enough time to prove themselves, not more.

I hope you will take into consideration that what you are doing is ruining our way of life and killing our stream life and ocean sea food that we rely on to subsist our living and way of life in our remote town. We live and barter (exchange) food like the Hawaiians did in the old Ahupua'a system. Please reconsider.

Sincerely,

Earle Kuikahi Medeiros
Hana Resident

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Medeiros:

Thank you for comments dated November 4, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am writing to you on behalf of myself and many other fishermen and gatherers from East Maui who either don't have time or don't have any kind words to say regarding the Draft EIS for the "proposed water lease for Nahiku, Ke'anae, Honomanu and Huelo areas."*

My Father and Grandfather were fishing practitioners from East Maui. My Father taught us how to fish in the ocean. My Mother is a gatherer of opihi, limu, kupe'e, hihiwai and opae, like her parents taught them and they have taught us, now finally with the Opae, hihiwai & o'opu returning.

Response 1: We acknowledge your comments and understand that you are making comments on behalf of yourself as well as other fisherman and gatherers from East Maui who do not have time or any kind words regarding the Draft EIS. We also acknowledge your comment that opae, hihiwai and o'opu are returning. Please note that the updated Cultural Impact Assessment (CIA), Appendix F to the EIS, also notes that several commenters to the Draft EIS stated that they have observed an increase in fish returning to the nearshore coastal environments since the cessation of sugarcane operations in 2016. Section 7.5.2 of the CIA has been updated to include information in the analysis of cultural impacts, specifically in the analysis of impacts to

freshwater ecosystems, as summarized in Section 4.6 of the EIS. See pages 4-239 to 4-252 of the Final EIS. Any noticeable population increases of these stream species could be a result of less or, in some cases, no water being diverted from certain streams since sugar cultivation ceased in late 2016. However, it could also suggest that diverted streams may be benefitting from increased flows as a result of amended Interim Instream Flow Standards (IIFS) being implemented pursuant to the Commission on Water Resources Management (CWRM) Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O). Section 1.3.4 of the Draft EIS discusses CWRM D&O, its objectives, and the amended IIFS established for many streams in the License Area. Notably, the CWRM D&O ordered full restoration of 10 streams that were identified as valuable for traditional taro farming. The CWRM D&O also ordered partial restoration of several other streams in the License Area for habitat or biological purposes.

With respect to native stream species, Section 4.2.1 of the Draft EIS discusses the impacts that the Proposed Action (i.e., issuance of the long-term Water Lease) would have on native stream species, including opae, hīhīwai & ‘o‘opu, based on analysis in the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report provided as Appendix A of the EIS. Please note that Appendix A has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals’ habitats as summarized in Section 4.2.1 of the EIS. See pages 4-56 to 4-67 of the Final EIS. Under the Proposed Action, habitat units (HU) are expected to increase compared to historical diversion rates during sugarcane operations. However, as stated in Section 4.2.1 of the EIS, habitat units would decrease by approximately 36.1% when compared to a theoretical natural flow scenario where no water was diverted from the License Area (which is theoretical because even under the No Water Lease scenario, the EMI Aqueduct System would continue to divert 30% of the water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS requirements).

With respect to the nearshore coastal environment, Section 4.2.3 of the Draft EIS discusses the impacts the Proposed Action would have on coastal waters and nearshore environments based on the analysis in the East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry report provided as Appendix B of the EIS. As discussed in Section 4.2.3 of the EIS, the Proposed Action is not anticipated to have significant adverse impacts to the nearshore environment due to the intense mixing processes that occur the nearshore ocean in East Maui. Thus, because the nutrient concentrations in the ocean do not change substantially due to stream diversions as proposed under the Water Lease, there is no pathway for fishing to be negatively impacted.

Moreover, within the HSHEP model, estuarine reaches are defined as stream segments occurring below the one-meter elevation. Section 4.2.3 of the Final EIS has been revised to show that under these parameters, there are very little estuarine habitats present in the East Maui due to the steep terrain of the streams that flow from the License Area as shown in the pages 4-78 to 4-83.

Comment 2: *I am also writing to ask for an extension because by the time this 2700+ page draft eis reached Hana Library, almost 3 weeks had gone by. This may make most peoples comments seem like we're not addressing something because you may or may not have addressed it in another chapter.*

Response 2: Please note that there is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comments were received during the statutory comment period.

Regarding your comment about the Draft EIS being received by Hāna Public Library after publication, we originally sent one hard copy to the Wailuku Public Library as that is the most centralized location between East Maui, Upcountry Maui, and Central Maui. However, at the request of a County councilmember, two more hard copies were sent out; one to the Hāna Public Library and one to Maui County Council Office. Moreover, please note that pursuant to HAR § 11-200-21 a distribution list of reviewers needed to be approved by the State of Hawai'i Office of Environmental Quality Control (OEQC), which notified the reviewers of the availability of the Draft EIS. The distribution list included Federal, State, and County agencies, list of depositories, as well as organizations and individuals (who provided addresses) that participated in the early consultation and EIS Preparation Notice (EISPN) scoping meetings and commented on the EISPN. This list was provided as Table 9-2 in the Draft EIS. Hence, the Draft EIS was distributed in compliance with the required State process.

Comment 3: *However, the parts that I did read earlier in the book didn't address and please address this:*

How will you address DHHL (Department of Hawaiian Home Lands) water needs in the future? Keanae and Hana has Hawaiian Home Lands and are planning to use them soon for 200 plus young families who need a place to live. Many are living with Parents or Grandparents.

Response 3: The Draft EIS acknowledged the Department of Hawaiian Home Lands' (DHHL) plans in Ke'anae and the fact that DHHL has the right to seek a reservation of water. Section 2.1.1 of the Draft EIS states that:

The DHHL has previously secured from the CWRM the following reservations of groundwater:

- 3,000 gpd for Ke‘anae-Wailuānui
- 813,000 gpd for Kēōkea-Waiohuli
- 1,734,000 gpd for Pulehunui

Non-potable water needs for the DHHL’s lands in Ke‘anae-Wailuānui amount to 6,868,000 gpd. Although the DHHL holds a reservation for 3,000 gpd of potable water for this area for development over the next 20 years, another 7,000 gpd of potable water may be required for longer-term development. Thus, a potential reservation for this area amounts to 6,875,000 gpd. Ke‘anae is fed by Pi‘ina‘au and Palauhulu Streams; Wailuānui is fed by Wailuānui and Waiokomilo Streams. These four streams are, or will soon be, fully restored. The proposed Water Lease, therefore, would not be affected by such reservations of water for the DHHL.

DHHL lands in Hāna should not be impacted by the proposed Water Lease as the EMI Aqueduct System does not divert streams in the Hāna area. Makapiipi Stream marks the furthestmost eastern stream diverted by the EMI Aqueduct System.

Specific information regarding DHHL future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL’s Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd, as shown in pages 2-4 to 2-7. As explained in pages

2-4 to 2-7 of the Final EIS, the DHHL water reservation process involves several steps before a reservation amount is formally identified. The first step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following adoption of the Beneficiary Consultation Report and an authorization to the Chairman to seek a reservation of water by CWRM, CWRM could act on a reservation request related to a proposed lease. As explained in Section 2.1.1 of the Draft EIS, DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B/EMI, Mahi Pono, the DLNR's Land Division, and DHHL staff and consultants. The results of the Beneficiary Consultation were presented to the HHC on May 30, 2019, as agenda item G-2. The motion passed by the HHC to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation request was approved by the HHC related to the EMI Aqueduct System for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

Section 2.1.1 of the Draft EIS stated, with respect to the DHHL reservation, that "*Until that reservation is physically claimed, however, it will be available for use by the lessee.*" That statement has been clarified in the Final EIS as shown in pages 2-4 to 2-7, as it is uncertain whether the DHHL reservation amount would be available to the lessee until such time as it is needed by DHHL. Such temporary uses of the DHHL reservation water are not addressed under Hawai'i Revised Statutes (HRS) § 171-58. We further acknowledge that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessor and the DHHL would be necessary to allow any temporary use of water reserved for DHHL.

Comment 4: *What about Upper Nahiku? They are mostly on water catchment and some have mentioned not being able to maintain their water line soon due to age. There are many who can use County water or just water from their own streams.*

Response 4: Please note, the description of the Nāhiku water service in Section 2.1.3.3 of the Draft EIS has been revised to take into account clarifications from the County of Maui Department of Water Supply (MDWS), as shown in pages 2-21 to 2-22 of the Final EIS.

According to MDWS, EMI's West Makapipi Tunnel (Well No. 4806-07) (also known as the Nāhiku Tunnel) is the sole source of water for the MDWS Nāhiku Water Service Area. EMI developed and owns this development tunnel that is the source of the water and the Nāhiku Tunnel sources water from lands owned by EMI. Per a 1973 Memorandum of Understanding

with EMI and HC&S as amended, MDWS is able to draw up to 20,000 gallons of water per twenty-four hour day from the Nāhiku Tunnel to serve the Nāhiku community . Deliveries for the Nāhiku community have ranged between 8,345 (2018) to 40,925 (2007) gpd on an average daily basis (MDWS 2007-2018). EMI continues to deliver water to the Nāhiku community pursuant to an agreement that is premised upon EMI's continued receipt of water permits or a lease from the State BLNR. It is our understanding that the water serves 43 water meters located along Nāhiku Road below the Hāna Highway. One meter is classified as an agricultural use while all the others are classified as single-family use. According to the Draft Maui Island Water Use and Development Plan (March 2019, Updated July 2020), there is sufficient source to accept new meter service applications to meet future demands below the highway. However, the cost for water service, storage, and transmission would be borne by the meter applicant. Under the Proposed Action, this portion of Nāhiku would continue to receive water sourced from the Nāhiku Tunnel.

The portion of the Nāhiku community above Hāna Highway is not served by MDWS because there is insufficient difference in elevation between the Upper Nāhiku Tank and the residences to have adequate water pressure. In order to serve the community above Hāna Highway, MDWS would need to build a new reservoir at a higher elevation and a new pump, transmission line(s), and disinfection system would be required to service that reservoir. Also, a new distribution system of pipes from the reservoir to residences will be required. However, it is our understanding that MDWS has not proposed building such a system.

Comment 5: *When Hana builds more homes, taro patches, farms, there really should be water available from these streams or wells for the future of Hana. East Maui water should feed East Maui people first and foremost. You have no future plans to sustain East Maui in the future. Some families are moving, or thinking about moving home due to the fires in CA and other contiguous states.*

Response 5: Please note that none of the streams proposed for diversion under the Proposed Action (i.e., the East Maui streams listed in Section 1.3.4 of the Draft EIS), are situated in the Hāna area. Further, the EMI Aqueduct System does not extend to Hāna thus it cannot supply water to Hana, nor does the MDWS Upcountry Maui Water System (which is partially supplied by the EMI Aqueduct System) service Hāna. Hence, the Hāna region is not subject to assessment under the scope of this EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The Water Lease, which will be awarded by public auction, will enable the lessee to

enter upon State lands to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System for the delivery of water.

Regarding your comment about plans to sustain East Maui in the future, it is unclear what is specifically meant by this comment. However, as discussed in the EIS, HRS § 171-58(e) requires a watershed management plan in connection with a water lease. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically address identifying priority outcomes essential to maintain or restore biological integrity of the watershed. The goals of watershed management plans are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4.

Regarding your comment about feeding "East Maui people first and foremost", the IIFS established by the CWRM D&O returned a significant amount of water to East Maui streams, reducing the amount of water that can be diverted out of East Maui to almost half of what was being diverted when sugar was in cultivation. As a proposed use of this water, as described in the EIS, the Mahi Pono farm plan is anticipated to produce a significant amount of food for both local consumption and export, generating significant beneficial economic and fiscal impacts, providing numerous direct and indirect jobs, and State and County tax revenues that will benefit the people of Maui and the State generally, including East Maui residents.

Your comment that some people living in California and other states are thinking of moving home due to fires is acknowledged. As discussed in Section 4.7.1 of the EIS, the population of East Maui is expected to increase by 3.6% to 12,321 by the year 2035.

It is also noted that under the CWRM D&O, streams in East Maui identified for taro growing and community use were fully restored and will have no diversions. Furthermore, additional streams were ordered to have limited diversions to restore and increase habitat within the License Area.

Comment 6: *It is not natural for water from rivers to cross lands horizontally. What should be done is letting the water go through its natural cycle to the ocean so all animal/sea life & river life can live and grow and sustain people.*

Response 6: Your comments about the natural flow of water are acknowledged. It is generally known that flow from mountain to ocean can provide environmental benefits. The Proposed Action also provides environmental benefits and supports important priorities for the State, such as supporting local agriculture and food sustainability. As discussed in Section 5.1.4 of the EIS, the Proposed Action will support farming on the Central Maui agricultural lands owned by Mahi Pono, a majority of which have been designated as Important Agricultural Lands by the State of Hawai'i Land Use Commission and all of which are suitable for agricultural uses.

As discussed in Response #1 above, the HSHEP model was used to quantify the impacts of flow restoration on native stream animal habitat and to assist decision makers determine an appropriate balance between instream and offstream water uses. Based on the analysis provided by the HSHEP model, impacts to stream habitats and native amphidromous stream species are summarized in Section 4.2.1 of the EIS. Impacts to coastal waters and nearshore environments are summarized in Section 4.2.3 based upon the technical study that was included as Appendix B. Impacts to terrestrial flora and fauna, including threatened and endangered species, are summarized in Section 4.4 of the EIS based upon the technical study that was provided as Appendix C, and which has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS, as shown in pages 4-121 to 4-124 and pages 4-129 to 4-131.

Specifically, as it relates to impacts of flow restoration on native stream animal habitat, it is expected that the Proposed Action will decrease the total potential habitat units (HU) available for native stream species in the License Area to approximately 63.9%, which would theoretically exist under the Natural Flow (no diversion) scenario. However, please note that this has not existed for over a century. The simplest way to mitigate these impacts is to restore more stream flow. As it relates to impacts caused by diversions structures, note that diversion structures come in many shapes and sizes and some do not have the potential to cause significant impacts. Some diversions do have the potential to cause the impacts such as blocking a species migration upstream, entrainment of larvae, and facilitation of mosquito breeding in certain circumstances. As it specifically pertains to native species habitat: as long as the diversion does not divert water, change the natural channel pathway, create a barrier, and impound water, then the impacts will be limited as discussed in Appendix A. However, this needs to be assessed and evaluated on a case-by-case basis. CWRM will be looking at how specific diversions should be modified in the course of overseeing the implementation of its CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O for the Interim Instream Flow Standards (IIFS) proceedings on the East Maui streams. CWRM ordered in relevant part:

- i. It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.
- j. This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process.
- k. The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.

See CWRM D&O at p. 269.

Moreover, CWRM took aesthetic values and recreational activities into account when setting the IIFS. This is reflected in Findings of Fact (FOF) made by CWRM in the CWRM D&O as follows:

70. *When setting IIFS, the information that is considered in connection with aesthetic values such as waterfalls and scenic waterways is the presence of scenic views, waterfalls and whether there is tourism in the area.*

and

71. *Aesthetics is a multi-sensory experience related to an individual's perception of beauty. As a subjective value, aesthetics cannot be quantitatively determined. Elements, such as waterfalls and cascading plunge pools that appeal to an observer's visual and auditory senses.*

CWRM D&O, FOF 70, 71.

Numerous other FOF addressed the aesthetic values of the specific streams. With respect to recreational matters, CWRM found:

66. *When setting IIFS, the information that is considered in connection with the instream use of outdoor recreation activities is the presence of opportunities for swimming, nature study, fishing, boating, and parks.*

CWRM D&O, FOF 66.

67. *Streams are often utilized for water-based activities such as boating, fishing, and swimming, while offering added value to land-based activities such as camping, hiking, and hunting.*

CWRM D&O, FOF 67.

Please note that the diversions closer to the stream mouth have more impact than those farther from the stream mouth, some designs can entrain larvae or block passage more than other designs, and the amount of water passing is also important when quantifying impacts. The *Assessment of the Environmental Impact of Stream Diversions on 33 East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model* (May 27, 2019) prepared by Trutta Environmental Solutions, Inc. addresses all of these factors on a diversion by diversion basis.

The section entitled, “Diversion Assessments” of Appendix A of the EIS regarding the HSHEP model provides that entrainment is directly related to the proportion of water removed by a diversion. Section 4.2.1 of the Draft EIS discuss how both diversion structures themselves and the taking of water from streams can lead to entrainment, decreasing potential HU.

However, generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As mentioned above and discussed in Appendix A, as long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best.

Conversely, meeting the IIFS at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the water flowing into the diversion and back to the stream from another location in the diversion ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

For example, Diversion K-15 on West Kopili‘ula Stream was closed with 100% of the water flowing through the bypass and continuing downstream (See Figure 12 of Appendix A of the EIS). However, the physical diversion structure was still present. Immediately upstream of this diversion, numerous native stream animals were observed. 409 ‘ōpae kala‘ole (*Atyioda bisulcata*) and 5 ‘o‘opu alamo‘o (*Lentipes concolor*) were counted in the stream above the diversion in less than 200 m² of habitat sampled for the study included as Appendix A. Even though the physical diversion structure still exists, the stream flowed downstream uninterrupted

and no entrainment or barrier to movement is present. The native stream animals observed were using the habitat immediately upstream of the diversion. Because these animals climb upstream from the ocean, this shows that the physical diversion structure did not prevent the animals from using the area. This being said, if the diversion structure was partially removed to make sure that the bypass opening would not be blocked by debris, then it would almost guarantee that this physical structure would continue to have no or very minor impact on native stream species habitat. Please note that Section 4.2.1 of the Final EIS has been updated to include an expanded discussion regarding stream habitat and native species impacts related to entrainment as shown in pages 4-61 to 4-67.

In summary, altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns. In summary, diversions come in many configurations and sizes, and will have to be assessed individually. However, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat. Exact structure modification will need to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts. Also note that the physical act of removing diversion structures could generate adverse impacts in certain circumstances that would not occur if the structures were left in place.

Specifically, as it relates to sea life and the nearshore coastal environment, as discussed in Response #1 above, Section 4.2.3 of the Draft EIS discusses the impacts the Proposed Action would have on coastal waters and nearshore environments based on the analysis in the East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry report provided as Appendix B of the EIS. As discussed in Section 4.2.3 of the EIS, the Proposed Action is not anticipated to have significant adverse impacts to the nearshore environment due to the intense mixing processes that occur the nearshore ocean in East Maui. Thus, because the nutrient concentrations in the ocean do not change substantially due to stream diversions as proposed under the Water Lease, there is no pathway for fishing to be negatively impacted. Moreover, Section 4.2.3 has been updated to show that there is very little estuarine environment within East Maui below the streams being diverted as shown in pages 4-78 to 4-83.

Specifically, as it relates terrestrial flora and fauna, Appendix C (Terrestrial Flora and Fauna Technical Report) of the EIS that was prepared by SWCA included a survey of approximately

33,000 acres of land in East Maui referred to in the SWCA report as the “License Area” and approximately 30,000 acres of agricultural land in Central Maui that it referred to as the “Service Area.” These areas were collectively referred to as the “Study Area” throughout the SWCA report. Appendix C of the Draft EIS specifically addresses the flora and fauna considerations of the Proposed Action and alternatives. To minimize the impacts to flora and fauna in the License Area, Section 7 of Appendix C identifies several avoidance and minimization measures, including measures to avoid the introduction of additional invasive species to the License Area, which is harmful to the watershed and to native flora which are also reflected in Section 4.4 of the EIS. Please note that Appendix C and Section 4.4 of the Final EIS has been updated as shown in pages 4-121 to 4-124 and pages 4-129 to 4-131 to discuss how the Proposed Action would potentially impact the flora and fauna within the License Area on a watershed by watershed basis, using data produced by the HSHEP model and HIGAP data provided by state, along with surveys conducted within the region.

Comment 7: *Nowhere in the pages I was allowed to read in the short time allowed, did I see how the lack of water will affect Hana people. Hana still lives as the old days and with cost of living so high, rely on the ocean and streams to subsist their way of life. People here still rely on fishing, hunting and gathering In streams and the ocean. It’s a way of life to survive the high cost of living here. The akule has returned since some streams were returned. Fish ponds are flourishing. Muliwai have more fish spawning. These fish migrate and their reaches are far. Hana people also gather opae, o’opu and hihiwai. Even though you mention speaking to Hana people, you never mention this. THE MOKU OF HANA RELY ON THESE STREAMS RUNNING TO THE OCEAN AND BEING ABLE TO GATHER FOOD FROM THE RIVERS. WE ALSO HAVE WATERCRESS PATCHES HERE AND THERE THAT RELY ON THE STREAMS.*

Response 7: As mentioned previously, please note that none of the streams proposed for diversion under the Proposed Action (i.e., the East Maui streams listed in Section 1.3.4 of the Draft EIS), are situated in the Hāna region. None of the streams diverted by the EMI Aqueduct System are within the Hāna region, nor does the MDWS Upcountry Maui Water System (which is partially supplied by the EMI Aqueduct System) service Hāna. Therefore, to that extent, the Hāna region would not be affected by the Proposed Action as discussed in the Draft EIS. This includes subsistence gathering activities in undiverted streams as well as any watercress patches drawing water from those streams.

The Social Impact Assessment (SIA) provided as Appendix G to the EIS covered a study area, which is described in SIA Section 2.1.2, that included geographic regions that are directly affected by the Proposed Action. The study area included portions of the Hāna and Makawao

Districts. In the Hāna District, the Ke‘anae, Wailuānui and Nāhiku communities were included because they are situated below the Ke‘anae and Nāhiku portions of the License Area. Hāna Town, as represented in the Hāna Census Designated Place, or CDP, was not a focus because it is located outside of the License Area.

To the extent that you are discussing gathering activities in streams west of the Hāna region that were diverted by the EMI Aqueduct System, it is likely that there has been a greater abundance of species such as hīhīwai, opae and ‘o‘opu after the amount of water diverted was reduced with the end of sugar cultivation in Central Maui and pursuant to the CWRM D&O.

Your comment that akule have returned since some East Maui streams were restored is acknowledged, but if you are referring to streams in Hāna, a causal relationship is unlikely since the EMI Aqueduct System does not, and never has, diverted streams in Hāna. A stream and ocean water chemistry assessment was conducted by Sea Engineering, Inc. (SE) and Marine Research Consultants, Inc. (MRC) in 2018 (See Appendix B). The study concluded that the effects of stream water on marine waters is minor in these habitats, due to the physical processes associated with a relatively small input of stream water to the vastly larger ocean environment with continual wave energy and intense mixing. Thus, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species. Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species (‘O‘opu naniha (*Stenogobius hawaiiensis*), ‘O‘opu akupa (*Eleotris sandvicensis*) and ‘Ōpae ‘oeha‘a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi‘ina‘au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa‘akea will have connectivity flow restoration, while ‘O‘opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83.

Regarding your comment about reliance on streams and the ocean for subsistence, the Cultural Impact Assessment (CIA), and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action as shown in pages 4-171 to 4-239. Tables 14, 15 and 16 of the CIA (Appendix F to the EIS) inventory the cultural practices and resources identified through the EIS process.

Comment 8: *We truly feel that the water should not be taken from East Maui, at least not with full consultation with the people of East Maui, who is your public, who the State is supposed to take care of. Please look it up in the Public trust doctrine.*

Response 8: We acknowledge your comments. Please note that community consultation has been undertaken in connection with the preparation of the EIS. Chapter 9 of the EIS details the consultation efforts for the EIS, which started in November 2016. Furthermore, the SIA provided as Draft EIS Appendix G and summarized in Section 4.7.2 of the Draft EIS, included

input from several East Maui residents and farmers. As discussed in SIA Section 4 (Preliminary Community Issues), as well as Section 4.7.3 of the Draft EIS, seven focus groups were convened in November 2018 and on November 16, 2018, a focus group was held with residents, farmers and cultural practitioners from Ke‘anae and Wailuānui. The concerns you raised were articulated in these meetings, and are presented and analyzed in Section 4 of Appendix G, and Section 4.7.2 of the Draft EIS.

Moreover, the CIA provided as Draft EIS Appendix F, includes input from three interviewees, as well as numerous declarations made during the CWRM D&O proceedings. Also, based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, pages 4-158 to 4-159.

Regarding water being a public trust, we acknowledge that the Proposed Action (the issuance of a 30-year Water Lease by BLNR), requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai‘i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. The dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B’s 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action as shown in pages 1-25 to 1-27.

Comment 9: *Mahi Pono does not have a clear enough farm plan to warrant taking any water yet. The acreage it is farming is minimal and a normal water meter can feed enough water to the plants. I’m sure A & B didn’t get rid of all of their water meters. Until such time as they show that there is a need for more, no water should be taken. We are all for farming and feeding our own people, but hear that most of the farmed food will be exported. Why, when we import over 80% of our produce? It makes no sense at all.*

Response 9: Mahi Pono has developed a farm plan that makes productive use of the approximately 30,000 acres of privately owned agricultural land in Central Maui. Please note as discussed in Section 2.1.4 of the Draft EIS that that the Mahi Pono farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding

to other variables such as the availability and cost of water for crop irrigation, which includes the DHHL water reservation. At present, over one-third of the land planned for crop farming is planted or is being prepared for planting. Section 2.1.4 of the Final EIS has been revised to reflect Mahi Pono's current and near-term expected water use as shown in pages 2-30 and 2-32 which details average water being diverted from East Maui streams through the EMI Aqueduct System for use in Upcountry Maui and use by Mahi Pono and Central Maui lessees for agricultural, reservoir, system losses, dust control, industrial, hydroelectric, and fire suppression needs, as well as projections of acreage to be in cultivation by the end of calendar year 2021. As of October 2020, approximately 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System. It important to note that as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet the needs of the approved water uses, including the MDWS and of Mahi Pono's agricultural operations in Central Maui.

At full build-out of the Mahi Pono Farm Plan, about 15,950 acres will be in crop, including: 800 acres in community farms; 12,850 acres in orchard crops (lemons, limes, mandarins, oranges, macadamia nuts, coffee, avocados, etc.); 600 acres in tropical fruits (dragon fruit, guava, lilikoi, papaya, white pineapple, etc.); 1,200 acres in row crops and annual crops (potatoes, etc.), and 500 acres in energy crops. In addition, about 13,800 acres will be used for grazing cattle, including about 4,700 of irrigated pasture and 9,100 acres of unirrigated pasture. Finally, about 250 acres will be used for one or more solar farms.

Table 2-1 presented in the Draft EIS is based upon the findings from Appendix I within the EIS. The calculations of future water requirements at full build-out (year 2030) are presented in Table 3 of Draft EIS Appendix I, "East Maui Water Lease: Agricultural and Related Economic Impacts". The per-acre water requirements used in the calculations are based on published crop studies, farming experience with specific crops, and evapotranspiration rates for Central Maui. Please note, Draft EIS Table 2-1 has been slightly revised to address rounding errors, and is now provided as Final EIS Table 2-2, which is provided on page 2-29.

In response to your comment about water meters, please note that the Central Maui agricultural fields are not and have never been irrigated with metered water (i.e., water from the MDWS). Rather, the agricultural fields are irrigated with surface water from the EMI Aqueduct System, supplemented with brackish groundwater from Central Maui wells that are owned by Mahi Pono.

Regarding your comment that 80% of the produce in Hawai'i comes from exports, as explained in Appendix I of the Final EIS, "Currently, Hawai'i farmers use about 15,000 acres to supply about

one-third of the fresh fruits, vegetables and melons consumed in Hawai'i (this does not include nuts or coffee). Self-sufficiency is low because of low-cost imports from the mainland." Please note that this has been added to the Final EIS in Section 4.7.4 as shown on page 4-303. In other words, over 65% of the produce consumed in Hawai'i is imported. To the extent economically feasible, Mahi Pono will grow food crops for the Hawai'i market, thereby reducing reliance on these imports. At full development of the farm plan, assuming issuance of the Water Lease consistent with the Proposed Action, Mahi Pono's farm sales would be predominately to the local market, with an estimated \$104.4 million (65%) in sales being Hawai'i sales, and \$56.2 million (35%) being export sales. Local sales are preferred over exports because it saves on overseas shipping costs. Both local sales and exports are beneficial to Hawai'i: local sales that displace imports reduce the financial drain on the State as a whole, while exports generate income for the State.

Comment 10: *The lease, if any, should not run longer than 5 years. That gives them enough time to prove themselves, not more.*

Response 10: Please note that an alternative duration for the subject lease is discussed and evaluated within Section 3.2.2.1 of the Draft EIS and throughout Section 3.4 of the Draft EIS. The Applicant requested that the BLNR consider the issuance of a long-term (30-year) water lease. However, it is acknowledged that the BLNR has the authority to offer a water lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. As discussed in Section 3.2.2.1 of the Draft EIS:

Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

Moreover, as discussed in Section 4 of Appendix I of the Draft EIS (East Maui Water Lease: Agricultural and Related Economic Impacts) of the EIS, and as summarized in EIS Section 2.1.5, a long-term Water Lease is important for the viability of diversified agriculture in Central Maui.

An estimated 10 years will be required for Mahi Pono and lessees to remove volunteer (i.e., rogue) sugarcane and weeds from 30,000 acres, amend soils, install

field improvements (e.g., irrigation systems, fencing, etc.), build warehouses and other structures), and plant crops.

In addition, about 5 years or more will be required for avocado, citrus and coffee trees to reach full maturity, and 12 years or more for macadamia nuts. After reaching maturity, macadamia nuts trees will provide yields for 35 years or more, citrus and coffee for 50 years or more, and avocado for over 100 years.

In order for Mahi Pono and other farmers to justify the very substantial investment in a 30,000-acre farm, a long-term water lease will be required. A short-term lease would derail development of the Mahi Pono Farm Plan—or any long term agricultural use of the Central Maui fields including any plan to convert the Central Maui lands to diversified agriculture—because of the risk of not being able to farm for a long enough period to recover their planned investment.

Consequently, a shorter lease term would not be feasible nor conducive to achieving the objectives of the Proposed Action as set forth in Section 1.2 of the Draft EIS.

