Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-56 to 4-67.

With regards to kalo farming, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified

through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu‘u, Ka‘aiea, ‘O‘opuola, Puehu, Nāili‘ilihaele, Kailua, Hanahana, Hoalua, Waipi‘o, Mokupapa and Ho‘olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on pages 1-13 to 1-24. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration statuts); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe‘e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo‘i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Letter to Amy Chant
Page 9 of 9
September 3, 2021

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 5: *Mahalo, for this opportunity to submit comments on this Draft EIS. Sincerely, Miss Amy Chang and Parents*

Response 5: We acknowledge your comments. Please note that we provided you with detailed responses to your comments above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 10, 2019 12:42:46 PM

Dear Mr. Matsukawa,

I am completely opposed to Alexander and Baldwin's proposal to further divert the streams of East Maui. The answer is NO! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. This goes for all of our streams. They have been destroyed, diverted and dried. It is a disgrace that private companies are allowed to take water from our threatened and endangered aquatic flora and fauna.

Thank you for this opportunity to submit comments on this Draft EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Huntemer:

Thank you for comments dated October 10, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

This goes for all of our streams. They have been destroyed, diverted and dried. It is a disgrace that private companies are allowed to take water from our threatened and endangered aquatic flora and fauna.

Thank you for this opportunity to submit comments on this Draft EIS.

Comment 1: *I am completely opposed to Alexander and Baldwin’s proposal to further divert the streams of East Maui. The answer is NO! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new,

diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and

agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *This goes for all of our streams. They have been destroyed, diverted and dried. It is a disgrace that private companies are allowed to take water from our threatened and endangered aquatic flora and fauna.*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 2: Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all

diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, November 7, 2019 9:14:34 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Continued diversion of streams in East Maui will continue to deplete the water table/aquifer, which has long-lasting and domino-effect issues on the flora and fauna of all East Maui. We do not know what healthy looks like because it has been so long since "normal" flow has been allowed and documented. In such uncertain times due to the effects of climate change, do not divert East Maui streams.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Annalea Fink

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Annalea Fink:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *Continued diversion of streams in East Maui will continue to deplete the water table/aquifer, which has long-lasting and domino-effect issues on the flora and fauna of all East Maui. We do not know what healthy looks like because it has been so long since “normal” flow has been allowed and documented. In such uncertain times due to the effects of climate change, do not divert East Maui streams.*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 2: With regards to your comments about depleting the water table/aquifer, please note that a 2019 United States Geological Survey (USGS) report titled, “Estimated Groundwater Recharge from a Water-Budget Model Incorporating Selected Climate Projections, Island of Maui, Hawai‘i” identifies certain aquifer sectors and aquifer systems that will experience either increases or decreases due to climate projections. In the scenarios presented in the USGS report, the aquifer systems in the Ko‘olau Aquifer Sector are projected to see some of the largest increases in recharge, whereas aquifer systems in the Central Aquifer Sector are projected to see decreases in recharge due to changes in rainfall patterns from future climate change trends. However, please note that under the Proposed Action, surface water is diverted from the East Maui License Area (which lies largely over the Ke‘anae, Waikamoi and Honopou aquifers in the Ko‘olau Aquifer Sector (See EIS Figure 4-17), to the Central Maui agricultural fields, which largely lie over the Pā‘ia Aquifer in the Central Aquifer Sector (See EIS Figure 4-18). As detailed in Section 4.2.2 of the EIS, the groundwater pumpage within the Ko‘olau Aquifer Sector is far below the Sustainable Yield (SY). This section of the EIS also addresses the anticipated impacts to the Central Aquifer Sector from the conveyance of East Maui surface water to Central Maui for irrigation purposes. Section 4.2.2 of the EIS has been updated to reflect your comment regarding the USGS report, as shown on pages 4-71 to 4-76.

With regards to flora and fauna impacts, Appendix C of the Draft EIS specifically addresses the flora and fauna considerations of the Proposed Action and alternatives. To minimize the impacts to flora and fauna in the License Area, Section 7 of Appendix C identifies several avoidance and minimization measures, including measures to avoid the introduction of additional invasive species to the License Area, which is harmful to the watershed and to native flora which are also reflected in Section 4.4 of the EIS.

Regarding your comment about not knowing what ‘healthy’ looks like, although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe‘e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals’ habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the

Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-332 to 4-335.

With regards to your comment about climate change, this is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts towards adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown on pages 4-89 to 4-94 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 17, 2019 10:11:44 PM

Dear Mr. Matsukawa,

You're not fooling our generation, the water belongs to the land. It is not for profit. NO MORE STREAM DIVERSIONS.

MY CHILDREN ARE THE FUTURE OF THIS ISLAND.

80% of homeowners in my new subdivision are from the continental US. I see their license plate when they move here, I know what local is. Locals and multigenerational families are not the ones purchasing new homes. We do not need more new homes.

I am a multigenerational Hawaiian, and we want water and land.

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Ariana Flores

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Flores:

Thank you for comments dated October 17, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *You’re not fooling our generation, the water belongs to the land. It is not for profit. NO MORE STREAM DIVERSIONS.*

MY CHILDREN ARE THE FUTURE OF THIS ISLAND.

80% of homeowners in my new subdivision are from the continental US. I see their license plate when they move here, I know what local is. Locals and multigenerational families are not the ones purchasing new homes. We do not need more new homes.

I am a multigenerational Hawaiian, and we want water and land.

Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai

Response 1: We acknowledge your comments and understand that you are a multigenerational Hawaiian that is opposed to the Water Lease. With regards to your comment about new homes, please note that the Proposed Action does not entail the development of new homes. The EIS was prepared to support the application for the issuance of a long-term Water Lease for the purpose of developing, diverting, and transporting the use of the State's East Maui waters through the EMI Aqueduct System for the uses described in the EIS.

Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural

environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Kotler:

Thank you for comments dated October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *I totally support the intentions of Mahi Pono, and of course they'll need a good flow of water to create diversified agriculture on Maui. But 35,000 gpd needs to be justified with very specific studies that take into account competing needs for the same water, both practical and cultural.*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 2: We acknowledge your comments. Your comment about '35,000 gpd' is unclear as nowhere in the EIS is that stated. Please note that under the Proposed Action, as discussed in Section 2.1.2 of the Draft EIS, that an estimated 87.95 mgd will be diverted from the License Area, and an additional 4.37 mgd between Honopou Stream and Māliko Gulch will be diverted, for a total of 92.32 mgd for uses described in the EIS. With regards to daily crop demands, this is justified by Table 2-1 in the Draft EIS (Table 2-2 in the Final EIS) which depicts the Mahi Pono farm plan in Section 2.1.4.

With regards to your comment about specific studies as it relates to cultural impacts, Section 4.6 of the Draft EIS, which summarized the Cultural Impact Assessment (CIA) (Appendix F) describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail;

Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the

Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, pages 4-158 to 4-159. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the

10238-04
Letter to Arnie Kotler
Page 6 of 6
September 3, 2021

Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, November 7, 2019 10:57:26 AM

Dear Mr. Matsukawa,

My name is Brianna Craig, and I have been a resident of East Maui for 7 years. I received by baccalaureate degree in Marine Science and Geology, with a focus on groundwater and estuarine ecosystems that are so vital for most of our coastal marine and stream life. I live in Nahiku with my fiance who was born and raised in Lower Nahiku, and his lived here all of his life, sustaining himself, our family, and community by fishing, hunting, and gathering from mauka to makai. My comments below are based on my own experiences in the short time I have lived here, as well as my partners experiences spending his entire life of 34 years here.

The draft EIS submitted, although long and extensive, is severely lacking in quantitative information.

First, the draft EIS is drastically ill-defining "baseline" flow of East Maui streams as streams WITH A&B/EMI diversions in place. Any qualified environmental consultant with the proper background and credentials to conduct this EIS research will know what base-flow is the surface water and groundwater that flows into streams in between rain events and during droughts (definition provided by USGS). This assessment of base flow can only be determined mauka (mountain-side) of the EMI diversions, and not below. Base flow below diversion infrastructure is severely interrupted, and therefore this EIS is grossly mistaken.

Second, and building off of the above facts, native aquatic stream life below the diversions have not been properly assessed in base flow conditions because the diversions squander that possibility. Any biological surveys conducted makai (ocean-side) of diversions are inadequate and grossly mistaken.

Third, although certain streams have been "restored" to 100% flow, water is still being diverted from streams. For example, the Makapipi stream in Nahiku is one of the "fully restored" streams, yet if you walk to the diversion infrastructure, you can plainly see that the culvert/flume that is meant to channel water north/west of the stream is ABOVE the floodgate. So even though the floodgate is "100% open," there is still a wall across the river that water builds up behind, and the flume is located underneath the base flow water level, so water is still being diverted into the flume. When speaking to local EMI employees about this, they use the excuse that the water is being diverted and released in the next stream over, Hanawi. Even if this is true, this disproves EMI's claim that 100% of Makapipi stream is released and flowing in a base flow condition. Even worse, when we experience heavy rainfall, a larger percentage of water is still diverted. Too many times to count, we have witnessed dry river beds in Lower Nahiku, when the water should be flowing. Stagnant pools of water persist, although water flowing above the diversion is plentiful and abundant.

This example brings me to my point that EMI should be held accountable for their false statements and definition of "released streams" by the county and state. East Maui is rural, rugged, and isolated, so EMI has gotten away with gross misconduct of water management because of the sheer lack of oversight by our public agency. We the people of East Maui entrust in the county and state agencies to protect our natural resources, so it is high-time that A&B/EMI be held accountable for their corporate-driven blatant disregard of East Maui's natural hydrologic processes, native flora and fauna, and the peoples native sustenance, ancestral, cultural, and spiritual practices within our waterways.

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless all of the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Brianna Craig

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Craig:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *My name is Brianna Craig, and I have been a resident of East Maui for 7 years. I received my baccalaureate degree in Marine Science and Geology, with a focus on groundwater and estuarine ecosystems that are so vital for most of our coastal marine and stream life. I live in Nahiku with my fiance who was born and raised in Lower Nahiku, and his lived here all of his life, sustaining himself, our family, and community by fishing, hunting, and gathering from mauka to makai. My comments below are based on my own experiences in the short time I have lived here, as well as my partners experiences spending his entire life of 34 years here.*

The draft EIS submitted, although long and extensive, is severely lacking in quantitative information.

First, the draft EIS is drastically ill-defining "baseline" flow of East Maui streams as streams WITH A&B/EMI diversions in place. Any qualified environmental consultant with the proper background and credentials to conduct this EIS research will know what base-flow is the surface water and groundwater that flows into streams in between rain events and during droughts (definition provided by USGS). This assessment of base flow can only be determined mauka (mountain-side) of the EMI diversions, and not below. Base flow below diversion infrastructure is severely interrupted, and therefore this EIS is grossly mistaken.

Response 1: We acknowledge your comments and understand that you are an East Maui resident with a degree in Marine Science and Geology.

With regards to your comments about how the Draft EIS defines the baseline flow, please note that baseflow has many definitions and many ways to calculate it. It is true that baseflow is generally considered the stable low flow that occurs between rain events but defining an exact amount of water in a stream that constitutes baseflow is not easy in practice. It can be done using field methods, hydrograph recession statistics or long-term discharge statistics and all will yield slightly different baseflow discharge results. The definition of how the EIS interprets baseflow, which is consistent with how CWRM interpreted baseflow has been made clearer in Sections 1.3.4, 2.1 and 4.2.1 of the EIS as shown on pages 1-13 to 1-24.

In preparing its study to support the EIS, Trutta Environmental Solutions (Trutta) generally followed the USGS regression statistics approach to estimate streamflow at all diversion locations based on watershed and rainfall characteristics included in the HSHEP model. The streamflow estimates are based on the regression relationships published by the USGS in:

Gingerich, S.B., 2005, Median and Low-Flow Characteristics for Streams under Natural and Diverted Conditions, Northeast Maui, Hawaii: Honolulu, HI, U.S. Geological Survey, Scientific Investigations Report 2004-5262, 72 p.

To predict the amount of water in a stream under “normal low flow conditions” (or baseflow), Trutta standardized the HSHEP discharge estimates with the USGS Base Flow Discharge 50 % exceedance statistic or BFQ₅₀. Since the HSHEP model used basin characteristics and rainfall input to predict BFQ₅₀, Trutta was able to estimate the comparable baseflow statistic consistently throughout the License Area. This provides an estimated streamflow above the many ungaged diversions and the ability to estimate baseflow return downstream of diversions. While this approach has its weaknesses, statistical models are commonly used to estimate discharge in data-poor areas for comparative use. For example, see discussion of discharge statistics and mathematical models from the CWRM Instream Flow Assessment Report for West Wailuaiki on Maui. On page 32, it states:

Mathematical models and equations are commonly used to represent hydrologic occurrences in the real world; however, they are typically based on a set of assumptions that oftentimes render their estimates questionable in terms of accuracy and precision. This does not mean the public should entirely discount the estimates produced by these mathematical tools because they do provide quantitative and qualitative relative comparisons that are useful when making management decisions.

Thus, the BFQ₅₀ statistic was used appropriately for comparative purposes in the HSHEP model results.

Regarding your comment about the need to determine baseflow on the mauka side of any diversions, rather than below, please see our responses to our next comment which also raises this issue. However, regarding whether an assessment of base flow can only be determined mauka of diversions, baseflow can be determined at any location within a stream. Whether baseflow is measured upstream or downstream of a diversion the result can be used for different applications. We use natural or “undiverted” baseflow as a

quantity of water that accumulates in a downstream direction. Diversions would remove a portion of the baseflow quantity. That removal of baseflow would be consistently removed from all downstream baseflow estimates.

Overall, it appears that you misunderstand the use of baseflow measurements. Measuring baseflow below a diversion would be important to distinguish two separate stream conditions. One where the diversion removes 100% of flow and there is no flow recovering due to groundwater input and therefore baseflow below the diversion is 0. The other where the diversion removes 100% of flow and there is flow recovery due to groundwater input and the baseflow would be a value greater than 0. These cases addressed by measuring baseflow below a diversion would have great differences in the amount of habitat available to stream animals.

Comment 2: *Second, and building off of the above facts, native aquatic stream life below the diversions have not been properly assessed in base flow conditions because the diversions squander that possibility. Any biological surveys conducted makai (ocean-side) of diversions are inadequate and grossly mistaken.*

Response 2: Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been

updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-335.

Trutta surveyed both up and downstream of diversions wherever not limited by the dangerous terrain. Generally, East Maui streams are very steep, and oftentimes prevent surveying either up- or downstream due to large waterfalls.

The comment, "*Any biological surveys conducted makai (ocean-side) of diversions are inadequate and grossly mistaken*" is not accurate. Biological surveys both upstream and downstream of diversions provide information to address different ecological questions. For example, if a species is observed immediately below a diversion, but not above the diversion, then the diversion may be acting as a barrier to upstream movement. Conversely, if a species is found above the diversion and not below, the diversion may be eliminating habitat downstream of the diversion.

As far as the surveys in East Maui stream being inadequate, in addition to the surveys completed for the Proposed Action Dr. James Parham (preparer of Appendix A of the EIS) co-authored the results of 4 years of post-water return monitoring surveys in East Maui Streams with colleagues at Division of Aquatic Resources.

Higashi, G. R., **J.E. Parham**, S. Hau and E.K. Lapp. 2014. Monitoring Changes in Habitat, Biota, and Connectivity Resulting from Water Returns in the East Maui Streams of East Wailua Iki, West Wailua Iki, and Waiohue Streams.

Additionally, Dr. James Parham co-authored the DAR survey reports for the East Maui streams of Kōlea, Waikamoi, Puohokamoa, Punalau, Honomanu, Nua'ailua, 'Ōhi'a, West Wailuā Iki, East Wailuā Iki, Kopili'ula, Waiahue, Pa'akea Gulch, Hanawī, Makapipi, Waihe'e, Pi'ina'au, Waiehu, Honopou, Waiokamilo, Hanehoi, and Wailuanui Streams.

USGS also completed numerous surveys both above and below diversions in East Maui streams and all this information was included in the HSHEP model due to its inclusion in the DAR Aquatic Surveys Database.

Gingerich, S.B. and Wolff, R.H. 2005. Effects of surface-water diversions on habitat availability for native macrofauna, northeast Maui, Hawaii: U.S. Geological Survey Scientific Investigations Report 2005-5213, 93 p.

Comment 3: *Third, although certain streams have been "restored" to 100% flow, water is still being diverted from streams. For example, the Makapipi stream in Nahiku is one of the "fully restored" streams, yet if you walk to the diversion infrastructure, you can plainly see that the culvert/flume that is meant to channel water north/west of the stream is ABOVE the floodgate. So even though the floodgate is "100% open," there is still a wall across the river that water builds up behind, and the flume is located underneath the base flow water level, so water is still being diverted into the flume. When speaking to local EMI employees about this, they use the excuse that the water is being diverted and released in the next stream over, Hanawi. Even if this is true, this disproves EMI's claim that 100% of Makapipi stream is released and flowing in a base flow condition. Even worse, when we experience heavy rainfall, a larger percentage of water is still diverted. Too many times to count, we have witnessed dry river beds in Lower Nahiku, when the water should be flowing. Stagnant pools of water persist, although water flowing above the diversion is plentiful and abundant.*

This example brings me to my point that EMI should be held accountable for their false statements and definition of "released streams" by the county and state. East Maui is rural, rugged, and isolated, so EMI has gotten away with gross misconduct of water management because of the sheer lack of oversight by our public agency. We the people of East Maui entrust in the county and state agencies to protect our natural resources, so it is high-time that A&B/EMI be held accountable for their corporate-driven blatant disregard of East Maui's natural hydrologic processes, native flora and fauna, and the peoples native sustenance, ancestral, cultural, and spiritual practices within our waterways.

Response 3: We respectfully disagree with your comment that streams ordered to be fully restored are still being diverted. Please note that the work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows.

The CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. CWRM ordered in relevant part (see CWRM D&O at p. 269):

- I. *It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.*
- J. *This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major*

diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process

K. The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.

CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

However, please note that generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best. The presence of cement or wood near or partially within the stream channel is not inherently bad for stream animals.

Conversely, meeting the instream flow standard at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the water flowing into the diversion and back to the stream from another location in the diversion ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

The two primary conditions where diversion structures could impact native stream species are structures where diversion and ditch water still comingle or structures that create a barrier to upstream migration. A diversion structure could also impact native stream animals as they move upstream if it creates an unnatural barrier. If no wetted pathway exists, upstream passage will be stopped.

Altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns.

In summary, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts.

The above is discussed in more detail in Section 4.2.1 of the Final EIS as shown on pages 4-63 to 4-67.

We respectfully disagree with you your comment about EMI employees stating water is being dumped in the next stream, as the streams ordered to be fully restored are no longer being diverted from those streams ordered to be fully restored, including Makapipi Stream.

Regarding your comment about freshets, please note that as discussed in Section 2.1.2 the EMI Aqueduct System is not designed to capture and convey short periods of high streamflow that occurs when it rains heavily in the upslope areas of the watershed. Such larger flows quickly overtop or bypass the diversions and remain in the streams. The system will only divert up to the capacity of the ditches to convey slow moving water along the very slight slopes of the ditches.

Regarding your comment about stagnant pools, please note that the Draft EIS does analyze each reasonable alternative on stream flow in Section 3.4.3 and Section 4.2.1 of the Draft EIS. The combination of the lower and upper bounds used for the HSHEP model in Appendix A, provide the range at which we would expect changes to the diversions to fall within and provides a way to comparatively discuss different flow restoration scenarios as by definition the changes must fall somewhere between 100% diversion and 0% diversion.

Two scenarios presented in Appendix A of the Draft EIS, the Proposed Action compliant with the CWRM D&O (Trutta Environmental Solutions' 2018 IIFS scenario) and No Action Alternative (30% remaining flow diversion) are examples of how different flow restoration scenarios result in different amounts of habitat restored. The HSHEP model is used to quantify these differences based on flow restoration changes at specific diversions.

As discussed in Section 3.4.3 of the Draft EIS, the HSHEP model requires specific diversion conditions at each diversion. Applying the model to the Reduced Water Volume alternative would require information regarding where stream flows are proposed to be increased over the Proposed Action and the amounts. Given such information, the HSHEP model is able to readily calculate the number of remaining Habitat Units (HU) in any given scenario. The appendices contained within the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report (Appendix A of the EIS) provides the necessary data to form a scenario that the HSHEP model can use to analyze and quantify the changes that occur. Hence, the HSHEP model and the appendices within the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report provides data that can assist decision makers understand how impacts could change across different diversions scenarios.

Regarding your comment about accountability, the current East Maui water revocable permits specify that quarterly reports to the BLNR are required. These reports are mandated to include a statement of compliance with the IIFS and identify the total amount of water being diverted from License Area measured at Honopou. It is expected, and the EIS takes into account, that compliance with the IIFS requirements under the CWRM D&O will also be required under the Proposed Action. In compliance with the CWRM D&O streamflow requirements, EMI has adjusted certain movable portions of gates to

ensure that streamflow below the gates complies with the IIFS requirements. Compliance with the CWRM D&O IIFS requirements is always subject to CWRM staff verification.

Comment 4: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless all of the streams of East Maui have a healthy flow of water mauka to makai.*

Response 4: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at

268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beuprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 19, 2019 4:19:51 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Only human being can destroy nature. We need earth but earth does not need us. Other creatures live in nature but we exploit nature's resources for profiting. If we are not harmonious with nature's cycle, our existence will be compromised.

Sincerely,
Casey Takayama

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Casey Takayama:

Thank you for comments dated October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing

some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *Only human being can destroy nature. We need earth but earth does not need us. Other creatures live in nature but we exploit nature's resources for profiting. If we are not harmonious with nature's cycle, our existence will be compromised.*

Response 2: We acknowledge your comments. With respect to the Draft EIS, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts. As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area. These impacts are related to stream habitat, as there will be a reduction from natural flow conditions which can be mitigated by adjustments in diversions to minimize entrainment; terrestrial flora and fauna resources, as well as historic and archeological resources, from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; cultural resources and practices which can be mitigated by a myriad of recommendations proposed by Cultural Surveys Hawai'i; and socio-economic characteristics which can be mitigated by further public outreach and consultation.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Opposition to A&B's Draft Environmental Impact Statement
Date: Wednesday, November 6, 2019 10:34:33 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui.

While many Maui residents do support agriculture for the central valley we also need to have some common sense about how much water we allow to be taken from the streams that our East Maui residents, farmers, wildlife and aquatic life depend on for survival.

The proposed amounts of water will cause long lasting and in some cases irreparable damage to them. Further the length of the proposed lease is unacceptable. Giving a foreign corporate entity too much control for too long will undoubtedly have extremely negative impacts on our environment as well as community relations.

There remain many other concerns the DEIS fails to either recognize or address such as the effect of these diversions on the conditions of the natural environments downstream and to our coastline aquatic life, or how this may affect hunting or gathering access for our local residents.

I do not believe any stream flow diversion should be approved until all concerns are resolved to the satisfaction of our community.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Charles Morales

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Morales:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui.*

While many Maui residents do support agriculture for the central valley we also need to have some common sense about how much water we allow to be taken from the streams that our East Maui residents, farmers, wildlife and aquatic life depend on for survival.

The proposed amounts of water will cause long lasting and in some cases irreparable damage to them.

Response 1: We acknowledge your comments and understand that you are opposed to the Proposed Action.

With regards to your comment about how much water will be taken from the streams in East Maui, please note that as described in Section 2.1.2 of the Draft EIS, under the Proposed Action approximately 87.95 mgd will be diverted from the License Area, and an additional 4.37 mgd in between Honopou and Māliko Gulch for the uses described in the EIS.

With regards to impacts to East Maui residents and farmers, the CIA for the Nāhiku, Ke‘anae, Honomanū and Huelo License Areas prepared by CSH provided as Appendix F to the Draft EIS, and as further supplemented for the Final EIS, includes a regional analysis of the entire License Area, including the non-petitioned streams and the petitioned-streams. Section 4.6 of the Final EIS has been revised to more fully describe the cultural practices and related impacts for the streams within the License Area, including the non-petitioned streams as shown on pages 4-171 to 4-425.

Earthplan conducted a Social Impact Assessment (SIA) that is included in EIS Appendix G and summarized in Section 4.7.2 of the EIS. Focus groups convened for the purposes of identifying and assessing social impacts included Huelo / Ha‘ikū residents and farmers. As discussed in Section 4.7.2, the social impact of diverting water is generational, and one that has affected livelihoods, family cohesion, the ability to integrate with environment for food gathering and recreation, resource stewardship, and personal connections or disconnections with values inherent in their lifestyles.

Furthermore, economic and fiscal impacts, including agricultural related economic impacts are discussed in detail for the East Maui region. This information is included in Appendix H and Appendix I which are summarized in Sections 4.7.3 and 4.7.4 of the EIS respectively. These studies found that the Proposed Action would have little agricultural or economic impact to the East Maui region.

Specifically, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including

information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

With regards to wildlife and aquatic life, please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown on pages 4-56 to 4-67 of the Final EIS. The above excerpt and the updated text on pages 4-56 to 4-67 present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See pages 4-56 to 4-67 of the Final EIS.