Comment 11: *I hope you will take into consideration that what you are doing is ruining our way of life and killing our stream life and ocean sea food that we rely on to subsist our living and way of life in our remote town. We live and barter (exchange) food like the Hawaiians did in the old Ahupua'a system. Please reconsider.*

Response 11: Your comments have been acknowledged. Please note that the EIS does not authorize anything. The subject EIS is a disclosure and informational document prepared to disclose the effects of the Proposed Action on the economic welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed Water Lease, measures proposed to minimize adverse effects, and alternatives to the proposed Water Lease and their environmental effects. In this case, the Proposed Action is for a 30-year Water Lease from the State. The Draft EIS adequately discusses the impacts of the Proposed Action both in terms of the effects on the environment, including the impacts on traditional and customary Native Hawaiian practices, as well as the social context of the impacted communities.

Specifically, in terms of habitat, Appendix A and Section 4.2.1 of the Draft EIS presented the HSHEP model that was used to quantify the impacts of flow restoration on native stream animal habitat to determine an appropriate balance between instream and offstream water uses. Impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B of the EIS. Impacts to terrestrial flora and fauna, including threatened and endangered species, are

analyzed in Section 4.4 and Appendix C of the EIS. As it relates to traditional and customary resources and practices, please note that CSH provides a detailed and comprehensive report accounting the history of East Maui. This report is included in Appendix E and summarized in Section 4.5 of the EIS. The EIS includes an assessment of effects on the cultural practices through the CIA provided as Appendix F. The SIA (Appendix G) provides history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono based on focus group meetings as summarized in Section 4.7.2 of the EIS. The SIA has been updated to include a discussion relating the cumulative social impacts which is included in Section 4.7.2 of the Final EIS as shown on pages 4-262 to 4-265.

In summary, the Proposed Action is expected to result in less environmental impacts than what occurred over the past century during sugarcane operations in Central Maui. Moreover, the Proposed Action must comply with the CWRM D&O, which resulted in numerous streams being fully restored for community use and taro cultivation, as well as many other streams being partially restored for habitat restoration and mauka-makai connectivity as explained in Section 1.3.4 of the Draft EIS, before any water can be diverted by the EMI Aqueduct System. Moreover, as a proposed use of this water, as described in the EIS, the Mahi Pono farm plan is anticipated to produce a significant amount of food for both local consumption and export, generating significant beneficial economic and fiscal impacts, providing numerous direct and indirect jobs, and State and County tax revenues that will benefit the people of Maui and the State generally, including East Maui residents.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Draft EIS
Date: Wednesday, October 30, 2019 5:33:43 PM

Dear Mr. Earl Matsukawa,

My daughter-in-law just posted an article by MauiTime, Mahi Pono is Coming for Our Water. In the article, it was stated that there is a draft EIS for the 30-year lease of A&B/East Maui Irrigation ditches and use of the water which flows from the East End of Maui to the Central Plain.

My understanding is that the Draft was made available on September 23, 2019. And comments will be received until November 7, 2019.

My husband is a landowner in East Maui, and I would be interested in reading the DEIS.

Could you help me find where I can read the Draft EIS? Is it online? Is it available at the public library? Is it available at your office? Or at the offices of the Board of Land and Natural Resources?

Thank you for your assistance in this matter.

Respectfully,

Elizabeth Hueu

Hi Elizabeth Hueu:

The Draft EIS was published on September 23, 2019 in the Office of Environmental Quality Control's Environmental Notice. The 45-day comment period ends on November 7, 2019. The Draft EIS is available online in the link below:

http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2019-09-23-MA-DEIS-East-Maui-Water-Lease.pdf

Hardcopies of the Draft EIS are located at the Kahului Regional Library, Hawaii State Library, Hana Public Library, Hana County Council Office, and the Wailuku County Council Office.

Thank you,
Wilson Okamoto Corporation

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Hueu:

Thank you for comments dated October 31, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200, Section 18. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *My daughter-in-law just posted an article by MauiTime, Mahi Pono is Coming for Our Water. In the article, it was stated that there is a draft EIS for the 30-year lease of A&B/East Maui Irrigation ditches and use of the water which flows from the East End of Maui to the Central Plain.*

Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanu, and Huelo License Areas

Please accept my comments on the subject DEIS.

I care very deeply about this proposed lease of public water because I am a 13 year resident of Huelo and farming on Ho'olawa. This DEIS has left out many of the most important considerations. A proper EIS must discuss the importance of full stream flow to the ocean and the care of the streams from mauka to makai. Full stream flow is necessary for the habitat of native flora and fauna and it is vitally important for healthy estuaries and near shore ecosystems. These areas are meant to be rich in biodiversity, but through the years of diversion, they did not thrive and the dry streams filled with invasive species. The EIS must discuss the urgency to restore these ecosystems and at the same time return these East Maui lands to their glory, while protecting our most precious resource of all, our wai. Another mistaken point in this DEIS is the idea that Maui's central valley is a good location for water-intensive crops. This is simply ridiculous...because it does not have the water for this on a massive scale. The land itself must be respected and used properly and the watershed cared for so that all the people can enjoy and live from it.

I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.

Aloha,

Ember Behrendt

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Behrendt:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I care very deeply about this proposed lease of public water because I am a 13 year resident of Huelo and farming on Ho‘olawa.*

Response 1: We acknowledge your comments and understand that you are a 13-year resident of Huelo and have been farming on Ho‘olawa.

Comment 2: *This DEIS has left out many of the most important considerations. A proper EIS must discuss the importance of full stream flow to the ocean and the care of the streams from mauka to makai. Full stream flow is necessary for the habitat of native flora and fauna and it is vitally important for healthy estuaries and near shore ecosystems. These areas are meant to be rich in biodiversity, but through the years of diversion, they did not thrive and the dry streams filled with invasive species.*

Response 2: Please note that it is generally acknowledged that continuous stream flow from the mountain to sea can provide environmental benefits. We also acknowledge that stream flow is necessary for providing habitat units within the License Area. However, full stream flow is not necessary to achieve habitat restoration as discussed in Section 4.2.1 of the Draft EIS and presented using the HSHEP model in Appendix A. The HSHEP model addressed the impacts of

streamflow diversion on the habitat of native amphidromous stream animals. The model considers changes in habitat, entrainment of animals into the ditch system and barrier to passage from migrating animals. It quantifies these impacts with respect to various flow restoration scenarios. Specifically, Section 4.2.1 of the Draft EIS states:

Under the Full Diversion scenario (diverting 100% of available low flows), less than half of the HUs remained in the License Area; whereas under the CWRM D&O standards, the number of remaining HUs increases to nearly 60%. (Trutta, p. 59-61, 2019)

In other words, compared to historical diversions, under the Proposed Action, it is anticipated that there will be some habitat restoration that occurs within the License Area. We do acknowledge that compared to “Natural Flow” scenarios, or no diversions, total habitat units decrease by approximately 40% as a result of the Proposed Action.

With regards to estuaries and nearshore environments in East Maui, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of

impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat

based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83 of the Final EIS.

As it relates to native flora and faunal impacts, the area surrounding the EMI Aqueduct System tends to be composed of “alien forest” which consist of non-native species. Hence, it is anticipated under the “Reduced Water Volume” alternative, which would involve more human activity, that an increase in water flow would likely have little impact on native land-based flora and fauna in the areas where more stream flow would be restored. However, as noted in Section 6.3 of Appendix C in the Final EIS, the impacts would vary on a stream-by-stream basis. Please note that Appendix C has been updated to discuss how the Proposed Action would potentially impact the flora and fauna within the License Area on a watershed-by-watershed basis, using data produced by the HSHEP model and HIGAP data provided by the State, along with surveys conducted within the region. The updates are reflected on Section 4.4 of the Final EIS. See pages 4-121 to 4-124 and pages 4-129 to 4-131 of the Final EIS.

Comment 3: *The EIS must discuss the urgency to restore these ecosystems and at the same time return these East Maui lands to their glory, while protecting our most precious resource of all, our wai.*

Response 3: We acknowledge your comments. Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

Comment 4: *Another mistaken point in this DEIS is the idea that Maui’s central valley is a good location for water-intensive crops. This is simply ridiculous...because it does not have the water*

for this on a massive scale. The land itself must be respected and used properly and the watershed cared for so that all the people can enjoy and live from it.

Response 4: We respectfully disagree with your comment. As summarized in Section 4.7.4 and Appendix I, “East Maui Water Lease: Agricultural and Related Economic Impacts”

Central Maui has some of the best agricultural conditions in the State for farming, including a large area in a compact configuration, high-quality soils, high solar radiation, a location near markets and shipping terminals, and potentially ample water at low delivery costs (assuming a new Water Lease with a reasonable use fee), and for lessees rents that will be comparatively low.

The basis for this finding is given in Subsection 5.a of Appendix I (pp. 13 to 22), along with Figures 4 to 12 (pp. 70 to 78) in Appendix I.

Without sufficient water to irrigate crops, most of Central Maui would change from green expanses of farmland to fire-prone dry-land grasses. However, since diversified crops require much less water than sugarcane, there is sufficient water to restore many of the streams in East Maui and to grow crops in Central Maui.

However, for Central Maui to reach its agricultural potential, surface water from East Maui will be required to irrigate the Central Maui fields.

Also, O‘ahu farmers have demonstrated that food crops can be grown safely and successfully on former sugarcane lands.

Comment 5: *I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.*

Response 5: We acknowledge your comments and have provided detailed responses to your comments.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

Subject: Do not approve KIUC's long-term lease for diversions to Waiahi Hydropower Facility

KIUC should not be exempted from the EIS requirement.

A&B, Wailuku Water Company, and Mahi Pono should not be allowed to divert if stream flow standards aren't met.

Do not approve the continued abuse of water rights by these corporations.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Fay:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *KIUC should not be exempted from the EIS requirement.*

Response 1: Please note that the KIUC Water Lease is not within the scope of assessment within this EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users, including A&B’s former sugar cane fields in Central Maui. The environmental impacts of the potential Water Lease are discussed throughout Chapter 4 of the EIS.

Comment 2: *A&B, Wailuku Water Company, and Mahi Pono should not be allowed to divert if stream flow standards aren’t met.*

Do not approve the continued abuse of water rights by these corporations.

Response 2: We acknowledge your comments. Please note that the Proposed Action requests to divert the maximum amount of water from the License Area after compliance with the CWRM

10238-04
Letter to Fay
Page 2
September 3, 2021

D&O. Also note that the current East Maui water revocable permits specify that quarterly reports to the BLNR are required. These reports are mandated to include a statement of compliance with the IIFS and identify the total amount of water being diverted from License Area measured at Honopou. It is expected, and the EIS takes into account, that compliance with the IIFS requirements under the CWRM D&O will also be required under the Proposed Action. In compliance with the CWRM D&O streamflow requirements, EMI has adjusted certain movable portions of gates to ensure that streamflow below the gates complies with the IIFS requirements. Compliance with the CWRM D&O IIFS requirements is always subject to CWRM staff verification.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Legal ownership of lands and resources from the legal titleholders and landowners.

I am not self appointed my appointment by undroken genealogical history, from the 1700 to the present date my title comes from the first sovereign kamehameha the great then reaffirmed by kamehsmeha the III during the inventory and incorperstion and proclamations of his lands during the Mahele 1848. By conveyances and proclamations I am the Legal owner of the lands and resources from the legal titleholders and landowners. With on the table I have been through your corrupt justice and court system. That showed no due process or fair and impartial treatment. It is so evedent of tampering fabricating and use of tactics of illegal and unlawful conduct. Its unbelievable but wear there is no justices then look for lawlessness. If you where to study my case you wouldn't have to go to far to see the lawlessness of the federal court system and the statecourt system..these are war crimes committed and human right violations. These imposter and so called elected officials and their corperations are going to be held liable or at least the ones sitting in the seats of control. By the laws of my country you will be held accountable for your actions. Piracy, treasonous and terrorist attack upon a peaceful nation state. One that there neutrality was jeopardised by the action of a treaty nation that promised to defend our sovereignty and neutrality. This has been broken by this terrorist country

Then there enforcement implanted their private mercenary army and added their illegal and unlawful injected laws and administered these fake laws and rules. The impostering as if they are the legal authority and titleholder of my lands and resources. Be advised you have been put on notice by the legal titleholders and landowners, the representative of the legal treaty nation of the last raining sovereign. Like I stated I am not self appointed nor is the position made up as yours are. This comes from the sovereign himself and the dominion authority of and by the absolute. My title is Konohiki my name is Hinano Kaleleiki, first law of the land Kanawai Mamala hoe. This give to my grandfather's in consinunity and in continuity with the customary laws of sovereign as well as international, maritime, united nations, the laws of the seas and our Kindom laws. Of the original treaty nation of Ko Hawaii pae aina the sovereign Hawaiian kingdom from 1843. Upon this status my lands and resources are private property and cannot be taken unlawfully or seized illegally or taken as spoils of war. This is in law your lawlessness will not go unpunished. I have done everything by the rule of law and I have not given you permission to do as you please or take what you wanted. I didn't give you permission to represent me in anyway whatsoever. Your ignorance of the true facts by your fake authority and jurisdictional authority. Will be what will charge you for as terrorist. There will be no place for you and your kind to hide in this world. At the age of 93, 94 and 95 these Nazi war criminals were brought to trial last week they still had to stand trial and charged with 5000 plus counts of accessories to murder. These acts of violence and abuse of powers terrorism and genocide of the Kanaka maoli people the original host culture of the lands to the Hawaiian islands. The modification of your engineered host culture to disenfranchises our people of this sovereign nation state. Is unbelievable your countrys characteristic proceeds you. The american way of life is WHAT YOU CANNOT STEAL YOU TRY AND BUY WHAT YOU CANNOT AFFORD OR BUY YOU TAKE. Your actions are down right or even worse than the nazi's. I have traveled this earth I have been on both ends of this world and the story is always the same. The people have the responsibility to correct their government when it no longer serves the people and the government works for its self, you the able body's and everything under the sun on the surface and below should be making the correction not a objection. Remove those that perpetuate these violations and criminal acts, I have served your country and once believe in it's TRUE position of freedoms equality and fairness. Only to find that it is not the country that it said it is and they do not stand by the rule of law. Your terrorist country has not honored any of its agreements as present as today with the Kurdish people lead them in to battle and leave them hanging. With no shame and no problem with lieing to it's people or their allies. is that the government you want. We the Kanaka maoli have and will always be the true nation of a none discriminatory society and the absolute in fairness and equality mindful of our environment and our people and culture. First to out law slavery in 1842 and anyone who practiced or dabbled in this trade found no conferred here. It's no to you to those that continue to assist and oppress our sovereign my dominion authority and those that continue to perpetuate this act of piracy espionage against the legal titleholders and landowners by conveyances and proclamations by the absolute kamehaneha

the III. The fabrication manipulation and fraudulen acts to steal, kill, cheat and lie with the intention to deprive me of my health and weath. You have No rights to be doing that kind of evil to anyone. You need to stop ceases and dismiss with all acts that do not comply with the law of the land there is no political question we are sovereign and authority is present instead of work with me you intend to profit and run. Thank you for your time with all the facts and evidence known to all of you, you apply your illegal law and rules within the sovereign territory of the Hawaiian Kingdom, the original treaty nation state of Ko Hawaii Pae Aina since 1843. My status is appointed my position is Konohiki. This is in law. No no and no. You can not sale or lease trade or give away what you do not owne this is stealing, larceny, intent or knowingly to do harm or deprive from other what is legally theirs by deception. Stop make right the wrongs and make restitution and compensation for damages. Your laws are shallow and illegal stop and work with the dominion authority and jurisdiction authority and representative of the treaty nation. Everything is in tacteted just a few adjustments and you will see a better and heather nation one to be proud of. Because we implement what is good for me is good for you. Stop the illegal occupation an operation. Thank.you

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Hinano Kaleleiki:

Thank you for comments dated October 21, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am not self appointed my appointment by undroken genealogical history, from the 1700 to the present date my title comes from the first sovereign kamehameha the great then reaffirmed by kamehsmeha the III during the inventory and incorperstion and proclamations of his lands during the Mahele 1848. By conveyances and proclamations I am the Legal owner of the lands and resources from the legal titleholders and landowners. With on the table I have been through your corrupt justice and court system. That showed no due process or fair and impartial treatment. It is so evedent of tampering fabricating and use of tactics of illegal and unlawful conduct. Its unbelievable but wear there is no justices then look for lawlessness. If you where to study my case you wouldn't have to go to far to see the lawlessness of the federal court system and the statecourt system..these are war crimes committed and human right violations. These imposter and so called elected officials and their corperations are going to be held liable or at least the ones sitting in the seats of control. By the laws of my country you will be held accountable for your actions. Piracy, treasonous and terrorist attack upon a peaceful nation state. One that there neutrality was jeopardised by the action of a treaty nation that promised to defend our sovereignty and neutrality. This has been broken by this terrorist country*

Response 1: We acknowledge your comments. However, please note that it is not within scope of the EIS to review your court case. The scope of the EIS assesses the anticipated environmental

impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 2: *Then there enforcement implanted their private mercenary army and added their illegal and unlawful injected laws and administered these fake laws and rules. The impostering as if they are the legal authority and titleholder of my lands and resources. Be advised you have been put on notice by the legal titleholders and landowners, the representative of the legal treaty nation of the last raining sovereign. Like I stated I am not self appointed nor is the position made up as yours are. This comes from the sovereign himself and the dominion authority of and by the absolute. My title is Konohiki my name is Hinano Kaleleiki, first law of the land Kanawai Mamala hoe. This give to my grandfather's in consinquity and in continuity with the customary laws of sovereign as well as international, maritime, united nations, the laws of the seas and our Kindom laws. Of the original treaty nation of Ko Hawaii pae aina the sovereign Hawaiian kingdom from 1843. Upon this status my lands and resources are private property and cannot be taken unlawfully or seized illegally or taken as spoils of war. This is in law your lawlessness will not go unpunished. I have done everything by the rule of law and I have not given you permission to do as you please or take what you wanted. I didn't give you permission to represent me in anyway whatsoever. Your ignorance of the true facts by your fake authority and jurisdictional authority. Will be what will charge you for as terrorist. There will be no place for you and your kind to hide in this world.*

Response 2: Your comments are unclear therefore we cannot provide you with a specific response. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

To: ian.c.hirokawa@hawaii.gov; Public Comment
Subject: EMI Draft EIS

To Earl Matsukawa,

Please accept my comments to the Draft EIS for the Proposed Lease (Water Lease) for the Nahiku, Ke`anae, Honomanu, and Huelo License Area.

I feel deeply vested in this matter and care decisions considered about this proposed lease for my kuleana also know as "water" and to others a public trust because I am a lineal descendant. I have lived in Nahiku since the mid 30's. Yes I am 83 years old

and still take ownership to right to fish, both kahakai and kahawai. (fresh and salt water). Both right require water. Because the land does not appear like the barren stretches of dry acres known as plantation fields, THE EIS needs to include data that proves there are no land worth farming in east Maui. The EIS needs to include how well over 350 acres used for plantation in Nahiku alone well documented some how disappeared.

The EIS need to provide and include how they came to the conclusion that the fishing in the area is no longer good and will suffer no impact. I have seen the difference when Hanawi and Wahinemo`o was constantly flowing and teaming with food. Then I saw the rivers to bone dry for months on end. I remember when the ponds were left stagnant and we had an outbreak of dengui in the 90's. No one would have mercy for the community in Lower Nahiku to flush the river with fresh water to kill the mosquitos, not even the Board of Health. Now that the rivers have been restores gathering is good and lots of fish.

The EIS needs to include how much water will be kept in the river. Will they need to shut off the system for maintenance. When and for how long will the water be impacted. How many times a year if any.

The EIS needs to include their consultation process with the recommendation arm of DLNR known as AHA MOKU. Every moku has a representative. I find any consultation with this entity absent. Also, include all the kuleana.

The EIS needs to include an index as to definitions to some of the language with in their 2700 document. For example there is a section that talk about millions spent on operational cost and that is dropped when there was no more sugar production. Following that analysis they say so we can expect maintenance cost to go down. Is operational and maintenance the same expense?

The EIS describes how they will maintain the banks with chemicals. The EIS needs to include alternate means to prevent contaminates in our drinking water, rivers and oceans.

I started my comments with what I do which is kuleana aka (gathering rights). The EIS needs to include how they state there are none to very little traditional practices exercised there for will not have any impacts. Due to my age I now have my son go to the same place I was taught to go by my kupuna and tutu. Also, my grandsons and great grandsons and great grand daughters continue what my aged legs can't do.

The EIS needs to include what they are going to water. The public trust can not be sold as a commodity and not necessity.

Please accept my concerns and if I may not be quiet clear and understanding please contact me by email.
Mahalo

James Kaihou Sagawinit

The EI needs to include inventory of repairs and replacement if any on the ditch.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Sagawint:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments to the Draft EIS for the Proposed Lease (Water Lease) for the Nahiku, Ke`anae, Honomanu, and Huelo License Area.*

I feel deeply vested in this matter and care decisions considered about this proposed lease for my kuleana also know as "water" and to others a public trust because I am a lineal descendant. I have lived in Nahiku since the mid 30's. Yes I am 83 years old and still take ownership to right to fish, both kahakai and kahawai. (fresh and salt water). Both right require water. Because the land does not appear like the barren stretches of dry acres known as plantation fields, THE EIS needs to include data that proves there are no land worth farming in east Maui. The EIS needs to include how well over 350 acres used for plantation in Nahiku alone well documented some how disappeared.

Response 1: We acknowledge your comments and understand that you are a long-time resident of Nāhiku who partakes in cultural and traditional practices. With regards to your comment about the public trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B’s 2001 application to the BLNR for the auction of the

subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown in pages 1-25 to 1-27.

Comment 2: *The EIS need to provide and include how they came to the conclusion that the fishing in the area is no longer good and will suffer no impact. I have seen the difference when Hanawi and Wahinemo`o was constantly flowing and teaming with food. Then I saw the rivers to bone dry for months on end. I remember when the ponds were left stagnant and we had an outbreak of dengui in the 90's. No one would have mercy for the community in Lower Nahiku to flush the river with fresh water to kill the mosquitos, not even the Board of Health. Now that the rivers have been restores gathering is good and lots of fish.*

Response 2: Please note that nowhere in the EIS is it stated that fishing in East Maui is no longer good. Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of

impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in the pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat

based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in the pages 4-78 to 4-83 of the Final EIS.

With regards to your comment about dengue and mosquitoes, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown in pages 4-58 to 4-61, pages 4-126 to 4-127, and pages 4-130 to 4-131 .

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e., they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g., guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Comment 3: *The EIS needs to include how much water will be kept in the river. Will they need to shut off the system for maintenance. When and for how long will the water be impacted. How many times a year if any.*

Response 4: On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

As discussed in Draft EIS Section 2.1.2 (East Maui/License Area) and 2.1.4 (Central Maui Field System), the long-term average delivery of water by the EMI Aqueduct System up until 1986 had been approximately 165 mgd (prior to any use of water by the MDWS or HC&S on the agricultural fields). This measurement was taken at Māliko Gulch. As discussed in Section 2.1.2

of the Draft EIS, the amount of water that could be diverted from the License Area under the Proposed Action is approximately 87.95 mgd.

Please note that maintenance of the EMI Aqueduct System involves, at times, completely dewatering certain sections of the respective ditches to access and repair portions. As infrequent as this is (possibly bi-annually), it does occur. When this happens, EMI tries to return flows to the streams of origin as much as the system will allow.

Comment 5: *The EIS needs to include their consultation process with the recommendation arm of DLNR known as AHA MOKU. Every moku has a representative. I find any consultation with this entity absent. Also, include all the kuleana.*

Response 5: Regarding your comments about the EIS including the consultation process, Chapter 9 of the EIS contains all consultation efforts during this EIS process. Particularly, two aha moku members, one each from the Aha Moku o Hamakua Loa/Hamakua Poko and Aha Moku o Kaupo, participated during the EISPN process and commented on the EISPN and were encouraged to continue to participate throughout the entire EIS process. Additionally, the Aha Moku o Maui, Inc. was contacted and one member provided an interview as part of the Cultural Impact Assessment (Appendix F) for the EIS.

The CIA also includes outreach to members of the Aha Moku Council as listed in Table 12 of the CIA (among other groups and organizations). Of the recognized members of the Aha Moku Council who participated in the CIA, Mr. Nakanelua provided a discussion of Pākanaloa Heiau. The location and description of Pākanaloa Heiau is addressed in the LRFI in Section 2.4 (Walker Site 84). The heiau is located outside of the license area, on Ke‘anae Peninsula. The field inspection did not include an inventory of historic properties or inspection of historic properties outside of the License Area.

No other recognized members of the Aha Moku Council provided information on specific historic properties during consultation for the CIA.

Comment 6: *The EIS needs to include an index as to definitions to some of the language with in their 2700 document. For example there is a section that talk about millions spent on operational cost and that is dropped when there was no more sugar production. Following that analysis they say so we can expect maintenance cost to go down. Is operational and maintenance the same expense?*

Response 6: The EIS includes a list of acronyms and abbreviations that are used throughout the EIS. This list is found at the end of the Table of Contents and prior to the Summary. The Economic and Fiscal Impact Study included with the DEIS as Appendix H included an assessment of operational costs

for the EMI Aqueduct System. Operational costs include maintenance, repair, and personnel costs. Due to the nature of the system, operational costs are largely fixed, with minimal variable costs. Future operational costs for the EMI Aqueduct System, estimated at \$1.8 million annually, are anticipated to be similar to the average cost experienced during the recent sugar operations period (2008-2013). Please note, the figure \$1.8 million is a correction from the figure of \$1.4 million that was included in the Draft EIS. The operational costs for the system are assumed to be similar across various future conditions alternatives, with the primary variation being the amount of the Water Lease payments that would be owed to the State, depending on the amount of water that is diverted.

Comment 7: *The EIS describes how they will maintain the banks with chemicals. The EIS needs to include alternate means to prevent contaminates in our drinking water, rivers and oceans.*

Response 7: Mahi Pono intends to use a limited amount of fertilizers and pesticides in accordance with all laws and regulations and only on an as-needed basis. As described in Section 2.1.4 of the Draft EIS, Mahi Pono's goals for its diversified farm plan will be guided by its core principles of using reasonable and environmentally responsible BMPs, planting non-GMO crops, and growing food for local consumption. In addition, since January 2020, Mahi Pono has also committed to foregoing the use of Round-Up and other glyphosate-based products within the Central Maui agricultural fields. This commitment is reflected in Section 4.12 of the Final EIS as shown pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations. Mahi Pono's use of fertilizers and pesticides will follow BMPs approved by the State of Hawai'i DOH, the U.S. NRCS, the U.S. EPA, the State of Hawai'i Department of Agriculture (DOA) and other governmental agencies in regards to the use of chemicals, and controlling dust and erosion and, thus, runoff. The State of Hawai'i DOA's Pesticide Branch also provides regulatory oversight over Mahi Pono's pesticide use. In accordance with this oversight, records of pesticide use must be kept and made available to the Pesticide Branch upon request at any time. In addition, Act 45, which was passed by the 2018 Hawai'i Legislature and effective January 1, 2019, required that all Certified Applicators of Restricted Use Pesticides (RUP) submit a report of the RUP that were applied each year.

Comment 8: *I started my comments with what I do which is kuleana aka (gathering rights). The EIS needs to include how they state there are none to very little traditional practices exercised there for will not have any impacts. Due to my age I now have my son go to the same place I was taught to go by my kupuna and tutu. Also, my grandsons and great grandsons and great grand daughters continue what my aged legs can't do.*

Response 8: Please note that nowhere in the EIS does it state that there are none to very little traditional practices exercised. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, see pages 4-239 to 4-252 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause

whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Comment 9: *The EIS needs to include what they are going to water. The public trust can not be sold as a commodity and not necessity.*

Response 9: Please note that the Proposed Action entails the issuance of a long-term Water Lease for the purpose of developing, diverting, transporting and use of the State’s East Maui waters through the EMI Aqueduct System for the uses described in the EIS. With regards to your comment about the public trust, as noted in Response #1, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B’s 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown in pages 1-25 to 1-27.

Comment 10: *Please accept my concerns and if I may not be quiet clear and understanding please contact me by email.*

The EIS needs to include inventory of repairs and replacement if any on the ditch.

Response 10: We acknowledge your comments. Under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

State of Hawaii
Mr. Ian Hirokawa
ian.c.hirokawa@hawaii.gov

Dear Mr. Hirokawa,

I am writing in regards to “The Proposed Lease (Water Lease) for the Nahiku, Keanae, Honomanu and Huelo License Areas Draft Environmental Impact Statement” (hereafter referred to as “DEIS”).

First, I am opposed in principle to Maui Pono or any other unproven entity being given control over the water belonging to the people of Hawaii, especially when it is unclear why (or if) they need such a massive amount. Of course, once they have been control of our water, it will be only that much harder to wrest it away from them at a future date.

Second, this process is being needlessly rushed and controlled by the very groups (Maui Pono, and A & B) who stand to gain so much if they are given unsupervised control of our water. However sad the demise of HC&S, at least it provides us with a rare and golden opportunity to take stock of our resources and plot a new, more egalitarian direction.

Third, for the 2,700-page DEIS to be fairly and completely evaluated it will take more than the 45-day period we have been given. (I, for one, only heard about this situation today.)

I am sure I don't have to remind you, Mr. Hirokawa, that you are a trustee, representing us, the people of Hawaii. As stated in the Hawaii Constitution, the government is entrusted with the duty to “protect, control and regulate the use of Hawaii's water resources for the benefit of its people.”

Respectfully yours,

Jeff Gray

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Gray:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *First, I am opposed in principle to Maui Pono or any other unproven entity being given control over the water belonging to the people of Hawaii, especially when it is unclear why (or if) they need such a massive amount. Of course, once they have been control of our water, it will be only that much harder to wrest it away from them at a future date.*

Response 1: We acknowledge your comments and understand that you are opposed to the issuance of the Water Lease. With regards to your comment about Mahi Pono being unproven, please note that Mahi Pono has been farming the Central Maui agricultural fields since they were sold A&B’s former sugarcane land in December 2018 and has been expanding their agricultural operations since then. It is acknowledged that Mahi Pono is new entity that has just been recently formed with the goal of operating a large diversified agriculture farm in Hawai‘i. However, in its first 18 months of existence, Mahi Pono has hired over 200 workers from Maui, most of whom have farm experience on the island. In addition, Mahi Pono’s management has significant experience cultivating diverse crops on more than 100,000 acres on the continental U.S. Also, the company has established market channels, and substantial financial resources. The Mahi Pono farm plan is discussed not only in the Executive Summary, but in detail in Section 2.1.4. and Section 4.7.4, as well as Appendix I. Water requirements for 2030 are discussed in

Subsection 9.a of Appendix I, with details provided in Table 3, Section 3.a of Appendix I. This table includes average daily per-acre water requirements by crop. Production figures are discussed in Subsection 10.a, with details provided in Table 4, Section 4.a of Appendix I.

The Mahi Pono farm plan will evolve over time based on a number of factors, including the available supply of surface water, experience which will be gained on crops that grow well in Central Maui, crops that are profitable, the size of the market for profitable crops, etc.

Comment 2: *Second, this process is being needlessly rushed and controlled by the very groups (Maui Pono, and A & B) who stand to gain so much if they are given unsupervised control of our water. However sad the demise of HC&S, at least it provides us with a rare and golden opportunity to take stock of our resources and plot a new, more egalitarian direction.*

Response 2: We respectfully disagree with your comment that this process is being rushed. Please note that the EIS process began in the year 2016. Specifically, As explained in Section 1.4 of the Draft EIS, in connection with A&B's May 2001 submittal to the BLNR requesting that the BLNR offer a long-term (30 year) water lease at public auction, A&B offered to perform the associated HRS, Chapter 343 environmental review. As part of the contested case hearing on the proposed Water Lease, NHLC, on behalf of Nā Moku, objected to A&B undertaking the environmental review process, and asserted that the BLNR was required to prepare conduct the environmental review. NHLC later orally withdrew its objection during oral arguments before the BLNR in May 2015. BLNR issued an order on April 14, 2016, directing A&B to scope the EIS, including the identification of the portions of the EIS that could proceed prior to the CWRM issuing a final IIFS decision, and those portions which could not. That scope was filed with the BLNR in June 2016. On July 8, 2016, the BLNR approved the scope and instructed that "A&B and EMI should proceed with the preparation of an environmental impact statement (EIS) in as expeditious manner as possible." The EIS recites this history in Section 1.3.3 of the Draft EIS and recognizes that the Water Lease will be awarded by public auction.

Regarding your comment that the water would be 'unsupervised', note that the current East Maui water revocable permits specify that quarterly reports to the BLNR are required. These reports are mandated to include a statement of compliance with the IIFS and identify the total amount of water being diverted from License Area measured at Honopou. It is expected, and the EIS takes into account, that compliance with the IIFS requirements under the CWRM D&O will also be required under the Proposed Action. In compliance with the CWRM D&O streamflow requirements, EMI has adjusted certain movable portions of gates to ensure that streamflow below the gates complies with the IIFS requirements. Compliance with the CWRM D&O IIFS requirements is always subject to CWRM staff verification.

Comment 3: *Third, for the 2,700-page DEIS to be fairly and completely evaluated it will take more than the 45-day period we have been given. (I, for one, only heard about this situation today.)*

Response 3: Please note that the actual text of the Draft EIS is approximately 560 pages, which includes numerous graphics, and there are a total of thirteen appendices, nine of which were completed by technical consultants. We also note that over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M). The Applicant made every reasonable effort to convey information through the Draft EIS in a manner that is accurate, thorough, and appropriately concise in order to provide the public with an opportunity to fairly analyze the potential impacts of the Proposed Action. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai‘i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 4: *I am sure I don't have to remind you, Mr. Hirokawa, that you are a trustee, representing us, the people of Hawaii. As stated in the Hawaii Constitution, the government is entrusted with the duty to "protect, control and regulate the use of Hawaii's water resources for the benefit of its people.*

Response 4: We acknowledge your comments. Note that the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown in pages 1-25 to 1-27.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

10238-04
Letter to Mr. Jeff Gray

Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke`anae, Honomanu, and Huelo license areas.

Please accept my comments on the subject DEIS. I have attached these comments in a PDF format on this email. Please send me an email verifying that you received this email on time. Mahalo nui, Jenny Pell

I care deeply about this proposed lease of public water because I am Maui resident and a regenerative agriculture expert and consultant, with specialties in agroforestry, windbreaks, water conservation in farming, and farm profitability. I am very concerned that the DEIS does not include essential information about proper commercial farming water conservation strategies that systematically reduce the needs for water over time. I am also a concerned citizen who respects indigenous farming and fishing, and believes that the water is a public trust and that opening (and keeping open) streams for indigenous practices is of tantamount importance.

1. The EIS needs to include the reasons why Mahi Pono needs a 30 year lease for the water, when there are many proven strategies to reduce water needs in commercial farming, that lead to higher yields and more profitability. The DEIS needs to include all the best practices agriculture studies showing these results:

- USDA Studies of how adding at least 1% organic matter to the soil increases the soil water carrying capacity by 25,000 gallons per acre. Over time this needs to be 5% - 6% organic matter in the soil to further save water.

- Planting diverse cover crops increases water retention in the soil, and builds healthy soil, reduces erosion (which in turn protects reefs), and reduces external input costs such as nitrogen and other fertilizers

- Mulching crops reduces evapotranspiration, cools the soil, builds healthy soil, and reduces erosion

- Planting robust windbreaks increases water infiltration into the soil, increases the water-holding capacity of the soil, stems nutrient loss, drastically reduces evapotranspiration and irrigation losses, protects crops from damaging winds and physical

abrasions, and thereby buffers against diseases in crops weakened by drying and damaging winds

- Earthworks including keyline design and swales that keep precious rainfall and irrigation water on the land and slowly infiltrate that water into the soil. This also protects from soil erosion (which leads to loss of topsoil and reef siltation)

- Practice rotational grazing of livestock to substantially increase the water-carrying capacity of the soil, reduce run-off, deposit manures/fertilizers, stimulate crops growth, reduce compaction, and build soil organically (which again allows the soil to hold more water)

- Use biochar which is proven to improve water-retention and water-holding capacity in the soil

- Plant perennial crops, hedgerows, deep-rooted vetiver, and pollinator strips. Perennial crops are robust, they protect soil from erosion and improve soil structure, increase ecosystem nutrient retention, sequester carbon, increase water infiltration, and contribute to climate adaptation and mitigation

- Apply Compost and use Compost teas.

The EIS needs to include all of the above proven water-saving techniques, all of which are endorsed, promoted, and often funded by the USDA. Using these strategies, Mahi Pono will need less water every year, be more profitable, have healthier soil, improve watersheds, increase biodiversity, and be a good corporate farming citizen. Mahi Pono can easily reduce their water needs every year while earning more money.

2. The EIS needs to include all the remaining crops planned over what time period, and in what locations. The current map as presented in the DEIS is incomplete. When it is known what acreage of which crops will be planted in what specific locations over time, it can be determined how much water per acre each crop will need. Over-irrigating crops leads to root rot, wilting trees/coffee plants, and eventual failure of the crop. Until we have the complete farm plan it is impossible to say how much water is needed – for which crop, which location, and in what time frame. If there are no plans to plant acreage for several years clearly less water is required.

3. The EIS states that 30% of the water that originates in the license area is owned by A&B. The DEIS needs to present evidence of said ownership, and should not assume this is true.

4. The EIS needs to show a diagram of how the Nahiku Ditch households are connected to the ditch, as stated in the DEIS currently. It is a fact that the Nahiku area households water comes from groundwater tunnels, not ditches.

5. The EIS needs to show evidence of current salination analysis of the wells that they claim are too salty for irrigation, to verify that this claim is true. Also, the DEIS needs to include that healthy soil that uses mycoremediation strategies has proven to buffer against salted soils and slightly brackish well-water. Also the DEIS needs to include which crops will be planted where so we can research whether they truly are sensitive to brackish water. An example is coconuts, which thrive in brackish water.

6. The EIS needs to include impacts on fish, and the impressive rebound in every stream that has been reopened in the last three years on Maui. The Bishop Museum conducted 9 years of studies on fish rebound and the return of robust fish systems the Big Island after the closure of the sugar cane industry. The DEIS needs to include these studies.
7. The EIS needs to include facts about low-flow streams and problems with mosquito blooms.
8. The EIS needs to include the current and historical acreages of kalo and other perennial and annual crops to counter the claim that "East Maui only has only 44 acres total potential kalo crops and 35 acres for truck farming" as stated by the report. This also needs to include the POTENTIAL acreages that can come into cultivation if more streams are opened. East Maui supported a large population prior to the ditch system's construction, with master farmers and master fishermen cultivating and abundantly harvesting vast areas all across the area that now takes the majority of water via the EMI ditch system.
9. The EIS needs to include facts regarding the Ahupua`a of the each stream prior to ditch construction for real comparisons to current production, both for indigenous farming and for fishing. It is well documented across the globe that the interface of fresh water streams into the ocean is where there is an abundance of fish. The statement in the DEIS that fisheries are insignificant/non-existent is specious, as the fresh water has not been flowing for many decades, thereby changing the previous abundant fish supplies and stream-interface fisheries that were traditional fishing areas.
10. The EIS needs to include a comprehensive archeological survey across the entire East Maui license areas. It is not true that managing the ditch system does not disturb any Hawaiian cultural Iwi, lo`i sites, and other areas of cultural significance.
11. The EIS needs to verify the claim that only the Central Valley has the substantial potential to grow useful food crops for Maui's future. I have studied the Central Valley Mahi Pono lands extensively and this statement is false. The EIS needs to include a complete study of all the arable land on Maui, either in cultivation, or with the potential to be in cultivation to verify or disprove this claim.
12. As much as 30% of the Mahi Pono land is considered marginal growing areas, and the EIS states Mahi Pono will be farming only 16,900 acres, and grazing 5,000 acres. This only equals 21,000 acres, which does not support their claim to need that quantity of water, nor to need it for 30 years.

I am asking that the EIS include this important information. Thank you for the opportunity to submit comments on this DEIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Pell:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I care deeply about this proposed lease of public water because I am Maui resident and a regenerative agriculture expert and consultant, with specialties in agroforestry, windbreaks, water conservation in farming, and farm profitability. I am very concerned that the DEIS does not include essential information about proper commercial farming water conservation strategies that systematically reduce the needs for water over time. I am also a concerned citizen who respects indigenous farming and fishing, and believes that the water is a public trust and that opening (and keeping open) streams for indigenous practices is of tantamount importance.*

Response 1: The introductory statements conveying your interest in the subject Water Lease and outlining your background are acknowledged. Thank you for participating in the Draft EIS review process and for providing commentary on the subject Draft EIS, as outlined in your letter. Point by point responses to your specific comments are provided in this letter.

Comment 2: *The EIS needs to include the reasons why Mahi Pono needs a 30 year lease for the water, when there are many proven strategies to reduce water needs in commercial farming, that lead to higher yields and more profitability.*

Response 2: Please note that an alternative duration for the subject Water Lease is discussed and evaluated within Section 3.2.2.1 of the EIS, and a comparative evaluation of that alternative, and the other reasonable alternatives, is provided throughout out Section 3.4 of the EIS. Table 3-2 has been added to the Final EIS to provide a comparative table of the environmental benefits, costs, and risks of the Proposed Action at full implementation of the Mahi Pono farm plan, the "No Action" alternative, and the reasonable alternatives to the Proposed Action, including the Alternative Lease Duration alternative. See pages 3-49 to 3-80 of the Final EIS.

The Applicant requested that the Board of Land and Natural Resources (BLNR) consider the issuance of a long-term (30-year) water lease. However, it is acknowledged that the BLNR has the authority to offer a water lease with a term that is either shorter or longer than 30 years, provided, however, that under Hawai‘i Revised Statutes (HRS) § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. As discussed in Section 3.2.2.1 of the Draft EIS:

Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

Moreover, as discussed in Section 4 of Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts) of the EIS, and as summarized in EIS Section 2.1.5, a long-term Water Lease is important for the viability of diversified agriculture in Central Maui:

An estimated 10 years will be required for Mahi Pono and lessees to remove volunteer (i.e., rogue) sugarcane and weeds from 30,000 acres, amend soils, install field improvements (e.g., irrigation systems, fencing, etc.), build warehouses and other structures), and plant crops.

In addition, about 5 years or more will be required for avocado, citrus and coffee trees to reach full maturity, and 12 years or more for macadamia nuts. After reaching maturity, macadamia nuts trees will provide yields for 35 years or more, citrus and coffee for 50 years or more, and avocado for over 100 years.

In order for Mahi Pono and other farmers to justify the very substantial investment in a 30,000-acre farm, a long-term water lease will be required. A short-term lease would derail development of the Mahi Pono Farm Plan—or any long term

agricultural use of the Central Maui fields including any plan to convert the Central Maui lands to diversified agriculture—because of the risk of not being able to farm for a long enough period to recover their planned investment.

Consequently, a shorter lease term would not be feasible nor conducive to achieving the objectives of the Proposed Action as set forth in Section 1.2 of the Draft EIS.

It should be noted that Mahi Pono expects to invest over \$20 million to increase the efficiency of its private Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to the Executive Summary, Section 2.1.4, and various other sections of the Final EIS as shown on page v and page 2-25.

Mahi Pono has also implemented several water saving strategies for the Central Maui agricultural fields and continues to evaluate additional methods. Mahi Pono water saving strategies include the following:

- Planting windbreaks in the fields.
- Incorporating significant uses of weed mat along plant lines, which will reduce evapotranspiration and erosion.
- Mowing rather than plowing inter-rows to preserve organic matter and keep cover to prevent soil erosion.
- Operating within the terms of a Conservation Plan from NRCS, which includes swales and diversions for erosion protection.
- Practicing rotational grazing of livestock.
- Planting permanent tree crops that will develop canopies that will assist with soil moisture retention and reduce evapotranspiration.

It should also be noted that as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. However, the amount of water diverted at any given time will be only what is needed to meet actual needs.

Comment 3: *The DEIS needs to include all the best practices agriculture studies showing these results:*

- *USDA Studies of how adding at least 1% organic matter to the soil increases the soil water carrying capacity by 25,000 gallons per acre. Over time this needs to be 5% - 6% organic matter in the soil to further save water.*

- *Planting diverse cover crops increases water retention in the soil, and builds healthy soil, reduces erosion (which in turn protects reefs), and reduces external input costs such as nitrogen and other fertilizers*

- *Mulching crops reduces evapotranspiration, cools the soil, builds healthy soil, and reduces erosion*

- *Planting robust windbreaks increases water infiltration into the soil, increases the water-holding capacity of the soil, stems nutrient loss, drastically reduces evapotranspiration and irrigation losses, protects crops from damaging winds and physical abrasions, and thereby buffers against diseases in crops weakened by drying and damaging winds*

- *Earthworks including keyline design and swales that keep precious rainfall and irrigation water on the land and slowly infiltrate that water into the soil. This also protects from soil erosion (which leads to loss of topsoil and reef siltation)*

- *Practice rotational grazing of livestock to substantially increase the water-carrying capacity of the soil, reduce run-off, deposit manures/fertilizers, stimulate crops growth, reduce compaction, and build soil organically (which again allows the soil to hold more water)*

- *Use biochar which is proven to improve water-retention and water-holding capacity in the soil*

- *Plant perennial crops, hedgerows, deep-rooted vetiver, and pollinator strips. Perennial crops are robust, they protect soil from erosion and improve soil structure, increase ecosystem nutrient retention, sequester carbon, increase water infiltration, and contribute to climate adaptation and mitigation*

- *Apply Compost and use Compost teas.*

The EIS needs to include all of the above proven water-saving techniques, all of which are endorsed, promoted, and often funded by the USDA. Using these strategies, Mahi Pono will need less water every year, be more profitable, have healthier soil, improve

watersheds, increase biodiversity, and be a good corporate farming citizen. Mahi Pono can easily reduce their water needs every year while earning more money.

Response 3: Your comments regarding agricultural best practices are acknowledged. Mahi Pono has an inherent long-term interest in farming the Central Maui agricultural fields consistent with best practices that are most suitable for those lands. The Mahi Pono farm team, as well as its lessees, follow Best Management Practices (BMPs) approved by the Hawai'i Department of Health (DOH), the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), the U.S. Environmental Protection Agency (EPA), and other governmental agencies in the use of chemicals, and controlling dust and erosion and runoff associated with their farming activities. As it relates to agricultural chemicals for diversified agriculture, usage would be in strict compliance with federal regulations and Mahi Pono will exercise due care to prevent the release of fuels, lubricants and other hazardous materials. Mahi Pono intends to use a limited amount of fertilizers and pesticides in accordance with all laws and regulations and only on an as-needed basis. In addition, as mentioned above, since January 2020, Mahi Pono has also committed to foregoing the use of Round-Up and other glyphosate-based products within the Central Maui agricultural fields.

As Mahi Pono incrementally increases the amount of farmed acreage over time and crops are planted (particularly the permanent orchard crops), ground disturbance will be again be limited, as appropriate and consistent with farming BMPs. Towards this end, as noted in Response #2 above, Mahi Pono has implemented several water saving strategies for the Central Maui agricultural fields and continues to evaluate additional methods, some of which are consistent with the specific measures you recited. Mahi Pono water saving strategies include the following:

- Planting windbreaks in the fields.
- Incorporating significant uses of weed mat along plant lines, which will reduce evapotranspiration and erosion.
- Mowing rather than plowing inter-rows to preserve organic matter and keep cover to prevent soil erosion.
- Operating within the terms of a Conservation Plan from NRCS, which includes swales and diversions for erosion protection,
- Practicing rotational grazing of livestock.
- Planting permanent tree crops that will develop canopies that will assist with soil moisture retention and reduce evapotranspiration.

Comment 4: *The EIS needs to include all the remaining crops planned over what time period, and in what locations. The current map as presented in the DEIS is incomplete. When it is known what acreage of which crops will be planted in what specific locations over time, it can be determined how much water per acre each crop will need. Over-irrigating crops leads to root rot, wilting trees/coffee plants, and eventual failure of the crop. Until we have the complete farm plan*

it is impossible to say how much water is needed – for which crop, which location, and in what time frame. If there are no plans to plant acreage for several years clearly less water is required.

Response 4: As discussed in Section 2.1.4 of the Draft EIS, Mahi Pono’s farm plan is expressly intended to be conceptual based on best information known at this time and is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type and context of agricultural initiatives outlined for pursuit (i.e. orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation, and the need to be sensitive to the existing local farming community.

It is anticipated that the Mahi Pono farm plan will continue to evolve over time based on a number of factors, including the available supply of surface water, experience which will be gained on crops that grow well in Central Maui, crops that are profitable, the size of the market for profitable crops, etc. Mahi Pono’s farm plan and its impacts are based on a production timeline of full operations by 2030. It is explained in Section 2.1.5 of the Draft EIS that it will take approximately 10 years for Mahi Pono and its lessees to properly prepare their lands for cultivation including actions to remove volunteer sugarcane and weeds, amend soils, install field improvements, etc. It is also noted that the Draft EIS includes a variation of the Mahi Pono farm plan in the event that a Water Lease is not issued as discussed in Section 3.4.13. Both the Mahi Pono farm plan associated with the Water Lease under the Proposed Action and the No Action alternative farm plan provide information about the gallon per acre per day requirements based upon the mix of agricultural uses proposed. See Table 2-1 and Table 3-1 of the Draft EIS for more details. Please note that some water use projections for the Mahi Pono farm plan under the Proposed Action have been revised, as shown on page 2-29, which also provides an updated discussion of Mahi Pono’s water use as of October 2020 and projected water use for 2021 based upon projected agricultural operations for that period.

The Mahi Pono team has extensive experience in agriculture and is aware of the risks posed by root rot and has planned accordingly. Furthermore, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

The locations of crops for the near-term plantings are shown in Figure 23 in Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts) in the Draft EIS, as updated in the Final EIS and provided as Figure 2-10 of the Final EIS, depicted on page 2-32. Figure 2-9 of the EIS (previously Figure 2-6 of the Draft EIS) depicts the Mahi Pono farm plan at full implementation.

The approach to estimating impacts and the level of detail are consistent with EIS requirements. A rigid farm plan and detailed schedule—i.e., specific future crops planted on specific fields and when, annual growth of various orchard crops and their yields, annual changes in water requirements, etc.— would be unrealistic as a basis for meaningful discussion or evaluation.

Comment 5: *The EIS states that 30% of the water that originates in the license area is owned by A&B. The DEIS needs to present evidence of said ownership, and should not assume this is true.*

Response 5: The Draft EIS does not state that 30% of the water that originates in the License Area is owned by A&B. Rather, Section 3.3 of the Draft EIS explains that ". . . under the 1938 agreement and a related calculation involving isohyet analysis of rainfall patterns, it is understood that approximately 30% of the water in the License Area streams is derived from the privately-owned lands. Therefore, the EMI Aqueduct System could continue to divert approximately 30% of the water available from the Collection Area . . . "

A copy of the 1938 Agreement has been provided within the Final EIS as Appendix R. The 30% figure was agreed to between the BLNR and EMI at the end of 1987, to represent the amount of water originating from private (vs. State) lands in the 50,000-acre Collection Area and was based on estimates of the average annual total yields from the streams in License Area. Prior to that time, the United States Geological Survey (USGS) provided a table in which USGS estimated, for each of the four license areas, the percentages of water estimated to have arisen on State land versus private land. This was explained in the testimony and exhibits submitted to the Commission on Water Resource Management (CWRM) throughout the contested case hearing on the petitions to establish interim instream flow standards (IIFS), which petitions were resolved by CWRM's issuance of its Findings of Fact, Conclusion of Law, and Decision and Order in Case CCH-MA13-01, dated June 20, 2018 (CWRM D&O). Copies of relevant documents on this subject have been appended to the Final EIS as Appendices R-1, R-2, R-3, R-4, and R-5, and are further described in Section 3.3 of the Final EIS as shown in the enclosed pages 3-24 to 3-25.

Comment 6: *The EIS needs to show a diagram of how the Nahiku Ditch households are connected to the ditch, as stated in the DEIS currently. It is a fact that the Nahiku area households water comes from groundwater tunnels, not ditches.*

Response 6: In response to your comment requesting diagrams specifically showing where Nāhiku water comes from, please see page 2-23 which has been added to the Final EIS as Figure 2-6. Please note, the description of the Nāhiku water service from Section 2.1.3.3 of the Draft EIS, has been revised to take into account clarifications provided by the County of Maui Department of Water Supply (MDWS), as shown in pages 2-21 to 2-22.

According to MDWS, EMI's Nāhiku Tunnel is the sole source of water for the MDWS Nāhiku Water Service Area. It is also our understanding that EMI developed and owns the Nāhiku Tunnel. Per a 1973 Memorandum of Understanding, as amended, MDWS can draw up to 20,000 gallons of water per twenty-four hour day to serve the Nahiku community. EMI continues to deliver water to the MDWS for the Nāhiku community pursuant to the agreement. However, that continued delivery is premised upon EMI's continued receipt of permits or a lease from the State BLNR.

Comment 7: *The EIS needs to show evidence of current salination analysis of the wells that they claim are too salty for irrigation, to verify that this claim is true. Also, the DEIS needs to include that healthy soil that uses mycoremediation strategies has proven to buffer against salted soils and slightly brackish well-water. Also the DEIS needs to include which crops will be planted where so we can research whether they truly are sensitive to brackish water. An example is coconuts, which thrive in brackish water.*

Response 7: Regarding your comment about current salination for the irrigation wells in the Central Maui agricultural fields, please note that there are 10 brackish groundwater wells that can serve the Central Maui agricultural fields. The Draft EIS referred to 15 brackish groundwater wells in Section 2.1.4 and Section 3.1.1.1 which discussed the Groundwater Alternative. This information was derived from the CWRM D&O, Finding of Fact (FOF) 738, as that was the number of brackish groundwater wells utilized during sugarcane operations by A&B. However, Mahi Pono only has access to 10 brackish wells that can serve the Central Maui agricultural fields. Please note that Section 2.1.4, Figure 2-7, and Section 3.1.1.1 of the Final EIS have been revised as shown on pages 2-23 to 2-25 and pages 3-3 to 3-4.

In response to your request regarding the Mahi Pono wells, please see the table below, which has been added to Section 4.2.2 of the Final EIS as shown in page 4-75.

State Well No.	TMK Number	Installed Pump Capacity (MGD)	Typical Range of Chlorides (MG/L) from 2003 through 2014¹	CWRM Delineated Aquifer System
4825-001	(2) 3-8-004:001	20.448	225 to 350	Pā'ia
5226-002	(2) 3-8-006:001	24.048	350 to 550	Kahului
5224-002	(2) 3-8-003:004	15.120	350 to 550	Pā'ia

¹ There is limited salinity data prior to 2003 and after December 2014, surface water for irrigation use rapidly declined as A&B ramped down operations prior to closing in 2016.

5323-001	(2) 3-8-001:006	20.016	No data	Pā‘ia
5424-001	(2) 3-8-001:007	5.760	400 to 700	Pā‘ia
5522-001	(2) 2-5-005:021	8.640	350 to 525	Pā‘ia
5422-001	(2) 2-5-005:054	10.080	350 to 525	Pā‘ia
5422-002	(2) 2-5-005:020	11.664	325 to 475	Pā‘ia
5321-001	(2) 2-5-005:019	30.240	400 to 1600	Pā‘ia
5520-001	(2) 2-7-004:032	10.080	900 to 1600	Ha‘ikū

The salinity levels fluctuate and therefore a range was provided. Note that Mahi Pono is in the early stages of implementing its farm plan and thus has not pumped a significant amount of ground water for its farming operations, and has not measured the salinity levels of those wells that it did pump.

Regarding your comment that the salt tolerance of crops need to be verified, Section 5 of Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts) in the Draft EIS states that:

According to the Maui Department of Water Supply, “Many of the older high-capacity irrigation wells and shafts operated by sugarcane plantations in central Maui reported salinity exceeding 4 percent of seawater” (“Maui Island Water Use and Development Plan Draft, Part III Regional Plan, Central Aquifer Sector Area,” Nov. 2018). Akinaka & Associates (A&A) found that, during prolonged droughts, the brackish groundwater in Central Maui had average salinity of about 3.6% seawater (chlorides of about 703 mg/L), and this level of salinity is assumed for analysis.

Crops sensitive to salinity can be irrigated with diluted brackish water with little reduction in yields, provided that the water is less than about 0.9% seawater (derived from Government of Western Australia, Department of Agriculture and Food, “Water Salinity and Plant Irrigation,” and Wikipedia, “Salt Tolerance of Crops”).

Less than half of the crops planned for the lower-elevation fields are sensitive to salinity. With this in mind, a reasonably aggressive adjustment to this 0.9% seawater mix would result in irrigation water containing about 1.1% seawater. This adjustment would result in a target figure for irrigation water in the lower

elevation fields of Central Maui of more than 70% surface water and less than 30% brackish groundwater ($30\% \times 3.6\% = 1.1\%$). The upper elevation fields of Central Maui would be irrigated with 100% surface water. Combining the upper and lower fields, the overall water split across all 30,000 acres would be approximately 80% surface water and 20% brackish groundwater water.

Hence, based on the crops proposed under the Mahi Pono farm plan and the salinity of the brackish groundwater wells available for use, approximately 20% of the water used to irrigate the crops and supplement the surface water diversions will be from the 10 brackish groundwater.

Regarding your comment about healthy soils that use mycoremediation strategies, please note that best practices and prevailing agricultural findings outline that the buildup of salt in the soils can be ameliorated through the flushing of soils and the planting of certain grasses, shrubs and trees. Mahi Pono will follow applicable best management practices to the extent feasible.

Notably, however, the central issue regarding the salinity of the aquifers underlying the Central Maui agricultural fields is the risk that the irrigation waters may be too salty to grow certain crops. It is anticipated that finding viable agricultural crops will require a range of trial and error efforts to identify an ideal crop mix that coordinates to the quality and amount of water available. Further, as noted in Section 5 of Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts) in the Draft EIS:

The irrigation system in Central Maui was not designed to vary the mix of surface water and brackish groundwater to accommodate crop needs of different fields. As a result, the surface-to-groundwater mix will be the same across all of the lower fields that can be irrigate[d] with groundwater.

Specifically, the above is described in Section 2.1.4 of the Draft EIS:

These brackish wells extract groundwater from the subsurface aquifers lying beneath the agricultural lands, and which are cyclically dependent on recharge derived from the irrigation of the overlying lands by water from the EMI Aqueduct System. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water. Groundwater, however, can be delivered to 7,000 acres at higher elevations via a shared pipeline that served as a penstock line for a hydroelectric unit (CWRM D&O, FOF 739). This pump station was designed and built to be an emergency water source for the high-elevation fields in the event of extreme drought.

Regarding your comment about wanting to see where the various crops will be planted, please refer to Response #4 above.

Comment 8: *The EIS needs to include impacts on fish, and the impressive rebound in every stream that has been reopened in the last three years on Maui. The Bishop Museum conducted 9 years of studies on fish rebound and the return of robust fish systems the Big Island after the closure of the sugar cane industry. The DEIS needs to include these studies.*

Response 8: Please note that the Draft EIS discusses the potential impacts of the Proposed Action and alternatives on stream habitats and native amphidromous species in Section 4.2.1 and Appendix A (Assessment of Impacts of Stream Diversions On Instream Habitat in East Maui Streams Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model), as well as the potential impacts of the Proposed Action and alternatives on the nearshore and coastal environment in Section 4.2.3 and Appendix B (East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry).

The initial conclusion, as presented in Section 4.2.1 of the Draft EIS, was that "under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition." However, please note that Section 4.2.1 of the Final EIS has been revised, and the HSHEP model report provided as Appendix A has been clarified. Under the Proposed Action, the number of HU within the entire License Area is decreased by an estimated 36.1% from a theoretical Natural Condition (i.e., a condition where no streams are diverted). However, under the Proposed Action, the number of HU is increased by approximately 27.4% in comparison to the Full Diversion condition.

Habitat units (HU), as defined by the HSHEP model report are a relative measures of stream habitat where each unit length of stream is multiplied by the Habitat Suitability Indices for the particular species. It is important to recognize that the accumulation of HU for amphidromous species is additive, meaning that a single unit of stream may have a total HU in excess of the stream area quantified. In other words, if HU for multiple non-competitive species in a given area are added together, the combined HU could be greater than the area. This is important when considering the total HU for all eight amphidromous species in a stream as the total HU for all eight species may be greater than the total stream area.

Regarding your comment about the impressive rebound, please note that since the cessation of sugarcane operations in 2016, significantly less surface water has been diverted from East Maui.