Section 4.4 of the EIS specifically addresses the impacts of the Proposed Action to flora and fauna resources within the License Area, including a discussion of the cumulative impacts. Appendix C (Terrestrial Flora and Fauna Technical Report) of the EIS that was prepared by SWCA included a survey of approximately 33,000 acres of land in East Maui referred to in the SWCA report as the License Area and approximately 30,000 acres of agricultural land in Central Maui that it referred to as the Service Area. These areas were collectively referred to as the Study Area throughout the SWCA report. This report is summarized in Section 4.4 of the EIS, which has been supplemented with a discussion on potential impacts on a watershed by watershed basis,

using data produced by the HSHEP model and HIGAP data provided by the State, along with surveys conducted within the region as shown on pages 4-121 to 4-124 and pages 4-129 to 4-131.

Comment 2: *Further the length of the proposed lease is unacceptable. Giving a foreign corporate entity too much control for too long will undoubtedly have extremely negative impacts on our environment as well as community relations.*

Response 2: We acknowledge your comments. Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years.

Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term maybe and diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to

farm for a long enough period to recover its planned investment. Please also see pages 3-50 to 3-80 of the Final EIS for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

With regards to your comment about a foreign corporate entity, Mahi Pono will introduce new agricultural activity to the State of Hawai‘i, which will benefit the State by increasing food production, employment, payroll, profits for farm tenants and companies supplying goods and services, and tax revenues to the State and County of Maui as described in Sections 4.7.3 and 4.7.4 of the Draft EIS as well as Appendix H (Economic and Fiscal Impact Study) and Appendix I (Agricultural and Related Economic Impacts). While profits from Mahi Pono’s farming activities, when they exist, will be distributed to its investors, including but not limited to PSP, a Canadian pension fund, most of the economic benefits will remain in Hawai‘i. Please note that farming activity typically requires significant upfront investment, with much later returns. The capital for that investment is provided by Mahi Pono’s investors. Hence, the financial impact of a foreign-owned company is taken into account when assessing the Proposed Action.

Comment 3: *There remain many other concerns the DEIS fails to either recognize or address such as the effect of these diversions on the conditions of the natural environments downstream and to our coastline aquatic life, or how this may affect hunting or gathering access for our local residents.*

Response 3: We respectfully disagree with your comment. With regards to wildlife and aquatic life, please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown on pages 4-56 to 4-67 of the Final EIS. The above excerpt and the updated text on pages 4-56 to 4-67 present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the

HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See pages 4-56 to 4-67 of the Final EIS.

With regards to nearshore coastal environments, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow

restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on page 4-83. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on page 4-83.

With regards to hunting and gathering access, it is recognized that the License Area could be smaller for the proposed Water Lease than the 33,000 acres of State-land that has historically been the subject of the water lease and/or revocable permits for East Maui surface water. BLNR, under the terms of the revocable permits in effect as of January 1, 2020, removed the Hanawi Natural Area Reserve, consisting of approximately 7,500 acres, from the land area encumbered by the revocable permits which has been reflected in the various figures depicting the License Area in the Final EIS. DLNR-DOFAW has expressed a desire to further reduce the License Area by removing portions of the Ko'olau Forest Reserve that are not managed by A&B/EMI or that A&B/EMI does not need to operate, maintain and repair the EMI Aqueduct System. It is assumed that the management of public access to those lands would fall on a State Agency as discussed in Section 3.2.2.2 of the Draft EIS. However, due to concerns about public safety, including safety from risks from stream flooding and risks related to the EMI Aqueduct System, it is not anticipated that DLNR would authorize unfettered public access to the EMI Aqueduct System, and therefore it is not anticipated that members of the public would be in a position to report "streamflow violations."

Section 3.2.2.2 of the Draft EIS discusses an alternative, the "Modified Lease Area" alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access to areas that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding impacts to the areas that would allow for more public access. Moreover, impacts of the Modified Lease Area alternative are discussed in Section 3.4 of the EIS (Comparative Evaluation of Reasonable Alternatives) against different environmental resource categories.

Comment 4: *I do not believe any stream flow diversion should be approved until all concerns are resolved to the satisfaction of our community.*

Response 4: We acknowledge your comments. Please note that the terms and conditions of the Water Lease are at the discretion of the BLNR.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 11, 2019 7:20:00 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

This is not right. Please do what's right for the community as a whole. Hawaiian water and land rights should be respected. It's all we have left. Please allow us to practice our culture and FEED OUR OHANA. If you don't care about Hawaiian culture, protect the right to feed our families. This is so sad and heartbreaking.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Chelsea Ann Furtado

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Furtado:

Thank you for comments dated October 11, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *This is not right. Please do what's right for the community as a whole. Hawaiian water and land rights should be respected. It's all we have left. Please allow us to practice our culture and FEED OUR OHANA. If you don't care about Hawaiian culture, protect the right to feed our families. This is so sad and heartbreaking.*

Response 2: We acknowledge your comments. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'ōpu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates

that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, see pages 4-239 to 4-252 of the Final EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the*

following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 11, 2019 7:20:00 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

This is not right. Please do what's right for the community as a whole. Hawaiian water and land rights should be respected. It's all we have left. Please allow us to practice our culture and FEED OUR OHANA. If you don't care about Hawaiian culture, protect the right to feed our families. This is so sad and heartbreaking.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,

Subject: Proposed Lease & DEIS
Date: Wednesday, November 6, 2019 10:02:43 AM

To whom it may concern-

Mahi Pono should NOT be granted a 30 year permanent lease to divert East Maui waters to Central Maui.

The tactics used by A&B and Mahi Pono thus far reeks of suspicion for the following reasons;

-For the DEIS process to be controlled by the applicant, A&B/Mahi Pono, who also paid for the DEIS preparation, automatically makes it biased. To submit a 2700 page, vague, redundant DEIS with a 45 day time limit for review is unreasonable. To deny granting an extension for review also adds to suspicion.

- A&B's sale contingency that, if Mahi Pono is not granted long term water leases from the state, they will have to rebate \$31 million shows an incentive to scew the process and accuracy.

- The four day, flora and fauna survey conducted over 33,000 acres that concluded that water diversion would have no effect on resources, culture and habitat is ridiculous. That sort of conclusion needs years of observation to estimate.

-To say crops cannot grow as well as in Central Maui is a falsehood. If crops grew well in Central Maui they would

not need diverted water in the first place. Not to mention the years of toxic, chemical fertilization required by sugarcane.

-The hiring of COO Tim O'Laughlin, a California attorney, that specializes in privatizing public water, is an extreme red flag.

Maui water is a public trust. The government has an obligation to protect, control and regulate the use of it's resources for it's citizens. The Board of Land and Natural Resources should be in charge of preparing the EIS. This would hopefully give good, educated decision making a chance. We need set water standards for all of Hawaii's streams. If not this will be a constant, reoccurring problem from those of profiteering and avarice.

Mahalo,
Cheryl Hendrickson

-Board of land and natural resources BLNR, preparation eis

The very fact they were not in existence until the purchase of Maui lands seems precarious.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Hendrickson:

Thank you for comments dated October 18, 2019 and November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Mahi Pono should NOT be granted a 30 year permanent lease to divert East Maui waters to Central Maui.

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing

some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The tactics used by A&B and Mahi Pono thus far reeks of suspicion for the following reasons;*

-For the DEIS process to be controlled by the applicant, A&B/Mahi Pono, who also paid for the DEIS preparation, automatically makes it biased. To submit a 2700 page, vague, redundant DEIS with a 45 day time limit for review is unreasonable. To deny granting an extension for review also adds to suspicion.

Response 2: Regarding your comment about the Applicant preparing the Draft EIS, BLNR determined that A&B was to prepare the EIS for the proposed Water Lease. As explained in Section 1.4 of the Draft EIS, in connection with A&B's May 2001 submittal to the BLNR requesting that the BLNR offer a long-term (30 year) water lease at public auction, A&B offered to perform the associated HRS, Chapter 343 environmental review. As part of the contested case hearing on the proposed Water Lease, NHLC, on behalf of Nā Moku, objected to A&B undertaking the environmental review process, and asserted that the BLNR was required to prepare conduct the environmental review. NHLC later orally withdrew its objection during oral arguments before the BLNR in May 2015. BLNR issued an order on April 14, 2016, directing A&B to scope the EIS, including the identification of the portions of the EIS that could proceed prior to the CWRM issuing a final IIFS decision, and those portions which could not. That scope was filed with the BLNR in June 2016. On July 8, 2016, the BLNR approved the scope and instructed that "A&B and EMI should proceed with the preparation of an environmental impact statement (EIS) in as expeditious manner as possible." The EIS recites this history in Section 1.3.3 of the Draft EIS and recognizes that the Water Lease will be awarded by public auction.

With regards to your comment about the public comment period that followed the Draft EIS, please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai'i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 3: *- A&B's sale contingency that, if Mahi Pono is not granted long term water leases from the state, they will have to rebate \$31 million shows an incentive to scew the process and accuracy.*

Response 3: Please note that this issue is outside the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using

government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 4: - *The four day, flora and fauna survey conducted over 33,000 acres that concluded that water diversion would have no effect on resources, culture and habitat is ridiculous. That sort of conclusion needs years of observation to estimate.*

Response 4: Regarding your comment about the length of time to conduct physical surveys related to the flora and fauna resources, ground and aerial surveys were conducted in 2017 and 2018 by SWCA to field-verify vegetation types and species found during previous surveying and mapping efforts. It was determined that the HIGAP vegetation data layer produced by Gon et al. (2006) was highly representative of the vegetation found in the "Study Area." Please note that the SWCA report, provided as EIS Appendix C, defined the "Study Area" as the collective License Area and the 30,000 acres of agricultural land that it referred to as the "Service Area." The HIGAP mapping data was used to estimate species distributions and potential impacts for the entire 33,000-acre License Area. Threatened and endangered species were categorized by each species' potential to occur in each vegetation type based on habitat needs. Methods have been further clarified in Appendix C, as summarized in Section 4.4 of the Final EIS as shown on page 4-113.

Comment 5: -*To say crops cannot grow as well as in Central Maui is a falsehood. If crops grew well in Central Maui they would not need diverted water in the first place. Not to mention the years of toxic, chemical fertilization required by sugarcane.*

Response 5: Please note that nowhere in the EIS is this stated. Rather, as summarized in Section 4.7.4 and Appendix I, "East Maui Water Lease: Agricultural and Related Economic Impacts"

Central Maui has some of the best agricultural conditions in the State for farming, including a large area in a compact configuration, high-quality soils, high solar radiation, a location near markets and shipping terminals, and potentially ample water at low delivery costs (assuming a new Water Lease with a reasonable use fee), and for lessees rents that will be comparatively low.

The basis for this finding is given in Subsection 5.a of Appendix I (pp. 13 to 22), along with Figures 4 to 12 (pp. 70 to 78) in Appendix I.

Without sufficient water to irrigate crops, most of Central Maui would change from green expanses of farmland to fire-prone dry-land grasses. However, since diversified crops require much less water than sugarcane, there is sufficient water to restore many of the streams in East Maui and to grow crops in Central Maui.

However, for Central Maui to reach its agricultural potential, surface water from East Maui will be required to irrigate the Central Maui fields.

Comment 6: *-The hiring of COO Tim O'Laughlin, a California attorney, that specializes in privatizing public water, is an extreme red flag.*

Response 6: Please note that your comment about Mr. Tim O'Laughlin is outside the scope of this EIS. As noted in Response #3, the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 7: *Maui water is a public trust. The government has an obligation to protect, control and regulate the use of it's resources for it's citizens. The Board of Land and Natural Resources should be in charge of preparing the EIS. This would hopefully give good, educated decision making a chance. We need set water standards for all of Hawaii's streams. If not this will be a constant, reoccurring problem from those of profiteering and avarice.*

Response 7: With regards to your comment about the public trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown in pages 1-25 to 1-27.

Regarding your comment about the BLNR preparing the EIS, as noted in Response #2, the BLNR determined that A&B was to prepare the EIS for the proposed Water Lease. As explained in Section 1.4 of the Draft EIS, in connection with A&B's May 2001 submittal to the BLNR requesting that the BLNR offer a long-term (30 year) water lease at public auction, A&B offered to perform the associated HRS, Chapter 343 environmental review. As part of the contested case hearing on the proposed Water Lease, NHLC, on behalf of Nā Moku, objected to A&B undertaking the environmental review process, and asserted that the BLNR was required to prepare conduct the environmental review. NHLC later orally withdrew its objection during oral arguments before the BLNR in May 2015. BLNR issued an order on April 14, 2016, directing A&B to scope the EIS, including the identification of the portions of the EIS that could proceed prior to the CWRM issuing a final IIFS decision, and those portions which could not.

That scope was filed with the BLNR in June 2016. On July 8, 2016, the BLNR approved the scope and instructed that “A&B and EMI should proceed with the preparation of an environmental impact statement (EIS) in as expeditious manner as possible.” The EIS recites this history in Section 1.3.3 of the Draft EIS and recognizes that the Water Lease will be awarded by public auction.

Comment 8: *-Board of land and natural resources BLNR, should be in preparation of the EIS. The very fact they were not in existence until the purchase of Maui lands seems precarious.*

Response 8: As noted in Response #2, the BLNR determined that A&B was to prepare the EIS for the proposed Water Lease. As explained in Section 1.4 of the Draft EIS, in connection with A&B's May 2001 submittal to the BLNR requesting that the BLNR offer a long-term (30 year) water lease at public auction, A&B offered to perform the associated HRS, Chapter 343 environmental review. As part of the contested case hearing on the proposed Water Lease, NHLC, on behalf of Nā Moku, objected to A&B undertaking the environmental review process, and asserted that the BLNR was required to prepare conduct the environmental review. NHLC later orally withdrew its objection during oral arguments before the BLNR in May 2015. BLNR issued an order on April 14, 2016, directing A&B to scope the EIS, including the identification of the portions of the EIS that could proceed prior to the CWRM issuing a final IIFS decision, and those portions which could not. That scope was filed with the BLNR in June 2016. On July 8, 2016, the BLNR approved the scope and instructed that “A&B and EMI should proceed with the preparation of an environmental impact statement (EIS) in as expeditious manner as possible.” The EIS recites this history in Section 1.3.3 of the Draft EIS and recognizes that the Water Lease will be awarded by public auction.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, October 2, 2019 8:17:04 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

I would assume that bribery through significant campaign contributions provides incentives for you to consider A & B's request to control most of the water from east Maui streams. This is not the proper moral behavior of representatives of the people. The water should be shared with the small farms in the area.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Cliff Devries

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Devries:

Thank you for comments dated October 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *I would assume that bribery through significant campaign contributions provides incentives for you to consider A & B's request to control most of the water from east Maui streams. This is not the proper moral behavior of representatives of the people. The water should be shared with the small farms in the area.*

Response 2: Please note that this comment is outside the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Co Pegg:

Thank you for comments dated October 22, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. The people of Maui have waited for our water to return to us. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui. The water to local streams should be returned to the people for the diversity of fish and plant life. Make the East Maui streams have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS. Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Water Justice
Date: Wednesday, October 2, 2019 11:01:20 PM

Dear Mr. Matsukawa,

Please explain how your proposal is fair to all, especially people living in areas where A & B has taken much of the water for years.

Wouldn't it be more fair to give those people most of the water for as many years as A & B has had most of the water?

If this was done, what contributions are people with restored water likely to give the community, compared to what A & B would give?

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Harden:

Thank you for comments dated October 2, 2019 and October 13, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please explain how your proposal is fair to all, especially people living in areas where A & B has taken much of the water for years. Wouldn't it be more fair to give those people most of the water for as many years as A & B has had most of the water?*

Response 1: We acknowledge your comments. However, please note that it is not within the scope of the EIS to determine what is and what is not fair. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 2: *If this was done, what contributions are people with restored water likely to give the community, compared to what A & B would give?*

Response 2: Your comment about what contribution are people with restored water likely to give is unclear. However, please note as discussed in detail in Response #3 that several East Maui stream were restored under the 2018 CWRM D&O. Moreover, the socio-economic impacts of the Proposed Action are addressed at length in Section 4.7 of the Draft EIS, and in further detail in Appendices G through I

(Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report). Draft EIS Section 4.7 has subsections addressing impacts to populations and impacts (Section 4.7.1), impacts to social characteristics (Section 4.7.2), impacts to the economy and other fiscal considerations (4.7.3), and impacts to the agricultural economy. (4.7.4). The potential socio-economic impacts of the alternatives to the Proposed Action considered by the Draft EIS are analyzed in Section 3.4.11 (Social Characteristics), 3.4.12 (Economic and Fiscal Resources), and 3.4.13 (Agricultural and Related Economic Resources). The Draft EIS thoroughly addressed cumulative socio-economic impacts in Section 4.17. That discussion has been further supplemented by updates in the Social Impact Assessment, Economic and Fiscal Impact Study, and Agricultural and Related Economic Impacts report as shown in pages 4-331 to 4-336 of the Final EIS.

Comment 3: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 3: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and

habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 4: *Water justice for all!*

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Response 4: As noted in Response #3 above, please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields

previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanu, and Huelo License Areas

Please accept my comments on the subject DEIS.

I care very deeply about this proposed lease of public water because I am a twenty-five year resident of Huelo. Our nearest stream, Hanehoi, is due to be restored, but many of our neighbors depend on other streams like Waipio, Mokupapa and Ho'olawa, which were never even considered for revised stream flows. I have watched neighbors suffer from lack of stream water for irrigation, for water to purify for household use when rain catchment is not enough, or when their shallow wells and springs are lowered by lack of ground water as streams are entirely diverted in dry seasons.

A proper DEIS needs to include alternative plans that provide adequate flows year round for all these streams where hundreds of people live, not just the three Huelo streams that are supposed to be restored.

I have neighbors who have given up on farming due to lack of reliable water supply. I have walked the stream valleys here and seen abandoned taro loi in almost all the wider, less steep parts of almost all the streams I've walked. Cumulatively, these would be miles of once productive taro fields. I have seen loi on state lease land near diversions, and am concerned that no archeological studies are required, because "no ground altering activities are proposed", ignores the poor management by EMI causing channel and bank erosion that leads to uprooting of large trees that wash downstream, damaging loi and Hawaiian historic sites.

It is clear that before stream diversion, there were many hundreds, probably thousands of Hawaiians growing food in East Maui stream beds. It is ridiculous and perhaps criminal of an EIS to ignore damages to environment and culture in the past when it is asking to continue those damages without remedy simply because they have never been properly addressed.

Another unexamined issue is the value of the aquatic life these streams provided to people for food gathering. Fish, shellfish and native plants were vital to Hawaiians that lived along these streams for hundreds of years. The whole ecosystem of ocean and streams was crucial in maintaining quality of life for many thousands of Hawaiians for centuries. The loi left in streams is evidence of that life, just as the rise of plantations for export coincided with the loss of self sufficiency in food, clean water, land to live on and plants for shelter and clothing. It is significant that Hawaiian language associates water, wai, with wealth, just as it is significant that as the water was taken to the corporate landowners, the wealth was taken along with it.

The state recognizes a public trust in public resources like water and clean air, and this DEIS should be explicit in how that trust is being respected, instead of just assuming there is no problem in continued taking from the public while ignoring ongoing damage to the life and the land.

I am asking that the DEIS answer these important questions, and that it offer more time to read, consider and comment on its 2700 pages. The record of EMI's poor management alone, which is not mentioned in the DEIS, has resulted in far more than damage to archeological sites. Consider the proliferation of invasive plants and animals that crowd out native plants and are harmful to a healthy watershed, the

creation of stagnant pools in formerly healthy streams, the uncertainty of changing rainfall and water supply over 3 decades, and the probable increase in damage to East Maui watersheds as stream diversion continues in a warming climate, as we have witnessed in 2019.

Thank you for this opportunity to submit comments on this Draft EIS.

Aloha,
Daniel Grantham

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Grantham:

Thank you for comments dated October 19, 2019 and November 5, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *Please accept my comments on the subject DEIS.*

I care very deeply about this proposed lease of public water because I am a twenty-five year resident of Huelo. Our nearest stream, Hanehoi, is due to be restored, but many of our neighbors depend on other streams like Waipio, Mokupapa and Ho'olawa, which were never even considered for revised stream flows. I have watched neighbors suffer from lack of stream water for irrigation, for water to purify for household use when rain catchment is not enough, or when their shallow wells and springs are lowered by lack of ground water as streams are entirely diverted in dry seasons.

A proper DEIS needs to include alternative plans that provide adequate flows year round for all these streams where hundreds of people live, not just the three Huelo streams that are supposed to be restored.

Response 2: We acknowledge your comments and understand that you are a Huelo resident. We do note and agree that Waipi'o, Mokupapa, and Ho'olawa streams were not a part of the CWRM proceedings and did not receive an IIFS. The reason they were not considered by CWRM is because these streams were not a part of the petitions filed by NHLIC. Regarding your neighbors suffering from a lack of stream flow for irrigation, it is unclear if you are discussing the three streams mentioned in your comment or not. Regardless, Waipi'o, Mokupapa, and Ho'olawa Streams were analyzed using the HSHEP model presented in Appendix A and Section 4.2.1 of the EIS. Please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown in pages 4-61 to 4-62 of the Final EIS. The above excerpt and the updated text in 4-61 to 4-62 of the Final EIS present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See pages 4-61 to 4-62 of the Final EIS. Moreover, please note that the HSHEP model includes 'opae within its analysis.

However, the HSHEP model does not account for water needed offstream. In response to this comment, it has been acknowledged in Section 4.7.2 of Final EIS that many of the communities downstream of the EMI Aqueduct System adjacent to the non-petitioned streams do not have access to MDWS water and depend upon these streams to meet their domestic water use as shown on pages 4-262 to 4-263.

With regards to your comment about alternative plans, it is assumed that restoration scenarios of the non-petitioned streams would fall under the Reduced Water Volume alternative. The Reduced Water Volume alternative described in Chapter 3 of the EIS provides an assessment of the impacts of less water being made available for the Proposed Action, including Maui Pono farm plan in the Central Maui agricultural fields. Specifically, consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture.

Comment 3: *I have neighbors who have given up on farming due to lack of reliable water supply. I have walked the stream valleys here and seen abandoned taro loi in almost all the wider, less steep parts of almost all the streams I've walked. Cumulatively, these would be miles of once productive taro fields. I have seen loi on state lease land near diversions, and am concerned that no archeological studies are required, because "no ground altering activities are proposed", ignores the poor management by EMI causing channel and bank erosion that leads to uprooting of large trees that wash downstream, damaging loi and Hawaiian historic sites.*

Response 3: We acknowledge your comments, however, you do not offer specificity. We assume that you are referring to the Huelo region. With regards to taro farming, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown in pages 1-19 to 1-23. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration status); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamo Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or

nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

We acknowledge your comments and recognize that you have observed what appears to be abandoned taro lo‘i. Please note that an archaeological literature review and field inspection was prepared to determine the likelihood that historic properties (any building, structure, object, district, area, or site over 50 years old) may be affected by the project and, based on findings, consider cultural resource management recommendations. This document was intended to facilitate the project’s planning and support the project’s environmental review compliance. The archaeological literature review and field inspection report included an analysis of the natural and built environment of the license area, a comprehensive review of traditional and historic background information of the region, a review of previous archaeological studies and findings in the region, and a field inspection of the license area focused on inspecting the areas nearest to the EMI aqueduct system infrastructure and access roads. The investigation did not include an inventory of all historic properties that may be present within the license area, but has provided cultural resource management recommendations based on the extensive research and analysis conducted during the study.

A Chapter 6E-7 and 6E-42 historic preservation review letter dated 25 January 2017 (Log No. 2017.00026; Doc. No. 1701GC08) sent from the SHPD to the DLNR Land Division requested that, pursuant to HAR §13-284-5(b)(5)(A and C), an archaeological inventory survey (AIS) and architectural inventory survey would be required prior to issuance of the lease and that these surveys also be preceded by inventory plans.

Additional information regarding the lease was provided to the SHPD including the understanding that the proposed water lease will not involve any ground disturbance and that the potential impact of flooding from abandoning the diversion on five streams will not be greater than periodic naturally occurring events. A subsequent Chapter 6E-8 historic preservation review letter (Log No. 2017.00026; Doc. No. 1706MBF11) sent from the SHPD to the DLNR Land Division updated the previous correspondence to no longer request the completion of an AIS plan or AIS in the project area in conjunction with the proposed lease because SHPD found that an AIS was not required since no ground disturbing activity is planned as part of the Proposed Action.

Regarding your comment about channel and bank erosion, the majority of the diversion structures are made of concrete, metal or wood and were designed to be stable (not easily washed out) when subjected to the common high flow events typical in East Maui streams. Local erosion issues were primarily caused by access roads to the diversion structures. Complete removal of the structures is likely to cause disruption of the stream bottom and stream banks and this will result in high erosion rates. However, EMI staff cannot perform any stream alteration work without first consulting with CWRM or the USACE. This includes work such as the cutting or uprooting of trees along stream embankments. Please note that many of the events also occur during large freshets where stream levels are extremely high and unpredictable.

A consult letter was mailed and emailed to you on 20 February 2020. CSH then followed up by email on 3 March 2020. However, no response was received.

Comment 4: *It is clear that before stream diversion, there were many hundreds, probably thousands of Hawaiians growing food in East Maui stream beds. It is ridiculous and perhaps criminal of an EIS to ignore damages to environment and culture in the past when it is asking to continue those damages without remedy simply because they have never been properly addressed.*

Response 4: Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI

Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown in pages 4-331 to 4-336.

Comment 5: *Another unexamined issue is the value of the aquatic life these streams provided to people for food gathering. Fish, shellfish and native plants were vital to Hawaiians that lived along these streams for hundreds of years. The whole ecosystem of ocean and streams was crucial in maintaining quality of life for many thousands of Hawaiians for centuries. The loi left in streams is evidence of that life, just as the rise of plantations for export coincided with the loss of self sufficiency in food, clean water, land to live on and plants for shelter and clothing. It is significant that Hawaiian language associates water, wai, with wealth, just as it is significant that as the water was taken to the corporate landowners, the wealth was taken along with it.*

Response 5: We acknowledge your comments. The CIA, Appendix F of the EIS, thoroughly describes the intimate relationships that Hawaiians had with their environment and natural / cultural resources

which is summarized in Section 4.5 and 4.6 of the Draft EIS. Specifically, Section 4.5 of the Draft EIS states:

There are legends of the gods Kāne and Kanaloa visiting the region causing fresh water to spring up, leaving their mark on the area. There is the myth of Kana, who is the son of the goddess Hina, who is said to have resided in East Maui. Kana along with his brother, Niheu, saved their mother Hina from Hā'upu, after she was abducted from Kapepe'ekauila. There is the story of 'Ai'ai receiving his fishing powers from his father, Kū'ula, and setting up new fishing grounds around the Hawaiian Islands, including the East Maui region. The demigod Maui made the Ko'olau region of Maui Island famous as this was the part of the island where Maui chose to ascend to the top of Haleakalā to snare the sun so that his mother Hina could dry her kapa (tapa). Many of the natural resources and natural phenomena, such as the flora and fauna, rain and lighting, were believed to be kinolau (physical manifestations) of gods, goddesses, and nature spirits of Hawaiian antiquity creating unique cultural landscapes. The famous shark god of Ko'olau, Hi'u, is said to reside in a cave near Ke'anae wharf.

Over 150 place names were documented throughout the East Maui region. The place names indicate the intimate relationship that Native Hawaiians had with the natural environment. The place names found throughout East Maui indicate that the lands were widely used for multiple purposes relevant to Native Hawaiian subsistence, habitation, and history. The land bears names associated with agriculture, domestic, and recreational uses of the local streams and pools. Sometimes these place names are references to the actions of historic individuals, and at other times to the deeds of legendary or mythological figure, but often are rich with symbolic associations to the point of encompassing a comprehensive history of a place that can combine all these elements. Tables within CSH's report contain the documented place names of Hāmākua Loa and Ko'olau Moku (See Appendix E)...

Evidence from the abundance of land divisions, place names, and heiau are suggestive that the period of habitation in East Maui between initial establishment and western contact was extensive. Evidence suggests that there were not many taro terraces throughout the region as the geography is not favorable due to the gulches and not many flats. However, where possible, especially in Ke'anae, taro terraces were cultivated. There is evidence that many of the stream beds were lined with stream taro well into the uplands and dry agriculture was utilized above the coastal area. The East Maui region is extremely fertile, and with an abundance of water resources, it was productive and supported a large population...

The most significant change in land-use in the Hawaiian Islands came with the Māhele of 1848 which changed the communal land system to one of private ownership. The

foundation for private land ownership set by the Māhele of 1848 began a marked pace of development across the entire island chain, and Maui was no exception to the age of Western development. The Māhele enabled many foreigners and foreign nationals to acquire land for the establishment of ranching and plantation operations, including the infrastructure projects that were aimed at supporting these land-intensive industries (aqueducts, roads, etc.). Within the Māhele records for the License Area there are over 85 claims for terrestrial agricultural features such as lo‘i (irrigated taro terraces), pākanu (garden, planting enclosure), ‘auwai (artificial irrigation canals, used to feed lo‘i), kula (fields, open pasture), pali (cliff, precipice, or steep hill suitable for cultivation of select plants), kīhāpai (small cultivated patch or orchard), mo‘o (ridge for similar purpose as pali), and pō‘alima (small agricultural patches tended in traditional times solely for chiefly tribute) (Pukui and Elbert 1986). There are also kuleana claimed for their naturally occurring vegetation and the right of tenants to collect these resources, such as ‘ie (aerial roots of the ‘ie‘ie vine, used in plaiting, basketry, and wicker weaving), olonā (shrub with fibrous bark used in fishnets, baskets, and to construct tī leaf raincoats and capes), wauke (paper mulberry used in making tapa cloth), hala (pandanus tree) and wildly occurring kalo (taro) and sweet potato (Pukui and Elbert 1986:50,94,256,286). Lastly are the kuleana claims over aquatic resources such as off-shore fisheries (documented as “sea” in LCA awards) and muliwai (river mouth, freshwater pool behind a shoreline sand bar) that are naturally occurring and not man made (Pukui and Elbert 1986). The Māhele also marked a turning point in Hawai‘i’s history as Western commercial interests and travelers began their influence on the remote region of East Maui and elsewhere.

Moreover, the CIA has been updated with follow-up interviews in response to comments on the Draft EIS and identifies impacts to the regional environment, taro farming, and freshwater ecosystems within the License Area based consultation with the community which are summarized in Section 4.6 of the Final EIS as shown in pages 4-239 to 4-252.

Comment 6: *The state recognizes a public trust in public resources like water and clean air, and this DEIS should be explicit in how that trust is being respected, instead of just assuming there is no problem in continued taking from the public while ignoring ongoing damage to the life and the land.*

Response 6: Regarding your comment about the mandated protection of the Public Trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B’s 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has

been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27.

Comment 7: *I am asking that the DEIS answer these important questions, and that it offer more time to read, consider and comment on its 2700 pages.*

Response 7: We acknowledge your comments noting for a time extension to allow for additional public comment. Please note that the period for public comment associated with the Draft EIS is defined by statute, as set forth under Hawai'i Revised Statutes (HRS) § 343-5. There is no statutory mechanism that provides for time extensions of the comment period. Hence, the comment period for the Draft EIS was not extended. Please note that more than 400 comment letters were received during the statutory comment period.

Comment 8: *The record of EMI's poor management alone, which is not mentioned in the DEIS, has resulted in far more than damage to archeological sites. Consider the proliferation of invasive plants and animals that crowd out native plants and are harmful to a healthy watershed, the creation of stagnant pools in formerly healthy streams, the uncertainty of changing rainfall and water supply over 3 decades, and the probable increase in damage to East Maui watersheds as stream diversion continues in a warming climate, as we have witnessed in 2019.*

Response 8: Your comment regarding EMI's poor management is acknowledge, however, it is unclear which archeological sites you are referring to as your comment does not specifically identify any sites by name or location. Following receipt of your Draft EIS comments you were invited to participate in additional consultation for the CIA by CSH to assist in identifying the archaeological sites that you commented on as being damaged from poor management of the License Area.

As noted in Response #3 above, a letter and figures were sent via email to you and via USPS on 20 February 2020. CSH sent a follow up email dated 3 March 2020. However, CSH did not receive a response from you.

As noted in Response #4, please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, November 2, 2019 6:03:14 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

My family has lived on Waiokamilo Stream for over 7 generations. It has once again be a Health Hazard. Disease spreading mosquitoes have made the stagnant water their breeding ground. Our animals have contracted Leptospirosis after ingesting the stagnant water and our tourists have lost their right to view a "Beautiful Ecosystem". This stream should be investigated under the Hawaii Department of Health for its diseased spreading bacteria and micro-organisms. We have waiting too long and demand the water to be released like we were supposedly awarded June 2018. WAIOKAMILO STREAM 100%.

Thank you for this opportunity to submit comments on this Draft EIS.

With all my heart,

FF Daryl Kunihi Boeche

Sincerely,
FF Daryl Boeche

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Boeche:

Thank you for comments dated November 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing

some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *My family has lived on Waiokamilo Stream for over 7 generations. It has once again be a Health Hazard. Disease spreading mosquitoes have made the stagnant water their breeding ground. Our animals have contracted Leptospirosis after ingesting the stagnant water and our tourists have lost their right to view a "Beautiful Ecosystem". This stream should be investigated under the Hawaii Department of Health for its diseased spreading bacteria and micro-organisms. We have waiting too long and demand the water to be released like we were supposedly awarded June 2018. WAIOKAMILO STREAM 100%.*

Response 2: We acknowledge your comments and understand that you and your family have lived along Waiokamilo Stream for over 7 generations. Please note that Waiokamilo Stream was one of the stream subject to the CWRM D&O and was ordered to be fully restored. Hence, this stream will no longer be diverted.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled "Modeling" of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown in pages 4-58 to 4-61, pages 4-126 to 4-127, and pages 4-130 to 4-131.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poeciliid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poeciliid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poeciliid fishes were observed upstream of

diversions in streams where natural flow patterns have continuously existed. While the reactions of poeciliid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Regarding your comment that the State of Hawai'i Department of Health should investigate Waiokamilo Stream for bacteria and micro-organisms that spread diseases, please note that is outside the scope of this EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: It is time to say no to corporate greed & tyranny
Date: Thursday, October 3, 2019 3:54:06 AM

Dear Mr. Matsukawa,

Alexander and Baldwin have had a pretty good 150 years of dictatorship over the islands and confiscation of natural resources for corporate and personal profit.

I am against their proposal to further divert the streams of East Maui.

East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Enough is enough! Thank you for your kind consideration.

Sincerely,
Denise Boisvert

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Boisvert:

Thank you for comments dated October 3, 2019, October 8, 2019, and October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Alexander and Baldwin have had a pretty good 150 years of dictatorship over the islands and confiscation of natural resources for corporate and personal profit.*

I am against their proposal to further divert the streams of East Maui.

East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Enough is enough!

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in

June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses.

The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *How many more decades will Alexander and Baldwin control these islands and their natural resources?*

Their proposal to further divert the streams of East Maui is based on pure greed. Enough is enough!

East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Please don't let future generations ask why the environment was not cared for when you had this last opportunity.

Response 2: As noted in Response #1 above, Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

Comment 3: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui.*

Alexander & Baldwin has ruled these islands for over 150 years. Enough is enough!

East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Response 3: As noted in Response #1 above, Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 18, 2019 10:06:40 PM

Dear Mr. Matsukawa,

Dear DLNR,

The day is not far off when you will personally be held accountable for representing neo-colonial interests over the interests of the aina and the ohana.

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Dennis O'Shea
Maui resident and Hawai'i national

Sincerely,
Dennis O'Shea

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Keʻanae, Honomanū and Huelo License Areas

Dear Mr. O'Shea:

Thank you for comments dated October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawaiʻi Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The day is not far off when you will personally be held accountable for representing neo-colonial interests over the interests of the aina and the ohana.*

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing

10238-04
Letter to Mr. Dennis O'Shea
Page 3 of 3
September 3, 2021

some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Monday, October 21, 2019 5:37:10 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. So much of the testimony that has been submitted in favor of the continuance has always been to claim that diversified ag will use less or no diverted water. Over and over the BLNR and elected officials have prevented the return of waters. Bad land practices of the past should not justify continuing diversion. The ecosystem needs the water to regenerate itself. Streams, native farms, nearshore habitats need to regenerate.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
don cooke

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Cooke:

Thank you for comments dated October 21, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *So much of the testimony that has been submitted in favor of the continuance has always been to claim that diversified ag will use less or no diverted water. Over and over the BLNR and elected officials have prevented the return of waters. Bad land practices of the past should not justify continuing diversion. The ecosystem needs the water to regenerate itself. Streams, native farms, nearshore habitats need to regenerate.*

Response 2: Please note that the Proposed Action will use significantly less water than what was historically used for sugarcane operations. As discussed in Draft EIS Section 2.1.2 (East Maui/License Area) and 2.1.4 (Central Maui Field System), the long-term average delivery of water by the EMI Aqueduct System up until 1986 had been approximately 165 mgd (prior to any use of water by the MDWS or HC&S on the agricultural fields). This measurement was taken at Māliko Gulch. As discussed in Section 2.1.2 of the Draft EIS, the amount of water that could be diverted from the License Area under the Proposed Action is approximately 87.95 mgd.

With regards to your comment about the return of waters, please note as discussed in Response #1 above, On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

With regards to stream impacts, please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown on pages 4-61 to 4-62 of the Final EIS. The above excerpt and the updated text in on pages 4-61 to 4-62 of the Final EIS present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See A on pages 4-61 to 4-62 of the Final EIS.

With regards to farm impacts, similarly, the CIA for the Nāhiku, Ke‘anae, Honomanū and Huelo License Areas prepared by CSH provided as Appendix F to the Draft EIS, and as further supplemented for the Final EIS, includes a regional analysis of the entire License Area, including the non-petitioned streams and the petitioned-streams. Section 4.6 of the Final EIS has been revised to more fully describe the cultural practices and related impacts for the streams within the License Area, including the non-petitioned streams as shown on pages 4-171 to 4-254.

Earthplan conducted a Social Impact Assessment (SIA) that is included in EIS Appendix G and summarized in Section 4.7.2 of the EIS. Focus groups convened for the purposes of identifying and assessing social impacts included Huelo / Ha‘ikū residents and farmers. As discussed in Response #15 above, for this area referred to in Comment #20, the social impact of diverting water is generational, and one that has affected livelihoods, family cohesion, the ability to integrate with environment for food gathering and recreation, resource stewardship, and personal connections or disconnections with values inherent in their lifestyles.

Furthermore, economic and fiscal impacts, including agricultural related economic impacts are discussed in detail for the East Maui region. This information is included in Appendix H and Appendix I which are summarized in Sections 4.7.3 and 4.7.4 of the EIS respectively. These studies found that the Proposed Action would have little agricultural or economic impact to the East Maui region.

Specifically, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional

acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

With regards to nearshore coastal environments, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown on the pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species (‘O‘opu naniha (*Stenogobius hawaiiensis*), ‘O‘opu akupa (*Eleotris sandvicensis*) and ‘Ōpae ‘oeha‘a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams, of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown on pages 4-78 to 4-83. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown on pages 4-78 to 4-83.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 24, 2019 4:26:33 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

In addition to the above truth, Alexander and Baldwin are positioning themselves to charge others for water which is a RESOURCE not a commodity. From the reading and research I have done it appears that Maui may be the first island to mismanage its water to the point of shortages for enough water for the continuous stream of people that relocate to Maui (tourists also strain the island's resources).

Private interests and the creation of a water crisis divert the focus from prevention to reacting. Greed and mismanagement of vital resources needs to be addressed BEFORE a water shortage occurs.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Dorothy Bach Ph.D., LMHC, NCC

Subject: Resources vs. commodities
Date: Thursday, October 24, 2019 4:40:18 PM

Alexander and Baldwin veil their agendas under the need of water for agriculture. If enough water is diverted to their purposes they will be in a position to dictate the price of water to the residents of Maui Island.

We lose sight of prevention and succumb to greed, mismanagement, and man made crises. Living in survival mode with the shadow of a new crisis does not make for a life one thrives in; one can only react and attempt to save themselves and their family. Prevention and conservation of water for each island would be an excellent discussion for the BLNR to have with the constituents of Maui and perhaps each island.

Planning and a concerted effort to pass a legacy on to future generations would be a wonderful thing to do. Looking at the resource of water and how to conserve this for the children and their children would be a blessing. If the bottom line is the dollar and everyone looks at water and people as commodities to be bought and sold then we may really face extinction.

Please concern yourselves with the future generations and how best to serve the land and distribute its resources fairly. Hawaii is unlike any other place in the world and I have travelled a bit, keep this beautiful and blessed land whole and caring for the people that have been graced to be able to live here.

Sincerely,

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Dr. Bach:

Thank you for comments dated October 24, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *In addition to the above truth, Alexander and Baldwin are positioning themselves to charge others for water which is a RESOURCE not a commodity. From the reading and research I have done it appears that Maui may be the first island to mismanage its water to the point of shortages for enough water for the continuous stream of people that relocate to Maui (tourists also strain the island's resources).*

Private interests and the creation of a water crisis divert the focus from prevention to reacting. Greed and mismanagement of vital resources needs to be addressed BEFORE a water shortage occurs.

Response 2: Your comments are unclear. However, there are many factors which could affect the cost of water delivered to the County of Maui. The cost of water to the County of Maui will depend, in part, on the amount of the lease payment for the Water Lease, which will be established by the BLNR. An appraisal to determine the fair market value of the Water Lease will be conducted prior to issuance of the Water Lease. Our expectation is that the DLNR, on behalf of the BLNR, will commission, or approve the commissioning of, the appraisal. The cost of water to the County of Maui also depends on the operational costs of running the EMI Aqueduct System, including all costs of complying with applicable regulations and laws.

However, as discussed in 4.7.3 of the Draft EIS, under the Proposed Action (where the maximum amount of water is limited by the CWRM D&O and therefore below historical averages), the rate MDWS currently pays to EMI (\$0.06 per kgal) will increase because EMI's per unit operating cost will increase as a result of fixed costs being spread out over a lower volume of water diverted and possible higher lease payments to the State compared to historic payments. While it is anticipated that the delivery costs to the County of Maui will increase, the exact amount of the increase cannot be known until the Water Lease is finalized. However, the estimate analyzed in the Draft EIS assumed a year 2030 water service fee rate of \$0.08 per kgal. This figure was calculated based on the ratio of operational cost to the MDWS service fee for 2008 to 2013. Under this assumption, the MDWS would pay an estimated \$214,600 per year to EMI. However, please note that this discussion in Section 4.7.3 of the Final EIS has been updated to take into account the latest equivalent per unit cost under the latest revocable permit as shown in pages 4-277 and 4-283.

The Draft EIS did address potential impacts to MDWS customers should the cost of water delivery through the EMI Aqueduct System to the MDWS rise significantly. County of Maui water service rates vary by class of users (i.e., residential, commercial, agricultural, etc.), but average approximately \$4 per kgal. Inasmuch as the same water rates are charged across the nine water systems in the County there are many factors that determine the water service rate. Due to the fact that water rates are not dependent on the service area a customer is located in, increases associated with increased water delivery costs from the EMI Aqueduct System and from new water source development for Upcountry Maui would affect MDWS ratepayers countywide, including domestic and agricultural users in Upcountry Maui. Moreover, as discussed in Section 4.7.3 of the Draft EIS an analysis conducted by Brown and Caldwell determined that the lifecycle cost of developing new water sources for Upcountry Maui customers would be \$34 per

kgal, which far exceeds the current average water service rate of \$4 per kgal. Specifically, in Section 4.7.3 of the Draft EIS, it is stated:

Under the Brown and Caldwell analysis, the life-cycle unit cost of developing and operating wells is \$34 per kgal. It is noted that the life-cycle unit cost to develop new water for Upcountry Maui customers is high. In comparison, a similar analysis conducted for the Central Maui Water System showed a unit cost of less than \$10 per kgal, or less than one third the cost of Upcountry Maui water development (Brown and Caldwell, 2014). The total life-cycle cost for 7.95 mgd of new wells is \$1.2 billion. The life-cycle cost is expressed as the net present value of all the costs incurred over 25 years, including capital, operating, and maintenance costs.

Moreover, as discussed in Appendix I, from an agricultural perspective, should water costs significantly rise for Upcountry Maui water users, farming in Upcountry Maui would significantly decrease as many farms would relocate to Central Maui given the overall better agronomic conditions, cheaper rents, and cheaper water.

Comment 3: *Alexander and Baldwin veil their agendas under the need of water for agriculture. If enough water is diverted to their purposes they will be in a position to dictate the price of water to the residents of Maui Island.*

Response 3: Your comments are unclear. However, as discussed in Response #2 above, there are many factors which could affect the cost of water delivered to the County of Maui. The cost of water to the County of Maui will depend, in part, on the amount of the lease payment for the Water Lease, which will be established by the BLNR. An appraisal to determine the fair market value of the Water Lease will be conducted prior to issuance of the Water Lease. Our expectation is that the DLNR, on behalf of the BLNR, will commission, or approve the commissioning of, the appraisal. The cost of water to the County of Maui also depends on the operational costs of running the EMI Aqueduct System, including all costs of complying with applicable regulations and laws.

Comment 4: *We lose sight of prevention and succumb to greed, mismanagement, and man made crises. Living in survival mode with the shadow of a new crisis does not make for a life one thrives in; one can only react and attempt to save themselves and their family. Prevention and conservation of water for each island would be an excellent discussion for the BLNR to have with the constituents of Maui and perhaps each island.*

Planning and a concerted effort to pass a legacy on to future generations would be a wonderful thing to do. Looking at the resource of water and how to conserve this for the children and their children would be a blessing. If the bottom line is the dollar and everyone looks at water and people as commodities to be bought and sold then we may really face extinction.

Please concern yourselves with the future generations and how best to serve the land and distribute its resources fairly. Hawaii is unlike any other place in the world and I have travelled a bit, keep this beautiful and blessed land whole and caring for the people that have been graced to be able to live here.

Response 4: We acknowledge your comments. Please note that the authorization, as well as the terms and conditions of the Water Lease is at the discretion of the BLNR.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 10, 2019 5:42:53 PM

Dear Mr. Matsukawa,

I am opposed to this action because water was taken already for many decades from East Maui residents and the results caused hardship and famine. This was a sacrifice too large to endure again. With climate change now, we cannot afford such long term agreements that also take away such a valuable resource needed more than ever for food production.

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Re: Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanu, and Huelo License Areas

Dear Mr. Ian Hirokawa, Earl Matsukawa:

Please accept my comments on the subject DEIS.

I care very deeply about this proposed lease of public water because I am a grandmother to 3 native Hawaiian children, who are and will be in Kamehameha Schools on Maui. Water is Life and part of their heritage.

- I'm a concerned upcountry Maui resident and lived in Nahiku. Water is so important for food production.
- I'm a mother-in-law to a native Hawaiian practitioner in east Maui who gathers from the streams
- I'm a grandmother to native Hawaiian grandchildren and one of Hana, and know the water history. Elder Kapuna Aaron Brown shared with me many stories about how as a child in Nahiku he watched people starve from no taro, when the water was diverted. It is time to restore the water for the Kalo farming, the land and to help sustain food production that Hawai'i needs.
- I'm concerned that no one is taking care of much of the watershed as it was used for the sugar industry, which is now gone, and this resource is too precious to waste.

"The EIS needs to consider these significant points:"

"The EIS needs to discuss the option of not diverting any streams, and discuss how that would benefit East Maui ecosystems and East Maui communities. In light of history, how is this an improvement and is it justified?"

- The EIS should give an in-depth review of and discuss the benefits of shorter term lease options of less than 30 years, due to uncertainties of future rainfall, climate change and future water supplies. Making shorter lease periods will provide flexible options for these changes.
- The EIS needs to discuss methods of restoring the 13 streams in the Honopou to Kailua area, where lots of people live and farm and gather. All that is said is that it's estimated that all of the water will be diverted from the streams 60% of the time. The EIS needs to discuss the impacts of continuing those diversions, which will decimate 85% of native stream habitat and impact thousands of local residents. It's time to make a difference for the environment, not just big business and profits over people and their ability to sustain life with access to water.

I am asking that the DEIS include this important information. Thank you for this opportunity to submit comments on this Draft EIS.

Aloha,

Gaylene L Barron

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Barron:

Thank you for comments dated October 10, 2019 and November 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am opposed to this action because water was taken already for many decades from East Maui residents and the results caused hardship and famine. This was a sacrifice too large to endure again. With climate change now, we cannot afford such long term agreements that also take away such a valuable resource needed more than ever for food production.*

Response 1: We acknowledge your comments and understand that you are opposed to the Proposed Action.

With regards to climate change, climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai‘i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown in pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

With regards to your comment about food production as it relates to East Maui, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown in pages 4-288 to 4-293.

Comment 2: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 2: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue

to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 3: *I care very deeply about this proposed lease of public water because I am a grandmother to 3 native Hawaiian children, who are and will be in Kamehameha Schools on Maui. Water is Life and part of their heritage.*

- *I'm a concerned upcountry Maui resident and lived in Nahiku. Water is so important for food production.*
- *I'm a mother-in-law to a native Hawaiian practitioner in east Maui who gathers from the streams*
- *I'm a grandmother to native Hawaiian grandchildren and one of Hana, and know the water history. Elder Kapuna Aaron Brown shared with me many stories about how as a child in Nahiku he watched people starve from no taro, when the water was diverted. It is time to restore the water for the Kalo farming, the land and to help sustain food production that Hawai'i needs.*
- *I'm concerned that no one is taking care of much of the watershed as it was used for the sugar industry, which is now gone, and this resource is too precious to waste.*

Response 3: We acknowledge your comments and understand that you a concerned Upcountry Maui resident with connections to East Maui. With respect to the Draft EIS, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts. As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area. These impacts are related to stream habitat, as there will be a reduction from natural flow conditions

which can be mitigated by adjustments in diversions to minimize entrainment; terrestrial flora and fauna resources, as well as historic and archeological resources, from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; cultural resources and practices which can be mitigated by a myriad of recommendations proposed by Cultural Surveys Hawai'i; and socio-economic characteristics which can be mitigated by further public outreach and consultation.

Comment 4: *The EIS needs to consider these significant points:*

The EIS needs to discuss the option of not diverting any streams, and discuss how that would benefit East Maui ecosystems and East Maui communities. In light of history, how is this an improvement and is it justified?