As of October 2020, the EMI Aqueduct System was diverting an average of approximately 23.3 mgd from East Maui as discussed in Section 2.1.4 of the Final EIS (see pages 2-30 to 2-32). This

is comparable to the amount diverted under the No Action alternative, which is estimated as 26.39 mgd from the License Area. As noted in Section 3.4.3 of the Final EIS, approximately 79.8% of the total stream HU would remain, or put conversely, the No Action alternative reduces HU by approximately 20.2% from natural flow conditions. When compared to the Proposed Action, discussed in Section 4.2.1 of the Final EIS, approximately 63.9% of the HU would remain, or put conversely, the Proposed Action reduces HU by approximately 36.1%. Hence, it is expected that stream HU may have increased since the cessation of sugarcane operations in late 2016. Please note that Section 4.2.1 of the Final EIS has been updated to include a general discussion more specific to the impacts and mitigations associated with the non-petitioned streams, and how stream flow restoration will influence HU in the License Area as shown on page 4-61 of the Final EIS. Moreover, the Cultural Impact Assessment (CIA) (Appendix F) also notes that several commenters to the Draft EIS stated that they have observed an increase in fish returning to the nearshore coastal environments since the cessation of sugarcane operations in 2016 which is noted in Section 4.6 of the Final EIS as shown on page 4-168.

Your comment does not provide a specific citation of the Bishop Museum document referenced. Based upon the limited description provided, we are not able to locate this study, nor able to review to verify its applicability. Nonetheless, although tangentially related, the ecosystems of Hawai'i Island are quite different from those evaluated within the scope of this EIS. Furthermore, the scientific consultants who prepared the East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry, provided as Appendix B to the EIS, are also not familiar with the subject study referenced in your comment, and could not corroborate or lend credence to its findings, as purported in your comment.

Comment 9: *The EIS needs to include facts about low-flow streams and problems with mosquito blooms.*

Response 9: Section 4.2.1 of the Draft EIS addressed the interplay between stream flow volume and mosquito habitat. The instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the HSHEP model and summarized in Section 4.2.1 and Section 4.4.2 of the EIS.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. Second, Hawaiian streams are naturally flashy (i.e., they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge

amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g., guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. Unfortunately, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed.

While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. Anecdotal observations made by Trutta staff members, support the continued presence of Culex mosquitoes under a wide range of stream flows as they reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i. Please note that Section 4.2.1 of the Final EIS has been updated to include the above discussions related to the Culex mosquito as shown in pages 4-58 to 4-61.

Comment 10: *The EIS needs to include the current and historical acreages of kalo and other perennial and annual crops to counter the claim that “East Maui only has only 44 acres total potential kalo crops and 35 acres for truck farming” as stated by the report. This also needs to include the POTENTIAL acreages that can come into cultivation if more streams are opened. East Maui supported a large population prior to the ditch system’s construction, with master farmers and master fishermen cultivating and abundantly harvesting vast areas all across the area that now takes the majority of water via the EMI ditch system.*

Response 10: Regarding your comment that the EIS needs to include the current and historical acreages of kalo, please note that, based on comments received on the Draft EIS, the Archaeological Literature Review and Field Inspection (LFRI) report (Appendix E) has been further supplemented to include additional information on historical agriculture in East Maui which is reflected in Section 4.5 of the Final EIS as shown in pages 4-143 to 4-147, and the East Maui Water Lease: Agricultural and Related Economic Impacts (Appendix I) was also supplemented with additional information regarding potential taro farming and truck farming under the Proposed Action and associated alternatives, as summarized in EIS Section 4.7.4. See pages 4-288 to 4-293 of the Final EIS.

Also, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the EIS, where it is noted that CWRM ordered full flow restoration to the identified taro streams.

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for taro were identified through consultation on the EIS.

For the analysis included in Appendix I and summarized in Section 4.7.4, taro farms in East Maui (from Honopou to Nāhiku), including use of water from streams not subject to the CWRM D&O, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. This acreage is assumed for the Proposed Action and all associated alternatives since nearly all potential new taro cultivation is assumed to draw water from fully restored taro streams which will have the same flows under all alternatives. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops.

The above discussion has been added to Section 4.7.4 of the Final EIS as shown in pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 11: *The EIS needs to include facts regarding the Ahupua`a of the each stream prior to ditch construction for real comparisons to current production, both for indigenous farming and for fishing.*

Response 11: Please note that construction of the EMI Aqueduct System started in the 1870s and was completed in 1923 as detailed in Section 1.3.2 of the Draft EIS. Due to the age of the diversions of the EMI Aqueduct System, we do not know of any past studies that show the conditions of the ahupua`a in East Maui prior to the diversions being constructed. However, there are mo`olelo that are known that provide insight to as what the East Maui ahupua`a may have looked like. The known mo`olelo are documented within Cultural Surveys Hawai`i's Archaeological LRFI report (Appendix E) which is summarized in Section 4.5 of the EIS; a subsection titled Historical Agricultural Land Use has been added to Section 4.5 of the Final EIS as shown in pages 4-143 to 4-147. In summary, historic maps dating between 1869 and 1922 were analyzed for the locations of farm plots and commercial agricultural ventures, which were quantified by type. Historic maps (1869-1922) document 1,126.3 acres of sugarcane, 38.1 acres of rice, 15.6 acres of taro, 14.7 acres of rubber (Ko`olau Rubber Company), and 13.3 acres of kula (fields, open pasture) in East Maui. Historic maps document an estimated total of 1,208 acres of farmland, including approximately 28.9 acres in use for traditional native Hawaiian agricultural practices (lo`i kalo and kula land). As with kuleana lands, the historic farmlands in East Maui were located near the coast in areas that could be accessed by trail or by ship.

Comment 12: *It is well documented across the globe that the interface of fresh water streams into the ocean is where there is an abundance of fish. The statement in the DEIS that fisheries are insignificant/non-existent is specious, as the fresh water has not been flowing for many decades, thereby changing the previous abundant fish supplies and stream-interface fisheries that were traditional fishing areas.*

Response 12: There are no statements made within the East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry report (Appendix B) or the Draft EIS that “*fisheries are insignificant/non-existent*”. The collected data presented in Appendix B and summarized in Section 4.2.3 of the EIS suggest that the broad scope of nutrient delivery conveyed from the streams to the ocean is limited. This is due to the intense mixing process that occurs when strong ocean currents – common in the nearshore ocean environments in East Maui – which quickly disperse a relatively small amount of fresh water into an exponentially larger ocean. Consequently, if nutrient concentrations in the ocean are not subject to substantial change, there is no meaningful vehicle for fishing to be negatively impacted by streamflow.

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow

diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the

estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83 of the Final EIS.

Comment 13: *The EIS needs to include a comprehensive archeological survey across the entire East Maui license areas. It is not true that managing the ditch system does not disturb any Hawaiian cultural Iwi, lo`i sites, and other areas of cultural significance.*

Response 13: An Archaeological LRFI report was prepared by CSH, in consultation with the Hawai'i State Historic Preservation Division (SHPD), to determine the likelihood that historic properties (any building, structure, object, district, area, or site over 50 years old) may be affected by the proposed Water Lease and, based on findings, consider cultural resource management recommendations. This study is summarized within Section 4.5 the EIS and appended as Appendix E. This document was intended to support the Proposed Action's compliance with environmental review requirements. The report provides a comprehensive review of traditional and historic background information of the region, a review of previous archaeological studies and findings in the region, and a field inspection of the License Area focused on inspecting the areas nearest to the EMI Aqueduct System infrastructure and access roads. Based on the research and analysis conducted for the LRFI, neither the Water Lease, nor the alternatives, is expected to have impacts on archaeological historic properties within the License Area because none of these actions include significant related ground disturbance. The proposed Water Lease will merely allow the Water Lease lessee to continue to enter and transit lands owned by the State in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System. In this context, "maintenance and repair" involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work may require small tractors and specialized equipment. Maintenance and repair work of this nature in these areas has been going on for more than a century in connection with the operation and maintenance of the EMI Aqueduct System.

There is no requirement under HRS Chapter 343 that an EIS include an archeological inventory survey (AIS). *Kaleikini v. Yoshioka*, 128 Hawai'i 53, 283 P.3d 60 (2012) (holding that, with respect to the EIS done for the Honolulu rail project, "although the final EIS did not include an AIS, it was nonetheless sufficient to enable the decision-maker to consider fully the environmental factors involved" and upholding the acceptance of the EIS). The Draft EIS, as required under HRS Chapter 343, includes extensive information about archaeological, historic, and cultural resources, including the following three technical studies: Historical Structure Assessment (Appendix D), Archaeological Literature Review and Field Inspection (Appendix E), and Cultural Impact Assessment (Appendix F). Initially, a Chapter 6E-7 and 6E-42 historic preservation review letter dated 25 January 2017 (Log No. 2017.00026; Doc. No. 1701GC08) sent from the SHPD to the DLNR Land Division requested that, pursuant to HAR §13-284-5(b)(5)(A and C), an AIS and an

architectural inventory survey, be prepared prior to issuance of the Water Lease, and that the AIS be preceded by archeological inventory survey plan. Thereafter, additional information regarding the Water Lease was provided to the SHPD including the understanding that the proposed Water Lease will not involve any significant ground disturbance and that the potential impact of flooding from abandoning certain diversion (which is a requirement under the CWRM D&O irrespective of the Water Lease) will not be greater than periodic naturally occurring events. A subsequent Chapter 6E-8 historic preservation review letter (Log No. 2017.00026; Doc. No. 1706MBF11) sent from the SHPD to the DLNR Land Division updated the previous correspondence to no longer request the completion of an AIS plan or AIS for the License Area in conjunction with the proposed Water Lease because the Water Lease does not entail ground disturbing activities (other than what has taken place as part of routine maintenance).

Comment 14: *The EIS needs to verify the claim that only the Central Valley has the substantial potential to grow useful food crops for Maui's future. I have studied the Central Valley Mahi Pono lands extensively and this statement is false. The EIS needs to include a complete study of all the arable land on Maui, either in cultivation, or with the potential to be in cultivation to verify or disprove this claim.*

Response 14: The Central Maui agricultural fields at issue in this EIS consist of approximately 30,000 acres of cultivatable land as discussed in Chapter 4 of the Draft EIS. Specifically, Chapter 4 of the Draft EIS states:

For the purposes of this DEIS, Central Maui is comprised of the approximately 30,000 acres of agricultural land that had been cultivated with sugarcane for over a century utilizing water from the EMI Aqueduct System. Geographically, what is referred to as Central Maui encompasses approximately 36,000 acres, but approximately 6,000 acres is comprised of uncultivated areas, including roads, gulches, and patches of uncultivated land as shown in Figure 4-1.

Please note that the above has also been added to the Executive Summary as shown in pages iii to iv.

As summarized in Section 4.7.4 of the Draft EIS and Appendix I (East Maui Water Lease: Agricultural and Related Economic Impacts):

Central Maui has some of the best agricultural conditions in the State for farming, including a large area in a compact configuration, high-quality soils, high solar radiation, a location near markets and shipping terminals, and potentially ample

water at low delivery costs (assuming a new Water Lease with a reasonable use fee), and for lessees rents that will be comparatively low.

The basis for this finding is given in Subsection 5 of Appendix I of the Draft EIS, along with Figures 4 to 12 in Appendix I of the Draft EIS.

Moreover, as discussed in Section 5 of Appendix I and Section 4.7.4 of the Draft EIS, the overwhelming majority of the Central Maui agricultural fields (approximately 80%) are rated by the UH Land Study Bureau (LSB) as having the highest Overall Productivity Rating of "A" (on a scale of "A" to "E" with "E" being the lowest soil rating), and a little over 11% has a "B" rating. In other words, about 27,567 acres (90.9%) are high-quality lands rated A or B. The Agricultural Lands of Importance to the State of Hawai'i (ALISH) Classification System, developed and compiled in 1977 by the State Department of Agriculture with assistance from the U.S. Department of Agriculture - Natural Resources Conservation Service (NRCS), and the College of Tropical Agriculture, University of Hawai'i. Approximately 25,669 acres of the Central Maui agricultural fields are classified under the ALISH system as "Prime", which means "agricultural land which is land that is best suited for the production of crops because of its ability to sustain high yields with relatively little input and with the least damage to the environment." Also, as discussed in Section 5.1.4 of the EIS and Section 5 of Appendix I, approximately 22,000 of the 30,000 acres of agricultural fields in Central Maui are designated as Important Agricultural Lands (IAL). Under Article XI, Section 3, of the Constitution of Hawai'i, the State is required to conserve and protect agricultural lands, promote diversified agriculture, increase agricultural self-sufficiency and assure the availability of agriculturally suitable lands. HRS Chapter, 205, § 205-41 through § 205-52, provides for the designation of IAL. As stated in HRS Chapter 205: "*The objective for the identification of important agricultural lands is to identify and plan for the maintenance of a strategic agricultural land resource base that can support a diversity of agricultural activities and opportunities that expand agricultural income and job opportunities and increase agricultural self-sufficiency for current and future generations.*" IAL designation facilitates the long-term dedication of lands for future agricultural use so long as there is a sufficient supply of water to allow for profitable farming.

However, the EIS and the associated technical studies do not claim that only Central Maui has the substantial potential to grow useful food crops for Maui's future. As discussed in Section 2.1 of the Draft EIS, the scope of this EIS is to assess the Proposed Action which is, "*...to enable the Board of Land and Natural Resources (BLNR)-awarded lessee the right, privilege and authority to enter and go upon State-owned lands for the purposes of developing, diverting, transporting and using government-owned waters. The requested Water Lease would allow the use of government-owned waters from the License Area (approximately 33,000 acres which includes lands within Nāhiku, Ke'anae, Honomanū, and Huelo) through the East Maui Irrigation Company,*

LLC (EMI) Aqueduct System. Use of that surface water would allow the continued provision of water to enable approximately 30,000 acres of farmland in Central Maui to remain in agriculture.” Hence, the EIS assesses the action of obtaining a Water Lease and diverting water from East Maui. With regards to agriculture, under the Proposed Action, a major portion of the diverted water from East Maui would be used to irrigate the agricultural fields in Central Maui to continue to transition to diversified agriculture.

Comment 15: *As much as 30% of the Mahi Pono land is considered marginal growing areas, and the EIS states Mahi Pono will be farming only 16,900 acres, and grazing 5,000 acres. This only equals 21,000 acres, which does not support their claim to need that quantity of water, nor to need it for 30 years.*

Response 15: We respectfully disagree with your assertion that 30% of the Central Maui agricultural fields represent "marginal growing areas." The agricultural suitability of the Central Maui agricultural fields is addressed in Response #14 in quantifiable terms. Regarding your statement that the EIS states that Mahi Pono will be farming only 16,900 acres, and grazing 5,000 acres, equaling 21,000 acres, it is unclear where you gathered your information from. Nowhere in the EIS is that statement made. To the contrary, the EIS explains that at full operation (which is anticipated by 2030), the Mahi Pono farm plan will utilize approximately 30,000 acres in Central Maui. Section 2.1.4 of the Draft EIS state:

- *That total amount of water will be delivered to approximately 30,000 acres. Of those 30,000 acres:*
 - *Approximately 15,950 acres would be used for farming, including 12,850 acres for orchard crops and 3,100 acres for other crops.*
 - *Approximately 13,800 acres would be used for pasture, of which about 4,700 acres would be irrigated.*
 - *Approximately 250 acres would be used for green energy, such as a solar farm.*

Because there is insufficient surface water to support the entire farm plan, brackish groundwater will also be used. . .

This farm plan would consist of the following:

- *Approximately 20,650 acres of irrigated farm land, including 12,850 of orchard crops, 600 acres of tropical fruit, 1,200 acres of row and annual crops, in addition to a community garden and limited non-GMO energy crops.*
- *Approximately 13,800 acres of cattle pasture, comprised of 4,700 acres of irrigated pasture, and 9,100 acres of unirrigated pasture. This should fit the proposed model of grass-finishing on irrigated pasture. The unirrigated acreage is less than 10,000 acres,*

10238-04
Letter to Ms. Jenny Pell
Page **21** of **21**
September 3, 2021

which helps ensure that that the entire area devoted to unirrigated pasture will remain productive.

However, please note that Table 2-1 of the Draft EIS (Table 2-2 of the Final EIS) that was incorporated into Section 2.1.4 has been updated with more precise water usage numbers as shown on page 2-29.

Comment 16: *I am asking that the EIS include this important information. Thank you for the opportunity to submit comments on this DEIS.*

Response 16: Please note that we have updated the Final EIS as applicable, and the Final EIS includes your comments and this response letter. Thank you for your participation in this EIS process.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.² Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanū, and Huelo License Areas Aloha,

The period for comment needs to be extended. 45 days for 2,700 pages is insufficient for analysis. The Draft EIS does not mandate standards for monitoring and streamflow compliance. A correctly done EIS should include an evaluation and examination of the possible impacts of this 30-year lease on our fisheries and nearshore gathering areas.

30 years is far too long. I object to this use of natural resources. It is not in the public interest.

You have a constitutional requirement of upholding the public trust. This DEIS and proposed arrangement will not.

I look forward to the opportunity to provide further comments on the Final EIS.

Aloha,

Joe Ritter Maui resident

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Ritter:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The period for comment needs to be extended. 45 days for 2,700 pages is insufficient for analysis.*

Response 1: We acknowledge your comments. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai‘i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 2: *The Draft EIS does not mandate standards for monitoring and streamflow compliance.*

Response 2: Please note that the EIS is a disclosure document and not a decision-making document, or in this case, a document that mandates standards. However, with regards to the IIFS set in the 2018 CWRM D&O, please note that the Proposed Action must be in compliance with the IIFS before any water is diverted through the EMI Aqueduct System. Also note that the current East Maui water revocable permits specify that quarterly reports to the BLNR are

required. These reports are mandated to include a statement of compliance with the IIFS and identify the total amount of water being diverted from License Area measured at Honopou. It is expected, and the EIS takes into account, that compliance with the IIFS requirements under the CWRM D&O will also be required under the Proposed Action. In compliance with the CWRM D&O streamflow requirements, EMI has adjusted certain movable portions of gates to ensure that streamflow below the gates complies with the IIFS requirements. Compliance with the CWRM D&O IIFS requirements is always subject to CWRM staff verification.

Comment 3: *A correctly done EIS should include an evaluation and examination of the possible impacts of this 30-year lease on our fisheries and nearshore gathering areas.*

Response 3: Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa

(*Eleotris sandvicensis*) and ‘Ōpae ‘oeha‘a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi‘ina‘au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa‘akea will have connectivity flow restoration, while ‘O‘opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi‘ina‘au Stream) have estuarine reaches, four of which were noted by Trutta’s HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR’s methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi‘ina‘au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa‘akea) have connectivity flow restoration ordered. Pa‘akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83 of the Final EIS.

Comment 4: *30 years is far too long. I object to this use of natural resources. It is not in the public interest.*

Response 4: We acknowledge your comments. Section 3.2.2.1 of the Draft EIS, discussing the Alternative Lease Duration alternative, explains that "*a lease term shorter than 30 years could limit the ability of Mahi Pono or a lessee to obtain financing for the needed investment in establishing successful diversified agricultural operations and crops that may take years to reach economic viability.*" The Alternative Lease Duration alternative is nevertheless fully analyzed in Section 3.2.2.1. The Agricultural and Related Economic Impacts report provided as Appendix I to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to complete the implementation of its proposed farm plan across its 30,000 acres of Central Maui agricultural land, including the removal of volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which take 5-12 years to reach full maturity, after which the trees will provide yields for 35 to over 100 years. This is a long-term commitment to farming, and needs long-term access to a reliable source of irrigation water.

Under the Alternative Lease Duration alternative, assuming a water lease shorter than the requested 30 years, the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed because of the risk of not being able to farm for a long enough period to recover their planned investment. Moreover, it is not unreasonable to expect that a return should be made on an investment in farming, particularly the magnitude of the investment that is required to return these 30,000 acres back to a sustainable diversified farming operation. As just one example, Mahi Pono expects to invest over \$20 million to increase the efficiency of its private, on-farm Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from the Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Financing may be sought for various aspects of the total investment, and financing organizations/banks will seek assurance of the financial stability of the farming operation to ensure the loan will be paid back, including assurance of a reliable source of irrigation water for at least the term of the loan.

Comment 5: *You have a constitutional requirement of upholding the public trust. This DEIS and proposed arrangement will not.*

Response 5: Regarding your comment about the Public Trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown in pages 1-25 to 1-27.

Comment 6: *I look forward to the opportunity to provide further comments on the Final EIS.*

Response 6: Please note that the Final EIS does not allow for public comment; only the EIS Preparation Notice and the Draft EIS allow for a public review period.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments and Concerns about the EIS for the East Maui Water Lease Draft

Dear Mr. Matsukawa,

As a concerned citizen and resident of Maui, I would appreciate your attention to the following comments and concerns that I have concerning the continued diversion of East Maui streams. This has been going on far too long without the transparency necessary for the proper management of this vital common public resource.

Thank you for this opportunity to voice my deep conviction concerning this issue and to raise points that require further discussion and clarification before this proposal can be accepted.

- 1) It should be not taken as a given that East Maui resources can continue to be diverted as they have for 100 years and that no other solutions to Maui's water needs are taken into consideration.
- 2) Please provide proof that EMI is the owner of the EMI aqua duct system particularly for those lands that are State owned.
- 3) Please provide documents that prove the transfer of the aqueduct system to A&B or EMI from the Kingdom, Republic, Territory or State of Hawai'i.
- 4) Describe with full transparency the financials and ownership of Mahi Pono including foreign ownership. What is the potential impact of issuing to a non-Hawaiian entity compared to an auction to a Hawaii-based company or a public authority?
- 5) Explain why it is stated in the EIS that the City of Honolulu would receive \$120K in tax revenues. Why isn't Maui the recipient of these funds?
- 6) Explain how, given the obligation to provide water to DHHL and the cost of doing so, this could be achieved in the financial model presented. Mahi Pono would not generate the necessary funds with the prices of water proposed - however the low prices suggested would greatly increase the profitability of Maui Pono's agricultural operations.
- 7) The presentation of the threats to the upcountry water supply are grossly overstated and verge on a "scare tactic" - this should be removed from the final document or accurately portrayed.
- 8) Will A&B (now a REIT) retain any water rights when the 17K acres that are currently owned jointly by A&B and Mahi Pono becomes 100% owner?
- 9) There needs to be a STRONG statement that no Monsanto RoundUp or any similar generic herbicide be used in the East Maui watershed.

10) There is no comprehensive analysis of the impact on Maui's economy and future by having Maui's water controlled by an off-island entity. Compare this to having the water managed, utilized and operated by a Water Authority.

Sincerely,
Joelle Lambiotte du Lac

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Joelle Lambiotte du Lac:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *As a concerned citizen and resident of Maui, I would appreciate your attention to the following comments and concerns that I have concerning the continued diversion of East Maui streams. This has been going on far too long without the transparency necessary for the proper management of this vital common public resource.*

Thank you for this opportunity to voice my deep conviction concerning this issue and to raise points that require further discussion and clarification before this proposal can be accepted.

Response 1: We acknowledge your comments and offer you detailed responses below to each one of your points.

Comment 2: *It should be not taken as a given that East Maui resources can continue to be diverted as they have for 100 years and that no other solutions to Maui’s water needs are taken into consideration.*

Response 2: Please note that the Proposed Action does not assume that streams from the License Area will be diverted as they were for the past century. However, the Proposed Action implicates

complex substantive issues with long histories. The EMI Aqueduct System has been diverting East Maui stream water for over a century as discussed in Section 1.3.2 of the Draft EIS. The Proposed Action cumulatively will result in the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4 albeit to a lesser extent and conditions are not anticipated to significantly change under the Proposed Action.

With regards to using less water than in the past, this is addressed in Section 2.1.2 of the Draft EIS as follows:

East Maui, specifically the License Area, has already been affected by increased stream flows resulting from less offstream diversions due to the closure of sugar operations in December 2016. Currently, the EMI Aqueduct System is only diverting approximately 20 mgd. As a result, very little surface stream water is currently being diverted relative to what would be allowed should the Water Lease be awarded per the Proposed Action. However, the amount of water that may be diverted should the Water Lease be issued is substantially less than the amount that was diverted during normal sugar production. For example, in 2006 it is estimated that the EMI Aqueduct System delivered approximately 156.69 mgd at Maliko Gulch, whereas under the CWRM D&O, it is estimated that the delivery at Maliko Gulch will be approximately 92.32 mgd (Akinaka, 2019).

However, please note that Section 2.1.4 of the Final EIS has been revised to reflect Mahi Pono's current and near-term expected water use as shown in pages 2-30 and 2-32, which details average water being diverted from East Maui streams through the EMI Aqueduct System and how that water will be used. It important to note that as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet the needs of the approved water uses, including the MDWS and of Mahi Pono's agricultural operations in Central Maui.

Although the Proposed Action will divert more water than under current conditions and when compared to the amount of water being diverted immediately prior to the cessation of sugarcane operations, the Proposed Action is not anticipated to result in significant adverse impacts as discussed throughout Chapter 4. The Proposed Action cumulatively will result in the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter

4 albeit to a lesser extent and conditions are not anticipated to significantly change under the Proposed Action.

With regards to your comment about no other solutions, please note that alternatives to the Proposed Action were also analyzed. Specifically, Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were well-discussed, but ultimately not assessed to the same degree as (a) through (d). Additionally, Chapter 3 acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible for the reasons discussed in Chapter 3. Moreover, based on comments received on the Draft EIS, the alternatives analysis in Chapter 3 has been further expanded within the spectrum of alternatives presented in the Draft EIS. See pages 3-2 to 3-19 of the Final EIS.

Comment 3: *Please provide proof that EMI is the owner of the EMI aqueduct system particularly for those lands that are State owned.*

Response 3: Please note that the EMI Aqueduct System is owned and operated by the East Maui Irrigation Company, LLC. Please note that the 1938 Agreement between A&B / EMI (referred to as "the Company") and the Territory of Hawai'i, which has been added to the Final EIS as Appendix R, acknowledges EMI's ownership of the EMI Aqueduct System. Pursuant to the 1938 Agreement, the Territory of Hawai'i (now the State) granted perpetual easements to EMI for the placement of the EMI Aqueduct System. See EIS Section 3.3.

As described in Section 2.1.2 of the Draft EIS, the EMI Aqueduct System spans both State-owned and EMI-owned lands and is an integrated system. The Collection Area for the EMI Aqueduct System covers approximately 50,000 acres, of which 33,000 acres are owned by the State and 17,000 acres are privately owned. See Draft EIS Figure 1-1 (EMI Aqueduct System Collection Area). As mentioned above, under the 1938 Agreement, the State and EMI each granted to the other "perpetual" easements to those portions of the EMI Aqueduct System located on the other's land. The duration of these "perpetual" easements was stipulated to last until the termination of the 1938 Agreement. The 1938 Agreement is still in place and valid.

The State may, but is not obligated to, terminate the 1938 Agreement only if the licenses are offered at auction but EMI fails to bid. EMI may, but is not obligated to, terminate the 1938 Agreement if the State fails to offer the licenses at auction. Thus, if no license is offered at auction, the 1938 Agreement provides that EMI may still collect water derived from the EMI-owned portions of the Collection Area and, utilizing the easement granted to it in the 1938 Agreement, transport it across the portions of the EMI Aqueduct System that transverse State lands.

The 1938 Agreement defines the “Territory” to include its “successors” (i.e., the State). EMI has not failed to bid at any auction of licenses, so the condition precedent for the State to have the right to terminate has not occurred. While the State has not yet offered the licenses at auction, EMI has not exercised its right to terminate and is instead a proponent of the Proposed Action which would lead to the licenses being offered at auction for the purpose of the continued integrated operation of the EMI Aqueduct System. Neither party has terminated the 1938 Agreement. Please note that this clarification has been added to Section 3.3 of the Final EIS as shown in pages 3-24 to 3-25.

Comment 4: *Please provide documents that prove the transfer of the aqueduct system to A&B or EMI from the Kingdom, Republic, Territory or State of Hawaii.*

Response 4: As noted in Response #3 above, the 1938 Agreement between A&B / EMI (referred to as “the Company”) and the Territory of Hawai‘i, which has been added to the Final EIS as Appendix R, acknowledges EMI’s ownership of the EMI Aqueduct System.

Comment 5: *Describe with full transparency the financials and ownership of Mahi Pono including foreign ownership. What is the potential impact of issuing to a non-Hawaiian entity compared to an auction to a Hawaii-based company or a public authority?*

Response 5: The ownership and financial relationships among the entities you listed are beyond the scope of the EIS, as those issues are not relevant to the analysis of environmental impacts. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 6: *Explain why it is stated in the EIS that the City of Honolulu would receive \$120K in tax revenues. Why isn’t Maui the recipient of these funds?*

Response 6: The General Excise Tax (GET) is a State tax that flows to the State General Fund. However, the State legislature authorized counties to adopt a surcharge on the GET up to 0.5 percent, and such funds will remain in the County where the GET is generated. As of this writing, the County of Maui has not adopted a GET surcharge. However, the City and County of Honolulu adopted a surcharge of 0.5 percent, effective from January 1, 2007 to December 31, 2030. Economic impacts that occur on Maui will generate indirect impacts elsewhere, including on the island of O‘ahu. At full farm operations in Central Maui, the farms and the families of their employees will purchase various goods and services, thereby generating indirect sales. Most of the indirect sales will be on Maui, but some will be on O‘ahu since Honolulu is the primary supply center in the State. These indirect sales will be subject to State excise tax. Because the County of Maui has not adopted a GET surcharge, the County of Maui does not collect an excise-tax surcharge.

For clarification, p. 3-18 of the Draft EIS does not recite that Honolulu would receive \$120,000 in tax revenues. Under the Proposed Action, at full operations of the Mahi Pono farm plan it is projected that the City and County of Honolulu would derive about \$140,000 per year from the excise tax surcharge.

Comment 7: *Explain how, given the obligation to provide water to DHHL and the cost of doing so, this could be achieved in the financial model presented. Mahi Pono would not generate the necessary funds with the prices of water proposed - however the low prices suggested would greatly increase the profitability of Maui Pono’s agricultural operations.*

Response 7: We respectfully disagree with your comment that Mahi Pono would not be able to generate necessary funds given the obligation to provide water to DHHL. Specific information regarding the DHHL's future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related

to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd as shown in pages 2-4 to 2-7. As explained in pages 2-4 to 2-7, the DHHL water reservation process involves several steps before a reservation amount is formally identified. The first step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following adoption of the Beneficiary Consultation Report and an authorization to the Chairman to seek a reservation of water, CWRM could act on a reservation request related to a proposed lease.

As explained in Section 2.1.1 of the Draft EIS, DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B/EMI, Mahi Pono, the DLNR's Land Division, and DHHL staff and consultants. The results of the Beneficiary Consultation were presented to the HHC on May 30, 2019, as agenda item G-2. The motion passed by the HHC to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation request was approved by the HHC related to the EMI Aqueduct System for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

Consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture. Based on the multipliers used to conduct the analysis for the Agricultural and Related Economic Impacts report appended as Appendix I of the EIS, the estimated changes to the Mahi Pono farm plan that would result from an 11 mgd reduction in the supply of surface water would be as follows:

- Land Use, Central Maui
 - Crops: decreased by 1,906 acres (11 mgd × 173.31 acres/mgd)
 - Irrigated pasture: decreased by 161 acres (11 mgd × 14.62 acres/mgd)

- Unirrigated pasture: increased by 2,067 acres (11 mgd × 187.93 acres/mgd)
- Sales (Mahi Pono and tenants): decreased by \$18.4 million per year (11 mgd × \$1.673 million/mgd)
- Employment (Mahi Pono and tenants): decreased by 93 jobs (11 mgd × 8.447 jobs/mgd)
- Payroll (Mahi Pono and tenants): decreased by \$3.33 million per year (11 mgd × \$0.303 million/mgd)

The above has been added to Section 2.1.4 as Footnote 6, to Section 4.7.3 as Footnote 16, and to Section 4.7.4 as Footnote 17 as shown in page 4-287 and page 4-304 of the Final EIS.

Hence, operating profits of Mahi Pono and its tenants would decrease by an estimated \$1.8 million per year (10% of sales) and agricultural operations would be impacted as described above based on an 11 mgd reduction of available water.

Comment 8: *The presentation of the threats to the upcountry water supply are grossly overstated and verge on a “scare tactic” - this should be removed from the final document or accurately portrayed.*

Response 8: We respectfully disagree with your comment that the discussion of alternatives as it relates to the MDWS receiving water being a ‘scare tactic’. The Draft EIS is intended to disclose the impact of the No Action alternative on Upcountry Maui, and the EIS includes an analysis of the various impacts that the termination of water service to MDWS could entail. No corrections are needed. The EIS assumes under the Proposed Action that approximately an average of 7.1 mgd is conveyed to MDWS at Kamole-Weir WTP from the EMI Aqueduct System via the Wailoa Ditch as discussed in Section 2.1.3.1 of the EIS. This is approximately more than half (≈54%) of the total surface water (13 mgd) delivered to the Upcountry Maui Water System. The 13 mgd accounts for approximately 80-90% of total water delivered to the entire Upcountry Maui Water System (CWRM D&O, FOF 799).

The reason the analysis comes to this conclusion is because the agreements MDWS has with EMI are contingent upon issuance of the Water Lease (or other suitable approvals for water use, such as revocable permits). Hence, under the No Action alternative, MDWS would no longer receive water from the EMI Aqueduct System, and no longer be entitled to diverted water from EMI's land (the Upper and Lower Waikamoi Flumes) to supply Upcountry Maui for its domestic and agricultural water demands as discussed in Section 3.3 of the EIS. Specifically, Section 3.3 of the Final EIS states in relevant part (revised from the Draft EIS to take into account that the Nāhiku community is not served by the EMI Aqueduct System):

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate for Upcountry Maui and Nāhiku. As a consequence, domestic and agricultural water needs in Upcountry Maui would need to be met by alternative water sources that would need to be developed by the MDWS.

Comment 9: *Will A&B (now a REIT) retain any water rights when the 17K acres that are currently owned jointly by A&B and Mahi Pono becomes 100% owner?*

Response 9: Please note that this is speculative and beyond the scope of the EIS. As noted in Response #5 above, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 10: *There needs to be a STRONG statement that no Monsanto RoundUp or any similar generic herbicide be used in the East Maui watershed.*

Response 10: We acknowledge your comments regarding the use of Round-Up. Pesticide use is regulated by both State and Federal law. In January of 2020 EMI committed to foregoing using Round-Up to maintain the EMI Aqueduct System and any trails and access roads in East Maui. Mahi Pono’s use of these chemicals is compliant with all laws regulating pesticide use, and certified commercial applicators are utilized as required. Act 45 which was passed by the 2018 Hawai‘i Legislature and effective on January 1, 2019 required that all Certified Applicators of Restricted Use Pesticides (RUP) submit a report of the RUP that were applied each year. This report as well as any other report required by law is publicly available from the respective government entity. The State of Hawai‘i DOA's Pesticide Branch also provides regulatory oversight over Mahi Pono’s pesticide use. In accordance with this oversight, records of pesticide use must be kept and made available to the Pesticide Branch upon request at any time. It is also noted that since January 2020 Mahi Pono committed to discontinuing use of Round-Up. This information has been included in the Final EIS as shown in pages 4-317 for East Maui relating to EMI operations and 4-318 for Central Maui relating to Mahi Pono operations.

Comment 11: *There is no comprehensive analysis of the impact on Maui's economy and future by having Maui's water controlled by an off-island entity. Compare this to having the water managed, utilized and operated by a Water Authority.*

Response 11: We respectfully disagree with your comment. The financial impacts of the Water Lease as contemplated under the Proposed Action are discussed in detail in the analysis conducted for the Economic and Fiscal Impact Study report included as Appendix H and is summarized in Section 4.7.3 of the EIS. These are the expected impacts of the Proposed Action, regardless of whether the Water Lease lessee is a Hawai'i entity or otherwise. Specifically, Section 4.7.3 discusses the impacts of the Proposed Action, including a discussion of operational costs, revenue, employment and earnings related to the EMI Aqueduct System; agricultural operations in Upcountry Maui, Central Maui, and East Maui (i.e., taro cultivation); and the impact on public/domestic water supplies (and related issues) in Nāhiku and Upcountry Maui.

Specifically, Section 4.7.3.1 of the Draft EIS as it relates to EMI states:

Total operational costs for EMI labor, fringe benefits, materials, professional services, taxes, Water Lease, and other expenses are projected to be \$2.3 million per year. This would translate to \$0.068 per kgal. A currently unknown factor in EMI's operating cost is the annual Water Lease payment to DLNR. For the purposes of the economic impacts analysis, the Water Lease payment has been calculated based on the equivalent per unit cost under the existing 2019 revocable permit. The revocable permit rent payment set in November 2018 for calendar year 2019 was \$230,964.24, which represents an increase from the rent that was previously paid. Assuming 16.8 MGD is diverted under the 2019 revocable permit, the Water Lease rent rate would translate to \$0.038 per thousand gallons. This rate of \$0.038 is assumed as the basis for the future annual lease payment to the DLNR. However, the actual Water Lease rental amount will be based on an appraisal conducted prior to issuance of the Water Lease. Should the Water Lease amount be higher or lower, the operational costs of the EMI Aqueduct System would be adjusted accordingly.

Direct spending by EMI, excluding the long-term Water Lease payments to the State from the operational costs, is forecasted to be \$1.4 million. Total direct spending and indirect sales is estimated at \$3.2 million, of which \$2.6 million would be on Maui.

EMI is expected to employ a staff of 17 people with a payroll of \$0.8 million. Total direct and indirect jobs was 24, with an associated payroll of \$1.1 million.

The direct and indirect jobs associated with EMI operations would support an estimated 54 residents.

Fiscal impacts under the Proposed Action assume that the rate the MDWS pays to EMI will increase because EMI's per unit operating cost will increase as the fixed costs will be spread out over a lower volume of water diverted and possible higher Water Lease payments to the State compared to historic payments. It is estimated that EMI's operating cost under the Proposed Action would be \$0.068 per kgal, which is higher than the current MDWS payment to EMI of \$0.06 per kgal. The actual rate the MDWS will pay to EMI in 2030 will be subject to a future agreement between the parties. However, for the purposes of the fiscal impacts analysis, the 2030 water service fee rate is estimated to be \$0.10, which has been calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, EMI would receive an estimated \$268,000 in 2030 from the MDWS.

The amount paid to the State Special Land Development Fund for the Water Lease would be based on an appraisal conducted prior to issuance of the Water Lease. Assuming the amount of the Water Lease is based on the equivalent per unit cost under the existing revocable permits, the annual payment to the Special Land Development Fund would be \$846,700. Of this, \$169,300 would be disbursed to OHA and \$254,000 would be set aside for the DHHL. GET revenue would be estimated at \$37,000 while payroll tax would be \$45,400 per year.

However, please note that the above has been revised to take into account the rates charged under the current revocable permits, as approved by the BLNR in November 2020 as shown in pages 4-277 and 4-283.

As it relates to East Maui:

The taro farms and other farms in East Maui that depend on stream flows would produce at full development about 1.0 million pounds per year of taro, and about 400,000 pounds per year of other crops. The resulting direct sales would be about \$1.4 million per year. Indirect sales generated by the purchase of goods and services would be about \$1.5 million per year. Thus, total direct and indirect sales would be about \$2.9 million per year (with rounding), of which about \$2.3 million would be on Maui and \$500,000 on O'ahu. Profits from farm operations and indirect sales would be about \$300,000.

Full development of the taro farms and other farms in East Maui that depend on stream flows would result in about 14 jobs and generate about 7 indirect jobs, for a total of about 21 jobs. The payroll is expected to reach about \$500,000 for the direct jobs and \$800,000 for all direct and indirect jobs. The direct and indirect jobs provided will support an estimated 47 residents, most of which would be on Maui.

Given the small population of Nāhiku and the lack of commercial land uses, the economic impacts to Nāhiku under the Proposed Action, where water continues to be provided to the community, are considered negligible.

In terms of fiscal impacts, the taro farms and other farms in East Maui that depend on stream flows would generate approximately \$67,000 per year in State taxes at full development. For the County of Maui, property taxes will total about \$100 per year. The City and County of Honolulu will derive about \$300 per year from the excise tax surcharge. Given the small population of Nāhiku and the lack of commercial land uses, the fiscal impacts to Nāhiku under the Proposed Action, where water continues to be provided to the community, are considered negligible.

However, please note that the above has been updated to take into account the updated East Maui farming analysis based on comments received to the Draft EIS as shown in pages 4-288 to 4-293, recognizing modest increases in potential taro and truck farming in East Maui.

As it relates to Upcountry Maui:

Under the Proposed Action it is assumed that MDWS will continue to have access of up to 7.1 mgd through the EMI Aqueduct System. The County of Maui projects that the population in the Upcountry Maui Service Area will grow to approximately 43,700 in 2030, translating to an estimated 16,700 households. Assuming a median household income of \$77,400, households in the Upcountry Maui Service Area are anticipated to have a collective income of \$1.3 billion and consumption expenditures of \$710.0 million. Residential property values within Upcountry Maui are estimated to grow to \$2.7 billion.

Assuming proportional growth in line with population, there will be an estimated 1,100 businesses in Upcountry Maui in 2030, employing 6,700 individuals. Total payroll would be estimated at \$304.9 million, while direct sales associated with

these businesses would be \$1.1 billion. Commercial property values within Upcountry Maui are estimated to grow to \$180.9 million.

In total, direct sales from residents' consumption expenditures and Upcountry Maui businesses are estimated at \$1.6 billion and residential and commercial property value is approximately \$2.9 billion.

Fiscal impacts to Upcountry Maui arise from the assumption that the MDWS will need to develop 7.95 mgd of new water sources to meet future demands through 2030 (even with the continued supply of 7.1 mgd from the EMI Aqueduct System under the Proposed Action). The Brown and Caldwell analysis indicates that incremental basal wells would be a strategy to meet future demands assuming no reduction in surface water flows. Under the Brown and Caldwell analysis, the life-cycle unit cost of developing and operating wells is \$34 per kgal. It is noted that the life-cycle unit cost to develop new water for Upcountry Maui customers is high. In comparison, a similar analysis conducted for the Central Maui Water System showed a unit cost of less than \$10 per kgal, or less than one third the cost of Upcountry Maui water development (Brown and Caldwell, 2014). The total life-cycle cost for 7.95 mgd of new wells is \$1.2 billion. The life-cycle cost is expressed as the net present value of all the costs incurred over 25 years, including capital, operating, and maintenance costs.

As previously mentioned, the rate that the MDWS pays to EMI will increase by 2030 because it is assumed that EMI's per unit operating cost will increase under the Water Lease. The actual rate the MDWS will pay to EMI will be subject to a future agreement between the two entities. However, for the purposes of this analysis, the 2030 water service fee rate is estimated to be \$0.10, which has been calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, the MDWS would pay an estimated \$268,900 per year to EMI.

Water service rates vary by class of users (i.e., residential, commercial, agricultural, etc.). The average the MDWS water service rate Countywide is \$4 per kgal. Inasmuch as the same water rates are charged across the nine water systems in Maui County, there are many factors that determine the water service rate. Therefore, it is difficult to predict what the water service rate would be in 2030. However, it is noted that the life-cycle unit cost to develop new water for Upcountry customers of \$34 per kgal far exceeds the current average water service rate of \$4 per kgal. It is assumed that the MDWS would seek a variety of

funding sources to cover the cost to develop new wells. This may include County capital improvement program funds as well as State and/or Federal funds.

Nevertheless, due to the significant cost of new water source development, it would be reasonable to expect that water service rates would increase in the future to offset the costs of new water sources. As noted above, the County's water rate structure is uniform for all customers; water rates are not dependent on the service area a customer is located in (Brown and Caldwell, 2014). Therefore, under the MDWS' current rate structure, the increases would apply Countywide because rates do not vary by service area.

However, please note that the above has been revised to take into account the rates charged under the current revocable permits, as approved by the BLNR in November 2020 as shown in pages 4-277 and 4-283.

As it relates to Central Maui:

At full operations, the Mahi Pono farm plan will cause a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops. Annual sales are expected to reach \$155.9 million. The pastures would support a cattle herd of about 7,300 cow-and-calf animal units, produce over 4,300 calves per year, and generate revenues of about \$4.8 million per year. The solar farm would generate about 82,125 mW of electricity per year, with revenues of about \$8.2 million per year. Combined farm and energy revenues would reach \$168.9 million per year in direct sales (far exceeding the 2006 revenues from sugar production of \$101 million, and the \$116 million average for the 2008 to 2013 period).

Purchases of goods and services by farmers and the families of employees would generate indirect sales and, in turn, these suppliers would generate more indirect sales by their purchase of goods and services. The indirect sales are estimated at about \$160.7 million per year. Total direct and indirect sales would be about \$329.5 million per year, of which about \$273.3 million would be on Maui and about \$56.2 million on O'ahu. Profits from farm operations, energy operations, and indirect sales would be about \$33 million.

At full operations farm employment is expected to reach about 790 jobs (about 160 more than provided by sugar operations in 2006). The jobs would be typical of those provided by diversified-crop farming and ranching-managing soils and pests, operating and maintaining irrigation systems, planting crops, pruning trees, harvesting crops, sorting and washing crops, packing crops, trucking crops to markets and shipping terminals, moving cattle among pastures, maintaining fences, marketing, accounting, etc.

The purchase of goods and services by farmers and ranchers and by the families of their employees would generate an estimated 350 jobs. In total, about 1,140 direct and indirect jobs would be supported, including about 1,000 jobs on Maui. Payroll is estimated at \$45.3 million for all direct and indirect jobs. The direct and indirect jobs would support an estimated 2,550 residents.

Regarding fiscal impacts at full operations, diversified agricultural operations in Central Maui would generate an estimated \$4.5 million in State tax revenues by 2030. Property taxes paid by to the County of Maui would be about \$800,000 per year, and the City and County of Honolulu would derive about \$140,000 per year from the excise tax surcharge.

However, please note the above has been updated to include a statement about COVID-19 and potential impacts on the economy as it relates to the Proposed Action as shown on page 4-302 of the Final EIS.

Regarding your comment about a public water authority having ownership of the EMI Aqueduct System, please note that Section 3.1.2 of the Draft EIS considered alternative ownership of the EMI Aqueduct System which has been updated in the Final EIS as shown in pages 3-19 to 3-20 to acknowledge the County of Maui, Board of Water Supply Temporary Investigative Group (TIG) Report dated October 17, 2019 that was made available after the publication of the Draft EIS..

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

10238-04

Subject: A&B Draft EIS for East Maui Stream Leases. Comments, Questions
and Requests for Information.

Aloha Hawai'i Board of Land and Natural Resources, Alexander & Baldwin
and East Maui Irrigation,

REQUEST #1

Request the complete information and disclosure of salinity levels of all
water sources located on property sold to Mahi Pono LLC. Please list by tax map
key numbers (TMK).

Please include specific description of source or sources for each parcel. For
example, if the source is a well, what is the amount of water availability and
pumping capacity? Please include certified and verified information.

This important question came from a discussion I watched between Tom
Blackburn-Rodriguez and Warren Watanabe, Executive Director of the Maui Farm
Bureau on Akaku Television. Warren Watanabe stated (paraphrase) that Maui
Pono LLC would not be able to grow certain crops with the brackish water sources
that were available on the property they purchased. He stated the previous
growing of sugar cane was not negatively impacted by brackish water. This point

of view supported the idea that Mahi Pono LLC needed sources of water that are not brackish.

Did Mahi Pono LLC fully research the salinity (brackish) water issues before purchasing the land upon which they hope to have a successful diversified farming operation?

What legal disclosures did Alexander & Baldwin and East Maui Irrigation make to Mahi Pono LLC regarding brackish water?

Did Alexander & Baldwin and East Maui Irrigation legally disclose to Mahi Pono that the State of Hawai'i has a Public Trust Doctrine in the Constitution regarding water?

“In strong language, the Hawai`i Supreme Court described the public trust doctrine as “the right of the people to have the waters protected for their use [which] demands adequate provision for traditional and customary Hawaiian rights, wildlife, maintenance of ecological balance and scenic beauty, and the preservation and enhancement of the waters . . .”

“For the benefit of present and future generations, the State and its political subdivisions shall conserve and protect Hawaii’s natural beauty and all natural resources, including land, water, air, minerals and energy sources, and shall promote the development and utilization of these resources in a manner consistent with their conservation and in furtherance of the self-sufficiency of the State. All public natural resources are held in trust by the State for the benefit of the people.”
Quote is from <http://www.hawaiis1000friends.org/public-trust-doctrine.html>

Please reference the Hawai'i State Constitution at <https://www.lwv-hawaii.com/govt/constitution/constitution2.htm> and other sites.

Please discuss the possible use of R1 recycled water for the Mahi Pono LLC farming operations. Why divert water from East Maui when there is an urgent need to recycle and use R1 water in Central and South Maui? A combination of R1 water and large reservoirs or “lakes” might make aquaculture possible, too.

Mahalo!

REQUEST #2

Please list by Tax Map Key (TMK) all land ownership interests sold to Mahi Pono LLC by Alexander & Baldwin and East Maui Irrigation. Please disclose a comprehensive and complete certified title report for each parcel or interest.

Please list by Tax Map Key (TMK) all East Maui Irrigation and Alexander and Baldwin land ownership interests that are related to water diversions, the historic ditch system and any proposed leases. Please disclose a comprehensive and complete certified title report for each parcel or interest.

Mahalo!

REQUEST #3

Request for complete information and disclosure regarding the *“Nāhiku community, which, through the County of Maui Department of Water Supply, draws up 20,000 to 45,000 gallons per day (dependent on weather), directly from the EMI Aqueduct System.”*

This quote is from MAUI BUSINESS ([HTTPS://MAUINOW.COM/CATEGORY/MAUI-BUSINESS/](https://mauiNOW.com/category/maui-business/)) October 7, 2019, 12:29 PM HST , Updated October 8, 11:47 AM, **“Comments on East Maui Water Lease, Draft EIS Due by Nov. 7”**

The article stated, “According to the Draft EIS document, the lease would allow for the continued operation of the EMI aqueduct system to deliver water to the Maui Department of Water Supply for domestic and agricultural water needs in Upcountry Maui. This includes the agricultural users at the Kula Agricultural Park and the planned 262-acre Kula Agricultural Park expansion, *as well as for the Nāhiku community, which, through the County of Maui Department of Water Supply, draws up 20,000 to 45,000 gallons per day (dependent on weather), directly from the EMI Aqueduct System.”*

This definition from Wikipedia states: “An **aqueduct** is a watercourse constructed to carry water from a source to a distribution point far away. In modern

engineering, the term *aqueduct* is used for any system of pipes, ditches, canals, tunnels, and other structures used for this purpose.”

Please describe in detail the complete County of Maui Department system currently serving the Nahiku Community, including maps and tax map keys (TMK).

Is the system supplied by a tunnel or from the East Maui Irrigation “ditch” system? Please describe in detail.

Please describe the current and possible anticipated future expansion or improvement of the entire county system.

Please describe the TWO (2) water tanks in close proximity on opposite sides of the Lower Nahiku Road. Are both tanks County of Maui owned and maintained? If not, please disclose the ownership and water source for the second tank. Is the source for either tank a well? If so, please describe in detail and disclose the well drilling permit and subsequent monitoring reports.

Please understand this is important information for the community because; Makapipi Stream has recently been legally ordered to be permanently re-watered and restored by the Hawai’i State Commission on Water Resource Management. The continued use of the historic “ditch” system between the old Kuhiwa well, Makapipi Stream, Hi’inui Stream (aka: “the unnamed stream”) and Hanawi Stream, including “Big Springs”, would contradict the legal order for re-watering and restoring Makapipi Stream.

Further, the expansion of the County of Maui system serving Nahiku will impact the closely interrelated hydrology of the area. The hydrology reports developed during the “Kuhiwa Well Contested Case Hearing” are useful and educational. There is a clear understanding of the hydrology and interconnectedness of Makapipi Stream, Hi’inui Stream (aka: “the unnamed stream”) and Hanawi Stream, including “Big Springs”.

Does East Maui Irrigation or Mahi Pono LLC want to take ANY water between Makapipi Stream and Hanawi Stream? YES OR NO?

When is EMI legally required to dismantle the entire “ditch” system, including ALL diversions between the old Kuhiwa Well, Makapipi Stream and Hanawi Stream? Would EMI work with the Nahiku Community to dismantle the entire “ditch” system, including ALL diversions, between the old Kuhiwa Well, Makapipi Stream and Hanawi Stream?

Mahalo!

REQUEST #4

Request for comprehensive disclosure and discussion of the possible future of Hanawi Stream. What are the possible plans of East Maui Irrigation and Mahi Pono in relation to Hanawi Stream? What is preferred by the East Maui Community? Is the County of Maui considering the purchase of East Maui Irrigation? Please incorporate the Maui County Board of Water Supply report as part of this Environmental Impact Statement (EIS) process. For information on the 85-page TIG report, visit www.mauicounty.gov/DocumentCenter/View/119847/2019-10-17-TIG-Report. All these factors must be carefully considered.....

In a U.S. National Park Service, U.S. Department of Interior, “Rivers, Hawaii” Report Hanawi Stream was recognized as “Scenic stream flowing through an undeveloped dense forest and over several waterfalls (one drops more than 150 feet). May be the most pristine stream left in the State with cold, clear, spring-fed water and a great diversity of native stream fauna”.

“May be the most pristine stream left in the State” correctly recognizes the value of this stream and habitat. The interrelated “Big Springs” is part of this miracle of creation. Ua Mau ke Ea o ka ‘Āina i ka Pono!

Several important considerations;

The State Commission on Water Resource Management recently ordered a continuous flow of water under the Hanawi Stream bridge to continuously connect the mauka waterway to the makai waterway. This order was to insure that native

species could travel from the mouth of the stream to areas mauka of the bridge through a continuous flow of water. Why was the order needed? **Because the stream mauka of the bridge is being pumped and diverted.**

Please consider alternatives to dewatering and diverting Hanawi Stream. Please remember the statement by the National Park Service.... “May be the most pristine stream left in the State”. It could and should be one of the most pristine streams in the state.

How many gallons per day are currently being pumped out of Hanawi Stream? Please include all historical pumping records, past to present. Please include all historical stream monitoring records, past to present.

Please include all U.S. Geological Survey monitoring records.

I have recently and over many years witnessed no water flowing under the bridge. This is contrary to the State Commission on Water Resource Management order. Hanawi Stream needs to be permanently restored and re-watered. That needs to include removal of electric poles, potentially toxic transformers and electric lines that once serviced Kuhiwa well. Maui Pine installed the poles. Why aren't they responsible for the removal. Who is responsible?

Safety concerns: Uninformed tourists are “trespassing” and swimming every day at the pool directly mauka and Keanae side of the bridge. This certainly appears very dangerous. Is this the pool that is pumped? Can the tourists be “sucked in” to the intake pipe? Please address this issue and the issue of dangerous “rafting” in the ditch system. What is the East Maui Irrigation or Mahi Pono plan?

Let's work and plan together to solve these problem issues. "A'ohe hana nui ke alu 'ia." No task is too big when done together by all.

For Reference. <https://www.nps.gov/subjects/rivers/hawaii.htm>

River: Hanawi Stream

County: Maui

Reach: Headwaters to mouth including the two major source tributaries

Length Description (miles): 10

Description: Scenic stream flowing through an undeveloped dense forest and over several waterfalls (one drops more than 150 feet). May be the most pristine stream left in the State with cold, clear, spring-fed water and a great diversity of native stream fauna.

ORVs: Scenic, Wildlife

Watershed (HUC Code 8): Maui

Year Listed/Updated: 1982

Please consider and comment on two statements adopted in the 1994 Hana Community Plan Ordinance <https://www.mauicounty.gov/DocumentCenter/View/1710/Hana-Community-Plan-1994?bidId=>

“C. Interregional Issues, page 11

Several issues impact the Hana Community Plan region which need interregional, island-wide or County-wide comprehensive policy analyses and formulation.

1. Exportation of resources found within the Hana Community Plan Region. The impacts and implications of exporting resources, particularly the diversion of surface water from the region, are of key concern to Hana residents. The exportation of these resources will not only affect resource availability and environmental integrity within the region, but also affect the balance of resource supply in other community plan regions.

Implementing Actions, page 16

1. In coordination with native Hawaiian residents and community representatives, prepare watershed management plans and a groundwater and surface water resources monitoring program to protect the district's surface and ground waters, and monitor water levels to meet current and future demands.”

Are EMI and Mahi Pono willing to constructively work with and communicate with lineal descendants and all residents in the East Maui Community?

Please inform your comments by reading the Hana Community Plan and recognize the important statement of *ALOHA* in the plan to “Encourage

community-based dialogue regarding proposed land use changes in order to avoid unwarranted conflict”.

Mahalo!

REQUEST #5

Please discuss the potentially negative and/or beneficial impacts of the long term weather forecasts, including global warming, on life on Maui. Particularly, as it relates to water and the Mahi Pono LLC farming plans.....

Mahalo!

REQUEST #6

Please consider and incorporate the “Values” expressed in the Maui Island Plan. <https://www.mauicounty.gov/1503/Maui-Island-Plan>

Mahalo!

Malama Pono!

John Blumer-Buell

Mr. John Blumer-Buell
P.O. Box 787
Hana, HI 96713

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Blumer-Buell:

Thank you for comments dated November 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: REQUEST #1

Request the complete information and disclosure of salinity levels of all water sources located on property sold to Mahi Pono LLC. Please list by tax map key numbers (TMK).

Response 1: There are ten (10) brackish groundwater wells that serve the Mahi Pono agricultural fields in Central Maui. The reference to 15 brackish wells in the Draft EIS was derived from the Commission on Water Resource Management (CWRM) Findings of Fact (FOF), Conclusions of Law (COL), & Decision and Order dated June 20, 2018 (CWRM D&O), FOF 738, as that was the number of brackish wells that A&B utilized during its sugar cane operations. However, one of the 15 wells referred to, State Well No. 5128-002, does not serve the Central Maui agricultural fields and four of the other brackish wells are on lands that are not owned by Mahi Pono. As such, Mahi Pono has access to only 10 brackish wells. Draft EIS Figure 2-5 (Figure 2-7 in the Final EIS) has been revised, as shown on pages 2-24 to 2-25, to more accurately depict the water infrastructure within the Central Maui agricultural fields that is available to Mahi Pono to support its farm plan for the Central Maui agricultural fields.

In response to your request for salinity numbers and the Tax Map Key (TMK) numbers for the Mahi Pono wells, please see the table below, which has been added to Section 4.2.2 of the Final EIS as shown in page 4-752.

State Well No.	TMK Number	Installed Pump Capacity (MGD)	Typical Range of Chlorides (MG/L) from 2003 through 2014 ¹	CWRM Delineated Aquifer System
4825-001	(2) 3-8-004:001	20.448	225 to 350	Pā‘ia
5226-002	(2) 3-8-006:001	24.048	350 to 550	Kahului
5224-002	(2) 3-8-003:004	15.120	350 to 550	Pā‘ia
5323-001	(2) 3-8-001:006	20.016	No data	Pā‘ia
5424-001	(2) 3-8-001:007	5.760	400 to 700	Pā‘ia
5522-001	(2) 2-5-005:021	8.640	350 to 525	Pā‘ia
5422-001	(2) 2-5-005:054	10.080	350 to 525	Pā‘ia
5422-002	(2) 2-5-005:020	11.664	325 to 475	Pā‘ia
5321-001	(2) 2-5-005:019	30.240	400 to 1600	Pā‘ia
5520-001	(2) 2-7-004:032	10.080	900 to 1600	Ha‘ikū

Please note that the salinity levels fluctuate and therefore a range was provided.

Comment 2: *Please include specific description of source or sources for each parcel. For example, if the source is a well, what is the amount of water availability and pumping capacity? Please include certified and verified information.*

Response 2: See the table included in Response #1 above for the installed pump capacity of each well. Please note that the Central Maui Field Irrigation System includes water diverted by the EMI Aqueduct System, a system of reservoirs for storage, and 10 brackish water wells that work together to irrigate the approximately 30,000-acre Central Maui agricultural fields as discussed in Section 2.1.4 of the EIS. Section 2.1.4 of the EIS has been revised, as shown in pages 2-24 to 2-25.