Response 4: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the "No Action" alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water

delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate.

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80, enclosed. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

With regards to your comment about taro farming, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for taro were identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown in pages 1-19 to 1-23. The CWRM did, however, address and order in the Huelo portion of the License Area: (1)

Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration status); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O "*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*" (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 5: *The EIS should give an in-depth review of and discuss the benefits of shorter term lease options of less than 30 years, due to uncertainties of future rainfall, climate change and future water supplies. Making shorter lease periods will provide flexible options for these changes.*

Response 5: We acknowledge your comments. Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such

a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 6: • *The EIS needs to discuss methods of restoring the 13 streams in the Honopou to Kailua area, where lots of people live and farm and gather. All that is said is that it's estimated that all of the water will be diverted from the streams 60% of the time. The EIS needs to discuss the impacts of continuing those diversions, which will decimate 85% of native stream habitat and impact thousands of local residents.*

Response 6: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the

Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-61 to 4-67.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams and assesses the impacts of the diversions across an array of environmental criteria.

Comment 7: *It's time to make a difference for the environment, not just big business and profits over people and their ability to sustain life with access to water.*

I am asking that the DEIS include this important information.

Response 7: We acknowledge your comments. Please note that we provided you with detailed responses to each of your comments above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on diversion of the east maui streams
Date: Wednesday, November 6, 2019 6:22:23 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

I would like to see the eco system of east maui benefit from no diversion of streams, so that native aquatic species can thrive once again.

A lot of people need the water from the stream for agriculture and livelihood, the diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. This is simply not ok and affects a lot of residents of east maui.

Please analyze the threat and damage the diversions have caused to native aquatic species and find a way to do this without killing stream life, nor affecting the native taro farmers & other residents.

Our water supply is essential to our island and needs to stay in the streams for use by the east maui residents. A 30 year lease is unacceptable, as we don't know how the rainfall will be affected by climate change.

these public lands need to be available to the public for hiking and pooled water is breeding grounds for mosquitoes who can carry dengue fever, therefore be detrimental to our population, as well as affect the tourist industry.

changing the flow of streams and altering nature's way has many negative impacts on the land, the animals, the plants and the people, please assess all possible results of this and reconsider, this is not acceptable nor does it support our residents & farmers.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Grace Pretre

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Pretre:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM

proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *I would like to see the eco system of east maui benefit from no diversion of streams, so that native aquatic species can thrive once again.*

Response 2: Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai'i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the "No Action" alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown in pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *A lot of people need the water from the stream for agriculture and livelihood, the diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. This is simply not ok and affects a lot of residents of east maui.*

Response 3: The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided in pages 4-61 to 4-67.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 4: *Please analyze the threat and damage the diversions have caused to native aquatic species and find a way to do this without killing stream life, nor affecting the native taro farmers & other residents.*

Response 4: The Draft EIS included an analysis of the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum

available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 5: *Our water supply is essential to our island and needs to stay in the streams for use by the east maui residents. A 30 year lease is unacceptable, as we don't know how the rainfall will be affected by climate change.*

Response 5: We acknowledge your comments. Please note that that Chapter 3 of the Draft EIS included an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for

the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term maybe and diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

With regards to climate change, climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown in the pages 4-89 to 4-91 as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Comment 6: *these public lands need to be available to the public for hiking and pooled water is breeding grounds for mosquitoes who can carry dengue fever, therefore be detrimental to our population, as well as affect the tourist industry.*

Response 6: With regard to your comment that public lands need to be available to the public for hiking, please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown in pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown in pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown in page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately

33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR. It is unlikely that the removal of the Hanawī NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the *potential* to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

With regard to your comment about pooled water being breeding grounds for mosquitoes who can carry dengue fever, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-61.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai‘i.

Comment 7: *changing the flow of streams and altering nature's way has many negative impacts on the land, the animals, the plants and the people, please assess all possible results of this and reconsider, this is not acceptable nor does it support our residents & farmers.*

Response 7: Please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown in pages 4-61 to 4-62 of Final EIS. The above excerpt and the updated text in pages 4-61 to 4-62 present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See pages 4-61 to 4-62 of Final EIS.

Regarding the East Maui streams in the License Area, the EIS presents four scenarios using the HSHEP model. The diversion amounts were determined in advance and modeled for those specific scenarios. Due to common sense technical challenges to the HSHEP model, not all scenarios were presented or analyzed. To provide context, there are approximately 388 individual diversions in the EMI Aqueduct System. Potentially any of these diversions could: (1) have different levels of water restoration mandated at the diversion location; (2) could have engineering changes to increase fish passage and decrease larval entrainment; and/or (3) have the sequence of water restoration or engineering changes include numerous different scenarios with for example, 50% water return on diversion 1, an engineering change on diversion 2, a 60 % water return and an engineering change on diversion 3, and so on. This could result in many different scenarios - too many for meaningful review, and each potential adjustment would not alter the overall findings as presented in the Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP Model). To be more specific on the number of potential iterative scenarios, there is a formula for the number of permutations = n^r . So, in a stream with 3 diversions, if we wanted to present different flow restoration levels, 0 to 100% in 10% intervals, we get 11^3 which equals 1,331 different scenarios. If a single engineering adjustment is added (2 options of no change and new design), the result is 22^3 , which equals 10,648 scenarios.

For example, there are 10 diversions on Nā'ili'ilihale Stream, which is one of the non-IIFS streams. Applying different flow restoration levels 0 to 100 in 10% intervals, as discussed above, there are approximately 25,937,424,601 scenarios. Twenty-five billion scenarios are far too many to reasonably understand or consider for management actions. Also note that no engineering changes to those diversions to increase fish passage or decrease larval entrainment were considered in the example. Thus, the number of permutations involved in considering all options for the 300+ diversions in the East Maui streams precludes a systematic optimization of all possible scenarios.

In other words, the difficulty lies in the complexity and the number of possibilities created by those questions regarding the restoration of the non-petitioned streams while attempting to determine the answers to best balance the offstream uses related to the Proposed Action. Therefore, while questions regarding restoration of the non-IIFS streams are valid, the questions need to be constrained to a smaller subset of possibilities to make optimization testing possible. With that caveat stated, some general guiding concepts can be concluded to minimize impacts to the non-petitioned streams from stream diversions.

With respect to diversion locations and amount for non-petitioned streams:

1. Regardless of the way the water is diverted, greater percentages of total streamflow diverted generally result in lower amounts of instream habitat for native stream species. However, when diversion amounts are similar among scenarios,
 - a. Diverting comparable amounts of water at higher elevation diversions is less damaging to instream habitat for native stream species than diverting that water at lower elevation diversions.
 - b. Returning comparable amounts of water at the higher elevation diversions and allowing it to flow downstream without additional diversion will result in more instream habitat than partial water diversion at all diversions due to the compounding impact of entrainment at each diversion.

With respect to modifications of the diversion for improved passage and decrease entrainment:

2. Improvements in diversion passage result in more suitable habitat at most flow amounts.
3. At lower flow restoration amounts, modifications to improve passage result in greater gains in suitable habitat than at higher flow restoration amounts.

Please note that Section 4.2.1 of the Final EIS has been revised to include a general discussion more specific to the impacts and mitigations associated with the non-petitioned streams, and how stream flow restoration will influence Habitat Units in the License Area as shown in pages 4-63 to 4-67. It has also been noted in Section 4.7.2 of Final EIS that many of the communities downstream of the EMI Aqueduct System adjacent to the non-petitioned streams do not have access to MDWS water and depend upon these streams to meet their domestic water use as shown in pages 4-63 to 4-67.

It is assumed that restoration scenarios of the non-petitioned streams would fall under the Reduced Water Volume alternative. As discussed in Response #73 above, the HSHEP model requires specific diversion conditions at each diversion. Applying the model to the Reduced Water Volume alternative would require information regarding where stream flows are proposed to be increased over the Proposed Action

and the amounts. Given such information, the HSHEP model is able to readily calculate the number of remaining Habitat Units (HU) in any given

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Harlow Todaro:

Thank you for comments dated October 12, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct

System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *ALOHA--PLEASE STOP STEALING EAST MAUI WATER FROM THE EAST MAUI RESIDENTS--YOU NEVER HELP OUR PEOPLE AND ARE PROFITEERS AND GREEDY THIEVES TO TAKE OUR WATER FOR ONLY ONE CORPORATION--WE, THE PEOPLE NEED OUR WATER RESTORED NOW, RSVP—HARLOW*

Response 2: We acknowledge your comments.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 19, 2019 7:32:31 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

It would be prudent for government officials on Oahu to actually LISTEN and accede to the desires of Maui citizens.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Jack Fisher

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Fisher:

Thank you for comments dated October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *It would be prudent for government officials on Oahu to actually LISTEN and accede to the desires of Maui citizens.*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 2: We acknowledge your comments. Please note that we provided you with detailed responses above to your comments.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, November 6, 2019 5:16:25 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

We need evidence provided now on the 30% water that originated within A&B?

Community has confirmed positive changes with water restored for abundance of sea and fresh water life (Maui Nui Makai Networking Workshop) in Keanae, Nahiku and Hana.

Problem of negligence to the new land owners diverting streams within their properties. They are the ones that are complaining. Also, fact is, the land owners affected by the illegal diversion will be devastated by the diversions (Kipahulu and Honopou, Maui). While on the other hand, many streams are being neglected.

Mahi Pono doesn't need all the water they are claiming. Do the math.

We need more access. Vandalism is majority to the tourism. They pay no attention to properties.

We need lease comments. Where is the change of Ownership? We need more evidence in what is being shared but not backed up with true facts and statistics.

Impacts. There are always impacts. We can provide the impacts if you can't State the fact on this. Remember this is a long term impacts.

Last, no lease! They had 33 years total. A poor excuse to extend but a sneaky and deceitful tactic to prolong the process up to today, November 2019. They have all the money to correct their wrong and restructure the diversion system. This is not negotiable. Stop it already

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Jade Smith

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Smith:

Thank you for comments dated November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The

need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *We need evidence provided now on the 30% water that originated within A&B?*

Response 2: The EMI Aqueduct System is owned and operated by the East Maui Irrigation Company, LLC. Please note that the 1938 Agreement between A&B / EMI (referred to as “the Company”) and the Territory of Hawai‘i, which has been added to the Final EIS as Appendix R, acknowledges EMI’s ownership of the EMI Aqueduct System. Pursuant to the 1938 Agreement, the Territory of Hawai‘i (now the State) granted perpetual easements to EMI for those portions of the EMI Aqueduct System located on State lands. See EIS Section 3.3, which has been updated in the Final EIS to further discuss rights the EMI Aqueduct System has to a limited amount of water collection irrespective of any Water Lease. See pages 3-24 to 3-25 of the Final EIS.

As described in Section 2.1.2 of the Draft EIS, the EMI Aqueduct System spans both State-owned and EMI-owned lands and is an integrated system. Relative to the proposed Water Lease, the Collection Area for the EMI Aqueduct System covers approximately 50,000 acres, of which 33,000 acres are owned by the State and 17,000 acres are privately owned. See Draft EIS Figure 1-1 (EMI Aqueduct System Collection Area). The EMI Aqueduct System also collections water from purely private lands located to the west of the Collection Area, as noted in Figure 1-1. As mentioned above, under the 1938 Agreement, the State and EMI each granted to the other “perpetual” easements to those portions of the EMI Aqueduct System located on the other’s land. The duration of these “perpetual” easements was stipulated to last until the termination of the 1938 Agreement. The 1938 Agreement is still in place and valid. The State may, but is not obligated to, terminate the 1938 Agreement only if the licenses are offered at auction but EMI

fails to bid. EMI may, but is not obligated to, terminate the 1938 Agreement if the State fails to offer the licenses at auction. Thus, if no license is offered at auction, the 1938 Agreement provides that EMI may still collect water derived from the EMI owned portions of the Collection Area and, utilizing the easement granted to it in the 1938 Agreement, transport it across the portions of the EMI Aqueduct System that transverse State lands.

The 1938 Agreement defines the “Territory” to include its “successors” (i.e., the State). EMI has not failed to bid at any auction of licenses, so the condition precedent for the State to have the right to terminate has not occurred. While the State has not yet offered the licenses at auction, EMI has not exercised its right to terminate and is instead a proponent of the Proposed Action which would lead to the licenses being offered at auction for the purpose of the continued integrated operation of the EMI Aqueduct System. Neither party has terminated the 1938 Agreement.

We note that CWRM, at p. iii of the Executive Summary of the CWRM D&O, characterized the EMI Aqueduct System as “a valuable asset that delivers offstream public trust benefits such as drinking water, as well as irrigation water for reasonable and beneficial uses.” CWRM further stated, at p. vi: “The Commission’s intent in this decision is to ensure that a sufficient amount of offstream water is available to support the cultivation of diversified agricultural crops on the lands designated as IAL [Important Agricultural Lands] in central Maui.” The continued existence of the 1938 Agreement, with its mutual grant of easements, is necessary in order for the uses of East Maui stream water envisioned by CWRM to be possible. As such, the continued recognition of the 1938 Agreement would appear to be consistent with the Public Trust Doctrine as it has been interpreted by CWRM.

Comment 3: *Community has confirmed positive changes with water restored for abundance of sea and fresh water life (Maui Nui Makai Networking Workshop) in Keanae, Nahiku and Hana.*

Response 3: We acknowledge your comments. Please note that many people at the EISPN public scoping meetings on February 22 and 23, 2017 testified noting positive impacts seen from increased stream flow resulting from the cessation of sugar operations, please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See pages 4-171 to 4-254 of the Final EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted. This is expected as it was discussed in Section 4.2.1 of the Draft EIS that the Proposed Action would increase the number of HU as compared to sugarcane operations. Please note that that as of October 2020, an average of 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System. Hence it can be assumed that current water diversion rates from the

License Area are comparable to the amount that would be diverted under the No Action alternative, which is estimated to be approximately 26.39 mgd. The HSheP model estimated that approximately 79.8% of total HU would be available under the No Action alternative. However, please note that under the Proposed Action, the total HU would be less than projected under the No Action alternative.

Comment 4: *Problem of negligence to the new land owners diverting streams within their properties. They are the ones that are complaining. Also, fact is, the land owners affected by the illegal diversion will be devastated by the diversions (Kipahulu and Honopou, Maui). While on the other hand, many streams are being neglected.*

Response 4: Your comments are acknowledged. However, please note that it is not within scope to assess illegal diversions from private land owners. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 5: *Mahi Pono doesn't need all the water they are claiming. Do the math.*

Response 5: We respectfully disagree with your comment. The CWRM D&O was issued in June 2018 and included the A&B diversified agriculture plan. Mahi Pono did not purchase the Central Maui agricultural fields from A&B until December 2018, which was after the issuance of the CWRM D&O. The Mahi Pono farm plan is not anticipated to have a decrease in water demand over the years, though at full build-out, it will require significantly less water than utilized when sugarcane was cultivated on these same lands. So, while there is a total decrease in water demand over historical sugar operations, as with any new and growing farm operation, the water demand of the Mahi Pono farm plan is expected to increase over the years until full build-out. Moreover, as discussed in Response #44, if more water were to become available in the future, Mahi Pono intends to plant additional crops in areas that are currently planned to be unirrigated pasture due to the lack of enough water to irrigate all 30,000 acres of land.

Comment 6: *We need more access. Vandalism is majority to the tourism. They pay no attention to properties.*

Response 6: Your comment is unclear however, we assume that you are referring to public access. Section 3.2.2.2 of the Draft EIS discusses an alternative, the "Modified Lease Area"

alternative that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access to areas that are not within the License Area. Please also see Response #55 regarding the revised License Area under the most recent revocable permits and projections related to the geographical extent of the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown in pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding impacts to the areas that would allow for more public access. Moreover, impacts of the Modified Lease Area alternative are discussed in Section 3.4 of the EIS (Comparative Evaluation of Reasonable Alternatives) against different environmental resource categories.

Comment 7: *We need lease comments. Where is the change of Ownership? We need more evidence in what is being shared but not backed up with true facts and statistics.*

Response 7: Your comments are unclear however, we assume that you are referring to sale of A&B land to Mahi Pono. Please note that this is not within scope of the EIS to investigate. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 8: *Impacts. There are always impacts. We can provide the impacts if you can't State the fact on this. Remember this is a long term impacts.*

Response 8: Your comments are unclear. With respect to the Draft EIS, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts. As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area. These impacts are related to stream habitat, as there will be a reduction from natural flow conditions which can be mitigated by adjustments in diversions to minimize entrainment; terrestrial flora and fauna resources, as well as historic and archeological resources, from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; cultural resources and practices which can be mitigated by a myriad of recommendations proposed by Cultural Surveys Hawai'i; and socio-economic characteristics which can be mitigated by further public outreach and consultation.

Comment 9: *Last, no lease! They had 33 years total. A poor excuse to extend but a sneaky and deceitful tactic to prolong the process up to today, November 2019. They have all the money to correct their wrong and restructure the diversion system. This is not negotiable. Stop it already*

Thank you for this opportunity to submit comments on this Draft EIS

Response 9: We acknowledge your comments. With regards to your comment about restructure the diversion system, we assume that your comment relates to the physical condition of the EMI Aqueduct System. In this regard, the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely

10238-04
Letter to Jade Smith
Page 8 of 8
September 3, 2021

energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” The EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, October 2, 2019 6:23:34 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

This, like numerous other issues (climate change, food labeling, gun safety, immigration reform, prison reform, education reform, short-term lending regulation, healthcare reform, banking regulation, opioid regulation) remains a vexing problem primarily due to corporations' ability to curry favor with elected officials. The corrupting influence of money in our political system is undermining our democratic traditions and discouraging Americans from voting and/or running for office. This ominous development may well end our experiment in representative democracy unless we alter this decades-long trend. For the sake of the republic, we must amend the US Constitution to state that corporations are not people (and do not have constitutional rights) and money is not speech (and thus can be regulated by state and/or federal campaign finance laws). Short of accomplishing this, no other reform of significance will be achieved. The moneyed interests will turn any reform to their benefit, often at the expense of the nation as a whole.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
James Klein
3501 Monterrey St Corpus Christi, TX 78411-1709

This, like numerous other issues (climate change, food labeling, gun safety, immigration reform, prison reform, education reform, short-term lending regulation, healthcare reform, banking regulation, opioid regulation) remains a vexing problem primarily due to corporations' ability to curry favor with elected officials. The corrupting influence of money in our political system is undermining our democratic traditions and discouraging Americans from voting and/or running for office. This ominous development may well end our experiment in representative democracy unless we alter this decades-long trend. For the sake of the republic, we must amend the US Constitution to state that corporations are not people (and do not have constitutional rights) and money is not speech (and thus can be regulated by state and/or federal campaign finance laws). Short of accomplishing this, no other reform of significance will be achieved. The moneyed interests will turn any reform to their benefit, often at the expense of the nation as a whole.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
James Klein

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear James Klein:

Thank you for comments dated October 2, 2019 and October 21, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

October 2, 2019:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *This, like numerous other issues (climate change, food labeling, gun safety, immigration reform, prison reform, education reform, short-term lending regulation, healthcare reform, banking regulation, opioid regulation) remains a vexing problem primarily due to corporations' ability to curry favor with elected officials. The corrupting influence of money in our political system is undermining our democratic traditions and discouraging Americans from voting and/or running for office. This ominous development may well end our experiment in representative democracy unless we alter this decades-long trend. For the sake of the republic, we must amend the US Constitution to state that corporations are not people (and do not have constitutional rights) and money is not speech (and thus can be regulated by state and/or federal campaign finance laws). Short of accomplishing this, no other reform of significance will be achieved. The moneyed interests will turn any reform to their benefit, often at the expense of the nation as a whole.*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 2: We acknowledge your comments. However, please note that it is not within scope of the EIS to amend the U.S. Constitution and make reforms to government. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "right, privilege, and authority to enter and go upon" the Nāhiku, Keʻanae, Honomanū, and Huelo License Areas for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

October 21, 2019:

Comment 3: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 3: As noted in Response #1 above, please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

Comment 4: *This, like numerous other issues (climate change, food labeling, gun safety, immigration reform, prison reform, education reform, short-term lending regulation, healthcare reform, banking regulation, opioid regulation) remains a vexing problem primarily due to corporations' ability to curry favor with elected officials. The corrupting influence of money in our political system is undermining our democratic traditions and discouraging Americans from voting and/or running for office. This ominous development may well end our experiment in representative democracy unless we alter this decades-long trend. For the sake of the republic, we must amend the US Constitution to state that corporations are not people (and do not have constitutional rights) and money is not speech (and thus can be regulated by state and/or federal*

campaign finance laws). Short of accomplishing this, no other reform of significance will be achieved. The moneyed interests will turn any reform to their benefit, often at the expense of the nation as a whole.

Thank you for this opportunity to submit comments on this Draft EIS.

Response 4: As noted in Response #2 above, it is not within scope of the EIS to amend the U.S. Constitution and make reforms to government. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on East Maui Stream Diversions
Date: Thursday, November 7, 2019 6:33:55 AM

Dear Mr. Matsukawa,

As a landowner in East Maui who owns land adjacent to both diverted and undiverted streams, I can clearly see the impact these diversions have on stream life and water flow. It is my belief that the 100+ year old diversion systems are decrepit, causing much of the diverted stream water to be lost and wasted. A and B and it's successors should be required to maintain and improve their diversion systems rather than just taking more water to offset what is lost through poor maintenance. I believe that until a healthy flow of water from mauka to makai is restored, no further water should be diverted for agriculture in Central Maui. I oppose A and B,s Draft Eis.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely
Jan Elliott

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Elliott:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *As a landowner in East Maui who owns land adjacent to both diverted and undiverted streams, I can clearly see the impact these diversions have on stream life and water flow. It is my belief that the 100+ year old diversion systems are decrepit, causing much of the diverted stream water to be lost and wasted. A and B and it’s successors should be required to maintain and improve their diversion systems rather than just taking more water to offset what is lost through poor maintenance. I believe that until a healthy flow of water from mauka to makai is restored, no further water should be diverted for agriculture in Central Maui. I oppose A and B,s Draft Eis.*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 1: We acknowledge your comments and understand that you are a landowner in East Maui. Regarding your comments on diversion impacts, please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown on pages 4-61 to 4-62 of the Final EIS. The above excerpt and the updated text in on pages 4-61 to 4-62 of the Final EIS present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See on pages 4-61 to 4-62 of the Final EIS.

Regarding your comment about the old diversion system, we assume that you are referring to the physical condition of the EMI Aqueduct In this regard, the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System. We also note that Appendix D of the EIS provides a Historical Structure Assessment East Maui Aqueduct System prepared by Mason Architects to provide an assessment of the historical significance of the EMI Aqueduct System.

We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered

diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jane Leatherman Van Praag:

Thank you for comments dated October 3, 2019 and October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

October 3, 2019:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows

of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the

noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

October 18, 2019:

Comment 2: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 2: As noted in Response #1 above, please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

Comment 3: *Their stream diversions have harmed the East Maui watershed and the people who rely on it. A&B and Mahi Pono are required by law to respond to every comment.*

Response 3: We acknowledge your comments. Regarding your comment about responding to every comment by law, please note that we have provided responses to each point that you bring up in your comment letter as required by HRS § 11-200-22(c)(1).

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 11, 2019 8:37:09 PM

Dear Mr. Matsukawa,

Aloha,

I was a Maui resident for 5 years before moving to Hawai'i Island 35 years ago. The way Maui uses -- or abuses - its water affects and sets precedent for the rest of our island chain.

I am in strong opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Those streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of waters from the top of mountains to the sea.

There is a long list of negatives and omissions in the DEIS. Some include:

The DEIS does not discuss a "no diversion" alternative. Nor does it discuss how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather.

Diversions like the ones planned will decimate 85% of native streamlife habitat and impact thousands of local residents and the flora and fauna of an integrated ecosystem that all of us, and particularly native Hawaiian culture, depends upon. The DEIS does not sufficiently analyze the threat and damage the diversions have caused and will cause to native aquatic species.

The DEIS omits any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands in Maui.

The DEIS lacks a discussion of options for more public hiking access to public lands in the proposed lease area, meaning that every hiker will need permission from a private entity. These are public lands that people should be allowed to reasonably access. This is a significant breach of the Public Trust.

The DEIS should give a full review of shorter term lease options. Thirty years is too long with the changes that may occur especially due to climate change.

The DEIS doesn't include potential stagnant water that will increase mosquito populations - a serious and perilous situation which Hawai'i Island residents dealt with only a few years ago with many people getting seriously ill from dengue fever.

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Mahalo for this opportunity to submit comments on this Draft EIS. I look forward to seeing these and other serious issues to be better addressed in the EIS, including the addition of the "no diversion" alternative.

Sincerely,
Janice Palma-Glennie

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Janice Palma-Glennie:

Thank you for comments dated October 11, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *The DEIS omits any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands in Maui.*

Response 1: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging

invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4 of the Final EIS.

Comment 2: *The DEIS lacks a discussion of options for more public hiking access to public lands in the proposed lease area, meaning that every hiker will need permission from a private entity. These are public lands that people should be allowed to reasonably access. This is a significant breach of the Public Trust.*

Response 2: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown in pages 4-305 to 4-309 to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown in pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to

include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawī Natural Area Reserve (NAR) was removed from the RP area as shown in page 1-2 and page 3-22. Thus, it is anticipated that BLNR may remove the Hanawī NAR from the License Area under any Water Lease. The Hanawī NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawī NAR. It is unlikely that the removal of the Hanawī NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the potential to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 3: *The DEIS should give a full review of shorter term lease options. Thirty years is too long with the changes that may occur especially due to climate change.*

Response 3: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 4: *The DEIS doesn't include potential stagnant water that will increase mosquito populations - a serious and perilous situation which Hawai`I Island residents dealt with only a few years ago with many people getting seriously ill from dengue fever.*

Response 4: We respectfully disagree with your comment that the Draft EIS did not discuss the role diverted streams have on mosquito populations in East Maui.

With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled "Modeling" of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown on pages 4-58 to 4-67.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased

streamflow. First, in addition to breeding in streams, the *Culex* mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the *Culex* mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for *Culex* mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the *Culex* mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of *Culex* mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Comment 5: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Mahalo for this opportunity to submit comments on this Draft EIS. I look forward to seeing these and other serious issues to be better addressed in the EIS, including the addition of the "no diversion" alternative.

Response 5: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The

need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Regarding your comment about the ‘no diversion’ scenario, please note that the EIS discusses a No Action alternative whereby no Water Lease would be issued. However, under the No Action alternative, the EMI Aqueduct System can still divert up to 30% of the stream water that flows through the License Area based on the 1938 Agreement discussed in Section 3.3 of the EIS. Please note that the comparative impacts of the alternatives are discussed in Section 3.4 of the EIS and Section 3.5 of the Final EIS has been added to summarized the impacts and benefits of the Proposed Action and associated alternatives.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC’s website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jen Collins:

Thank you for comments dated October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *East Maui has waited far longer than 20 years for water rights, fairness let alone EIS.*

Why continue irrigate arid valley and deny the righteous originals corporations want to run over.

Thank you for this opportunity to submit comments on this Draft EIS.

Response 2: We acknowledge your comments. Please note that Section 4.7.3 and Section 4.7.4 of the Draft EIS correctly describes accurate information regarding the benefits of the Mahi Pono farm plan. At Section 4.7.3:

At full operations, the Mahi Pono farm plan will cause a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops. Annual sales are expected to reach \$155.9 million. The pastures would support a cattle herd of about 7,300 cow-and-calf animal units, produce over 4,300 calves per year, and generate revenues of about \$4.8 million per year. The solar farm would generate about 82,125 mW of electricity per year, with revenues of about \$8.2 million per year. Combined farm and energy revenues would reach \$168.9 million per year in direct sales (far exceeding the 2006 revenues from sugar production of \$101 million, and the \$116 million average for the 2008 to 2013 period).

And at Section 4.7.4:

At full development, the Mahi Pono farm plan would result in a substantial amount of crop production, including about 8 million pounds per year from the Community Farm, 321 million pounds per year from orchards, and 9 million pounds per year of tropical fruits, plus production from row crops, annual crops, and energy crops.

Impacts related to agricultural economics are discussed in detail in Section 4.7.4 of the EIS based on findings in Appendix I. Please refer to Section 4.7.4 and Appendix I to see discussions regarding the numerous benefits anticipated as a result of the Proposed Action. In summary, at full build-out, the Mahi Pono farm plan is anticipated to produce a significant amount of crops for both local consumption and export generating significant beneficial economic and fiscal impacts, providing numerous direct and indirect jobs, State and County tax revenues, etc.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 18, 2019 7:01:20 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Mahi Pono has become the new imperialists who are working hard to divide our people while lending their name to the list of who wishes to profit from the stream diversion issues that we are working so hard to reconcile.

Although the land rental under Mahi Pono appears financially cheap, there are many issues that I would like to see fully resolved prior to allowing this company to bring California values to Hawai'i.

1. Mahi Pono should be utilizing a desalination plant to water its thousands of acres, not continue to steal water from other parts of the island. This proves that Mahi Pono's priority is to profit from our people, and not for the betterment of our futures.
2. By fostering a method of division against our people, Mahi Pono is contributing to the past and current problems that have plagued our island for decades.
3. This is another method of asserting corporate powers to govern land. At which point has Mahi Pono contacted the heirs of these lands to engage their mana'o in governance of the land that belongs to them?
4. Where is the evidence that Mahi Pono has gotten permission from those affected by the water diversions? Or is Mahi Pono asserting corporate powers to continue the theft?

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Jennifer Chrupalyk

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Chrupalyk:

Thank you for comments dated October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The

need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *Mahi Pono has become the new imperialists who are working hard to divide our people while lending their name to the list of who wishes to profit from the stream diversion issues that we are working so hard to reconcile.*

Response 2: We acknowledge your comments however, we disagree with your comment. Mahi Pono objective is to continue to transition as much of the former sugarcane land in Central Maui to a diversified agricultural operation. Moreover, the objectives of the Proposed Action as stated in Section 1.2 of Draft EIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to transition fields previously used for sugar cane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku.

Comment 3: *Although the land rental under Mahi Pono appears financially cheap, there are many issues that I would like to see fully resolved prior to allowing this company to bring California values to Hawai'i.*

Response 3: We acknowledge your comments and provide you with detailed responses to your comments below.

Comment 4: *Mahi Pono should be utilizing a desalination plant to water its thousands of acres, not continue to steal water from other parts of the island. This proves that Mahi Pono's priority is to profit from our people, and not for the betterment of our futures.*

Response 4: With respect to your comment encouraging desalinization of the existing Mahi Pono fields, please note that Chapter 3 of the Final EIS has been updated to include Section 3.1.1.4 which analyzes the option of desalinization and its environmental impacts, as shown in pages 3-14 to 3-19. As shown in the discussion in pages 3-14 to 3-19, desalinization of the existing Mahi Pono brackish water wells would yield approximately half the amount of brackish water, about 50 mgd. Furthermore, desalinization is not a cheaper option than diverting surface water resources and has other negative environmental impacts such as impacts to regional hydrologic, geologic, and biological resources. Hydrological resources would be assumed to experience the greatest impacts due to withdrawals and injections greatly influencing the regional water sources. Highly in-depth hydrogeological study will need to be done within the area of the proposed injection wells due to the fact that the injection wells must discharge the brine into a confined aquifer/space at least ¼ mile under any drinking water aquifers so as not to contaminate any other freshwater sources. Due to the increased restrictions and preventative measures that are required under Class I injection wells (Class I is the type of injection well associated with industrial waste), there would not be a need for a “no-farming zone” since, under construction regulations for a Class I well, extreme preventative measures are required in order to prevent harmful water from infiltrating drinking water sources in the event of a spill/leakage. Additionally, the harmful discharge from the desalination plant will be pumped extremely deep underground, minimizing any effect to surrounding soils. Nevertheless, a buffer area between the injection wells and the agricultural lands would be recommended. Please also note that for operational purposes, the tunnels and diversions of the EMI Aqueduct System are not in need of significant repair as you state.

Comment 5: *By fostering a method of division against our people, Mahi Pono is contributing to the past and current problems that have plagued our island for decades.*

Response 5: Please note that the Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past.

Comment 6: *This is another method of asserting corporate powers to govern land. At which point has Mahi Pono contacted the heirs of these lands to engage their mana ‘o in governance of the land that belongs to them?*

Response 6: Your comments are unclear. Note that over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M). Moreover, the Cultural Impact Assessment and the Social Impact Assessment studies also conducted community outreach documenting community perceptions and opinions.

Comment 7: *Where is the evidence that Mahi Pono has gotten permission from those affected by the water diversions? Or is Mahi Pono asserting corporate powers to continue the theft?*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 7: Again, your comments are unclear. As noted in Response #6 above, over 700 pages of the Draft EIS consist of pre-assessment consultation correspondence (Appendix J), scoping meeting transcripts (Appendix K and Appendix L), and scoping meeting and EIS Preparation Notice (EISPN) comments and responses (Appendix M). Moreover, the Cultural Impact Assessment and the Social Impact Assessment studies also conducted community outreach documenting community perceptions and opinions. With regards to permission, please note that the authorization of the Water Lease is within the purview of the BLNR.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Tuesday, October 15, 2019 9:59:08 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

My ohana on both sides Kaauamo and Kekiwi use the streams to feed our lo'i kalo (taro patches). We also use these streams for our rights to culturally gather and provide for our families.

It is our right to have these God given waters to flow where it is naturally meant to flow with no DIVERSION to help create any disturbance in these East Maui streams.

Without these free flowing waters into it's rightful streams, the stream and ocean life can be greatly disturbed and will no longer be available for our future generations. You see we have been passed down from generation to generation the knowledge to care for our natural resources. Once this diversion disturbance takes place there will be no natural resources left for our future generations.

Greed is not the answer to this situation, but honesty and facts are. Take into consideration that diverting water from OUR East Maui streams will affect all our SMALL communities in the East end, and our natural resources and gathering rights will be limited.

We have been fighting these water issues FOREVER.

Thank you for taking the time in reading my letter.

Jessie Kekiwi-Aweau

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,

Jessie Kekiwi-Aweau

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, November 6, 2019 1:51:37 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

We the farmers of East Maui have been fighting for OUR waters in the streams to be released back to our streams at a 100% stream flow.

We have been in this fight for a long time and for two generations long (I am third generation, my kids are fourth generation, and my grandkids are fifth generation). This is heart breaking to see that this fight for OUR waters continues as I seen my Tutu and my Dad pass while this fight continues.

We have seen our water at its fullest, and then seen it slowly disappearing, then GONE. WE SEEN OUR STREAM BEDS EMPTY, DRIED UP, WITH NO STREAM LIFE IN IT.

Without water our stream animals cannot thrive, and also our ocean animals that come up into the streams to spawn cannot do their circle of life routine.

Without water in our streams(streamflow at 100%), our kalo cannot get the nutrients it needs to help us (as farmers, hunters, and gatherers) live a sustainable life. Disease and rot tends to harm our kalo (taro), which then make our kalo not edible or not worth selling.

With out water in our streams our stream life die, such as the 'opae, hihiwai, 'o'opu, prawn, ocean life such as 'aholehole, kumu, and mullet won't be able to use the streams to spawn. Forest animals won't be able to drink water and they would need to come close to homes and find water.

It has been disturbing seeing our waterfalls disappear because streamflow is being diverted. The water belongs to the people of the area where the stream flows naturally. It is called stealing when one takes something that don't belong to them.

So I am calling the State, County, and all who is involved in this DIVERSIONS of our water, THIEVES.

Mind you, I have ohana that work for these organizations, and understand that they have to do what they have to do to support their family, but WE AS TARO FARMERS HAVE TO DO WHAT WE HAVE TO DO TOO. SO IN ORDER FOR US TO CONTINUE FARMING AS TARO FARMERS, WE NEED OUR WATER TO BE RESTORED, RETURNED, AND KEPT IN OUR STREAM BEDS FLOWING AT A HUNDRED PERCENT WITH NO DIVERSIONS.

MAHALO FOR YOUR TIME,
JESSIE KEKIWI-AWEAU
DESCENDANT OF WAILUANUI

Thank you for this opportunity to submit comments on this Draft EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Jessie Kekiwi-Aweau:

Thank you for comments dated October 15, 2019 and November 6, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

October 15, 2019:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The

need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *My ohana on both sides Kaauamo and Kekiwi use the streams to feed our lo'i kalo (taro patches). We also use these streams for our rights to culturally gather and provide for our families.*

It is our right to have these God given waters to flow where it is naturally meant to flow with no DIVERSION to help create any disturbance in these East Maui streams.

Without these free flowing waters into it's rightful streams, the stream and ocean life can be greatly disturbed and will no longer be available for our future generations. You see we have been passed down from generation to generation the knowledge to care for our natural resources. Once this diversion disturbance takes place there will be no natural resources left for our future generations.

Greed is not the answer to this situation, but honesty and facts are. Take into consideration that diverting water from OUR East Maui streams will affect all our SMALL communities in the East end, and our natural resources and gathering rights will be limited.

We have been fighting these water issues FOREVER.

Thank you for taking the time in reading my letter.

Jessie Kekiwi-Aweau

Thank you for this opportunity to submit comments on this Draft EIS.

Response 2: We acknowledge your comments. With regards to taro farming, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License

Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for taro were identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown in pages 1-19 to 1-23. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration statuts); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo'i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be

minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in the included pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

With regards to cultural impacts, the CIA acknowledges that the Proposed Action may impact Native Hawaiian cultural resources and practices and provides for several recommendations to mitigate those impacts. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to ‘ōpae, ‘o‘opu, pūpūlo‘i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graiosa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water

not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, enclosed as pages 4-239 to 4-252. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting

of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything herein before granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

With regards to the nearshore coastal environment, please note that the primary focus of the survey conducted for East Maui Irrigation Assessment of Streams and the Ocean (Appendix B) was to evaluate the fate of stream-delivered nutrients to nearshore marine habitats. The collected data presented in EIS Appendix B and summarized in Section 4.2.3 of the EIS suggest that the nutrient delivery from streams to the ocean is limited by the intense mixing processes that occur in the nearshore ocean in East Maui. Thus, if nutrient concentrations in the ocean do not change substantially, there is no pathway for fishing to be impacted, either negatively or otherwise.

However, one limitation of all studies for the East Maui streams is the incredible difficulty of access to most of the streams. The majority of streams are extremely steep with large waterfalls and slippery bedrock bottoms filled with unconsolidated boulders and cobble that may shift as they are stepped on. This makes travel up or down the stream channel extremely dangerous and difficult except in limited areas. Additionally, few trails exist along the streams and those that were utilized were slippery and dangerous, making carrying field sampling equipment problematic. Helicopter access was also limited and was primarily located on the beaches at stream mouths. As a result of the difficulty of access, specific field-based measurements of many segments within East Maui streams were not attempted. For the streams that were accessible, no estuaries (muliwai) were present in the stream systems examined for the East Maui Irrigation Assessment of Streams and the Ocean (Appendix B).

Moreover, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in the pages 4-78 to 4-83. The HSHEP model used to conduct the analysis of impacts of streamflow diversions on the habitat of native amphidromous stream animals also considers habitat within estuarine segments of Hawaiian streams. While the HSHEP specifically focuses on the eight native stream species of concern, the assumption is that positive habitat benefits for the low reach species ('O'opu naniha (*Stenogobius hawaiiensis*), 'O'opu akupa (*Eleotris sandvicensis*) and 'Ōpae 'oeha'a (*Macrobrachium grandimanus*)) are likely to result in positive habitat benefits for other low reach and estuarine species.

The HSHEP model is capable of defining estuarine reaches as stream segments occurring below one-meter elevation. The results found very little estuarine habitats present in the East Maui stream that flow from the License Area. The HSHEP found that only five streams of the 33 subject to analysis, have the possibility of estuarine reach. For these five streams, three streams (Waiohue, Pi'ina'au, and Honomanū) are the most likely to have estuarine reaches and all three of these streams have either full or habitat flow restoration planned. Of the two streams that may have a small estuarine reaches, Pa'akea will have connectivity flow restoration, while 'O'opuloa, as a non-petitioned stream, is not expected to have flow restoration. Thus overall, the majority of

estuarine habitat related to the License Area streams will be either fully or partially restored under the Proposed Action.

The CWRM D&O, however, notes that a total of nine streams (one of which is considered a tributary to Pi'ina'au Stream) have estuarine reaches, four of which were noted by Trutta's HSHEP + aerial image review approach for identifying estuarine reaches. The streams included in the CWRM D&O are shown in Table 4-8 below along with their overlap with streams determined with the method used by Trutta as shown in pages 4-78 to 4-83. It should be noted that for purposes of the D&O, CWRM considered an estuary anywhere that the DLNR Division of Aquatic Resources (DLNR-DAR) conducted an estuary survey. This includes surveys conducted in bays and/or streams. The DLNR-DAR's methodology used for estuary surveys, unlike the HSHEP model, does not define the size or extent of an estuary. The DLNR-DAR surveys were conducted to look for the presence of fish near a stream mouth. The differences between the two methodologies provide some different outcomes.

Of the streams recognized by the CWRM D&O as having estuarine reaches, four streams (Makapipi, Waiohue, West Wailuāiki, and Pi'ina'au and its tributary Palauhulu) have full flow restoration ordered, and three streams (Kopiliula, East Wailuāiki, and Honomanū) have habitat flow restoration ordered under the CWRM D&O IIFS requirements. Based on these flow restoration requirements, the majority of estuarine habitat will be restored in these streams. The remaining two streams (Hanawī and Pa'akea) have connectivity flow restoration ordered. Pa'akea is a small stream, and the connectivity flow will improve freshwater input to the estuarine stream segment, although not as much as in the other streams. Therefore, similar to the combined classification approach used by the HSHEP Model, the majority of estuarine habitat based on the estuaries identified in the CWRM D&O will be restored by the flow restoration ordered under the CWRM D&O as shown in pages 4-78 to 4-83.

Moreover, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The

analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts. As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area. These impacts are related to stream habitat, as there will be a reduction from natural flow conditions which can be mitigated by adjustments in diversions to minimize entrainment; terrestrial flora and fauna resources, as well as historic and archeological resources, from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; cultural resources and practices which can be mitigated by a myriad of recommendations proposed by Cultural Surveys Hawai‘i; and socio-economic characteristics which can be mitigated by further public outreach and consultation.

November 6, 2019:

Comment 3: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 3: As noted in Response #1 above, please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important

Agricultural Lands (IAL), as are approximately 22,000 acres of the applicable Central Maui fields.

Comment 4: *We the farmers of East Maui have been fighting for OUR waters in the streams to be released back to our streams at a 100% stream flow.*

We have been in this fight for a long time and for two generations long (I am third generation, my kids are fourth generation, and my grandkids are fifth generation). This is heart breaking to see that this fight for OUR waters continues as I seen my Tutu and my Dad pass while this fight continues.

Response 4: We acknowledge your comments and understand that you have been fighting for full restoration of stream flow in East Maui. As noted in Response #1 above, For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 5: *We have seen our water at its fullest, and then seen it slowly disappearing, then GONE. WE SEEN OUR STREAM BEDS EMPTY, DRIED UP, WITH NO STREAM LIFE IN IT.*

Without water our stream animals cannot thrive, and also our ocean animals that come up into the streams to spawn cannot do their circle of life routine.

Response 5: We acknowledge your comments. Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe‘e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a

discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown in pages 4-331 to 4-336.

Please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

However, please note that the above has been revised as shown in pages 4-61 to 4-62 of the Final EIS. The above excerpt and the updated text in pages 4-61 to 4-62 present that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See 4-61 to 4-62 of the Final EIS.

With regards to ocean life, as noted in Response #3 above, Section 4.2.3 of the Final EIS has been revised to show that there are very little estuarine habitats present in the East Maui streams that flow from the License Area as shown in pages 4-78 to 4-83.

Comment 6: *Without water in our streams (streamflow at 100%), our kalo cannot get the nutrients it needs to help us (as farmers, hunters, and gatherers) live a sustainable life. Disease and rot tends to harm our kalo (taro), which then make our kalo not edible or not worth selling.*

Response 6: We acknowledge your comments. As noted in Response #1 above, For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown in the included pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 7: *Without water in our streams our stream life die, such as the ‘opae, hihiwai, ‘o‘opū, prawn, ocean life such as ‘aholehole, kumu, and mullet won't be able to use the streams to spawn. Forest animals won't be able to drink water and they would need to come close to homes and find water.*

Response 7: We acknowledge your comments. Regarding stream life, as noted in Response #6 above, please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts, which include 'opae, hīhīwai, and 'o'opu and other native amphidromous stream animals.

Regarding your comment about forest animals, Appendix C and Section 4.4 of the Draft EIS specifically addresses the flora and fauna considerations of the Proposed Action and alternatives.

Comment 8: *It has been disturbing seeing our waterfalls disappear because streamflow is being diverted. The water belongs to the people of the area where the stream flows naturally. It is called stealing when one takes something that don't belong to them.*

So I am calling the State, County, and all who is involved in this DIVERSIONS of our water, THIEVES.

Mind you, I have ohana that work for these organizations, and understand that they have to do what they have to do to support their family, but WE AS TARO FARMERS HAVE TO DO WHAT WE HAVE TO DO TOO. SO IN ORDER FOR US TO CONTINUE FARMING AS TARO FARMERS, WE NEED OUR WATER TO BE RESTORED, RETURNED, AND KEPT IN OUR STREAM BEDS FLOWING AT A HUNDRED PERCENT WITH NO DIVERSIONS.

Response 8: We acknowledge your comments. As noted in Response #1 above, For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming.

Letter to Jessie Kekiwi-Aweau
Page **16** of **16**
September 3, 2021

The above discussion has been added to Section 4.7.4 of the Final EIS as shown in the included pages 4-288 to 4-293.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development –Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 18, 2019 7:24:23 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Sharing water does NOT mean GRABBING water. The issue of public access to public land is something important to residents and visitors who should have free access to recreation. Free Access requires responsibility of the people who access the land. Permits should be free but rules about keeping the aina pristine need to be stated and then enforced.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
John Rita Shockley

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Shockley:

Thank you for comments dated October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not

needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *Sharing water does NOT mean GRABBING water. The issue of public access to public land is something important to residents and visitors who should have free access to recreation. Free Access requires responsibility of the people who access the land. Permits should be free but rules about keeping the aina pristine need to be stated and then enforced.*

Thank you for this opportunity to submit comments on this Draft EIS

Responses 2: We acknowledge your comments. Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access to areas that are not within the License Area. Please also see Response #55 regarding the revised License Area under the most recent revocable permits and projections related to the geographical extent of the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown in pages 3-21 to 3-24 to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding impacts to the areas that would allow for more public access. Moreover, impacts of the Modified Lease Area alternative are discussed in Section 3.4 of the EIS (Comparative Evaluation of Reasonable Alternatives) against different environmental resource categories.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 10:29:20 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui.

Enough is enough!

Diverting East Maui streams like sugarcane used to do is not needed by agriculture in central Maui. We should concentrate on ensuring the restoration of East Maui streams, making sure they have a healthy flow of water mauka to makai so ancient Hawaiian ecosystems can flourish again for our children and future generations. Please restore the aina before stealing unneeded water for profit.

Mahalo for this opportunity to submit comments on this Draft EIS.

Sincerely,
Jono Knight

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Sunday, October 20, 2019 6:47:33 PM

Dear Mr. Matsukawa,

Originally no streams were diverted as they are now, so the "baseline" is no stream diversion.

We should be striving to return the land, streams and ocean to how it was, allowing native & indigenous aquatic species to return to streams. Let farmers only take what water they truly require to farm and no more.

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Please return all streams their original flow. We will all benefit from this.

Mahalo for this opportunity to submit comments on this Draft EIS.

Sincerely,
Jono Knight

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Knight:

Thank you for comments dated October 3, 2019 and October 20, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

October 3, 2019:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui.*

Enough is enough!

Response 1: We acknowledge your comments and that you are opposed to the Proposed Action.

Comment 2: *Diverting East Maui streams like sugarcane used to do is not needed by agriculture in central Maui. We should concentrate on ensuring the restoration of East Maui streams, making sure they have a healthy flow of water mauka to makai so ancient Hawaiian ecosystems can flourish again for our children and future generations. Please restore the aina before stealing unneeded water for profit.*

Mahalo for this opportunity to submit comments on this Draft EIS.

Response 2: We acknowledge your comments. Please note that under the Proposed Action East Maui stream diversion is anticipated to be significantly less than they were during historical sugarcane operations. As discussed in Draft EIS Section 2.1.2 (East Maui/License Area) and 2.1.4 (Central Maui Field System), the long-term average delivery of water by the EMI Aqueduct System up until 1986 had been approximately 165 mgd (prior to any use of water by the MDWS or HC&S on the agricultural fields). This measurement was taken at Māliko Gulch. As discussed in Section 2.1.2 of the Draft EIS, the amount of water that could be diverted from the License Area under the Proposed Action is approximately 87.95 mgd.

Regarding your comment about having flow mauka to makai, Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au,

Wailuānui, Honomanū, Waikamoi, Nua‘ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā‘ula, Pa‘akea, Pua‘aka‘a, Puohokamoa, Ha‘ipua‘ena, Nua‘ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

October 20, 2019:

Comment 3: *Originally no streams were diverted as they are now, so the "baseline" is no stream diversion.*

We should be striving to return the land, streams and ocean to how it was, allowing native & indigenous aquatic species to return to streams. Let farmers only take what water they truly require to farm and no more.

Response 3: We acknowledge your comments. With regards to your comment about the ‘baseline’, the use of the upper and lower boundaries applied to the HSHEP model for the assessment of impacts to the native amphidromous stream species was used as the baseline to assess impacts. Specifically, Section 4.2.1 of the Draft EIS states:

Baseline Condition — Full Diversion

The lower boundary for the HSHEP model was full diversion by the EMI Aqueduct System in its current configuration as existed under sugar cultivation, which was the prevailing conditions for nearly 100 years. (Trutta, p. 41, 2019) The Full Diversion scenario assumes that all the diversions in the EMI Aqueduct System are fully open or diverting 100% of available low flows, roughly analogous to the stream's baseflow. The diversions in the EMI Aqueduct System were built to capture 100% of normal low flows plus some small amount of storm runoff. Hawaiian streams are "flashy", meaning discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions. When low flow conditions persist and water needs call for all the low flow to be diverted, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production. (Trutta, p. 55-56, 2019) Under Full Diversion conditions, approximately 46% of the total HU remained; or conversely, Full Diversion conditions reduced the number of HU by approximately 54%.