As discussed in Section 4.2.2 of the Final EIS, in the past, actual pumping has exceeded the official sustainable yield (SY) of the Central Maui aquifers which the wells are located in because the official SY of the Central Maui aquifers represents the SY under natural conditions, which

¹ There is limited salinity data prior to 2003 and after December 2014, surface water for irrigation use rapidly declined as A&B ramped down operations prior to closing in 2016.

ignores the significant return irrigation recharge from waters imported from East Maui. Thus, pumping capacity can exceed the official SY of the aquifers. However, taking into account a lower rate of irrigation recharge that will occur as compared to under sugar cultivation, due to less available East Maui stream waters, pumping at less-than-historical-levels will be needed to protect the aquifers.

Hence, water from all the wells can be pumped to the lower elevations in the Central Maui agricultural fields. But please note that under the Mahi Pono farm plan, the supplementation of surface water demands by these brackish wells presents a significant constraint to the viability of the future implementation of diversified agriculture. It is anticipated that no more than approximately 16.47 mgd of brackish groundwater could be used in the Central Maui agricultural fields under the Proposed Action as discussed in Section 2.1.4 of the EIS.

Comment 3: *This important question came from a discussion I watched between Tom Blackburn-Rodriguez and Warren Watanabe, Executive Director of the Maui Farm Bureau on Akaku Television. Warren Watanabe stated (paraphrase) that Maui Pono LLC would not be able to grow certain crops with the brackish water sources that were available on the property they purchased. He stated the previous growing of sugar cane was not negatively impacted by brackish water. This point of view supported the idea that Mahi Pono LLC needed sources of water that are not brackish.*

Response 3: It is acknowledged within the Draft EIS that certain crops cannot be grown using brackish water. You are correct that many crops are not as salt tolerant as sugarcane was. However, excessive use of brackish groundwater also adversely affected sugar yields during Recent Sugar (Years 2008 to 2013). This is mentioned in Sections 2.1.4 and 4.7.4 of the EIS, and in Appendix I, “East Maui Water Lease: Agricultural and Related Economic Impacts”, because of an insufficient supply of surface water:

...a large volume of brackish groundwater was used to irrigate the sugarcane in order to maintain high levels of biomass for energy production, even though the high salinity decreased sugar yields.

It is also stated in Appendix I and in Section 2.1.4 of the Draft EIS that the Central Maui Field Irrigation System has brackish groundwater wells that can supplement surface water to approximately 17,200 acres of the Central Maui agricultural fields at the lower elevations. The remaining approximately 12,800 acres cannot be serviced by pumped ground water on a consistent basis due to their higher elevation, which makes the land uneconomical to reach with pumped water.

During sugarcane operations, the combined pumping capacity of A&B's 15 brackish water wells was 228 mgd of brackish water, but the true instantaneous pumping capacity of the wells – the most that can be pumped over 3 to 5 days – was 115 mgd during sugar cultivation, after which sump levels started to decline. From 1986 to 2013, A&B pumped an average of 71 mgd from the brackish water wells; during the 2008-to-2013 period, these wells delivered about 70 mgd of brackish groundwater to the lower-elevation fields. This was a suitable source of water for sugarcane during droughts because sugarcane can tolerate periodic use of water with higher salinity levels. However, please note that Section 2.1.4 of the Final EIS regarding the description of the brackish groundwater wells that serve the Central Maui Field Irrigation System has been revised to accurately reflect the number of wells that can serve Mahi Pono, as not all were a part of the sale transaction between Mahi Pono and A&B as shown in page 2-25 and one well does not serve the Central Maui agricultural fields.

Moreover, as discussed in Section 4.7.4 of the EIS, with respect to the Mahi Pono farm plan, because of salinity and the salt tolerance of diversified agricultural crops, which are less salt-tolerant than sugarcane, the use of brackish water on the lower fields is assumed to be limited to about 30% of the water applied. Combining the upper and lower fields, the overall water split across all 30,000 acres would be approximately 80% surface water and 20% brackish groundwater water. If insufficient water is available from the EMI Aqueduct System, then crop farming will have to be reduced no matter how much brackish water is available. Thus, we disagree with your statement that the brackish wells are part of a 'reliable system'. Additionally, the SY of the underlying aquifers as well as the quality of water are uncertain in light of the fact that significantly less recharge from imported East Maui waters will occur. Historically, the sustainable pumping capacity of these wells was highly dependent on irrigation recharge and the positive benefits to the underlying aquifers.

Comment 4: *Did Mahi Pono LLC fully research the salinity (brackish) water issues before purchasing the land upon which they hope to have a successful diversified farming operation? What legal disclosures did Alexander & Baldwin and East Maui Irrigation make to Mahi Pono LLC regarding brackish water? Did Alexander & Baldwin and East Maui Irrigation legally disclose to Mahi Pono that the State of Hawai'i has a Public Trust Doctrine in the Constitution regarding water?*

Response 4: What Mahi Pono knew or researched prior to purchasing the Central Maui agricultural fields, and what disclosures were given by the seller, are beyond the scope of this EIS. Nevertheless, it is understood that Mahi Pono did undertake due diligence before its acquisition, and that it was aware of the importance of the East Maui stream water for best use of the Central Maui agricultural fields (although it should be pointed out that the Draft EIS also includes a variation of the Mahi Pono farm plan to be implemented in the event that no Water

Lease is issued). It is also understood that the Water Lease will need to be consistent with Hawai'i's Public Trust Doctrine, and the Interim Instream Flow Standards (IIFS) decision issued under the CWRM D&O.

We acknowledge that the Proposed Action (the issuance of a 30-year Water Lease by the Board of Land and Natural Resources (BLNR)), requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai'i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. The dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease. As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action as shown in pages 1-25 to 1-27.

Comment 5: *In strong language, the Hawai'i Supreme Court described the public trust doctrine as "the right of the people to have the waters protected for their use [which] demands adequate provision for traditional and customary Hawaiian rights, wildlife, maintenance of ecological balance and scenic beauty, and the preservation and enhancement of the waters . . ."*

"For the benefit of present and future generations, the State and its political subdivisions shall conserve and protect Hawaii's natural beauty and all natural resources, including land, water, air, minerals and energy sources, and shall promote the development and utilization of these resources in a manner consistent with their conservation and in furtherance of the self-sufficiency of the State. All public natural resources are held in trust by the State for the benefit of the people." Quote is from <http://www.hawaiiis1000friends.org/public-trust-doctrine.html>

Please reference the Hawai'i State Constitution at <https://www.lwvhawaii.com/govt/constitution/constitution2.htm> and other sites.

Response 5: As discussed in Response #4 above, we acknowledge that the Proposed Action (the issuance of a 30-year Water Lease by BLNR), requires BLNR, as the Public Trustee of the surface water sources in the License Area, to comply with the State of Hawai'i constitutional and statutory provisions that, together with relevant case law, comprise the Public Trust Doctrine. The dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the

streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B’s 2001 application to the BLNR for the auction of the subject long-term Water Lease. As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action as shown in pages 1-25 to 1-27.

Comment 6: *Please discuss the possible use of R1 recycled water for the Mahi Pono LLC farming operations. Why divert water from East Maui when there is an urgent need to recycle and use R1 water in Central and South Maui? A combination of R1 water and large reservoirs or “lakes” might make aquaculture possible, too.*

Response 6: The availability of the use of reclaimed water from the Wailuku-Kahului Wastewater Reuse Facility (WWRF) is discussed in Draft EIS Section 3.1.1.2 (Reclaimed Water), which provides an analysis of the feasibility of the use of reclaimed water from the Wailuku-Kahului WWRF to irrigate the Central Maui fields. As discussed, the recycled water alternative using existing R-2 water from the Kahului WWRF could be considered an alternative as a supplemental source. However, R-2 quality water has limited usability on crops. Further, the County of Maui Department of Environmental Management (DEM) does not intend to send this R-2 water to the Central Maui agricultural fields. Further consideration of this alternative has been included in Chapter 3 of the Final EIS, which has also been supplemented with a discussion about the potential new reuse/effluent disposal facility in Central Maui to be located south-west of the Kahului WWRF that is being considered by the DEM, as well as a discussion on the feasibility of use of R-1 treated waters. See pages 3-9 to 3-11 of the Final EIS. We note that while using R-1 treated waters is not as restrictive as R-2 waters from an agricultural viability standpoint, using R-1 waters on unprocessed agricultural food crops carries negative stigma from a commercial marketing perspective. Furthermore, the DEM's desired upgrade of the Kahului WWRF to provide R-1 is unfunded and therefore speculative at this time.

Regarding your comment about aquaculture, please note that aquaculture is not a part of the Mahi Pono farm plan. As discussed in Section 2.1.4 of the EIS, the Mahi Pono farm plan consists of the following as shown in Table 2-1 of the Draft EIS (Table 2-2 in the Final EIS):

<i>Proposed Use</i>	<i>Acres</i>	<i>Gallon Per Acre a Day</i>	<i>Surface MGD</i>	<i>Ground water MGD</i>	<i>Total MGD</i>	<i>Annual MGD</i>	<i>% of Total</i>
<i>Community Farm</i>	800	3,392	1.87	0.83	2.70	987	3.28%
<i>Orchards (citrus, mac nuts,</i>	12,850	5,089	53.39	12.04	65.43	23,883	79.48

<i>beverage crops)</i>							%
<i>Tropical Fruits</i>	600	4,999	2.07	0.87	2.94	1,073	3.57%
<i>Row and Annual Crops</i>	1,200	3,392	3.14	0.95	4.09	1,491	4.96%
<i>Energy Crops</i>	500	3,392	1.18	0.53	1.70	622	2.07%
<i>Pasture, irrigated</i>	4,700	1,161	4.20	1.25	5.46	1,992	6.63%
<i>Pasture, unirrigated</i>	9,100	0	0	0	0.00	0	0.00%
<i>Green Energy</i>	250	0	0	0	0.00	0	0.00%
TOTAL	30,000	2,744	65.86	16.47	82.33	30,047. 77	100.00 %

Please note that the Mahi Pono farm plan is, like any responsible farming plan, a fluid and responsive plan that responds to the ever-changing agricultural market demands and the type of agricultural activity to be pursued (i.e., orchard crops, tropical fruits, row and annual crops, energy crops, pasturage etc.), as well as responding to other variables such as the availability and cost of water for crop irrigation. All of these things must be considered when developing an evolving and feasible diversified agricultural plan for Central Maui.

Comment 7: REQUEST #2

Please list by Tax Map Key (TMK) all land ownership interests sold to Mahi Pono LLC by Alexander & Baldwin and East Maui Irrigation. Please disclose a comprehensive and complete certified title report for each parcel or interest.

Response 7: Disclosure of all lands sold by Alexander & Baldwin to Mahi Pono and providing a title report for each parcel of such land sold is not within the scope of the EIS. As described in Section 2.1 of the EIS, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water for uses described in the EIS. The environmental impacts of the Proposed Action and alternatives are discussed throughout Chapters 4 and 3, respectively, of the EIS. Please note, however, that identification and ownership of the lands that are the subject of the Proposed Action are identified in Section 1 of the EIS. Specifically, Table 1-1 and Figure 1-2 identifies the TMK numbers for the State-owned lands within the License Area.

Comment 8: *Please list by Tax Map Key (TMK) all East Maui Irrigation and Alexander and Baldwin land ownership interests that are related to water diversions, the historic ditch system*

and any proposed leases. Please disclose a comprehensive and complete certified title report for each parcel or interest.

Response 8: Please note that the Proposed Action is a request for a water lease to divert water from government-owned lands within the approximately 33,000-acre License Area. See EIS Section 2.1. The location of the License Area is on State-owned lands identified by the Tax Map Key numbers listed in Table 1-1 and Figure 1-2 of the EIS.

Regarding the EMI Aqueduct System, a 1938 Agreement between A&B / EMI (referred to as “the Company”) and the Territory of Hawai‘i, a copy of which has been added to the Final EIS as Appendix R, acknowledges EMI’s ownership of the EMI Aqueduct System. Pursuant to the 1938 Agreement, the Territory of Hawai‘i (now the State) granted perpetual easements to EMI for the placement of the EMI Aqueduct System. See EIS Section 3.3.

Regarding your comment about title reports, please refer to Response #7 above. Providing title reports is not within the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System which supplies water for uses described in the EIS. The environmental impacts of the potential Water Lease are included throughout Chapter 4 of the EIS.

Comment 9: REQUEST #3

Request for complete information and disclosure regarding the “Nāhiku community, which, through the County of Maui Department of Water Supply, draws up 20,000 to 45,000 gallons per day (dependent on weather), directly from the EMI Aqueduct System.”

Response 9: Regarding your comment about information and disclosure regarding the Nāhiku community, please note that following publication of the Draft EIS, the applicant received additional information from the County of Maui Department of Water Supply (MDWS) regarding the source of the water that services the Nāhiku community. A copy of the MDWS letter is included in Appendix P to the Final EIS. According to MDWS, EMI’s West Makapipi Tunnel 2, Well No. 4806-07, which is also known as the “Nāhiku Tunnel”, is the sole source of water for the MDWS Nāhiku Water Service Area. It is our understanding that EMI developed and owns the Nahiku Tunnel that is the source of the water. Per a 1973 Memorandum of Understanding with EMI and HC&S as amended, MDWS can draw only up to 20,000 gallons of water per twenty-four hour day to serve the Nāhiku community from properties owed by EMI

and those under license from the State. EMI continues to deliver water to the Nāhiku community pursuant to a 2018 agreement which embodied the 1973 agreement as amended, which is premised upon EMI's continued receipt of permits or a lease from the State BLNR. Even though the agreement provides the MDWS a right to up to 20,000 gpd per twenty-four hour day, EMI has accommodated the needs of the Nāhiku community, which have ranged between approximately 8,345 (2018) to 40,925 (2007) gpd on a daily basis, although supply of amounts over 20,000 gpd on any given day is not required under the agreement. Please note that Section 2.1.3.3 of the Draft EIS, has been revised to take into account clarifications from the MDWS, as shown in pages 2-21 to 2-22 of the Final EIS.

Comment 10: *This quote is from MAUI BUSINESS*

(<HTTPS://MAUINOW.COM/CATEGORY/MAUI-BUSINESS/>) October 7, 2019, 12:29 PM HST, Updated October 8, 11:47 AM, "Comments on East Maui Water Lease, Draft EIS Due by Nov. 7"

The article stated, "According to the Draft EIS document, the lease would allow for the continued operation of the EMI aqueduct system to deliver water to the Maui Department of Water Supply for domestic and agricultural water needs in Upcountry Maui. This includes the agricultural users at the Kula Agricultural Park and the planned 262-acre Kula Agricultural Park expansion, as well as for the Nāhiku community, which, through the County of Maui Department of Water Supply, draws up 20,000 to 45,000 gallons per day (dependent on weather), directly from the EMI Aqueduct System."

Response 10: We acknowledge that your comment above is a direct quote from the article noted in Comment #10 above. Please note that the above quote is consistent with the description of the Proposed Action as stated in Section 2.1 of the Draft EIS. Specifically, Section 2.1 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP

expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System. It will also allow the continued provision of water to approximately 30,000 acres of agricultural lands (formerly in sugarcane) in Central Maui.

Please refer to Response #9 above and pages 2-21 to 2-22 regarding the changes made to Section 2.1.3 of the Final EIS incorporating the information received from MDWS on the source of the water that services the Nāhiku community, as well as the agreement between EMI and MDWS on the quantity of water supplied to MDWS for use by the Nāhiku community.

Comment 11: *This definition from Wikipedia states: “An aqueduct is a watercourse constructed to carry water from a source to a distribution point far away. In modern engineering, the term aqueduct is used for any system of pipes, ditches, canals, tunnels, and other structures used for this purpose.”*

Response 11: Please note that the above definition is consistent with how the EMI Aqueduct System is defined. The EMI Aqueduct System conveys water from East Maui for uses described in the EIS. Please refer to Response #9 above regarding the agreement between EMI and MDWS on the quantity of water supplied to MDWS for use by the Nāhiku community.

Moreover, as discussed in Section 2.1.2 of the Draft EIS:

The EMI Aqueduct System consists of approximately 388 separate intakes, 24 miles of ditches, and 50 miles of tunnels, as well as numerous small dams, intakes, pipes, 13 inverted siphons and flumes.

Comment 12: *Please describe in detail the complete County of Maui Department system currently serving the Nahiku Community, including maps and tax map keys (TMK).*

Response 12: Please note as discussed in Response #9 above, according to MDWS, the Nāhiku Tunnel is the sole source of water for the MDWS Nāhiku Water Service Area. It is also our understanding that EMI developed and owns the Nāhiku Tunnel that is the source of the water. Per a 1973 Memorandum of Understanding with EMI and HC&S as amended, MDWS was to be able to draw only up to 20,000 gallons of water per twenty-four hour day to serve the Nahiku community from properties owed by EMI and those under license from the State. EMI continues to deliver water to the Nāhiku community pursuant to a 2018 agreement which embodied the 1973 agreement as amended, which is premised upon EMI’s continued receipt of permits or a lease from the State BLNR. Please note that Section 2.1.3.3 of the Draft EIS has been revised to

take into account clarifications from the MDWS, as shown in pages 2-21 to 2-22 of the Final EIS.

Comment 13: *Is the system supplied by a tunnel or from the East Maui Irrigation “ditch” system? Please describe in detail.*

Response 13: Please note as discussed in Response #9 above, that the Nāhiku Tunnel is the sole source of water for the MDWS Nāhiku Water Service Area. It is also our understanding that EMI developed and owns the Nāhiku Tunnel that is the source of the water. Per a 1973 Memorandum of Understanding with EMI and HC&S as amended, MDWS was to be able to draw only up to 20,000 gallons of water per twenty-four hour day to serve the Nahiku community from properties owed by EMI and those under license from the State. EMI continues to deliver water to the Nāhiku community pursuant to a 2018 agreement which embodied the 1973 agreement as amended, which is premised upon EMI’s continued receipt of permits or a lease from the State BLNR. Please note that Section 2.1.3.3 of the Draft EIS, has been revised to take into account clarifications from the MDWS, as shown in pages 2-21 to 2-22 of the Final EIS.

Comment 14: *Please describe the current and possible anticipated future expansion or improvement of the entire county system.*

Response 14: Your Comment #14 is unclear as to what area / region you are referring to. We are currently unaware of any expansion or improvements planned for the MDWS water systems in Nāhiku and Upcountry Maui.

Comment 15: *Please describe the TWO (2) water tanks in close proximity on opposite sides of the Lower Nahiku Road. Are both tanks County of Maui owned and maintained? If not, please disclose the ownership and water source for the second tank. Is the source for either tank a well? If so, please describe in detail and disclose the well drilling permit and subsequent monitoring reports.*

Response 15: Your comment is not entirely clear as to which water tanks you are referring to. However, MDWS has confirmed that it owns the Lower Nāhiku Tank situated Makai of Hāna Highway along Lower-Nāhiku Road, and two other tanks that are mauka of Hāna Highway. These are depicted on Exhibit D to MDWS’s letter to Akinaka and Associates dated July 24, 2020 and provided as Appendix P to the Final EIS.

Regarding your comment about the permit documentation and monitoring reports for these two water tanks, please note that this is outside the scope of the EIS. Please refer to Response #7 above regarding the scope of the EIS. Any such requests should be directed to MDWS.

Comment 16: *Please understand this is important information for the community because; Makapipi Stream has recently been legally ordered to be permanently re-watered and restored by the Hawai'i State Commission on Water Resource Management. The continued use of the historic "ditch" system between the old Kuhiwa well, Makapipi Stream, Hi'inui Stream (aka: "the unnamed stream") and Hanawi Stream, including "Big Springs", would contradict the legal order for re-watering and restoring Makapipi Stream.*

Response 16: We acknowledge your comments. Please note that the Proposed Action contemplates that the lessee will fully comply with the CWRM D&O. As discussed in the EIS, the Proposed Action would at maximum divert the amount of water allowed under the CWRM D&O. Thus, the continued use of the EMI Aqueduct System will be in compliance the CWRM D&O.

Regarding Makapipi Stream, you are correct that this stream has been ordered to be fully restored by the CWRM and is discussed in Section 1.3.4 and summarized in Table 1-3 of the Draft EIS. Specifically, Section 1.3.4 of the Draft EIS states:

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānuī, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138).

Regarding Hi'inui Stream, this is not a stream recognized by CWRM nor is it a recognized stream by EMI. EMI does not have any registered diversions on this stream.

Regarding Hanawī Stream, please note that Hanawī Stream is west of Makapipi Stream, and is diverted by the EMI Aqueduct System downstream of Makapipi. Furthermore, as discussed in Section 1.3.4 of the EIS, the CWRM D&O restored stream flow to Hanawī Stream and categorized it as a "Connectivity Stream." Hence, as specifically discussed in Section 1.3.4 of the Draft EIS:

Water for Streams That Have Barriers to Biological or Ecological Improvements

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula,

Pa'akea, Pua'aka'a, Puohakamoa, Ha'ipua'ena, Nua'ailua, Waia'aka, and Hanawī. (CWRM D&O, COL 146). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

Hence, the EMI Aqueduct System can divert water from Hanawī Stream after the IIFS has been met. However, please note that the above discussion in Section 1.3.4 of the Final EIS has been revised as shown in pages 1-13 to 1-24 to accurately describe the streams as categorized by the CWRM D&O.

Comment 17: *Further, the expansion of the County of Maui system serving Nahiku will impact the closely interrelated hydrology of the area. The hydrology reports developed during the “Kuhiwa Well Contested Case Hearing” are useful and educational. There is a clear understanding of the hydrology and interconnectedness of Makapipi Stream, Hi'inui Stream (aka: “the unnamed stream”) and Hanawi Stream, including “Big Springs”.*

Response 17: Please note as discussed in Response #14 above that we are currently unaware of any expansion or improvements planned for the MDWS water systems. Moreover, expansion of the County system is under the purview of the MDWS and is outside the scope of this EIS. Please refer to Response #7 above regarding the scope of the EIS. Also note that the flows in Makapipi Stream were ordered to be fully restored pursuant to CWRM D&O

Regarding your comments about the hydrology reports pertaining to the “Kuhiwa Well Contested Case Hearing,” please note that this pertains to the Hāna Aquifer Sector Area and is not relevant to the Proposed Action and is not related to the EMI Aqueduct System. As discussed in Section 4.2.2 of the EIS, the EMI Aqueduct System diverts surface water from the East Maui streams in the License Area, which are located over the Ko'olau Aquifer Sector, and delivers the water to the Central Maui agricultural fields, which are located over the Central Aquifer Sector.

Comment 18: *Does East Maui Irrigation or Mahi Pono LLC want to take ANY water between Makapipi Stream and Hanawi Stream? YES OR NO?*

Response 18: Yes. There are several small tributaries between Makapipi and Hanawī Stream that are diverted by the EMI Aqueduct System. Please note as discussed in Response #16 above that Makapipi Stream is order to be fully restored and that Hanawī Stream is ordered to have restored flow as a “Connectivity Stream.” The EMI Aqueduct System can only divert water at Hanawī Stream (which is downstream of Makapipi Stream) subject to compliance with the CWRM D&O and IIFS.

Comment 19: *When is EMI legally required to dismantle the entire “ditch” system, including ALL diversions between the old Kuhiwa Well, Makapipi Stream and Hanawi Stream? Would EMI work with the Nahiku Community to dismantle the entire “ditch” system, including ALL diversions, between the old Kuhiwa Well, Makapipi Stream and Hanawi Stream?*

Response 19: EMI is not legally required to dismantle the entire EMI Aqueduct System as it can still divert water from privately owned lands which also use the EMI Aqueduct System for water conveyance regardless of the issuance of the Water Lease as discussed in Section 3.3 of the EIS. Specifically, Section 3.3. of the Draft EIS states:

Under a 1938 agreement between the Territory of Hawai‘i and A&B, A&B was given a perpetual right and easement to convey water through those portions of the EMI Aqueduct System located within State lands, and to divert the water so conveyed through the EMI Aqueduct System, and A&B granted the Territory a similar perpetual right and easement. This agreement is in place irrespective of the issuance of any Water Lease. The No Action alternative would result in no Water Lease being issued from the State. However, under the 1938 agreement and a related calculation involving isohyet analysis of rainfall patterns, it is understood that approximately 30% of the water in the License Area streams is derived from the privately owned lands.

Hence, EMI could continue to divert approximately 30% of the water from the License Area as it is understood that this water is derived from privately owned lands above the License Area.

Moreover, it is recognized by CWRM and discussed in Section 1.3.4 of the EIS that removal of diversion structures is not necessary. Specifically, Section 1.3.4 of the Draft EIS states:

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The CWRM recognized that the stream water that may be leased/licensed by the BLNR from the petitioned East Maui streams may not be sufficient to satisfy the

full implementation of a diversified agricultural plan for Central Maui. However, the CWRM expected that a sufficient amount of noninstream water would be available to provide the initial phase of allowing lands already designated as Important Agricultural Lands (IAL) under HRS Chapter 205 in Central Maui to be developed for diversified agriculture. (CWRM D&O, COL 152).

The CWRM D&O does not require the removal or modification of every diversion. The CWRM's intent is that diversion structures only need to be modified to the degree necessary to accomplish the IIFS, and not for the complete removal of diversions, unless necessary to achieve the IIFS. The CWRM's intent is to allow for the continued use and viability of the EMI Aqueduct System (CWRM D&O at p. 269).

Comment 20: REQUEST #4

Request for comprehensive disclosure and discussion of the possible future of Hanawi Stream. What are the possible plans of East Maui Irrigation and Mahi Pono in relation to Hanawi Stream? What is preferred by the East Maui Community? Is the County of Maui considering the purchase of East Maui Irrigation? Please incorporate the Maui County Board of Water Supply report as part of this Environmental Impact Statement (EIS) process. For information on the 85-page TIG report, visit www.mauicounty.gov/DocumentCenter/View/119847/2019-10-17-TIG-Report. All these factors must be carefully considered.....

Response 20: Regarding your comment about the possible future of Hanawā Stream, please note as discussed in Response #16 above, that the EMI Aqueduct System can continue to divert Hanawā Stream under the Proposed Action so long as the IIFS for that stream is met. As noted in Response #16, the Hanawā Stream is west of Makapipi Stream and thus diverted downstream of Makapipi Stream.

Regarding your question about what is preferred by the East Maui community, please note that Earthplan conducted the Social Impact Assessment (SIA) included in Appendix G and summarized in Section 4.7.2 of the EIS. The SIA includes input from several East Maui farmers, cultural practitioners, and residents. As discussed in SIA Section 4 (Preliminary Community Issues), as well as Section 4.7.2 of the Draft EIS, seven focus groups were convened in November 2018 and on November 16, 2018, a focus group was held with residents, farmers and cultural practitioners from Ke‘anae and Wailuānuī. Their concerns were presented and discussed in these meetings and are presented and analyzed in Section 4 of Appendix G, and Section 4.7.2 of the Draft EIS. Furthermore, additional meetings were held in April 2019 following the sale of

A&B lands to Mahi Pono which are also summarized in Section 4.7.2 of the Draft EIS. Specifically, Section 4.7.2 of the Draft EIS states:

“Balance” was a frequent theme among interviewees. They acknowledged that various groups need water originating from East Maui State watershed lands and felt that users should have access to water they truly need. Of note is that, regardless of one’s own interest in the Water Lease, no one wanted water withheld from other groups.

There was disagreement as to the source of water and how the water is allocated. Further, interviewees sometimes felt that A&B’s efforts towards the Water Lease was self-serving and divisive. Nevertheless, people were hopeful that this contentious environment was coming to an end with Mahi Pono as the new owner. Those interviewed expressed willingness to explore options regarding water if community needs, such as local farming / ranching, food self-sufficiency, and so on, can be met.

Hence, those who participated voiced their concerns regarding their own personal needs and access to the water resources but also acknowledged that others also depend on this water. Thus, the Water Lease would need to “balance” all of these needs appropriately.

Regarding your question about the County of Maui considering purchasing the EMI Aqueduct System, please note that Sections 3.1.2 and 3.4 of the Draft EIS considered alternative ownership of the EMI Aqueduct System which has been updated in the Final EIS as shown in pages 3-19 to 3-20 to acknowledge the County of Maui, Board of Water Supply Temporary Investigative Group (TIG) Report dated October 17, 2019 that was made available after the publication of the Draft EIS.

Based upon information obtained to date, County acquisition of the EMI Aqueduct System is purely speculative at this time, however, even if such an action was being advanced by the County, it would not be consistent with the objectives of the Proposed Action as assessed in this EIS. Alternatives to be considered within an EIS must be able to “attain the objectives of the action, regardless of cost.” See HAR Section 11-200-17(f). As explained in EIS Section 1.2 (Objectives of the Proposed Action), in general, the objectives of the Proposed Action (issuance of the proposed Water Lease) are to:

- Preserve and maintain the EMI Aqueduct System, including its access roads and trails
- Continue to meet domestic and agricultural water demands in Upcountry Maui
- Continue to provide water for agricultural purposes in Central Maui (specifically, to allow for the full transition of fields previously used for sugar cane cultivation into new, diversified agricultural uses); and

- Continue to serve community water demands in Nāhiku

Neither the County's acquisition of the EMI Aqueduct System, nor the County's pursuit of a water lease from the BLNR, are consistent with the objectives of the Proposed Action within the subject EIS. However, the existence of the TIG Report and its findings have been acknowledged in Section 3.1.2 of the Final EIS. Specifically, Section 3.1.2 of the Final EIS has been revised, as shown in pages 3-19 to 3-20.

Comment 21: *In a U.S. National Park Service, U.S. Department of Interior, "Rivers, Hawaii" Report Hanawi Stream was recognized as "Scenic stream flowing through an undeveloped dense forest and over several waterfalls (one drops more than 150 feet). May be the most pristine stream left in the State with cold, clear, spring-fed water and a great diversity of native stream fauna".*

"May be the most pristine stream left in the State" correctly recognizes the value of this stream and habitat. The interrelated "Big Springs" is part of this miracle of creation. Ua Mau ke Ea o ka 'Āina i ka Pono!

Response 21: We acknowledge that this report states the above regarding Hanawī Stream. It is unclear what your comment on "Big Springs" is referring to. As noted on the National Park Service website, the identification of Hanawī Stream as a scenic stream was most recently made in 1982, which was during a period of time when Hanawī stream was subject to diversions to support the sugarcane fields in Central Maui. Specifically, as discussed in Section 2.1.2 of the Draft EIS:

Up until 1986, when the first return of water was made to the East Maui streams, the long-term average delivery by the EMI Aqueduct System was 165 mgd (CWRM D&O, FOF 519) before any use of the water by the MDWS or HC&S.