The lower boundary reflects the maximum impact or maximum amount of habitat lost because of the diversions. None of the proposed actions in the Draft EIS seek to increase diversion amounts over the amount of water diverted at the peak of sugar cane production. The modeled assumption under the full diversion scenario is 100% diversion of “base or normal low” streamflow at all diversions within the system. Thus, all habitat, entrainment, and barrier impacts were set to their maximum (greatest negative impact on species habitat) at all diversions. We acknowledge that Full Diversion resulted in more than half of all stream habitat being eliminated from the East Maui streams as stated,

Under Full Diversion conditions, approximately 46% of the total HU remained; or conversely, Full Diversion conditions reduced the number of HU by approximately 54%.

The use of the Full Diversion Conditions is also a historically coherent position as it reflects the conditions that were existing in East Maui streams for much of the past hundred years. Not considering diversion conditions under sugar cane agriculture seems disingenuous as it does not provide any context to a very well-known historical condition.

The lower boundary described by the Full Diversion Conditions is in contrast with the upper boundary as described by the Natural Condition. As in the report (Trutta, p56),

Natural Condition: This was the baseline comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals. This was the maximum available habitat units predicted.

This is also a coherent position as it provides context to the best conditions possible for native species. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat for native stream species.

The combination of the lower and upper bounds provide the range at which we would expect changes to the diversions to fall within and provides a way to comparatively discuss different flow restoration scenarios as by definition the changes must fall somewhere between 100% diversion and 0% diversion.

The two scenarios presented, the Proposed Action compliant with the CWRM D&O (Trutta's 2018 IIFS) and No Action Alternative (30% remaining flow diversion) are examples of how different flow restoration scenarios result in different amounts of habitat restored. The HSHEP model is used to quantify these differences based on flow restoration changes at specific diversions. This is exactly how impact assessment should be done. The HSHEP follows a logical approach and systematically addresses on-the-ground conditions.

Regarding your comment about farms, as discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke'anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional

taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown in pages 4-288 to 4-293.

Comment 4: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Please return all streams their original flow. We will all benefit from this.

Mahalo for this opportunity to submit comments on this Draft EIS.

Response 4: We acknowledge your comments. As discussed in Response #2 above, note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Joseph Kohn M.D.:

Thank you for comments dated October 13, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *This is an outrage! Stop corporate water theft forever. There are alternatives, such as catchment and desalination. We owe A&B nothing on top of their already ill gotten gains and crimes against The Kingdom and humanity! You will be held accountable for your complicity. Aloha 'Āina! Mālama Pono!*

Response 2: We acknowledge your comments. With respect to your comment encouraging desalination, please note that Chapter 3 of the Final EIS has been updated to include Section 3.1.1.4 which analyzes the option of desalination and its environmental impacts, as shown in pages 3-14 to 3-19. As shown in the discussion in pages 3-14 to 3-19, desalination of the existing Mahi Pono brackish water wells would yield approximately half the amount of brackish water, about 50 mgd. Furthermore, desalination is not a cheaper option than diverting surface water resources and has other negative environmental impacts such as impacts to regional hydrologic, geologic, and biological resources. Hydrological resources would be assumed to experience the greatest impacts due to withdrawals and injections greatly influencing the regional water sources. Highly in-depth hydrogeological study will need to be done within the area of the proposed injection wells due to the fact that the injection wells must discharge the brine into a confined aquifer/space at least ¼ mile under any drinking water aquifers so as not to contaminate any other freshwater sources. Due to the increased restrictions and preventative measures that are required under Class I injection wells (Class I is the type of injection well associated with industrial waste), there would not be a need for a “no-farming zone” since, under construction regulations for a Class I well, extreme preventative measures are required in order to prevent harmful water from infiltrating drinking water sources in the event of a spill/leakage. Additionally, the harmful discharge from the desalination plant will be pumped extremely deep underground, minimizing any effect to surrounding soils. Nevertheless, a buffer area between the injection wells and the agricultural lands would be recommended. Please also note that for

10238-04
Letter to Joseph Kohn M.D.
Page 4 of 4
September 3, 2021

operational purposes, the tunnels and diversions of the EMI Aqueduct System are not in need of significant repair as you state.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 7:58:22 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui.

The Draft EIS assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities

The DEIS does not talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. These diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species; nor does it include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.

The DEIS should also give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Karen Kirschling
San Francisco, CA 94117

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Kirschling:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui.*

The Draft EIS assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities

Response 1: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users.

The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko‘olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown in pages 3-49 to 3-80. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 2: *The DEIS does not talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated*

that all of the water will be diverted from the streams 60% of the time. These diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.

Response 2: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided in pages 4-61 to 4-67.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of

those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 3: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species; nor does it include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 3: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the Final EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown in pages 2-2 to 2-4.

Comment 4: *The DEIS should also give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 4: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the

establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80 of the Final EIS, for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 5: *Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 5: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through

several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural

10238-04
Letter to Karen Kirschling
Page 7 of 7
September 3, 2021

integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 19, 2019 12:39:03 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. The diversions have nearly destroyed these farming communities who have waited for years to have their water returned. Do not abdicate your fiduciary duty to manage public water to a private entity who has not justified it's need for the water.

That is a violation of your trust obligations. I am disappointed to also learn that Chris Yuen made a recommendation to increase water flow without A&B providing a justification for it. Water is life. Save these communities by being better stewards of this pressure resource in accordance with the state's constitutional mandate.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Kau'i Pratt-Aquino

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Kau'i Pratt-Aquino:

Thank you for comments dated October 19, 2019 and November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

October 19, 2019:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waihue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The diversions have nearly destroyed these farming communities who have waited for years to have their water returned. Do not abdicate your fiduciary duty to manage public water to a private entity who has not justified it's need for the water.*

Response 2: We acknowledge your comments. Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter

3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS, see pages 4-331 to 4-336 of the EIS.

Regarding your comment about justifying the need for water, the representations made by Mahi Pono about its desire to be both transparent and to use only as much water as it needs to implement its farm plan are accurate. The Draft EIS is extremely detailed and provides a large amount of relevant information in an effort to meet that commitment to transparency. The Draft EIS also contains the Mahi Pono farm plan that shows the planned crops and the corresponding demand for water. This is true to Mahi Pono's commitment to using only as much water as it needs. Moreover, it should be noted Mahi Pono expects to invest over \$20 million to increase the efficiency of its Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to Section 2.1.4 of the Final EIS as on pages 2-25 to 2-27 of the EIS.

Comment 3: *That is a violation of your trust obligations. I am disappointed to also learn that Chris Yuen made a recommendation to increase water flow without A&B providing a justification for it. Water is life. Save these communities by being better stewards of this pressure resource in accordance with the state's constitutional mandate.*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 3: We acknowledge your comments. Regarding your comment about the trust obligations, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27 of the EIS. Please note that decisions that Chris Yuen have made are not within the scope of this EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

November 1, 2019:

Comment 4: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 4: We acknowledge your comments. As discussed in Response #1 above, the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject

to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

Comment 5: *Please stop abdicating the state's trust obligation to a private entity who has not justified its use for the water at the detriment of communities who are being destroyed by the diversions.*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 5: Regarding your comment about justifying the need for water, as discussed in Response #2 above, the representations made by Mahi Pono about its desire to be both transparent and to use only as much water as it needs to implement its farm plan are accurate. The Draft EIS is extremely detailed and provides a large amount of relevant information in an effort to meet that commitment to transparency. The Draft EIS also contains the Mahi Pono farm plan that shows the planned crops and the corresponding demand for water. This is true to Mahi Pono's commitment to using only as much water as it needs. Moreover, it should be noted Mahi Pono expects to invest over \$20 million to increase the efficiency of its Central Maui Field Irrigation System (i.e., the infrastructure that distributes water from Kamole-Weir to the agricultural fields and also within those fields). As part of this upgrade, Mahi Pono's irrigation engineering team is also implementing high-efficiency irrigation systems. The new irrigation systems will reduce water usage by: (1) using automatic, real-time irrigation sensors to deliver precise amounts of water efficiently; (2) recycling and re-using all water used in Mahi Pono's processing plants; and (3) integrating various live technology feeds to constantly monitor plant, soil, and tree health. Please note that this discussion has been added to Section 2.1.4 of the Final EIS as shown on pages 2-25 to 2-27 of the EIS.

Regarding your comment about community impacts, as it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams

Dear Mr. Matsukawa,

I strongly oppose Alexander and Baldwin's proposal to further divert the streams of East Maui.

Enough is enough! A&B have controlled the islands and their natural resources for too many decades. It is pure greed.

East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for your kind consideration.

Sincerely,
Kim Jorgensen

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Jorgensen:

Thank you for comments dated October 19, 2019 and November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Alexander and Baldwin’s proposal to further divert the streams of East Maui is outright theft and greed. Enough is enough!*

East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O,

COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui.*

Enough is enough!

East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Response 2: As previously stated in Response 1, the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

Comment 3: *I strongly oppose Alexander and Baldwin's proposal to further divert the streams of East Maui.*

Enough is enough! A&B have controlled the islands and their natural resources for too many decades. It is pure greed.

East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Response 3: As previously stated in Response 1, the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Kristine Peterson:

Thank you for comments dated October 13, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single

coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The water still hasn't been restored that has been promised. Promises are not being kept and we are still waiting. Before any permits are approved streams must be restored. Not after!*

Response 2: The work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows.

The CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. CWRM ordered in relevant part (see CWRM D&O at p. 269):

- I. *It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.*
- J. *This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process*
- K. *The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.*

CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Wednesday, October 9, 2019 1:10:40 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The state should not allow long-term licenses for diversion of waters, which are a public trust resource.

-A&B has not been a good steward, neither of the lands it leased nor the waters it diverted.

-No commercial entity should be allowed to divert water.

- All of the infrastructure -- the cement, steel etc. dams, gates, tunnels, flumes, pipes, etc. -- for the East Maui diversions for the streams that have been fully restored, restored to 90% stream biota, or restored for connectivity of stream biota should be removed.

-The lands and streams should be restored to the same pristine condition they were in before these were constructed or installed.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Kyle Nakanelua

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Nakanelua :

Thank you for comments dated October 9, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The state should not allow long-term licenses for diversion of waters, which are a public trust resource.*

Response 2: We acknowledge your comments. Please note that the State has the authority to issue a water lease for a 65-year term. With regards to the public trust, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27 of the EIS.

Comment 3: *A&B has not been a good steward, neither of the lands it leased nor the waters it diverted.*

Response 3: We respectfully disagree. As discussed in Section 2.1 of the Draft EIS, A&B was a founding member of the East Maui Watershed Partnership (EMWP), which was the first watershed partnership in the State of Hawai'i and which served as a model for other watershed partnerships throughout the State. In reviewing existing watershed management plans in general, however, DLNR has recently determined that some of the existing watershed plans are not always directly correlated to the water lease area and some plans are old and outdated. In certain places, new threats to watershed health are not addressed in existing watershed plans. Additionally, DLNR determined that estimated budgets in such existing plans may not reflect the current cost of management if the plan is over 5 years old. As such, DLNR will work with proposed water lessees to determine if any existing plan meets the minimum content requirements and sufficiently addresses the protection of watershed forests and fresh water resources in the License Area. If it does not, DLNR will work with the lessee to determine the specific actions needed and jointly develop a new plan or update the existing plan as noted in

Response #71 above. It should be noted that the existence of a watershed management plan does not absolve a water lessees' duty to help with the implementation of management actions. A lessee must provide DLNR proof that it is already contributing to the protection of the watershed, and membership in a Watershed Partnership may not fulfill the requirement of implementation.

DLNR and a water lessee will jointly develop a watershed management plan that cites existing management plans, meets the minimum content requirements, and outlines what reasonable management practices are needed for the water lease area and the current estimated costs associated with implementation. The new plan will be specific to the watershed(s) associated with the lease (the sources that feed the lease area) and management will be based on current estimated costs. One of the required elements of a watershed management plan is a budget, which entails a) an estimate of costs and categories of expenditures needed; and b) potential sources of funding for implementing the actions. See pages 2-2 to 2-4 of the EIS.

Comment 4: *No commercial entity should be allowed to divert water.*

Response 4: We acknowledge your comments. However, please note that the BLNR authorizes the Water Lease.

Comment 5: *All of the infrastructure -- the cement, steel etc. dams, gates, tunnels, flumes, pipes, etc. -- for the East Maui diversions for the streams that have been fully restored, restored to 90% stream biota, or restored for connectivity of stream biota should be removed.*

Response 5: We respectfully disagree with your comments. Upon making the voluntary commitment to permanently restore the stream flows in the "taro streams", EMI returned approximately 90-95% of the natural flow of the streams—all that could be done by adjusting (opening or closing) the diversion gates. The final 5-10% to achieve complete restoration requires modifications to diversions, essentially construction projects, thus triggering various permitting processes that continue to be pursued.

Potential impacts from the abandonment of structures and equipment as it relates to native stream habitat was assessed and discussed in Appendix A, the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report.

The work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows.

The CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. CWRM ordered in relevant part (see CWRM D&O at p. 269):

- I. It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.*
- J. This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process*
- K. The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.*

CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

However, please note that generally speaking, the complete physical removal of a diversion structure is not required for eliminating the impacts of the diversion on the native amphidromous stream animals. As long as the diversion does not remove water from the stream, does not change the natural path of the water, or create a barrier to movement, then the physical structure will have a negligible impact on native species habitat at best. The presence of cement or wood near or partially within the stream channel is not inherently bad for stream animals. Conversely, meeting the instream flow standard at a specified downstream location does not guarantee that no impacts will occur. In a situation where changes to a diversion result in the water flowing into the diversion and back to the stream from another location in the diversion ditch, impacts are likely to continue to occur. This is true even if 100% of the stream volume is returned as the pathway may still entrain or divert animals from the natural stream channel.

The two primary conditions where diversion structures could impact native stream species are structures where diversion and ditch water still comingle or structures that create a barrier to upstream migration. A diversion structure could also impact native stream animals as they move upstream if it creates an unnatural barrier. If no wetted pathway exists, upstream passage will be stopped.

Altering the natural streamflow could have a negative impact on the stream and stream animal habitat. Removal of portions of the diversion structure that cause flow restrictions, passage

barriers, or unnatural impounding of the water (primarily the diversion dam) would remove these negative impacts. While complete elimination of the structure is one way to accomplish the goal, complete removal is not required to eliminate alterations to streamflow patterns.

In summary, complete removal of all diversion structure is not required for mitigation or elimination of instream impacts to native stream animal habitat, but exact structure modification needs to be addressed on a case-by-case basis as anticipated under the CWRM D&O, to prevent or mitigate impacts.

Th above is discussed in more detail in Section 4.2.1 of the Final EIS as shown on pages 4-56 to 4-67 of the EIS.

Comment 6: *The lands and streams should be restored to the same pristine condition they were in before these were constructed or installed.*

Thank you for this opportunity to submit comments on this Draft EIS.

Response 6: We acknowledge your comments. As discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Lauae Lind:

Thank you for comments dated October 12, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *East Maui watersheds are being overused and abused. It's time to stop this corruption and save our streams/wildlife that will go extinct if diversions continue.*

Response 2: We acknowledge your comments. With respect to the Draft EIS, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts. As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area. These impacts are related to stream habitat, as there will be a reduction from natural flow conditions which can be mitigated by adjustments in diversions to minimize entrainment; terrestrial flora and fauna resources, as well as historic and archeological resources, from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; cultural resources and practices which can be mitigated by a myriad of recommendations proposed by Cultural Surveys Hawai'i; and socio-economic characteristics which can be mitigated by further public outreach and consultation.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The

requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS, see pages 2-2 to 2-4 of the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Sunday, October 6, 2019 2:21:00 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Laura Gray

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 10, 2019 1:01:29 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. We all understand how important it is to restore natural flow to channelized streams to restore all aspects of environmental health from the mountains to the sea. That is why Kam Schools/Bishop Estate was forced to restore Punalu'u Valley (where I live) after years of degradation from water diversion. Please do not shirk your duty to protect and restore our public water.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Laura Gray

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Laura Gray:

Thank you for comments dated October 6, 2019 and October 10, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 2: As noted in Response #1 above, note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

Comment 3: *We all understand how important it is to restore natural flow to channelized streams to restore all aspects of environmental health from the mountains to the sea. That is why Kam Schools/Bishop Estate was forced to restore Punalu'u Valley (where I live) after years of degradation from water diversion. Please do not shirk your duty to protect and restore our public water.*

Response 4: Your comments in response to the Proposed Action are acknowledged. Outside of the EIS process for the Proposed Action, it should be noted that several of the East Maui streams were ordered for restoration under the CWRM D&O which was issued in June 2018. A description of the proceedings at CWRM and the restoration orders is provided in Section 1.3.4 of the EIS. The Proposed Action assumes full compliance with the CWRM D&O.

Regarding assessment of impacts from stream restoration, an Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model, prepared by Trutta Environmental Solutions, LLC (Trutta Report) included as Appendix A utilized the HSHEP model to quantify the impacts of flow restoration on native stream animal habitat to determine an appropriate balance between instream and offstream water uses. Impacts to stream habitats and native amphidromous stream species, are analyzed in Section 4.2.1 and Appendix A of the EIS. Impacts to coastal waters and nearshore environments are analyzed in Section 4.2.3 and Appendix B (East Maui Irrigation Assessment of Streams and the Ocean Water Chemistry) of the EIS. Impacts to terrestrial flora and fauna, including threatened and endangered species, are analyzed in section 4.4 and Appendix C (Terrestrial Flora and Fauna Technical Report) of the EIS.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS, see pages 2-2 to 2-4 of the EIS

Your comment regarding Punalu'u Valley is outside the scope of the EIS. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke'anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

cc: Suzanne Case, Chair, Department of Land and Natural Resources
A&B / EMI, Applicant

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Alexander and Baldwin's Draft EIS
Date: Thursday, October 10, 2019 2:27:07 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

My ancestors have been from this aina for many generations for the purpose of growing kalo and to enhance the ecosystem of East Maui. How can a "baseline condition" be created when it was naturally created by kanaka of the area (makaanana) who didn't base it on an agenda for a typical project that goes corporate. It was a project to feed the people to live. The baseline conditions that were physically, chemically, biologically, socially, and culturally proposed 100 years ago served for a purpose that was not for our kanaka people. It was created for an entity that benefited financially and this will only be another duplicate of that system. So no diversion so the ecosystems of East Maui will thrive just as the people of that area like it was more than 100's of years ago.

Thank you for this opportunity to submit comments on this Draft EIS.

Mahalo,

Laura (Lala) Johnson
Kanaka Maoli

Sincerely,
Laura Johnson

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Johnson:

Thank you for comments dated October 10, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the

Draft EIS and the technical studies, it is estimated that the maximum amount of surface water available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80 of the EIS. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *My ancestors have been from this aina for many generations for the purpose of growing kalo and to enhance the ecosystem of East Maui. How can a "baseline condition" be created when it was naturally created by kanaka of the area (makaanana) who didn't base it on an agenda for a typical project that goes corporate. It was a project to feed the people to live. The baseline conditions that were physically, chemically, biologically, socially, and culturally proposed 100 years ago served for a purpose that was not for our kanaka people. It was created for an entity that benefited financially and this will only be another duplicate of that system. So no diversion so the ecosystems of East Maui will thrive just as the people of that area like it was more than 100's of years ago.*

Response 3: We acknowledge your comments. Please note that the use of the upper and lower boundaries applied to the HSHEP model for the assessment of impacts to the native amphidromous stream species were correct. As noted in Section 4.2.1 of the Draft EIS:

Baseline Condition — Full Diversion

The lower boundary for the HSHEP model was full diversion by the EMI Aqueduct System in its current configuration as existed under sugar cultivation, which was the prevailing conditions for nearly 100 years. (Trutta, p. 41, 2019) The Full Diversion scenario assumes that all the diversions in the EMI Aqueduct System are fully open or diverting 100% of available low flows, roughly analogous to the stream's baseflow. The diversions in the EMI Aqueduct System were built to capture 100% of normal low flows plus some small amount of storm runoff. Hawaiian streams are "flashy", meaning discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions. When low flow conditions persist and water needs call for all the low flow to be diverted, the streams can be dewatered below the diversions resulting in negative impacts on species habitat and passage. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production. (Trutta, p. 55-56, 2019) Under Full Diversion conditions, approximately 46% of the total HU remained; or conversely, Full Diversion conditions reduced the number of HU by approximately 54%.

The use of the Full Diversion Condition as the lower boundary to amount of available habitat is completely correct. The lower boundary reflects the maximum impact or maximum amount of habitat lost because of the diversions. None of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugar cane production. The modeled assumption under the full diversion scenario is 100% diversion of "base or normal low" streamflow at all diversions within the system. Thus, all habitat, entrainment, and barrier impacts were set to their maximum (greatest negative impact on species habitat) at all diversions. We acknowledge that Full Diversion resulted in more than half of all stream habitat being eliminated from the East Maui Streams as stated,

Under Full Diversion conditions, approximately 46% of the total HU remained; or conversely, Full Diversion conditions reduced the number of HU by approximately 54%.

The use of the Full Diversion Conditions is also a historically coherent position as it reflects the conditions that were existing in East Maui streams for much of the past hundred years. Not considering diversion conditions under sugar cane agriculture seems disingenuous as it does not provide any context to a very well-known historical condition.

The lower boundary described by the Full Diversion Conditions is in contrast with the upper boundary as described by the Natural Condition. As in the report (Trutta, p56),

Natural Condition: This was the baseline comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on

passage or entrainment of animals. This was the maximum available habitat units predicted.

This is also a coherent position as it provides context to the best conditions possible for native species. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat for native stream species.

The combination of the lower and upper bounds provide the range at which we would expect changes to the diversions to fall within and provides a way to comparatively discuss different flow restoration scenarios as by definition the changes must fall somewhere between 100% diversion and 0% diversion.

The two scenarios presented, the Proposed Action compliant with the CWRM D&O (Trutta's 2018 IIFS) and No Action Alternative (30% remaining flow diversion) are examples of how different flow restoration scenarios result in different amounts of habitat restored. The HSHEP model is used to quantify these differences based on flow restoration changes at specific diversions. This is exactly how impact assessment should be done. The HSHEP follows a logical approach and systematically addresses on-the-ground conditions.

Moreover, several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes the present composition of the flora and fauna resources in the License Area that are a result of

human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS, see pages 4-331 to 4-336 of the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, October 3, 2019 10:52:44 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

East Maui streams are **STOLEN** from the local farmers and residence of agricultural land.

Our family land has a stream that has been dried out and water stolen for over 15 years now along with hundreds of other Hana residents, agricultural and taro farmers. The lack of natural flow severely diminishes the diversity and local sustainability for food which would contribute and sustain local economic growth and caters only to a monopolized corporate takeover of what is a public right.

Please do what is right for the people and longevity of the island.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Lehua Slater

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Lehua Slater:

Thank you for comments dated October 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *East Maui streams are STOLEN from the local farmers and residence of agricultural land.*

Response 2: As discussed in Section 4.7.4 of the EIS, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Truck farms in East Maui (from the Honopou to Nāhiku portion of the License Area), which includes farms areas using water from the streams not subject the CWRM D&O, are assumed to cover about 45 acres by 2030 based on about 80% of the estimated 55 acres in taro. In effect, 10 acres were added to the truck-crop acreage identified in the CWRM D&O in order to account for (1) the possibility that CWRM D&O may have missed some farm areas that would be feasible to cultivate, and (2) an increase in taro farming could result in more truck farming by taro farmers who supplement their income by using flow-through water to irrigate other crops. This additional discussion, including information on the historical and future agricultural uses, has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293.

Comment 3: *Our family land has a stream that has been dried out and water stolen for over 15 years now along with hundreds of other Hana residents, agricultural and taro farmers. The lack of natural flow severely diminishes the diversity and local sustainability for food which would*

10238-04
Letter to Lehua Slater
Page 4 of 4
September 3, 2021

contribute and sustain local economic growth and caters only to a monopolized corporate takeover of what is a public right.

Please do what is right for the people and longevity of the island.

Response 3: Please note that you do not offer any specificity to as what stream you are referring to, therefore we cannot provide you with a specific response. However, none of the streams to be diverted under the Proposed Action or historically diverted by the EMI Aqueduct System are within the Hāna region.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

We can only shake our heads at the recent actions the Board of Land and Natural Resources has taken to further enable the pillage of nature, upon which all life depends.

We are extremely disappointed in how the BLNR has abdicated its responsibility to the public to protect our natural and cultural resources.

Thank you for this opportunity to submit comments on this Draft EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Leigh Emerson Smith:

Thank you for comments dated October 3, 2019 and October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *By all appearances, this request from A&B is nothing more than greed. We must stop endless tinkering with nature, upon which ALL life depends*

Response 2: We acknowledge your comments. Please note that as discussed in Response #1 above, the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS.

Comment 3: *We can only shake our heads at the recent actions the Board of Land and Natural Resources has taken to further enable the pillage of nature, upon which all life depends.*

Response 3: Your comments about the recent actions of the BLNR are unclear therefore we cannot offer you a specific response. However, please note that the scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 4: *We are extremely disappointed in how the BLNR has abdicated its responsibility to the public to protect our natural and cultural resources.*

Response 4: We acknowledge your comments. The dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B’s 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a

new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27 of the EIS.