More recently, as discussed in Response #16 above, Hanawī Stream has stream flow restored pursuant to the IIFS set by the CWRM D&O. In other words, Hanawī Stream will have more water flowing through the stream than it did in 1982. As recognized in the CWRM D&O, a number of waterfalls are located along the lower reaches of the stream, one of which is visible from Hāna Highway. CWRM D&O, FOF 485.

As further discussed in Section 4.9 of the Draft EIS:

Several scenic view planes can be found within the vicinity of the License Area. Specifically, the License Area is located along the slopes of Haleakalā in East

Maui, and affords views of the ocean to the north and the peak of Haleakalā to the south. The scenic drive along the Hāna Highway was recognized in 2000 when President Clinton designated the Hāna Millennium Legacy Trail. The following year it was listed in the National Register of Historic Places. The drive along Hāna Highway is notable for views of waterfalls, including those in streams flowing out of the License Area. The highway also features waysides, lookouts and trails discussed Section 4.7.1...

No significant impacts on visual resources in the region are anticipated because no new construction or land alteration is planned for the License Area. However, in the short-term, measuring from the current time, where diversions are lower due to the lack of agricultural activity in Central Maui, against the time when Mahi Pono's diversified agriculture needs begin to use the maximum amount of water permitted, there will be a decrease in stream flows and waterfalls that can be viewed along Hāna Highway. However, this expected decrease from the current baseline must be considered in a historical context as well: the impacts to such visual resources under the Proposed Action will be far less than the impacts over the years of sugarcane operations when vastly more water was diverted from East Maui than is planned under the Proposed Action.

However, please note that Section 4.9 of the Final EIS has been expanded to further discuss scenic vistas, cascading waterfalls, and stream flow as shown in pages 4-311 to 4-312 of the Final EIS.

Comment 22: *Several important considerations;*

The State Commission on Water Resource Management recently ordered a continuous flow of water under the Hanawi Stream bridge to continuously connect the mauka waterway to the makai waterway. This order was to insure that native species could travel from the mouth of the stream to areas mauka of the bridge through a continuous flow of water. Why was the order needed? Because the stream mauka of the bridge is being pumped and diverted.

Response 22: Regarding your question about why was the order needed, this is discussed in detail in Section 1.3.4 of the EIS. Specifically, Section 1.3.4 of the Draft EIS states:

On May 14, 2001, A&B requested that the State, pursuant to Hawai'i Revised Statutes (HRS) Section 171-58, offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon State-owned lands at Ko'olau Forest Reserve and Hanawī Natural Area Reserve, Hāna and Makawao,

Maui, for the purposes of developing, diverting, transporting and using government-owned waters. The requested lease would allow the use of government-owned waters from the License Area. The location of the approximately 33,000-acre License Area is on State-owned land identified by Tax Map Key (TMK) numbers in Table 1-1 and are illustrated in Figure 1-2.

Shortly after the request was made, the Coalition to Protect East Maui Water, Maui Tomorrow Foundation, and Nā Moku Aupuni O Ko'olau Hui (Nā Moku) requested a contested case hearing on the lease matter, thereby delaying BLNR action. In recognition of the request for a contested case hearing, the BLNR deferred action on issuing a lease at public auction, and, in the interim, the BLNR approved a month-to-month holdover of the existing revocable permits...

Separate and apart from the Water Lease process, the Native Hawaiian Legal Corporation (NHLC) on behalf of Nā Moku, Beatrice Kepani Kekahuna, Marjorie Wallet, and Elizabeth Lehua Lapenia (hereafter collectively referred to as "Nā Moku") filed with CWRM 27 Petitions to Amend IIFS for various East Maui streams located within the License Area.

Hence, the CWRM D&O and IIFS occurred due to the petitions filed by Native Hawaiian Legal Corporation on behalf of Nā Moku, Beatrice Kepani Kekahuna, Marjorie Wallet, and Elizabeth Lehua Lapenia. Moreover, as discussed in Response #16 above, Hanawī Stream was categorized as a "Connectivity Stream" and had flow restored to allow for movement of biota. The reasoning for this decision is stated in the CWRM D&O (COL 146.h), which "*Hanawī...is a gaining stream mostly as a result of ground water gains from spring input below the diversion. Hanawī provides excellent instream habitats and a diversity of native stream animals exist in the stream. Little benefit would be achieved from the release of more water past the diversion.*" Connectivity Streams should allow for a minimum connectivity flow across diversion structures to allow for passage of biota upstream.

Regarding your comment about the stream mauka of the bridge, please note that the EMI Aqueduct System has one diversion on from Hanawī Stream but does not pump any stream water from Hanawī Stream.

Comment 23: *Please consider alternatives to dewatering and diverting Hanawi Stream. Please remember the statement by the National Park Service.... "May be the most pristine stream left in the State". It could and should be one of the most pristine streams in the state.*

Response 23: We acknowledge your comments. Please see Response #22 above, with the citation from the CWRM D&O noting that, even in its diverted state, Hanawā Stream provides excellent instream habitats and a diversity of native stream animals exist in the stream. Please note that under the Proposed Action, Hanawā Stream will be diverted in compliance with the CWRM D&O. However, Sections 3.2.1 and 3.4 of the EIS assess diverting less water than what is estimated to be available under the Proposed Action. Specifically, Section 3.2.1 of the Draft EIS states:

The BLNR cannot authorize a lease that allows the use of more water than can be diverted under the CWRM D&O. However, the BLNR could elect to issue a water lease that authorizes the use of a lesser amount of water. Projections of the amount of government water available from the License Area at Honopou stream after taking into account the CWRM D&O, is approximately 87.95 mgd. This amount would be subject to further reduction in accordance with the DHHL reservation once called upon for use by the DHHL. The CWRM estimated that the amount of water potentially available after implementation of the CWRM D&O might be enough for about 90% of the irrigation needs for the approximately 23,000 IAL lands in Central Maui (although it is not clear if the CWRM D&O took into account the future DHHL reservation). However, there are approximately 30,000 agricultural acres in Central Maui (largely, but not exclusively, IAL lands), and Mahi Pono has expressed an intention to farm as much of that land as possible.

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. Under the Reduced Water Volume alternative, depending on the amount of water authorized under the Water Lease, the MDWS may receive no water from the Wailoa Ditch or some amount up to 7.1 mgd. The greater the reduction in the amount authorized under the Water Lease, proportionally less water will be available to the MDWS.

As discussed in Section 3.4 of the Final EIS as shown on page 3-27, the HSHEP model requires specific diversion conditions at each diversion. Applying the model to the Reduced Water Volume alternative would require information regarding where stream flows are proposed to be increased over the Proposed Action and the amounts. Generally speaking, the more water returned to natural streamflow conditions, the more of an increase in habitat units there would be for native amphidromous species, including native damselfly species. This would likely also improve habitat conditions for a number of introduced predator and competitor species, which could prevent any increases to native species populations.

Hence, the terms and conditions of the Water Lease are at the discretion of BLNR, and should BLNR elect to place more diversion restrictions on Hanawī Stream, the lessee will comply with these terms and conditions.

Comment 24: *How many gallons per day are currently being pumped out of Hanawi Stream? Please include all historical pumping records, past to present. Please include all historical stream monitoring records, past to present.*

Response 24: Please note that the EMI Aqueduct System does not pump any water from Hanawī Stream. The EMI Aqueduct System only diverts water from Hanawī Stream at one location. Moreover, please note that EMI has 12 gauging stations located in several ditch locations across the License Area to monitor and manage East Maui ditch deliveries. These gauges measure the flow in the ditches only, using a system that includes optical encoders with float tape and data loggers. It is not feasible to measure flow in the streams, as there are limited areas that contain the necessary control points to accurately measure streamflow. EMI's 12 gauging stations includes seven gauges that were formerly operated and maintained by the United States Geological Survey (USGS) to calculate the total amount of water diverted from each of the four sections of the License Area. Those gauges were also in the ditches, not on individual streams. Due to USGS cost cutting, in 1986 EMI took over the responsibility of operation and maintenance of those seven former USGS gauges. At that time, the state began assessing a flat rental fee rather than one based on the specific amount of water collected in each license area. EMI contracts with the USGS to conduct quarterly discharge measurements to verify the accuracy of the gauges at the Honopou boundary of the License Area, which measure the total water withdrawn from the Collection Area.

It is not feasible to measure the amount of water diverted on a stream by stream, or stream section by stream section, basis. Prior efforts by the CWRM to measure water diversions involved the installation of water gauges in certain streams, which proved entirely impractical due to the flashy nature of the streams, which caused gauges to wash away. As noted in the CWRM D&O, FOF 50, EMI takes measurements at the boundary of each section of the License Area and at its gauging stations at Maliko Gulch. However, for the purpose of measuring the aggregate flow from entire License Area, the measurements taken at the Honopou boundary were used.

Regarding historical records, as stated in Draft EIS Section 2.1.2:

The system will only divert up to the capacity of the ditches to convey slow moving water along the very slight slopes of the ditches. Up until 1986, when the

first return of water was made to the East Maui streams, the long-term average delivery by the EMI Aqueduct System was 165 mgd (CWRM D&O, FOF 519) before any use of the water by the MDWS or HC&S. In 2001, the CWRM began the process toward its D&O for several East Maui streams that further changed the amount of water available for delivery to Upcountry Maui and to the Central Maui agricultural fields. Based on these changes to the system, a more recent history of flow deliveries from the EMI Aqueduct System was computed from 1987 to 2006 (20 year time period). When analyzing the delivery data at Honopou Stream and Maliko Gulch, the median (Q50) flow at these areas for this time period was 135.58 mgd at Honopou Stream and 146.64 mgd at Maliko Gulch (Akinaka, 2019).

Furthermore, as stated in Section 2.1.2 of the Draft EIS:

The median flow required by the CWRM D&O provides an estimated available median flow at Honopou Stream of 87.95 mgd, where the EMI Aqueduct System leaves the License Area. Beyond the License Area, the diverted streams only provide supplemental ditch flow when License Area diversions are low. The amount that can be added is relatively low because when rainfall is high in East Maui, the ditches are fuller and there is little needed to supplement the flow. And, when rainfall is low in East Maui, the streams west of Honopou Stream have less flow in them as they are in an area that receives less rainfall than areas further east. During drier (low flow) periods, it is estimated that 4.37 mgd is available to supplement the EMI Aqueduct System between Honopou Stream and Maliko Gulch. With this added flow, the estimated median flow available beyond Maliko Gulch for use in Upcountry Maui and the Central Maui fields is estimated to be 92.32 mgd (Akinaka, 2019).

With the issuance of the Water Lease under the Proposed Action, the EMI Aqueduct System would divert only the maximum allowable amount under the CWRM D&O from streams within the License Area, which is estimated to be approximately 87.95 mgd. The EMI Aqueduct System is estimated to divert an additional 4.37 mgd from the point that it leaves the License Area at Honopou Stream and collects water from streams on privately owned land to its last diversion at Maliko Gulch. Thus, an estimated total of approximately 92.32 mgd would be conveyed to supply the MDWS for users in Upcountry Maui, Nāhiku, and the agricultural fields in Central Maui.”

Comment 25: Please include all U.S. Geological Survey monitoring records.

Response 25: Please note as discussed in Response #24 above that USGS used to have gauges at each of the License Area boundaries, however, due to USGS cost cutting, several of those gauges were removed. Currently, USGS only has streamflow gauges within the License Area located along Honopou Stream, West Wailuāiki Stream, and Hanawī Stream according to the following link:

<https://waterwatch.usgs.gov/?m=real&r=hi>

Please note that both Honopou and West Wailuāiki Stream were ordered to be fully restored pursuant to the CWRM D&O. Moreover, Hanawī Stream was also ordered to have flow restored as discussed in Response #16 above.

Regarding your comment to include all USGS monitoring records, it unclear what monitoring records you are requesting. However, please refer to Section 3.3 and Appendices R-1 through R-4 of the Final EIS discussing the reports related to the EMI Aqueduct System submitted as exhibits in the CWRM IIFS proceedings.

Comment 26: *I have recently and over many years witnessed no water flowing under the bridge. This is contrary to the State Commission on Water Resource Management order. Hanawi Stream needs to be permanently restored and re-watered. That needs to include removal of electric poles, potentially toxic transformers and electric lines that once serviced Kuhiwa well. Maui Pine installed the poles. Why aren't they responsible for the removal. Who is responsible?*

Response 26: Your comments are acknowledged. Please note that the CWRM D&O, which was issued in June of 2018 as discussed in Section 1.3.4 of the EIS, after several years of analysis, determined that the most appropriate stream flow for Hanawī Stream at this time is restoring flow as a “Connectivity Stream” as described in Section 1.3.4 of the EIS and page 268 of the CWRM D&O. In making this decision, CWRM considered numerous factors, including without limitation, the stream's value for aesthetic, biological, and recreational purposes. See CWRM D&O at FOF 475-491. Please also note that since A&B ended its sugar operations in 2016, streamflow had increased in many streams as a result of less water being diverted due to the closure of sugar operations. Moreover, as discussed in Response #22, even in its diverted state, Hanawī Stream provides excellent instream habitats and a diversity of native stream animals exist in the stream.

Your comment about the removal of infrastructure related to Maui Land & Pine is outside the scope of this EIS and such infrastructure is not within the applicant's control. Please refer to Response #7 above regarding the scope of this EIS.

Comment 27: *Safety concerns: Uninformed tourists are “trespassing” and swimming every day at the pool directly mauka and Keanae side of the bridge. This certainly appears very dangerous. Is this the pool that is pumped? Can the tourists be “sucked in” to the intake pipe? Please address this issue and the issue of dangerous “rafting” in the ditch system. What is the East Maui Irrigation or Mahi Pono plan?*

Response 27: Please note that this pool you refer to is well below the License Area and the EMI Aqueduct System does not divert or pump any water at the Hāna Highway in Ke‘anae. Thus, addressing the public safety of this pool is outside the scope of the EIS. Please refer to Response #7 above regarding the scope of the EIS.

Regarding your comment about “rafting” in the EMI Aqueduct System, it is acknowledged that in or around 2007, two teenage individuals illegally trespassed and rafted in one of the EMI Aqueduct System ditches and ended up drifting into a siphon. Please note that siphons (U-shaped pipes) are part of the EMI Aqueduct System, enabling water in the ditches to cross gulches using gravity (the EMI Aqueduct System does not have any pumps or motors) to allow water from one side of the gulch to flow down the side of the cliff, across the bottom of the gulch, and up the other side (and back into a ditch). Since the trespassing incident, EMI has taken many steps to promote ditch safety on Maui, including conducting a safety audit of the EMI Aqueduct System using local and national experts which resulted in a program of ditch improvements (e.g., fencing, physical barriers, signage) in an effort to help prevent future incidents. Safety grates have been installed on all siphons. EMI also intensified its existing school presentation programs, giving in person slide presentations about the EMI Aqueduct System and the dangers of playing in it. EMI initiated a program of print and radio safety ads, focused around school vacation periods. EMI also created the EMI Safety Program, partnering with eight youth clubs across Maui to conduct an annual “Play Hard, Play Safe” campaign, that includes an EMI Safety Selfie contest, that serves to increase Maui youth’s awareness of the dangers of playing in the ditches and on the farm. Notwithstanding these efforts, trespassing cannot be completely controlled. Please note that this discussion has been added to Section 4.8 of the Final EIS as shown in pages 4-305 to 4-309.

As discussed in Sections 3.2.2.2 and 3.4.14 of the EIS, the Modified Lease Area alternative was considered, however, there are concerns that reducing the License Area could result in potentially adverse impacts, such as trespassing in and around the EMI Aqueduct System. To ensure public safety and security of the EMI Aqueduct System, the License Area must include the appropriate buffers. While there is a desire by some, as demonstrated in comments to the Draft EIS, to increase access to other areas within the License Area (i.e., for recreational or cultural access), there remains a need to keep public access away from the EMI Aqueduct

System itself for safety reasons. Sections 3.2.2.2 and 3.4.14 of the Final EIS have been updated with this discussion as shown in pages 3-21 to 3-24 and page 3-44.

Comment 28: *Let's work and plan together to solve these problem issues. "A'ohe hana nui ke alu 'ia." No task is too big when done together by all.*

Response 28: We acknowledge your comments. Please note that Mahi Pono has conducted community outreach and will continue to do so. Please note that the terms and conditions of the Water Lease are at the discretion of the BLNR and should BLNR make additional consultation a part of the Water Lease, the applicant will comply with all terms and conditions.

Comment 29: *For Reference. <https://www.nps.gov/subjects/rivers/hawaii.htm>*

River: Hanawi Stream

County: Maui

Reach: Headwaters to mouth including the two major source tributaries

Description (miles): 10

Description: Scenic stream flowing through an undeveloped dense forest and over several waterfalls (one drops more than 150 feet). May be the most pristine stream left in the State with cold, clear, spring-fed water and a great diversity of native stream fauna.

ORVs: Scenic, Wildlife

Watershed (HUC Code 8): Maui

Year Listed/Updated: 1982

Response 29: We acknowledge your comments. Please note as discussed in Response #21 above that Hanawī Stream will have more stream flow and will be diverted less under the Proposed Action than it was in past.

Comment 30: *Please consider and comment on two statements adopted in the 1994 Hana Community Plan Ordinance <https://www.mauicounty.gov/DocumentCenter/View/1710/Hana-Community-Plan-1994?bidId=> "C. Interregional Issues, page 11*

Several issues impact the Hana Community Plan region which need interregional, island-wide or County-wide comprehensive policy analyses and formulation.

Response 30: Regarding your comments about the two statements adopted in the Hāna Community Plan is unclear as there are three statements included on Page 11. However, please note that the Hāna Community Plan (1994) is discussed in detail in Section 5.7.1 and Table 5-13

of the Draft EIS. Specifically, Table 5-13 of the Draft EIS discusses each objective and policy that was adopted by the Hāna Community Plan (1994) as it relates to the Proposed Action.

The three overarching topics on page 11 of the 1994 Hāna Community Plan Ordinance deal with: (1) exportation of resources found within the Hāna Community Plan Region, (2) infrastructure and public services considerations; and (3) population and other socio-economic considerations. As discussed in Section 2.1 of the EIS, the Proposed Action involves the issuance of a water lease that would allow the lessee to divert water from the East Maui streams in accordance with the CWRM D&O and lease conditions. The impacts of the Proposed Action and its alternatives are considered in Chapters 4 and 3, respectively. In particular, the socio-economic considerations of the Proposed Action are discussed in Section 4.7 of the EIS and Appendix G (Social Impact Assessment). Please refer to Response #20 above regarding the scope of and outreach done for the SIA.

Regarding your comment that several issues impact the Hāna Community Plan and need comprehensive policy analyses and formulation, this is outside the scope of the EIS. Please refer to Response #7 above regarding the scope of the EIS. However, please note that Chapter 5 of the EIS discusses the relationship of the Proposed Action to State and County land use plans, policies, and controls.

Comment 31: *In coordination with native Hawaiian residents and community representatives, prepare watershed management plans and a groundwater and surface water resources monitoring program to protect the district's surface and ground waters, and monitor water levels to meet current and future demands."*

Response 31: Regarding your comment about preparing a watershed management plan, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the Final EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" identifies priority outcomes essential to maintaining or restoring biological integrity, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and

controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

Regarding your comment about groundwater and surface water resources monitoring programs, please note that the terms and conditions of the Water Lease are at the discretion of BLNR, and should BLNR make this a part of the Water Lease, the lessee will comply with all terms and conditions. Please refer to Response #24 above regarding EMI's gauging of ditches in the License Area however, stream gauging and monitoring lays within the expertise the CWRM and the USGS.

Comment 32: *Are EMI and Mahi Pono willing to constructively work with and communicate with lineal descendants and all residents in the East Maui Community?*

Response 32: Yes, please note as discussed in Response #28 above that EMI and Mahi Pono have conducted community outreach as part of the EIS process and will continue to do so. Furthermore, the SIA recommendations, as presented in Section 4.7.2 of the EIS are as follows:

Two areas of mitigative measures are recommended for consideration, should the proposed Water Lease be granted by the BLNR. These measures are intended to establish an ongoing working relationship between the community, Mahi Pono and EMI, and related public agencies, as well as continue resolution with East Maui communities.

It is recommended that interest groups, or stakeholder groups, are clearly defined so that there is recognition of who will be affected by the proposed Water Lease. Groups should include geographic communities, environmental, agriculture and business interests, and public agencies. Each group would be encouraged to reach consensus on their own needs, concerns, opportunities and possible solutions.

A starting point for identifying stakeholder groups could be the interviewees and focus group participants that participated in Earthplan's SIA and their networks.

It is recommended that interest groups are equitably represented in a "Core Working Group" that would serve as a forum for exchanging ideas and collaborative efforts, as well as provide feedback and suggestions to Mahi Pono. Each member of the Core Working Group would be expected to reach out to their own networks to extend the discussion beyond the Core Working Group. While

there would likely be strong differences in perspectives and opinions, the Core Working Group would need to find ways to establish core principles, common ground and manageable solutions.

The fundamental value that will help bring people to the same table is trust. The proposed Water Lease has elicited skepticism and distrust over many decades, and these feelings prevent willingness for participating in mediation and collaboration. While developing trust among the various groups will be challenging, the first step is transparency. Being open about intent, plans, and activities can begin to establish credibility and open the door to dialogue.

Hence, it is recommended that community outreach continue to occur under the Proposed Action. Please note that the terms and conditions of the Water Lease are at the discretion of the BLNR and should BLNR make this a part of the Water Lease, the applicant will comply with all terms and conditions.

Comment 33: *Please inform your comments by reading the Hana Community Plan and recognize the important statement of ALOHA in the plan to “Encourage community-based dialogue regarding proposed land use changes in order to avoid unwarranted conflict”.*

Response 33: We acknowledge your comments. Please note as discussed in Response #30 above that the Hāna Community Plan (1994) is discussed in detail in Section 5.7.1 and Table 5-13 of the Draft EIS. Specifically, Table 5-13 of the Draft EIS discusses each objective and policy that was adopted by the Hāna Community Plan as it relates to the Proposed Action. As discussed above in Response #32, ongoing consultation has been recommended for the Proposed Action.

Comment 34: REQUEST #5

Please discuss the potentially negative and/or beneficial impacts of the long term weather forecasts, including global warming, on life on Maui. Particularly, as it relates to water and the Mahi Pono LLC farming plans.....

Response 34: The EIS includes the most recent information regarding climate change within its analysis. As discussed in Section 4.3.1 of the Draft EIS:

Regular trade winds are key in driving the Hawai‘i’s hydrological cycle, generating rainfall which helps maintain Maui’s water supply. However, a recent study showed that Hawai‘i’s trade winds have decreased in frequency by approximately 30% over the past 37 years, from 291 days per year in 1973, to

210 days per year in 2009 (Garza et. al, 2012). The decrease in the trade winds could have serious implications for the Hawaiian Islands, including adversely impacting local agriculture, native ecosystems and endangered species, and the State's limited freshwater supply.

Overall, the State of Hawai'i is experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014)...

Regarding East Maui:

Climate change trends suggest increased potential for East Maui, including the License Area, to experience periods of intense, episodic rainfall where several inches of rain can fall in a matter of a few hours. Such rainfall patterns increase the amount of stormwater runoff flowing through the region, including through the streams within the License Area that reach the shoreline. The expected climatic changes in precipitation patterns and streamflow will influence the quantities and concentration of stormwater runoff entering the nearshore environments and coastal waters, resulting in increased sedimentation, impacting coral reefs. However, because of the continuous wave energy in shore areas in East Maui, nearshore areas in East Maui do not constitute important habitats for coral reef communities and associated marine species. (SE & MRC, 2019).

Regarding Upcountry Maui:

Upcountry Maui covers a large range of elevation and area. The average temperature varies at different elevations. As elevation increases, the average temperature decreases. The Leeward side of Upcountry Maui is mostly dry and sunny. The Windward Side of Upcountry Maui tends to be wetter than the Leeward Side. Average annual rainfall ranges from 16-20 inches per year on the Leeward Side to more than 240 inches per year on the Windward Side (Draft Maui Island Water Use and Development Plan, March 2019). The KAP receives an average amount of total rainfall of 15 to 25 inches per year.

Climate change trends may increase the potential for altered habitats and conditions. Warming air temperatures could cause ecosystems to shift upslope and decline in size. Changes in precipitation may affect Upcountry Maui's ecosystems and communities include flooding, erosion, drought, and fire. Changes vary from island to island, and even valley to valley. The overarching trend for the State has been a decrease in total rainfall. A decrease in total rainfall, without a reliable source of water delivery, would increase the demand for water in Upcountry Maui for both domestic and agricultural purposes. The demands of water could be potentially minimized through the implementation of water conservation measures, however, the extent to which such efforts would serve to counter reduced levels of water service is uncertain.

Regarding Central Maui:

Central Maui's climate is typical of Leeward coastal lowlands receiving little rainfall annually, and is relatively dry. The northeast areas receive more rain than the central and southern areas of Central Maui. The average annual rainfall ranges from less than 10 inches in the southern part of the isthmus to over 40 inches in the northeastern areas. Central Maui receives considerable amounts of sunshine, with average daily insolation ranging from slightly less than 450 calories per square centimeter per day in mauka areas to over 500 calories near Kahului.

Climate change trends may suggest an increased potential for the agricultural fields in Central Maui to experience longer, more intense, periods of drought. The overarching trend for the State has been a decrease in total rainfall. A decrease in rainfall would result in less water being conveyed to the agricultural fields. The water conveyed to the agricultural fields in Central Maui also plays a major role in the recharge of the Central Maui aquifer. Periods of prolonged and intense drought would further strain the aquifers in Central Maui that depend upon the water conveyed through the EMI Aqueduct System for recharge.

Note that Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown in pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Hence, the EIS recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides,

severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). It is therefore anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall. However, as noted in the USGS report cited in pages 4-89 to 4-90 of the Final EIS, East Maui could see an increase in rainfall due to future climate change trends.

Particularly as it relates to the Mahi Pono farm plan, as stated in Section 4.3.1 of the Draft EIS:

However, the exact nature of how the climate will change and impacts from any changes is unknown. As research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies for climatic changes.

Thus, as more information becomes available regarding climate change and its impacts, adaptation strategies may need to be developed and or implemented in the future.

Comment 35: REQUEST #6

Please consider and incorporate the “Values” expressed in the Maui Island Plan.
<https://www.mauicounty.gov/1503/Maui-Island-Plan>

Response 35: Your Comment #35 above is unclear as to what "values" you are referring to. However, as discussed in Response #30 above, Chapter 5 of the EIS discusses the relationship of the Proposed Action to State and County land use plans, policies, and controls, which also includes the Maui Island Plan.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

10238-04
Letter to Mr. John Blumer-Buell

Cc: Public Comment
Subject: Comments on East Maui Water Lease - Draft EIS

Aloha Ian Hirokawa,

This email contains my comments on the East Maui Water Lease Draft EIS.

I am a full-time resident of Maui and an avid hiker. My hiking group has 8 people and we average 15 miles a week. The Ko'olau Forest Reserve is a wonderful place and has some of the best hiking anywhere in the world.

My comments are focused on protecting public access to the Ko'olau Forest Reserve. East Maui Irrigation has a long history of trying to improperly block public access and I believe this issue can be solved in the new water lease. Currently, EMI instructs their employees to say that the Ko'olau Forest Reserve is EMI private property and that anyone who goes in the Ko'olau Forest Reserve will be arrested for trespassing.

1) The draft EIS is incomplete because it does not include an inventory of roads and trails in the Ko'olau Forest Reserve.

HRS 264 (Public Highways and Trails) protects public right-of-way on roads and trails owned by the state. When the Ko'olau forest reserve was created, all roads and trails in the forest reserve became protected rights-of-way. The draft EIS needs to be extended to show the protected roads and trails in the Ko'olau Forest Reserve.

HRS 171-35 (Lease provisions) requires leases to protect rights-of-way and access to other public lands. The draft EIS needs to be extended to show how the proposed water lease protects rights-of-way and access to other public lands.

The Hawaii Supreme Court has ruled (1908 19 H. 168) that the lease of public land can not affect a public right-of-way existing across it.

2) The draft EIS is incomplete because it does not include an inventory and history of roads and trails on East Maui Irrigation land.

HRS 264 (Public Highways and Trails) requires that historic roads and trails are protected rights-of-way. The draft EIS needs to be extended to show which historic roads and trail are protected.

HRS 115 (Public Access to Coastal and Inland Recreational Areas) requires public rights of way to be provided at reasonable intervals to inland recreational areas. Many parts of the Ko'olau Forest Reserve are land-locked by East Maui Irrigation property. The draft EIS needs to be extended to show public rights-of- way across EMI property to the Ko'olau Forest Reserve.

3) I support the position of the Division of Forestry and Wildlife in their December 19 2016 letter, included in the draft EIS. Specifically, I support:

“Thus the Division recommends that the areas to be conveyed for a water license be done so through a land agreement that is limited to the infrastructure required for maintenance and conveyance of water, and that any terms of any agreement established for the delivery of water ensure unrestricted public access to the reserves and any state owned roads and trails”

Mahalo,

-John Meier

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Meier:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am a full-time resident of Maui and an avid hiker. My hiking group has 8 people and we average 15 miles a week. The Ko'olau Forest Reserve is a wonderful place and has some of the best hiking anywhere in the world.*

My comments are focused on protecting public access to the Ko'olau Forest Reserve. East Maui Irrigation has a long history of trying to improperly block public access and I believe this issue can be solved in the new water lease. Currently, EMI instructs their employees to say that the Ko'olau Forest Reserve is EMI private property and that anyone who goes in the Ko'olau Forest Reserve will be arrested for trespassing.

Response 1: We acknowledge your comments and understand that you are an avid hiker. Please note that Public Access has been regulated, in partnership with the Department of Land and Natural Resources, by EMI for decades. EMI assumes liability for unlawful access into the License Area, thus restricting access protects EMI. Public access to the License Area, including the Forest Reserve lands, is currently limited to permitted access by hunting groups and hiking

clubs as discussed in Section 4.8 of the EIS. Access to the Ko‘olau Forest Reserve Hunting Units, which include portions of the Huelo, Honomanū, Ke‘anae, and Nāhiku License Areas, is managed by the Department of Land and Natural Resources (DLNR) Division of Forestry and Wildlife. In order to hunt in these areas, hunters must first obtain a license from the DLNR and an EMI Permit/Waiver. Access to the hunting units is managed by EMI through eight existing access roads. Hunters are permitted to enter the areas by vehicle but must traverse most areas by foot. Hiking is also a permitted recreational use within the License Area and is limited to hiking clubs. Hiking access requires a Hiking Waiver form EMI.