Moreover, there are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Cahill:

Thank you for comments dated October 11, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. You have stolen native waters long enough!*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

10238-04
Letter to Linda Cahill
Page 3 of 3
September 3, 2021

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Sunday, October 20, 2019 1:10:43 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands. The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.

Can you pls give me a list of all outreach you have tried to do with community meetings and hearing out the voices of those who are living an honest life as farmers?

Sincerely,
Lisa Lehuanani Chang

What is your experience with streams and where did you grow up?

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
lisa chang

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Chang:

Thank you for comments dated October 20, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 2: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as show on pages 4-56 to 4-67 of the EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact

on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 3: *The DEIS does not sufficiently analyze the threat and damage the diversions have caused to native aquatic species.*

Response 3: We respectfully disagree with your comment that the Draft EIS did not sufficiently analyze the threat and damage the diversions have caused to native aquatic species. Please note that while it is not scientifically possible to fully document impacts that first took place more than a century ago, as such data does not exist, the Draft EIS in Section 1.3 (Background - Historical Perspective) included a detailed discussion on the history of the EMI Aqueduct System and stream diversions in East Maui.

Moreover, with respect to impacts to native aquatic species, Section 4.2.1 of the Draft EIS, and the HSHEP model present four flow restoration scenarios within the License Area, and discusses the impacts of those flow scenarios on native aquatic species. The four flow scenarios presented are described as follows. (1) the Natural Condition scenario, which is the maximum boundary comparison scenario in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available habitat units predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available habitat units for native stream species. (2) the Full Diversion scenario, which is the minimum boundary comparison scenario where all diversions in this scenario were modeled as fully open or diverting 100% of available low flows. The low flows, roughly analogous to the stream's baseflow, are critical to protecting instream habitat for stream species. The diversions and aqueduct system were built to capture 100% of normal low flow plus some smaller amount of storm runoff. Hawaiian streams are "flashy" where discharge rises quickly in response to rainfall and then quickly falls back to low flow conditions.

When low flow conditions persist and overall diversion amounts do not exceed the conveyance capacity of the aqueduct, the streams can be dewatered below the diversions resulting in negative

impacts on species habitat and passage. This scenario was intended to represent the diversion conditions found during sugar cane production. Although the Full Diversion condition has not existed for more than ten years, it is identified as a baseline condition in that it was the prevailing condition for nearly 100 years when sugarcane was in full production and provided context to a very well known historical condition. It is important to note that none of the proposed actions in the DEIS seek to increase diversion amounts over the amount of water diverted at the peak of sugarcane production. (3) the 2018 IIFS scenario, where the flow conditions are as required under the IIFS set forth under the CWRM D&O. (4) the No Action alternative or "30% Remaining Flow Diversion" scenario, which represents the longstanding agreement that "government owned waters" from the License Area amounted to 70% of streamflow, and the remaining 30% of the streamflow emanated from private/A&B/EMI lands. Thus, the No-Action alternative is the diversion of 30% of water available at the Honopou Stream boundary after compliance with the CWRM D&O IIFS. This No-Action description is not directly translatable into the HSHEP model as the model requires specific diversion conditions at each diversion not an aggregate amount from a group of diversions. Therefore, this scenario assumed that 30% of remaining low flow discharge was diverted at each individual diversion after complying with the IIFS. The analysis of these different flow scenarios, including a comparison of the proposed Water Lease to the No Action/No Water Lease scenario, is provided within the EIS.

Comment 4: *The DEIS doesn't include any plan or funding to manage the invasive species in the lower state lands they lease. These invasive plants and animals are hurting the health and the function of the watershed lands.*

Response 4: Please note that as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a Watershed Management Plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species, and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS, see pages 2-2 to 2-4.

Comment 5: *The DEIS should give in depth review of and support for shorter term lease options of less than 30 years because of uncertainties of future rainfall and future water supplies.*

Response 5: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please see pages 3-49 to 3-80 of the EIS for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Comment 6: *Can you pls give me a list of all outreach you have tried to do with community meetings and hearing out the voices of those who are living an honest life as farmers?*

Response 6: The EIS process has included substantial engagement. Chapter 9 of the EIS contains all consultation efforts during this EIS process. Specifically, all the County of Maui agencies were consulted with during the EIS Preparation Notice (EISPN) and the Draft EIS stages. It is further noted that there were also several opportunities for members of the public to participate in public scoping meetings conducted as part of the EIS effort. Moreover, numerous of the agencies provided comments to both documents as shown in Appendix M of the EIS, which includes all comments and responses related to the EISPN, and Appendix N of the Final EIS which includes all comments and responses related to the Draft EIS.

Regarding meetings with the Maui County Council, representatives of A&B, after the close of its sugar operations and prior to the sale of its agricultural fields to Mahi Pono, appeared before the Council to discuss its diversified agricultural plans for its former sugar lands. Representatives of Mahi Pono have individually met with several members of the Maui County Council, but Mahi Pono has not been formally invited to provide testimony at a formal meeting of the County Council or any of its committees.

Mahi Pono has also had various meetings with community groups such as Go Maui, Maui Tomorrow, Mā‘alaea Community Association, Pukalani Community Association, and the Alliance of Maui Community Associations regarding the Mahi Pono farm plan and use of water from East Maui streams, and conducted farm tours with members of the community. Mahi Pono is also working directly with MDWS as well as the County Corporation Counsel and Mayor’s offices, to help coordinate continued deliveries of surface water to the County’s Kamole-Weir WTP and the KAP.

Comment 7: *What is your experience with streams and where did you grow up?*

Response 7: Your comment is unclear. However, please note that Trutta Environmental Solutions (Trutta) conducted the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) which documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals’ habitats. Please note that Trutta has extensive experience working with streams in the State of Hawai‘i.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 18, 2019 6:09:41 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

This is such a disappointing decision. I no longer live on Maui, but here on Kaua'i, we have the same issues. It's hard to believe that with all the research and testimony provided that the council continues to approve the diversion of water that should be allowed to flow and if anything be diverted for Hawaiian homes and more loi's.

It seems that corporate greed is always rewarded in Hawaii and the islands suffer all the more for it.

I suppose it will only end when every drop is drained. I wish there was some explanation as to what the water that A&B is diverting will be used for...very sad about this decision.

Sincerely,

Marina Drummer

Thank you for this opportunity to submit comments on this Draft EIS.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Drummer:

Thank you for comments dated October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through

1907 S. Beretania Street, Suite 400 • Honolulu, Hawaii • 96826 • (808) 946-2277

several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *This is such a disappointing decision. I no longer live on Maui, but here on Kaua'i, we have the same issues. It's hard to believe that with all the research and testimony provided that the council continues to approve the diversion of water that should be allowed to flow and if anything be diverted for Hawaiian homes and more loi's.*

Response 2: We acknowledge your comments. As it relates to your comment about Hawaiian homes, specific information regarding the Department of Hawaiian Home Lands' (DHHL) future water reservation, including the anticipated amount of the DHHL reservation, was discussed in Section 2.1.1 of the Draft EIS as follows:

The DHHL staff has identified 11,455,510 gpd (10,428,000 gpd for Kēōkea-Waiohuli + 1,027,510 gpd for Pulehunui) of water as their recommendation for a reservation of water rights sufficient to support current and future homestead needs related to this proposed Water Lease.

The DHHL has indicated that reserved water may be available for other purposes until the DHHL has an actual need for the water. For its Kēōkea-Waiohuli and Pulehunui lands, the DHHL will be dependent on the EMI Aqueduct System collecting and transporting East Maui stream waters, in order to get waters to its lands. Until actual need materializes, the DHHL would receive payments related to lease rents paid by the lessee for those waters should EMI use a portion/all of the DHHL's Water Reservation, and the DHHL could receive other possible compensation or consideration.

Hence, the assumption in the Draft EIS is that the DHHL reservation would be for approximately 11.5 mgd. This assumption is carried through in the Final EIS based upon the Hawaiian Homes Commission (HHC) actions of May 30, 2019, which approved a reservation request related to the EMI Aqueduct System for 11,445,510 gpd as shown on pages 2-4 to 2-7 of the EIS. As explained therein, the DHHL water reservation process involves several steps before a reservation amount is formally identified. The first step is to hold a DHHL consultation with the beneficiaries in accordance with DHHL's Beneficiary Consultation Policy. Then, following adoption of the Beneficiary Consultation Report and an authorization to the Chairman to seek a reservation of water, CWRM could act on a reservation request related to a proposed lease.

As explained in Section 2.1.1 of the Draft EIS, DHHL held a Beneficiary Consultation on January 14, 2019. Presentations were made by representatives of A&B/EMI, Mahi Pono, the Department of Land and Natural Resources' (DLNR) Land Division, and DHHL staff and consultants. The results of the Beneficiary Consultation were presented to the HHC on May 30, 2019, as agenda item G-2. The motion passed by the HHC to accept the Beneficiary Consultation Report on a water reservation related to the EMI Aqueduct System's request for water lease from DLNR, and to reauthorize the chairman to formally request a related water reservation from CWRM for Hawaiian Home Lands on Maui. The reservation request was approved by the HHC related to the EMI Aqueduct System for 11,455,510 gpd (this is comprised of 10,428,000 gpd non-potable water for Keokea-Waiohuli and 1,027,510 gpd non-potable water for Pulehunui). This amount is consistent with the amount of the DHHL reservation projected in the Draft EIS. However, as of this time, it is our understanding that the water reservation request has not been made by DHHL to CWRM.

While Mahi Pono's current farm plan assumes the full use of the water that can be diverted from East Maui streams after compliance with the CWRM D&O, Mahi Pono will be obligated to reduce elements of its farm plan, and thus the availability of crop, to accommodate the permanent reduction in available water resulting from DHHL's allocation. The Reduced Water Volume alternative described in Chapter 3 of the EIS provides an assessment of the impacts of less water being made available for the Proposed Action, including Maui Pono farm plan in the Central Maui agricultural fields. Specifically, consistent with the analysis provided in the Agricultural and Related Economic Impacts report (Appendix I), for each 1 mgd reduction of surface water available to Mahi Pono from the Water Lease, whether due to the DHHL reservation or otherwise, in Central Maui there would be an estimated reduction by about 173 acres of land in crops, a reduction by about 15 acres of land in irrigated pasture, an increase of about 188 acres of land in unirrigated pasture.

You are correct that Section 2.1.1 of the Draft EIS stated, with respect to the DHHL reservation, that "*Until that reservation is physically claimed, however, it will be available for use by the lessee.*" That statement has been clarified in the Final EIS as shown on pages 2-4 to 2-7 of the EIS, as it is uncertain whether the DHHL reservation amount would be available to the lessee until such time as it is needed by DHHL. Such temporary uses of the DHHL reservation water are not addressed under HRS § 171-58. We further acknowledge that in addition to any specifications made by the CWRM and BLNR regarding the Water Lease, a separate agreement between the Water Lease lessor and the DHHL would be necessary to allow any temporary use of water reserved for DHHL.

Please note that as discussed in Section 2.1.2 of the Draft EIS, under the Proposed Action, at full buildout of the Mahi Pono farm plan, it is estimated that approximately 87.95 mgd will be diverted from the License Area and an additional 4.37 mgd in between Honopou Stream and Māliko Gulch to support uses described in the EIS. However, as with any agricultural project of this scale, actual water usage varies over time, and will continue to increase as development of

the Mahi Pono farm plan continues to full buildout. Hence, the amount of water diverted at any given time will be only what is needed to meet actual needs.

As it relates to kalo farms, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waiānu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu'u, Ka'aiea, 'O'opuola, Puehu, Nāili'ilihale, Kailua, Hanahana, Hoalua, Waipi'o, Mokupapa and Ho'olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on page 1-23 of the EIS. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration statuts); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoā Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe'e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other

purposes, for restoration for lo‘i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293 of the EIS.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Comment 3: *It seems that corporate greed is always rewarded in Hawaii and the islands suffer all the more for it. I suppose it will only end when every drop is drained. I wish there was some explanation as to what the water that A&B is diverting will be used for...very sad about this decision.*

Response 3: We acknowledge your comments. However, please note that the EIS is not a decision-making document. It is an environmental disclosure document that assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI

Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 19, 2019 4:21:04 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. Please open your eyes to see that this is theft, and stealing is a crime.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Mark Hordyszynski

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Hordyszynski:

Thank you for comments dated October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Please open your eyes to see that this is theft, and stealing is a crime.

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

10238-04
Letter to Mark Hordyszynski
Page 3 of 3
September 3, 2021

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Sunday, November 3, 2019 2:32:04 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. East Maui streams should not be diverted for Maui Pono agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. This is not happening now (water flowing in all streams).

For the past several years, rainfall has decreased, sending less water to Maui Island. Predicting how much rain will fall in the future is impossible. However, it is likely that the weather will change, and hotter, drier seasons may come.

An environmental impact statement for a new water lease has not been submitted.

For these reasons, I urge you not to increase the amount of water allowed to be diverted by Maui Pono and not to approve a lease longer than one year.

Also I urge you to publicly disclose any new lease terms and to hold public hearings before any new leases are signed.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Martha Martin

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Martin:

Thank you for comments dated November 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. East Maui streams should not be diverted for Maui Pono agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. This is not happening now (water flowing in all streams).*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and

beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

With regards to your comment that this is happening now, please note that many people at the EISPN public scoping meetings on February 22nd and 23rd, 2017 testified noting positive impacts seen from increased stream flow resulting from the cessation of sugar operations. Please note that the CIA has been updated to include feedback received on the Draft EIS, as summarized in Section 4.6 of the Final EIS. See pages 4-239 to 4-252 of the EIS. This updated discussion details statements made regarding increases in stream life, marine life, and the health of the watershed since the cessation of sugarcane operations in 2016 due to less stream water being diverted. This is expected as it was discussed in Section 4.2.1 of the Draft EIS that the Proposed Action would increase the number of HU as compared to sugarcane operations. Please note that that as of October 2020, an average of 23.3 mgd was being diverted from East Maui streams through the EMI Aqueduct System. Hence it can be assumed that current water diversion rates from the License Area are comparable to the amount that would be diverted under the No Action alternative, which is estimated to be approximately 26.39 mgd. The HSHEP model estimated that approximately 79.8% of total HU would be available under the No Action alternative. However, please note that under the Proposed Action, the total HU would be less than projected under the No Action alternative as noted above in Response #17.

Comment 2: *For the past several years, rainfall has decreased, sending less water to Maui Island. Predicting how much rain will fall in the future is impossible. However, it is likely that the weather will change, and hotter, drier seasons may come.*

Response 2: We acknowledge your comments. Climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives

considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown on pages 4-89 to 4-91, which relates to climate change impacts to each of respective environmental resource category technically assessed.

Comment 3: *An environmental impact statement for a new water lease has not been submitted.*

Response 3: Please note that this is the EIS for the proposed Water Lease.

Comment 4: *For these reasons, I urge you not to increase the amount of water allowed to be diverted by Maui Pono and not to approve a lease longer than one year.*

Also I urge you to publicly disclose any new lease terms and to hold public hearings before any new leases are signed.

Response 4: Please note that that Chapter 3 of the Draft EIS provided an in-depth review of an Alternative Lease Duration alternative. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other

10238-04
Letter to Martha Martin

environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. Please also see pages 3-49 to 3-80 of the EIS for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Please note that it is anticipated that the BLNR will hold a public hearing in conjunction with this Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Re: Draft Environmental Impact Statement (DEIS) for the Proposed Lease (Water Lease) for the Nahiku, Ke'anae, Honomanu, and Huelo License Areas

Please accept my comments on the subject DEIS:

I am very concerned about this proposed lease of public water because I want the streams restored, to flow for the people, and for the fish & vegetation to flourish again in East Maui. I want to see the watershed restored for the future health of all & for the natural beauty to be nurtured by the decisions made today.

I will like the EIS to address my following concerns here.

I don't feel a 30 year lease option makes sense in light of changes in world climate and unpredictable circumstances ahead. No lease is my preference, and in any case, only a short-term lease with necessity to re-examine how the leasing affects the areas the water is being diverted from makes much more sense to me. I will like to see decisions made that honor the local ecosystem & residents of East Maui.

One unintended concern re: water diversion is the stagnant pools along diverted streams that have been breeding grounds for mosquitos carrying Dengue fever virus to East Maui residents. The EIS needs to discuss the role that diverted streams have on mosquito populations in East Maui, and the impact unwanted resuming of diversions will have on people living in & visiting the area.

Also, I will be most grateful if the EIS will discuss methods of restoring the 13 streams in the Honopou to Kailua area, where lots of people live and farm and gather. All that is said is that it's estimated that all of the water will be diverted from the streams 60% of the time.

I want the EIS to discuss the impacts of continuing those diversions, which will decimate 85% of native stream habitat and impact thousands of local residents.

I am asking that the DEIS include my interests here in your decision making process.
Thank you for this opportunity to submit comments on this Draft EIS!

MahaLO & with ALOha,
Melissa Verbena

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Verbena:

Thank you for comments dated October 18, 2019 and November 3, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be dive_rted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *I am very concerned about this proposed lease of public water because I want the streams restored, to flow for the people, and for the fish & vegetation to flourish again in East Maui. I want to see the watershed restored for the future health of all & for the natural beauty to be nurtured by the decisions made today.*

Response 2: As previously stated in Response 1, the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species;

and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the EIS.

Comment 3: *I don't feel a 30 year lease option makes sense in light of changes in world climate and unpredictable circumstances ahead. No lease is my preference, and in any case, only a short-term lease with necessity to re-examine how the leasing affects the areas the water is being diverted from makes much more sense to me. I will lime to see decisions made that honor the local ecosystem & residents of East Maui.*

Response 3: Please note that that Chapter 3 of the Draft EIS did include an in-depth review of an Alternative Lease Duration alternative. Please note that the State has the authority to issue a water lease for a 65-year term. Section 3.2.2.1 of the Draft EIS states:

As discussed in Chapter 1, on May 14, 2001, A&B requested that the BLNR offer a long-term (30 year) lease at public auction for the right, privilege and authority to enter and go upon the State-owned License Area for the purposes of developing, diverting, transporting and using government-owned waters. However, the BLNR has the authority to offer such a lease with a term that is either shorter or longer than 30 years, provided, however, that under HRS § 171-36, the BLNR cannot authorize a lease for a term longer than sixty-five years. Some have viewed a shorter term for the Water Lease as an opportunity to evaluate the lessee's performance during its term as a basis for further extension. In this context, a lease term shorter than 30 years could limit the ability of the lessee to obtain financing for the needed investment in the intended use—the establishment of successful, sustainable diversified agricultural operations of crops that may take years to reach economic viability. This would be inconsistent with the Proposed Action objective of developing diversified agriculture in Central Maui.

The lessee under the proposed Water Lease will have to assume the risk of lower rainfall and lower water supply in the future, over the term of the Water Lease, whatever that term may be. And diversions must be in compliance with the CWRM D&O, irrespective of rainfall or other environmental changes. However, the Alternative Lease Duration alternative is fully analyzed in Chapter 3. The Agricultural and Related Economic Impacts report provided as Appendix H to the Draft EIS explains that an estimated 10 years will be needed for Mahi Pono and its lessees to remove volunteer sugarcane and weeds from 30,000 acres of agricultural fields in Central Maui, amend soils, install field improvements, build warehouses and other structures, and plant crops. Moreover, the predominant crops will be various types of orchard trees (avocado, coffee, citrus, macadamia nuts, etc.), which reflect a long-term commitment to farming. About 5 to 12 years will be required for orchard trees to reach full maturity, after which the trees will provide yields for 35 to over 100 years. Under the Alternative Lease Duration alternative, assuming a lease shorter than the requested 30 years, this could limit the ability of Mahi Pono or a farm lessee to obtain financing for the needed investment to establish a successful diversified agricultural

operation and crops that may take years to reach economic viability, and the full development and implementation of Mahi Pono's farm plan would be hampered and potentially derailed due to the risk of not being able to farm for a long enough period to recover its planned investment. See pages 3-49 to 3-80 of the EIS for a table summarizing the comparative evaluation of all reasonable alternatives, including the Alternative Lease Duration alternative.

Climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of this EIS as shown on pages 4-89 to 4-91 of the EIS, which relates to climate change impacts to each of respective environmental resource category technically assessed.

Comment 3: *One untended concern re: water diversion is the stagnant pools along diverted streams that have been breeding grounds for mosquitos carrying Dengue fever virus to East Maui residents. The EIS needs to discuss the role that diverted streams have on mosquito populations in East Maui, and the impact unwanted resuming of diversions will have on people living in & visiting the area.*

Response 3: With respect to your comment about the creation of mosquito breeding grounds, the instream amount of potential mosquito habitat was quantified using the HSHEP model. Within the model, a positive linear relationship between decreased streamflow and increased mosquito habitat was used to assess the impacts of stream diversion on mosquito habitat as discussed in

Section 4.2.1 of the EIS. Thus, an increase in habitat was predicted to occur at diverted flows as noted in the section entitled “Modeling” of Appendix A of the EIS and summarized in Section 4.2.1 and Section 4.4.2 of the EIS. Please note that Section 4.2.1 of the Final EIS has been revised to include a discussion of the available mosquito habitat units in the License Area under different flow scenarios as shown of pages 4-58 to 4-61 of the EIS.

Although the HSHEP model assessed potential changes of mosquito habitat in response to stream flow, several problems occur with controlling or eliminating mosquitos with increased streamflow. First, in addition to breeding in streams, the Culex mosquitos are crevice breeders and small pockets of water throughout the forest will still exist under any streamflow scenario. While improved baseflow in reaches downstream of diversions would decrease standing water habitat for the introduced mosquito species, it is highly likely that some standing water pockets will always be present at the edges of the stream channel. Thus, streamflow restoration alone is unlikely to eliminate the Culex mosquitos from East Maui streams. Second, Hawaiian streams are naturally flashy (i.e they rise and fall quickly after rainfall) and this results in numerous shallow, slow-moving pockets of water along the stream margins at many discharge amounts. In earlier studies conducted by Trutta Environmental Solutions (Trutta), regarding controlling introduced poecilid fishes (e.g. guppies and mosquitofish) which transmit parasites to native streamfish, it was hypothesized that increased streamflow would wash these species out of the streams. However, this did not occur with increased streamflow. The introduced poecilid fishes remained after large floods and found numerous places to live along the stream margins and behind stream obstructions. Within the East Maui streams surveyed, the introduced poecilid fishes were observed upstream of diversions in streams where natural flow patterns have continuously existed. While the reactions of poecilid fishes are not a perfect analog for Culex mosquito response to increased streamflow, the benefits of increased streamflow alone may be limited once the Culex mosquito (*Culex quinquefasciatus*) is established. We also note that anecdotal observations made by Trutta staff members support the continued presence of Culex mosquitoes under a wide range of stream flows. They reported being swarmed by mosquitos in both diverted and undiverted streams in Hawai'i.

Comment 5: *Also, I will be most grateful if the EIS will discuss methods of restoring the 13 streams in the Honopou to Kailua area, where lots of people live and farm and gather. All that is said is that it's estimated that all of the water will be diverted from the streams 60% of the time. I want the EIS to discuss the impacts of continuing those diversions, which will decimate 85% of native stream habitat and impact thousands of local residents.*

Response 5: The Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a

tributary to Pa‘akea Stream which is classified under the CWRM D&O as a “connectivity stream.”

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action’s impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as shown on pages 4-56 to 4-67 of the EIS.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

Subject: Comments on Alexander & Baldwin's Draft Environmental Impact Statement
Date: Wednesday, October 2, 2019 7:00:54 PM

Dear Mr. Matsukawa,

Aloha.

Please accept my comments in opposition to Alexander & Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Water is very precious. While my grandfather and father worked to be sure that Alexander & Baldwin had as much water as was desired, I am of the belief that the times have changed. Big entities like A&B should not be allowed to use their big presence to get favorable conditions for their proposed activities.

Also, it is time for the governing bodies to be proactive in encouraging alternative uses other than what has been for 100 years.

Mahalo for this opportunity to submit comments on this Draft EIS.

Sincerely,
Midi Cox

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Midi Cox:

Thank you for comments dated October 2, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander & Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. Water is very precious. While my grandfather and father worked to be sure that Alexander & Baldwin had as much water as was desired, I am of the belief that the times have changed. Big entities like A&B should not be allowed to use their big presence to get favorable conditions for their proposed activities.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be dive_rted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *Also, it is time for the governing bodies to be proactive in encouraging alternative uses other than what has been for 100 years.*

Response 2: Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were well-discussed, but ultimately not assessed to the same degree as (a) through (d). Additionally, Chapter 3 acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible for the reasons discussed in Chapter 3. Moreover, based on comments received on the Draft EIS, the alternatives analysis in Chapter 3 has been further expanded within the spectrum of alternatives presented in the Draft EIS. See pages 3-2 to 3-19 of the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please

¹ Please note that the Office of Planning and Sustainable Development - Environmental Review Program website is still hosted on OEQC's website housed under the Department of Health and will eventually transfer under the Office of Planning. However, we are not aware when that transition will occur.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 12, 2019 12:59:53 PM

Dear Mr. Matsukawa,

I am a native Hawaiian community farmer in Honomma'ele, Hana, Maui. I manage a 10 acre farm that provides free fruits and vegetables to over 250 permanent residents per year. We utilize catchment water to run operations because we can't take water from the stream, and don't have access to municipal wai. Reckless are these short-sighted land and water grabs by corporations and government...our County and State are acting like corps. Back door deals must be exposed and prosecuted.