Access to the License Area is limited for the safety of entrants. For hunters, hunting grounds are limited to one hunting party per hunting area, as regulated by the DLNR. The hiking groups that currently access the License Area, Sierra Club Maui Group and Mauna Ala Hiking Club, enter the License Area by foot and are guided by a club hiking expert with a manageable number of people, however, access is not limited to these two clubs. Any hiking clubs wishing to access the License Area must follow the same procedures. However, limiting access to the License Area also limits potential impacts to historic properties and natural resources

Increased public access has the potential to pose a greater impact to historic properties and the environment, especially if public access is unmanaged. Recently, concerns for these impacts have prompted visitor limitations to the culturally significant Hā‘ena State Park on the north shore of Kaua‘i. Potential impacts from unmanaged access could include looting and “rock-robbing” of surface and subsurface historic properties, littering, harvesting of archaeologically associated flora such as *ti* (*Cordyline fruticosa*), trampling or erosion from pedestrian/vehicular access, and unpermitted ground disturbance. Significant impacts to historic properties as a result of unmanaged access have been documented elsewhere in the State.

Moreover, Section 3.2.2.2 of the EIS, “Modified Lease Area”, discusses what is needed to provide appropriate buffers to ensure public safety and the security of the system to allow for more public access into the License Area.

Regarding your comment that "EMI instructs their employees to say that the Ko'olau Forest Reserve is EMI private property and that anyone who goes in the Ko'olau Forest Reserve will be arrested for trespassing," EMI's understanding is that the most popular access points to the Ko‘olau Forest Reserve are [believed to be] owned by EMI. Therefore, EMI assumes liability for those access points. Thus, restricting access to the general public through areas that are owned by EMI/A&B is necessary.

Comment 2: *The draft EIS is incomplete because it does not include an inventory of roads and trails in the Ko'olau Forest Reserve. HRS 264 (Public Highways and Trails) protects public right-of-way on roads and trails owned by the state. When the Ko'olau forest reserve was created, all roads and trails in the forest reserve became protected rights-of-way. The draft EIS needs to be extended to show the protected roads and trails in the Ko'olau Forest Reserve.*

Response 2: The Draft EIS included suitable and adequate regional, location and site maps such as Flood Insurance Rate Maps, Floodway Boundary Maps, or United States Geological Survey topographic maps. See Draft EIS Figures 4-28 (East Maui Flood Insurance Rate Map) and 4-2 (USGS East Maui Topography Map), as well as numerous other figures and maps. Requirements, if any, under HRS Chapter 264 (Highways) are outside of the scope of an assessment of environmental impacts under HRS Chapter 343. With regard to the historic trails and roads that are within the License Area, Section 4.5 of the Final EIS as well as Appendix E (Archaeological Literature Review and Field Inspection) have been revised to include the current inventory of roads and trails in the License Area as shown in pages 4-147 to 4-149. CSH completed a geographic analysis of trails and roads that appear within the License Area as depicted on maps between 1869 and 1992 and available to the public domain. The majority of roads and trails within the License Area are associated with access to the EMI Aqueduct System and these road and “ditch trails” are likely contemporary with the construction of the EMI Aqueduct System.

Figure 4-39 has been added to the Final EIS to correspond with the above text (Figure 48 in Appendix E).

Furthermore, the various public recreational facilities, hiking trails, and hunting areas in the License Area, including access points, are identified in Section 4.8 of the EIS and Figures 4-37 and 4-38 of the Draft EIS (Figure 4-40 and 4-41 in the Final EIS). However, please note that Section 4.8 of the Final EIS has been updated to include more recreational facilities and an accurate discussion regarding access into the License Area as it relates to recreational activities as shown in pages 4-305 to 4-309.

Comment 3: *HRS 171-35 (Lease provisions) requires leases to protect rights-of-way and access to other public lands. The draft EIS needs to be extended to show how the proposed water lease protects rights-of-way and access to other public lands.*

The Hawaii Supreme Court has ruled (1908 19 H. 168) that the lease of public land can not affect a public right-of-way existing across it.

Response 3: HRS § 171-35 does not require a lessee to protect rights of way and access to other public lands. To the extent that HRS § 171-35 (Lease provisions; generally) applies to a water lease, it gives the BLNR discretion on whether and how to address reservations of rights of way and access to other public lands. The section of the law you cited provides as follows:

Every lease issued by the board of land and natural resources shall contain:

- 1. The specific use or uses to which the land is to be employed;*
- 2. The improvements required; provided that a minimum reasonable time be allowed for the completion of the improvements;*
- 3. Restrictions against alienation as set forth in § 171-36;*
- 4. The rent, as established by the board or at public auction, which shall be payable not more than one year in advance, in monthly, quarterly, semiannual, or annual payments;*
- 5. Where applicable, adequate protection of forests, watershed areas, game management areas, wildlife sanctuaries, and public hunting areas, reservation of rights-of-way and access to other public lands, public hunting areas, game management areas, or public beaches, and prevention of nuisance and waste; and*
- 6. Such other terms and conditions as the board deems advisable to more nearly effectuate the purposes of the state constitution and of this chapter.*

The issue in the case you cited from the Supreme Court of the Territory of Hawai‘i, *Robello v. Maui Cnty.*, 19 Haw. 168 (1908) was whether the easement of the public in an existing highway was extinguished by a lease to a private party when a new road was planned at some time in the future. The Court held that the lessee took his lease with full knowledge of the existing highway due to the reference on the map and actual knowledge of the existence of the road and was therefore not allowed to erect fences blocking the old road. The Court further held that no injunction should have been granted restraining the County from removing lessee's fences to keep the public road open. This case is not applicable to the proposed Water Lease.

A new condition included in the 2020 and 2021 water revocable permits required the removal of the Hanawā NAR from the revocable permit area and calls for A&B to continue discussions with DOFAW to identify additional forest reserve lands to be removed from the License Area. The Hanawā NAR consists of approximately 7,500 acres and is further discussed in Section 1.3.1 of the Final EIS as shown on page 1-2 of the Final EIS. It should be noted that no portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the revocable permit area will result in additional public access because the NAR

rules restrict public access. However, this may not be true for other areas that DOFAW may want the BLNR to withdraw from the License Area going forward.

Comment 4: *The draft EIS is incomplete because it does not include an inventory and history of roads and trails on East Maui Irrigation land.*

HRS 264 (Public Highways and Trails) requires that historic roads and trails are protected rights-of-way. The draft EIS needs to be extended to show which historic roads and trail are protected.

Response 4: As noted above in Response #2, Section 4.5 of the Final EIS, as well as Appendix E (Archaeological Literature Review and Field Inspection), have been revised to include the current inventory of roads and trails in the License Area as shown in pages 4-147 to 4-149. CSH completed a geographic analysis of trails and roads that appear within the License Area as depicted on maps between 1869 and 1992 and available to the public domain. The majority of roads and trails within the License Area are associated with access to the EMI Aqueduct System and these road and “ditch trails” are likely contemporary with the construction of the EMI Aqueduct System.

Comment 5: *HRS 115 (Public Access to Coastal and Inland Recreational Areas) requires public rights of way to be provided at reasonable intervals to inland recreational areas. Many parts of the Ko'olau Forest Reserve are land-locked by East Maui Irrigation property. The draft EIS needs to be extended to show public rights-of- way across EMI property to the Ko'olau Forest Reserve.*

Response 5: We acknowledge your comment regarding HRS Chapter 115, but we do not view this statute as applicable to the environmental review required under HRS Chapter 343. HRS § 115-2 (Acquisition of lands for public rights-of-way and public transit corridors) provides "When the provisions of section 46-6.5 are not applicable, the various counties shall purchase land for public rights-of-way to the shorelines, the sea, and inland recreational areas, and for public transit corridors where topography is such that safe transit does not exist." The County of Maui has not purchased a public right-of-way from the State or from EMI. Moreover, the provisions of HRS § 46-6.5 are not applicable. That section of the law applies when there is a subdivision into six or more lots, parcels, units, or interests. No subdivision is contemplated in connection with the proposed Water Lease. In any event, public access within portions of the License Area has been provided, as discussed in Section 4.8 of the Draft EIS, and it is expected either that public access will continue if the scope of the License Area remains the same, or, if the License Area is reduced, that public access within the former License Area lands will be dictated by a State agency. However, please note that Section 4.8 of the Final EIS, as noted in Response #2,

has been revised as shown in pages 4-305 to 4-309 to include more recreational facilities and an accurate discussion regarding access into the License Area as it relates to recreational activities.

Comment 6: *I support the position of the Division of Forestry and Wildlife in their December 19 2016 letter, included in the draft EIS. Specifically, I support:*

“Thus the Division recommends that the areas to be conveyed for a water license be done so through a land agreement that is limited to the infrastructure required for maintenance and conveyance of water, and that any terms of any agreement established for the delivery of water ensure unrestricted public access to the reserves and any state owned roads and trails”

Response 6: Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access to areas that are not within the License Area. Please also see Response #3 regarding the revised License Area under the most recent revocable permits and projections related to the geographical extent of the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown in pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding impacts to the areas that would allow for more public access. Moreover, impacts of the Modified Lease Area alternative are discussed in Section 3.4 of the EIS (Comparative Evaluation of Reasonable Alternatives) against different environmental resource categories.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on DEIS

To Mr. Earl Matsukawa,

Aloha and Mahalo for taking your time to accept my comments on the Draft EIS for the Proposed Water Lease for the Nahiku, Keanae, Honomanu, and Huelo License Areas.

I am a Haiku resident, kalo farmer, hunter, and fisherman who gathers from East Maui.

The Draft EIS needs to include the following information:

The importance of mauka to makai streamflow for our fisheries to thrive. Evidential studies show that when there is mauka to makai connectivity, that is when the fisheries are most abundant in marine aquatic life which is especially important for our native species. The DEIS needs to include the information on the fact that most East Maui streams have been allowed to flow for the past two years since HC&S closed which resulted in increased water flow and stream life. The EIS needs to discuss his diverting those streams for Mahi Pono farming would impact East Maui ecosystems and communities.

We gather within the 16 sq mi from Honopou to Maliko Gulch. These are the areas the DEIS states there are no impacts from diverting water which is false.

I humbly ask that the DEIS include this important information. Mahalo for this opportunity to submit comments on this Draft EIS.

Aloha no,

Jordan Tabura, resident of Haiku, Maui, Hawaii.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jordan Tabura:

Thank you for your comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Aloha and Mahalo for taking your time to accept my comments on the Draft EIS for the Proposed Water Lease for the Nahiku, Keanae, Honomanu, and Huelo License Areas.*

I am a Haiku resident, kalo farmer, hunter, and fisherman who gathers from East Maui.

Response 1: We acknowledge your comments and understand that you are a Ha‘ikū resident, kalo farmer, hunter, and fisherman who gather from the East Maui region. Please note that we provide detailed responses to each of your points below.

Comment 2: *The Draft EIS needs to include the following information:*

The importance of mauka to makai streamflow for our fisheries to thrive. Evidential studies show that when there is mauka to makai connectivity, that is when the fisheries are most abundant in marine aquatic life which is especially important for our native species.

Response 2: It is generally known that flow from mountain to ocean can provide environmental benefits. Impacts to stream flow and stream life as a result of diversions were assessed in the

Draft EIS Section 4.2.1. The HSHEP model was used to quantify the impacts of flow restoration on native stream animal habitat to help decision-makers determine an appropriate balance between instream and offstream water uses. The mauka to maikai connection is integral to the design of the HSHEP model in estimating the impacts of stream diversions on native species habitat. Impacts to stream habitats and native amphidromous stream species, are analyzed in Section 4.2.1 and Appendix A of the EIS.

Impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B of the EIS. Please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83 of the Final EIS. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83 of the Final EIS. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83 of the Final EIS.

Comment 3: *The DEIS needs to include the information on the fact that most East Maui streams have been allowed to flow for the past two years since HC&S closed which resulted in increased water flow and stream life. The EIS needs to discuss his diverting those streams for Mahi Pono farming would impact East Maui ecosystems and communities.*

Response 3: Regarding your comment that increased flow since the cessation of sugarcane operations in Central Maui has resulted in increased water flow and stream life is acknowledged. Please note that many people at the EISPN public scoping meetings on February 22nd and 23rd, 2017 testified noting positive impacts seen from increased stream flow resulting from the cessation of sugar operations, please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See page 4-168 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted. This is expected as it was discussed in Section 4.2.1 of the Draft EIS that the Proposed Action would increase the number of HU as compared to sugarcane operations. Please note that that as of October 2020, an average of 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System. Hence it can be assumed that current water diversion rates from the License Area are comparable to the amount that would be diverted under the No Action alternative, which is estimated to be approximately 26.39 mgd. The HSHEP model estimated that approximately 79.8% of total HU would be available under the No Action alternative. However, please note that under the Proposed Action, the total HU would be less than projected under the No Action alternative.

Please note with regards to your comment that the EIS needs to discuss the impacts of the Proposed Action, this is discussed in detail in Chapter 4 of the EIS. Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture,

traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown in pages 4-331 to 4-336.

Comment 4: *We gather within the 16 sq mi from Honopou to Maliko Gulch. These are the areas the DEIS states there are no impacts from diverting water which is false.*

Response 4: We acknowledge that you gather within the area from Honopou Stream (western end of the License Area) and Māliko Gulch. Please note that this area is outside the License Area. Please note that as discussed in Section 2.1.2 of the Draft EIS, under the Proposed Action, at full buildout of the Mahi Pono farm plan, it is estimated that approximately 87.95 mgd will be diverted from the License Area and an additional 4.37 mgd in between Honopou Stream and Māliko Gulch to support uses described in the EIS. However, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs. Regarding your comment that the Draft EIS states that no impacts are anticipated in this area under the Proposed Action as this area is anticipated to be diverted as it has been for over a century. Hence, the existing conditions are anticipated to remain similar and not change.

Comment 5: *I humbly ask that the DEIS include this important information. Mahalo for this opportunity to submit comments on this Draft EIS.*

Response 5: Please note that we provided detailed to your responses above. Thank you for your participation in this EIS process.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: A&B EIS

Please accept my comments for the EIS submitted by A&B for the 30 year lease on the East Maui ditches.

My name is Joyclynn Costa. I am a lineal descendant from Nahiku that has kuleana to Makapipi river.

A&B's EIS needs to include how they will operate in accordance to the Hawaii State water code particularly pertaining to kuleana rights and usage in the last section.

A&B's EIS needs to include acknowledgement of the kuleana being done currently and for future use for the ohana that are there as well as room for those contemplating, knowing that the waters are coming back, that are coming home to again create food on their kuleana.

The commission needs to include better and specific use of the ditch which should be how and in what condition they can proceed with any type of contract. Surrounding land should not be included only the ditch and the roads to access.

A&B needs to include a different plan of action to malama the ditch system and should not be allowed to continue operations as they have been which devastated and destroyed vast amounts of resources that caused injury to a people of kuleana.

A&B needs to include on each committee or management team someone from the community of the different Moku and Ahupua`a to ensure what is being done to our resources.

Mahalo for your consideration

Joyclynn Costa

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Costa:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *My name is Joyclynn Costa. I am a lineal descendant from Nahiku that has kuleana to Makapipi river.*

Response 1: We acknowledge your comments and understand that you are a lineal descendent from Nāhiku and have a kuleana to Makapipi Stream. Please note that Makapipi Stream was one of the streams subject to the 2018 CWRM D&O and was ordered to be fully restored as it was identified as valued for taro farming. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi‘ina‘au, Palauhulu, Waiokamilo, Wailuānui, ‘Ōhi‘a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to

the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

Comment 2: *A&B's EIS needs to include how they will operate in accordance to the Hawaii State water code particularly pertaining to kuleana rights and usage in the last section.*

Response 2: Regarding your comment about the State Water Code, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

With regards to your comment about kuleana rights, the 1876 agreement between the State and EMI recognized the existence of other property owners, stating that "*existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.*" Moreover, the prior licenses issued to EMI for the License Area in the past continued to recognize the rights of other property owners "for domestic purposes and the irrigation of kuleanas entitled to the same." See CWRM D&O, FOF 55.

Similarly, the relevant revocable permits issued by the State include a clause whereby "*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally*

protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water. . . .” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all constitutionally protected traditional and customary rights.

We believe that the Draft EIS adequately discusses the impacts of the Proposed Action both in terms of the effects on habitat and on traditional and customary Native Hawaiian practices. Specifically, in terms of habitat, Appendix A and Section 4.2.1 of the Draft EIS presented the HSHEP model was used to quantify the impacts of flow restoration on native stream animal habitat to determine an appropriate balance between instream and offstream water uses. Impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B of the EIS. Impacts to terrestrial flora and fauna, including threatened and endangered species, are analyzed in Section 4.4 and Appendix C of the EIS. As it relates to traditional and customary, please note that CSH provides a detailed and comprehensive report accounting the history of East Maui. This report is included in Appendix E and summarized in Section 4.5 of the EIS. The EIS includes an assessment of effects on the cultural practices through the CIA provided as Appendix F.

The information provided satisfies EIS content requirements. This information will also inform BLNR in the future, when it is deliberating on the issuance and terms of the Water Lease. Under the Public Trust Doctrine, BLNR will have to balance competing considerations before making a decision on the Water Lease. The balancing that BLNR is required to perform under the Public Trust Doctrine was described at length by the Hawai‘i Supreme Court in *In Re Water Use Permit Applications*, 94 Hawai‘i 97, 9 P. 3d 409 (2000) (“Waiahole I”) and summarized in Section 1.5 of the Final EIS as shown on pages 1-25 to 1-27.

With regard to the potential effects of the Proposed Action on traditional and customary practices, as discussed in the *Ka Pa ‘akai* decision, we acknowledge that BLNR will be required to “to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible.” *Ka Pa ‘akai*, 94 Hawai‘i at 35, 7 P. 3d at 1072. BLNR has previously so stated in its Findings of Fact, Conclusions of Law, and Decision and Order filed on March 23, 2007 in the contested case proceeding that is still pending regarding the Proposed Action (the 2007 D&O) as follows:

Public trust principles require that adequate provision be made for the protection of ***traditional and customary Hawaiian rights***, the protection and procreation of fish and wildlife, the maintenance of proper ecological balance and scenic beauty, and the preservation and enhancement of waters of the State for municipal uses, public recreation, public water supply, agriculture and navigation.

2007 D&O COL No. 6 at page 41 (citing *Waiahole I*). CWRM, in its June 20, 2018 D&O, also recited the State's constitutional obligation to consider the impacts of stream diversions in East Maui on traditional and customary practices of Native Hawaiians at pages 242 through 245, including the Supreme Court of Hawaii's more recent holding on this subject in *State v. Pratt*, 127 Hawai'i 206, 277 P. 3d 300 (2012).

We believe that the Draft EIS (including Appendix F) together with the CWRM D&O, provide ample information for the BLNR to consider regarding potential impacts to traditional and customary practices, and that will enable BLNR, at the point that it is deliberating on the Water Lease, to fulfill its constitutional obligation "to protect the reasonable exercise of customarily and traditionally exercised rights of Hawaiians to the extent feasible." *Ka Pa 'akai* at, 94 Hawai'i at 35, 7 P. 3d at 1072.

Comment 3: *A&B's EIS needs to include acknowledgement of the kuleana being done currently and for future use for the ohana that are there as well as room for those contemplating, knowing that the waters are coming back, that are coming home to again create food on their kuleana.*

Response 3: With regards to your comment about kuleana, as noted in Response #2 above, the 1876 agreement between the State and EMI recognized the existence of other property owners, stating that "existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted." Moreover, the prior licenses issued to EMI for the License Area in the past continued to recognize the rights of other property owners "for domestic purposes and the irrigation of kuleanas entitled to the same." See CWRM D&O, FOF 55.

Similarly, the relevant revocable permits issued by the State include a clause whereby "The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water. . . ." It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all constitutionally protected traditional and customary rights.

Comment 4: *The commission needs to include better and specific use of the ditch which should be how and in what condition they can proceed with any type of contract. Surrounding land should not be included only the ditch and the roads to access.*

Response 4: Regarding your comment about the specific use of the ditch, the EIS was prepared to support the application for the issuance of a long-term Water Lease for the purpose of developing, diverting, transporting and use of the State's East Maui waters through the EMI

Aqueduct System for the uses described in Chapter 2 of the EIS. Your comment about ‘what condition’ is unclear. We assume that your comment relates to the physical condition of the EMI Aqueduct System. In this regard, the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System. We also note that Appendix D of the EIS provides a Historical Structure Assessment East Maui Aqueduct System prepared by Mason Architects to provide an assessment of the historical significance of the EMI Aqueduct System.

Your comment that surrounding land should not be included is unclear. We assume that you are referring to the geographical extent of the License Area. Please note that it is recognized that the License Area could be smaller for the proposed Water Lease than the 33,000 acres of State-land that has historically been the subject of the water lease and/or revocable permits for East Maui surface water. DLNR, under the terms of the revocable permits in effect as of January 1, 2020, removed the Hanawi Natural Area Reserve, consisting of approximately 7,500 acres, from the land area encumbered by the revocable permits which has been reflected in the various figures depicting the License Area in the Final EIS. DLNR-DOFAW has expressed a desire to further reduce the License Area by removing portions of the Ko‘olau Forest Reserve that are not managed by A&B/EMI or that A&B/EMI does not need to operate, maintain and repair the EMI Aqueduct System. It is assumed that the management of public access to those lands would fall on a State Agency as discussed in Section 3.2.2.2 of the Draft EIS. However, due to concerns about public safety, including safety from risks from stream flooding and risks related to the EMI Aqueduct System, it is not anticipated that DLNR would authorize unfettered public access to the EMI Aqueduct System, and therefore it is not anticipated that members of the public would be in a position to report "streamflow violations." Section 3.2.2.2 has been expanded in the Final EIS to further take into account a modified License Area. See pages 3-21 to 3-24 of the Final EIS.

Comment 5: *A&B needs to include a different plan of action to malama the ditch system and should not be allowed to continue operations as they have been which devastated and destroyed vast amounts of resources that caused injury to a people of kuleana.*

Response 5: Your comment regarding the ‘plan of action to mālama the ditch system’ is unclear. We assume that you are referring to how EMI conducts repair and maintenance work on the EMI Aqueduct System within the License Area. As discussed in the Section 2.1.2 of the Final EIS as shown in page 2-7, under the Proposed Action, “maintenance and repair” involves keeping the waterways clear of trees, weeds, rocks, dirt, and anything that will potentially impede the flow of

water. This includes not only in the ditches, but in tunnels and flumes as well. While some of the maintenance and repair work is done by hand, other work requires small tractors and specialized equipment. Moreover, please note that EMI has established standard operating procedures to address the cleanup of trash and debris during the course of its activities. EMI has in place a practice of removing any equipment and excess materials it brings into the License Area to perform work on the EMI Aqueduct System as soon as the job(s) is completed. In addition, employees look out for unnecessary debris in the field during routine maintenance tasks and when unused items are observed from previous field work, EMI has conducted specific identification and removal operations. Of note, smaller portions of the EMI Aqueduct System have been misinterpreted by some to be unused 'debris' when in fact they do serve an operating function.

With regards to your comment about the destruction of resources, please note that under the Proposed Action, no vegetation removal in the License Area is anticipated except occasionally during routine maintenance and repair activities of the EMI Aqueduct System. Moreover, instream flow throughout the License Area is expected to increase and diverted water will be significantly less than what was historically diverted from the License Area during sugarcane operations. Hence, vegetation is expected to remain substantially the same and no direct impacts to flora or fauna are expected as discussed in Section 4.4.1 and Section 4.4.2 of the Draft EIS.

The elevation of the highest ditch that is part of the EMI Aqueduct System, the Koolau Ditch, is approximately 1,400 feet, and the EIS addresses mitigation measures that are applicable to the License Area. Appendix C and in Section 4.4.1 of the Draft EIS provide that endangered or threatened species and critical habitats exist in higher elevations of the License Area. As a mitigation measure, Section 4.4.1 of the Draft EIS states:

To avoid the introduction or transport of new invasive plant species into more pristine portions of the License Area during EMI Aqueduct System maintenance activities, all equipment and vehicles arriving from outside the License Area should be washed and inspected prior to any maintenance activities on cliff sides, near waterfalls, and in other native species-dominated areas in the License Area. Such washing and inspecting should be done at a designated location.

However, please note that the Section 4.4.1 of the Final EIS has been updated to include related mitigation measures based on comments received on the Draft EIS, as shown in pages 4-121 to 4-124.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The

requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

With regards to your comment about those with kuleana, as noted in Response #2 above, the 1876 agreement between the State and EMI recognized the existence of other property owners, stating that *“existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.”* Moreover, the prior licenses issued to EMI for the License Area in the past continued to recognize the rights of other property owners *“for domestic purposes and the irrigation of kuleanas entitled to the same.”* See CWRM D&O, FOF 55.

Similarly, the relevant revocable permits issued by the State include a clause whereby *“The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water. . . .”* It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all constitutionally protected traditional and customary rights.

Comment 6: *A&B needs to include on each committee or management team someone from the community of the different Moku and Ahupua`a to ensure what is being done to our resources.*

Response 6: We acknowledge your comments. However, please note that the terms and conditions of the Water Lease are at the discretion of the BLNR. Should the BLNR make this a part of the Water Lease, the lessee will comply with those terms and conditions.

September 3, 2021

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on the DEIS for East Maui Waters

I am a Marine Biologist and a concerned citizen of Maui County who has lived here for almost 20 years. I have witnessed and researched first hand the damage that the diversions have caused to our native aquatic species, important cultural practices, local Taro farmers and families who rely on these fresh water streams, and much more. There are five freshwater fishes native to Hawaii which are *Stenogobius hawaiiensis*, *Eleotris sandwicensis*, *Awaous guamensia*, *Sicyopterus stimpsoni*, and *Lentipes concolor* (endemic to Hawaii). Every one of them have record low numbers and are threatened because they have no way of getting past and through all of the number of diversions in these streams and the reduced water flows from these diversions and dams also limit larvae from reaching the ocean and recruiting back into streams. All of the EMI channelization leads to a decrease in riparian vegetation that causes a loss of shelter and erosion control and this needs to be addressed. I don't see any where in the DEIS that shows a plan for: Improving altered or diverted streams by modifying or removing gratings or diversions to allow for in stream passage of fish; Restoring riparian vegetation to help decrease in stream heating and reduce sediment loads; Removal of alien species; Creating pools infrequently dewatered stretches to provide safe usable habitat between flows; Ensuring adequate In stream flow and biological integrity of riparian areas; any work to clean streams with significant pollution; And any progress towards the development of a GIS database that make this information web-accessible.

Also as an avid hiker I have witnessed many stagnant pools full of mosquito larvae caused by these diversions not allowing the flow. This is a concern because it is a major public health issue that needs to be addressed as the Dengue, Chikungunya, and Zika virus diseases are transmitted via the mosquitoes found here in Hawaii. We just had an outbreak of Dengue here on Maui and this is a major concern for me and many others living here. Also as a hiker, there is limited public hiking access to the public lands with out needing to get permission from EMI. If it is public lands, I should have access to these public lands, this is not addressed in the DEIS.

The DEIS should also discuss shorter term lease options of way less than 30 years! That to me is insane as there are so many uncertainties of the future of rainfall especially with the climate crisis upon us and all the heat waves, droughts and fires we have been experiencing!

Lastly, there needs to be an option in the EIS for no diverted streams! I do not see this option and for this being an EIS, it really must be considered. As a resident and concerned biologist, I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.

Please accept these comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Be aware that many many many of us feel Enough is Enough, we will not be tolerating this any longer. Please know there will be a very strong stance against the privatization of public waters in a way that you have never seen before! The people are rising and you, as the informed scientists who created this DEIS, know what is the healthiest route for the land, the streams, the creatures, the plants, and the entire ecosystem, which ultimately affect the people. Your conscience will no longer allow you to cater to the big corporations such as A&B and Mahi Pono. East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. Thank you for this opportunity to submit comments on this Draft EIS.

Mahalo,
Kecia Joy, Kihei Maui

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Joy:

Thank you for comments dated November 8, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am a Marine Biologist and a concerned citizen of Maui County who has lived here for almost 20 years. I have witnessed and researched first hand the damage that the diversions have caused to our native aquatic species, important cultural practices, local Taro farmers and families who rely on these fresh water streams, and much more.*

Response 1: We acknowledge your comments and understand that you are a resident of Maui that is a marine biologist.

Regarding impacts on native aquatic species, please note that the HSHEP model in Appendix A estimates streamflow at all diversion locations based on watershed and rainfall characteristics and analyzes each reasonable alternative on stream flow in Section 3.4.3 and Section 4.2.1 of the Draft EIS. The combination of the lower and upper bounds used for the HSHEP model in Appendix A, provide the range at which we would expect changes to the diversions to fall within and provides a way to comparatively discuss different flow restoration scenarios as by definition the changes must fall somewhere between 100% diversion and 0% diversion.

The two scenarios presented in Appendix A of the Draft EIS, the Proposed Action compliant with the CWRM D&O (Trutta Environmental Solutions’ 2018 IIFS scenario) and No Action

Alternative (30% remaining flow diversion) are examples of how different flow restoration scenarios result in different amounts of habitat restored. The HSHEP model is used to quantify these differences based on flow restoration changes at specific diversions.

As discussed in Section 3.4.3 of the Draft EIS, the HSHEP model requires specific diversion conditions at each diversion. Applying the model to the Reduced Water Volume alternative would require information regarding where stream flows are proposed to be increased over the Proposed Action and the amounts. Given such information, the HSHEP model is able to readily calculate the number of remaining Habitat Units (HU) in any given scenario. The appendices contained within the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report (Appendix A of the EIS) provides the necessary data to form a scenario that the HSHEP model can use to analyze and quantify the changes that occur. Hence, the HSHEP model and the appendices within the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report provides data that can assist decision makers understand how impacts could change across different diversions scenarios.

Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown in pages 4-61 to 4-62 of the Final EIS. The above excerpt and the updated text on pages 4-61 to 4-62 of the Final EIS present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and

as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See pages 4-61 to 4-62 of the Final EIS.

Regarding cultural practices, Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates

that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, see pages 4-239 to 4-252 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.