Aloha and Mahalo

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Mikala Minn

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mikala Minn:

Thank you for comments dated October 12, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I am a native Hawaiian community farmer in Honommā‘ele, Hāna, Maui. I manage a 10 acre farm that provides free fruits and vegetables to over 250 permanent residents per year. We utilize catchment water to run operations because we can’t take water from the stream, and don’t have access to municipal wai. Reckless are these short-sighted land and water grabs by corporations and government...our County and State are acting like corps. Back door deals must be exposed and prosecuted.
Aloha and Mahalo*

Response 1: We acknowledge your comments and understand that you are a community farmer in the Hāna region. However, please note that none of the streams to be diverted under the Proposed Action or historically diverted by the EMI Aqueduct System are within the Hāna region.

Comment 2: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 2: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 7:01:57 PM

Dear Mr. Matsukawa,

Dear Mr. Matsukawa,

I hope you are well. Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS overlooks the opportunity to benefit East Maui communities and ecosystems if the water was not diverted. The "baseline condition" doesn't need to remain the default and all options should be explored, especially considering that residents have sought to prevent these diversions for decades for multiple reasons (traditional and cultural practices, equity in usage, environmental reasons, etc). Their needs and suggestions should be heavily considered and respected as stakeholders and kama'aina who know this region intimately.

Mahalo for this opportunity to submit comments on this Draft EIS.
Sincerely,

Molly Mamaril

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Mamaril:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *I hope you are well. Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be dive_rted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS overlooks the opportunity to benefit East Maui communities and ecosystems if the water was not diverted. The "baseline condition" doesn't need to remain the default and all options should be explored, especially considering that residents have sought to prevent these diversions for decades for multiple reasons (traditional and cultural practices, equity in usage, environmental reasons, etc). Their needs and suggestions should be heavily considered and respected as stakeholders and kama'āina who know this region intimately.*

Response 2: Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were well-discussed, but ultimately not assessed to the same degree as (a) through (d). Additionally, Chapter 3 acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible for the reasons discussed in Chapter 3. Moreover, based on comments received on the Draft EIS, the alternatives analysis in Chapter 3 has been further expanded within the spectrum of alternatives presented in the Draft EIS. See pages 3-2 to 3-19 of the EIS.

Moreover, Chapter 3 of the Draft EIS includes a comparative evaluation of the environmental "benefits, costs, and risks" of the Proposed Water Lease and "each reasonable alternative" i.e. (a) through (d) across a spectrum of environmental factors, such as Soils, Surface Waters and Aquatic Environment, Groundwater, Coastal Waters, Drainage, Natural Hazards, Flora, Fauna, and Invertebrates, Historic Resources, Cultural Resources and Practices Social Characteristics, Economic and Fiscal Resources, Agricultural and Related Economic Resources Recreational Resources, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Water Systems, and Public Services and Facilities. However, please note that Section 3.4 of the Final

10238-04
Letter to Molly Mamaril
Page 4 of 4
September 3, 2021

EIS includes a comparative table of the various alternatives and the associated impacts of each alternative as shown on pages 3-49 to 3-80 .

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Thursday, November 7, 2019 8:39:22 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The water belongs in the streams. Mauka to makai. As a Lifelong island resident, I have personally witnessed the impact these diversions have on the streams. Dry stream beds can not support aquatic life. Kalo farmers are greatly impacted and that effects our food security on an isolated island where the majority of food is imported. Taking the water from where it belongs and redirecting it to dry lands is not sustainable or nature's way. It's insulting to the land to be treated with such disrespect at the benefit of a corporation. Put the water BACK in the streams. Any one can stand at a diversion along the hana Highway and clearly see the impact on nature below the diversion point.

Sincerely
MomiFortune

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Momi Fortune:

Thank you for comments dated November 7, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be dive_rted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The water belongs in the streams. Mauka to makai. As a Lifelong island resident, I have personally witnessed the impact these diversions have on the streams. Dry stream beds can not support aquatic life. Kalo farmers are greatly impacted and that effects our food security on an isolated island where the majority of food is imported. Taking the water from where it belongs and redirecting it to dry lands is not sustainable or nature's way. It's insulting to the land to be treated with such disrespect at the benefit of a corporation. Put the water BACK in the streams. Any one can stand at a diversion along the hana Highway and clearly see the impact on nature below the diversion point.*

Response 2: We acknowledge your comments. Please note that several of the environmental factors assessed in Draft EIS Chapter 4 (Existing Environment, Impacts, and Mitigation Measures) are not expected to experience new impacts, or significant new impacts, as a result of the proposed Water Lease, which will result in less water diversion from streams than historically occurred. However, we acknowledge that an EIS must consider cumulative impacts, which means "*the impact on the environment which results from the incremental impact of the [Water Lease] when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*" HAR § 11-200-2. At the same time, an EIS is forward looking, meaning its aim is to study and present the potential impacts of a proposed action to help inform agency decision making. From that perspective, the impacts of over a century of stream diversions may inform decision-makers about the potential impacts of continued stream diversions as proposed under the Water Lease.

Although it is not scientifically possible to fully document impacts that first took place more than a century ago, the Draft EIS in Section 1.3 included a detailed discussion of the history of the EMI Aqueduct System and stream diversions in East Maui, and the Archaeological Literature Review and Field Inspection (Appendix E), which has been further supplemented to include information on the alleged legendary pōhaku in Wahinepe'e, archeological resources in Central Maui, climate change impacts on historical and archeological resources, and historical agriculture in East Maui, which provides information about the effects of East Maui stream diversions on streams, stream life, aquifers, watershed health, local subsistence agriculture, traditional farming and gathering and economic viability of rural families. As it relates to the natural environment, the Terrestrial Flora and Fauna Technical Report (Appendix C) describes

the present composition of the flora and fauna resources in the License Area that are a result of human activity, including operation of the EMI Aqueduct System. Appendix C has been updated to include targeted discussions based on comments received in response to the Draft EIS as it relates to the impacts of the Proposed Action and the associated alternatives presented in Chapter 3 of the EIS. Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model (Appendix A) documents the stream habitat potential within the License Area from existing conditions that have been shaped by human activities, including the operation of the EMI Aqueduct System which has been updated to include targeted discussions on stream diversion impacts under different flow scenarios to native stream animals' habitats. As it relates to the human environment, the Cultural Impact Assessment (CIA) (Appendix F) documents cultural resources and practices within and in the vicinity of the License Area. The CIA has been supplemented with information related to additional outreach conducted in response to comments received on the Draft EIS. The Social Impact Assessment (SIA) (Appendix G) history in a context for understanding the current perceptions of people from the community, including their perceptions of the recent involvement of Mahi Pono. The SIA has been updated to include a discussion relating the cumulative social impacts. Hence, the cumulative impacts of the Proposed Action are the continuation of the impacts resulting from the EMI Aqueduct System diverting water from the License Area streams in East Maui that has occurred over the past century that have shaped the existing environmental conditions described in Chapter 4, albeit the Proposed Action involves water diversions of a lesser extent than in the past. Please note that Section 4.17 of the Final EIS (Section 4.16 of the Draft EIS) has been updated to reflect the updates in the technical studies that support this EIS as shown on pages 4-331 to 4-336 of the EIS.

Specifically with regards to stream diversion impacts on aquatic life, please note that the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) model used to conduct the report contained in Appendix A of the EIS and summarized in Section 4.2.1 of the Draft EIS addresses native stream habitat impacts. Specifically, as discussed in Section 4.2.1 of the Draft EIS:

Under the Proposed Action, it is assumed that the Water Lease would grant the right to collect government-owned waters from the License Area up to the maximum allowed under the CWRM D&O. Thus, under the Proposed Action, the number of HU within the entire License Area is decreased by approximately 40% from Natural Flow (no diversion) condition, but is increased by more than 10% over the Full Diversion condition. In other words, 60% of the total HU remains within the License Area. This ranges from 96.7% of the HU in the Full-flow Restoration streams to 15% remaining HU in the No-Flow Restoration streams (including the streams for which no IIFS was set in the 2018 CWRM D&O).

The HSHEP model results conclude that the Proposed Action would have a negative impact by reducing native stream animal habitat from Natural Flow (undiverted) conditions

The above excerpt presents that from current conditions (i.e., October 2020, approximately 23.3 million gallons per day (mgd) diverted) to the Proposed Action (approximately 87.95 mgd), the number of habitat units (HU), as defined by the HSHEP report (Appendix A) as relative measures of stream habitat where each unit length of stream is multiplied by its suitability (range of 0 to 1) for a species resulting in a comparable measure of linear amount of suitable stream habitat which have measures of stream size and watershed wetness incorporated into the value that reflect comparative stream width and as a result only linear measures of habitat area are presented, would decrease to approximately 63.9% of the total potential HU available within the License Area. The Final EIS has included this clarifying statement in Section 4.2.1. See pages 4-56 to 4-67 of the EIS.

With regards to kalo farmers, please note that the CWRM D&O fully restored the streams identified as valued for taro farming in the License Area, thus addressing the water needs for kalo farming for the vast majority of streams that will be diverted under the Proposed Action as discussed in Section 1.3.4 of the Draft EIS. Specifically, Section 1.3.4. of the Draft EIS states:

Conveyance of Water to Kalo Growing Areas for Community Use

The CWRM ordered that all diversions on the following streams cease to allow for all water to flow to the taro growing areas or for community and non-municipal domestic uses: Honopou, Huelo/Puolua, Hanehoi, Pi'ina'au, Palauhulu, Waiokamilo, Wailuānui, 'Ōhi'a/Waianu, Kualani/Hāmau, and Makapipi. (CWRM D&O, Conclusions of Law (COL) 138). All diversions for these streams are required to be modified so that no out-of-watershed transfers will occur from these streams, which will have uninterrupted free flowing water to the communities that depend upon them. It was not the CWRM's intent to regulate where and how much water will be used for traditional kalo agriculture or how the water will be apportioned amongst the kalo lo'i. The CWRM's approach does not automatically set precedents for other areas, but provides a model of water use that integrates traditional culture with modern natural resource management (CWRM D&O, COL 138-145).

It is also noted that the CWRM D&O recognized the registered diversions within the various watersheds, including any diversions that were declared or registered for taro cultivation. It is unknown whether there are other taro farms located along the 12 streams that are not addressed by the CWRM D&O (the "non-petitioned streams") and no such diversions were identified through consultation in the EIS, including additional consultation done for the Cultural Impact Assessment (CIA), Appendix F to the EIS. Moreover, no registered diversions along non-petitioned streams for tarowere identified through consultation on the EIS.

We acknowledge that the CWRM did not amend the existing IIFS for 12 streams within the Huelo portion of the License Area (Kōlea, Punalu‘u, Ka‘aiea, ‘O‘opuola, Puehu, Nāili‘ilihaele, Kailua, Hanahana, Hoalua, Waipi‘o, Mokupapa and Ho‘olawa). These streams are indicated by blue in Figure 1-3 of the Draft EIS. However, please note that Figure 1-3 has been revised in the Final EIS as Figure 1-4 to accurately reflect the changes made in Section 1.3.4 regarding the stream references as shown on page 1-23 of the EIS. The CWRM did, however, address and order in the Huelo portion of the License Area: (1) Full restoration of Honopou, Hanehoi, and Huelo (Puolua) (tributary to Hanehoi; received its own restoration status); (2) Habitat restoration flows for Waikamoi Stream; (3) Connectivity flows for Puohokamoa Stream, and (4) after analysis, CWRM elected not to modify the IIFS for Wahinepe‘e Stream. The CWRM thus provided flow restoration spanning the Huelo portion of the License Area, including among other purposes, for restoration for lo‘i farming along those streams. However, even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches.

For the analysis, taro farms in East Maui (from Honopou to Nāhiku), both that use water from petitioned streams and non-petitioned streams, are assumed to cover about 55 net acres by 2030 (a little over 60 gross acres, and assuming the high estimate of 90% of the land is in crop). It is assumed that all or nearly all of the farming would take place in Honopou, Ke‘anae and Wailuā, and would rely primarily on the taro streams CWRM ordered for full restoration. Further, all or nearly all of the additional taro cultivation will occur in existing / historical taro cultivation areas, not in new areas, given the barriers presented by terrain and the economic challenges of initiating new taro cultivation. Even if restoration was made on additional streams, it is likely that the amount of additional acreage put into taro would be minimal, given that the areas lack the necessary river-valley characteristics of major taro growing areas, with many streams flowing through gulches. Under all scenarios addressed in the EIS, ample stream water should be available to irrigate the taro farms relying on these East Maui streams inasmuch-as the CWRM D&O “*will return free flowing water, with no upstream diversions, to all streams which have historically supported significant kalo cultivation ...*” (CWRM D&O at iv). Taro-farm operations and related economic activity would be about the same for all alternatives (i.e., the same production, sales, employment, payroll, taxes, etc.). Hence, the Proposed Action is not anticipated to have any significant impact on agronomic conditions in East Maui, nor on future East Maui taro farming. The above discussion has been added to Section 4.7.4 of the Final EIS as shown on pages 4-288 to 4-293 of the EIS.

Please note that the assumed acreage for taro farms excludes existing and potential farms for which the landowners do not have access or rights to water from the License Area streams, and farms irrigated with water from streams outside the License Area. In effect, East Maui taro farms west of Honopou and east of Nāhiku are excluded because they do not rely on the License Area streams.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Momi Ventura:

Thank you for comments dated October 19, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in Against A Huge Cane Burning Land Stealing (They Were Given Lease, And They Sold These Land's To Create Subdivisions Galore) They're Crooks And This Alexander & Baldwin's proposal to further Take!!! And divert the Natural streams From East Maui. Goodness Enough Is Enough!!!! East Maui streams should not be diverted for Agriculture Anymore, They Have Plans To Build More Homes On Land's They No Longer Own.. We Hawaiian's Need Our Ancestral Land's!!! We Need To Invest In Ourselves!!! Unless and until the streams of East Maui have An Extremely Full & Healthy Flow of Water From Mauka To Makai. They Made Their Millions By Irreparably Destroying The Natural Landscape Of The Once Beautiful Hawai'i's Mountains And Hills..*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that

were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not

needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Tuesday, October 15, 2019 9:02:39 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the "baseline condition". This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.

A & B has diverted East Maui streams for over a century. They did this even after the 1978 ConCon established CWRM and enshrined the public trust doctrine in our state constitution. Water is a public trust resource and is protected under the State Water Code. A & B continued to treat the water in the streams as their own property. It is long past time to correct this situation.

A & B is no longer involved in agriculture and is now a REIT, dealing primarily in real estate. Let's return Maui's water to Maui's citizens and have the county's board of water supply control the distribution of water. The board of water supply should not be paying A & B for the water -- by law, it is the county's water to be used for the county's residents.

Maui County should just purchase the entire EMI system and be done with this mess. If the county does not have enough money, they should get a loan from the State and pay it back over the next few decades. The control of East Maui's waters is at stake.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Mr. Ching:

Thank you for comments dated October 15, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS just assumes that most of the East Maui streams should stay diverted like they have been for 100 years as the “baseline condition”. This avoids discussing the option of no diverted streams and how that would benefit the East Maui ecosystems and East Maui communities.*

Response 2: We respectfully disagree with your comment that the Draft EIS does not discuss options of no diverted streams and the potential impacts that would occur from that option. Please note that Section 3.4.3 of the Draft EIS states:

The Proposed Action constitutes the issuance of one long-term (30-year) Water Lease from the BLNR that grants the lessee the "right, privilege, and authority to enter and go upon" the License Area for the "purpose of developing, diverting, transporting, and using government owned waters" through the existing EMI Aqueduct System which supplies water to domestic and agricultural water users. The Water Lease, which will be awarded by public auction, will enable the lessee to enter upon lands owned by the State of Hawai‘i in order to maintain and repair existing access roads and trails used as part of the EMI Aqueduct System, and will allow for the continued operation of the EMI Aqueduct System to deliver water to the MDWS for domestic and agricultural water needs in Upcountry Maui, including the agricultural users at the KAP and the planned 262-acre KAP expansion, as well as for the Nāhiku community, which, through the MDWS, draws up 20,000 to 45,000 gallons per day (gpd), dependent on weather, directly from the EMI Aqueduct System.

The Draft EIS analyzed the Proposed Action (the proposed Water Lease) and alternatives to the Proposed Action, including the “No Action” alternative whereby no Water Lease would be issued and the EMI Aqueduct System would only divert approximately 30% of the water from the overall Collection Area, and approximately 4.37 mgd from the private lands between Honopou Stream and Māliko gulch. Under that scenario, which is analyzed in Chapter 3 of the Draft EIS and the technical studies, it is estimated that the maximum amount of surface water

available to the EMI Aqueduct System would be approximately 30.76 mgd. The effects on East Maui ecosystems were analyzed. Under the no Water Lease scenario, 30% of remaining low flow discharge is diverted at each individual diversion after complying with the CWRM D&O. Under that scenario, approximately 79.8% of the potential habitat units, or "HU", would remain. Put another way, the No Water Lease/No Action alternative reduces the potential habitat units by approximately 20.2% from the Natural Flow scenario. Regarding impacts to East Maui communities, it is noted that a portion of the Nāhiku community is served by the MDWS via EMI's West Makapipi Tunnel 2 (Well No. 4806-07) (also known as "Nahiku Tunnel"), a development tunnel located on EMI land directly adjacent to the Ko'olau Ditch. Under the Proposed Action, water delivery to the Nāhiku community is expected to continue, whereas if no Water Lease is issued, water service to the MDWS for Nāhiku is presumed to terminate

The Draft EIS also provided an analysis of the impacts of a "Reduced Water Volume" alternative, meaning a scenario where a Water Lease is issued to authorize diversions in an amount less than what would be permitted after compliance with the CWRM D&O. Moreover, Section 3.4 of the Draft EIS provides a comparative analysis of all the reasonable alternatives, which has been updated in the Final EIS to include a comparative table as shown on pages 3-49 to 3-80 of the EIS. Chapter 3, Section 3.2.1 of the Draft EIS included a "sliding scale" analysis of the impacts of a water lease being issued authorizing diversions amounts at less than what is allowed under the CWRM D&O (the sliding scale quantified effects based upon each 1 mgd reduction in water).

Comment 3: *A & B has diverted East Maui streams for over a century. They did this even after the 1978 ConCon established CWRM and enshrined the public trust doctrine in our state constitution. Water is a public trust resource and is protected under the State Water Code. A & B continued to treat the water in the streams as their own property. It is long past time to correct this situation.*

Response 3: Please note that A&B has been diverting water from East Maui for over a century as discussed in Section 1.3.3 of the Draft EIS. Specifically Section 1.3.3 of the Draft EIS states:

Since 1876, A&B, or its predecessors and affiliates, have been issued from the Kingdom, the Territory and then the State of Hawai'i, various leases, agreements, licenses, and permits that authorized the development, diversion, transportation and use of government-owned water from streams in East Maui. The water leases were for the 33,000 acres owned by the Territory/State (License Area).

The original lease traces back to a September 13, 1876 license from the Kingdom of Hawai'i. Subsequent leases have been governed by an agreement dated March 18, 1938 between the Territory of Hawai'i and A&B. Over the course of the 20th Century, A&B retained the rights to the use of water from the License Area by being the successful bidder for water leases. The last long-term licenses were issued in

the 1950s and 1960s, ultimately expiring in 1986. Since 1986, however, the BLNR has authorized holdover and/or annual revocable permits for the use of water, with the latest being approved on November 9, 2018.

However, please note that the above excerpt has been revised for clarity.

With regards to the public trust doctrine, the dual roles of the BLNR and its sister agency, the CWRM, as Public Trustees with regard to the amount of surface water that the Public Trust Doctrine requires to be left undiverted from the streams within the License Area, is one of the subjects of the still pending contested case hearing on A&B's 2001 application to the BLNR for the auction of the subject long-term Water Lease (Proposed Action). As such, it is anticipated that the BLNR, in its decision-making regarding the requested issuance of the long-term Water Lease, will follow the judicial guidance that has already been given regarding what is necessary for the BLNR to comply with the requirements of the Public Trust Doctrine. Please note that a new Section 1.5 has been added to the Final EIS to discuss the Public Trust Doctrine as it relates to the Proposed Action in length as shown on pages 1-25 to 1-27 of the EIS.

Comment 4: *A & B is no longer involved in agriculture and is now a REIT, dealing primarily in real estate. Let's return Maui's water to Maui's citizens and have the county's board of water supply control the distribution of water. The board of water supply should not be paying A & B for the water -- by law, it is the county's water to be used for the county's residents.*

Response 4: You are correct that A&B is now a REIT, that deal primarily with real estate investments. With regards to your comment about the Maui BWS controlling the EMI Aqueduct System, the County Board of Water Supply (BWS) Temporary Investigative Group (TIG) Report, which was published after the Draft EIS, on the potential acquisition of the EMI Aqueduct System by the County, speaks directly to the "ownership change" alternative referenced in your comment. To provide further context, on July 19, 2019, the Maui County BWS formed the TIG to explore options for ensuring public access to water, including the feasibility of purchasing and maintaining the EMI Aqueduct System.

Based upon information available in relation to findings and conclusions of the TIG report, it is our assessment that the County's potential acquisition of the EMI Aqueduct System remains speculative. Furthermore, much of the institutional knowledge needed to properly operate the EMI Aqueduct System would be lost under any change in ownership scenario. This could reduce the efficacy of the system, the new owner may not have the expertise needed to properly maintain it, and possibly lead to additional and unforeseen environmental impacts. Moreover, a change in ownership would presumably directly contradict the objectives of the Proposed Action as outlined within the EIS. It is noted that the TIG report's proposal for water rates for the Central Maui agricultural fields is nearly ten times that of what is being charged to the

Agricultural Park and Upcountry agricultural users, thus rendering the economic viability of agriculture on the Central Maui fields unfeasible.

For purposes of assessment in this EIS, it is assumed that an alternative owner of the EMI Aqueduct System would be required to meet goals of the Proposed Action as described in this EIS, including meeting the Proposed Action's stated objective to support an economically feasible, sustainable diversified agricultural operation across the Central Maui agricultural fields.

For the reasons discussed above, the County's acquisition of the EMI Aqueduct System, and the County's pursuit of a water lease from the BLNR are viewed as speculative and an unreasonable alternatives. However, the existence and findings of the TIG Report has been acknowledged in Section 3.1.2 of the Final EIS, as shown on pages 3-19 to 3-20 of the EIS. A copy of the TIG Report has been included in the Final EIS as Appendix P.

Please note that 'by law' majority of the water actually belongs to the State as it originates on State owned land. However, approximately 30% of the water that flows through the License Area originates from privately owned lands as in Section 3.3 of the Draft EIS and as outlined by Appendix R-5 which has added to the Final EIS as shown on pages 3-24 to 3-25 of the EIS.

Comment 5: *Maui County should just purchase the entire EMI system and be done with this mess. If the county does not have enough money, they should get a loan from the State and pay it back over the next few decades. The control of East Maui's waters is at stake.*

Response 5: As noted in Response #4 above, based upon information available in relation to findings and conclusions of the TIG report, it is our assessment that the County's potential acquisition of the EMI Aqueduct System remains speculative. Furthermore, much of the institutional knowledge needed to properly operate the EMI Aqueduct System would be lost under any change in ownership scenario. This could reduce the efficacy of the system, the new owner may not have the expertise needed to properly maintain it, and possibly lead to additional and unforeseen environmental impacts. Moreover, a change in ownership would presumably directly contradict the objectives of the Proposed Action as outlined within the EIS. It is noted that the TIG report's proposal for water rates for the Central Maui agricultural fields is nearly ten times that of what is being charged to the Agricultural Park and Upcountry agricultural users, thus rendering the economic viability of agriculture on the Central Maui fields unfeasible.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, November 1, 2019 6:42:10 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

I do not believe the diversion of East Maui streams is in the best interest of the people of Maui, the environment, nor agriculture. The weather conditions are at best uncertain - climate change is upon us and diverting water from one source to a completely different source is not feasible at the present time.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Robyn Blaisdell

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Robyn Blaisdell:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *I do not believe the diversion of East Maui streams is in the best interest of the people of Maui, the environment, nor agriculture. The weather conditions are at best uncertain - climate change is upon us and diverting water from one source to a completely different source is not feasible at the present time.*

Response 2: We acknowledge your comments. Climate change is discussed in Section 4.3.1 of the Draft EIS. This section recognizes that the State of Hawai'i overall has been experiencing region-specific impacts that have been attributed to climate change, such as chronic flooding during king tides, severe shoreline erosion, changes in rainfall patterns, severity of storms and coral die off. While there is little consensus about the exact nature, magnitude, and timing of these changes, evidence indicates that there has been a rise in air and sea surface temperatures, a decrease in the prevailing northeasterly trade winds, a decline in average rainfall resulting in a decline in stream base flow, an increase in ocean acidity, and sea level rise (SOEST, 2014). Hence, it is anticipated that climate change will adversely impact the State. Since the warmer and drier conditions will bring about changes to the aquifers and surface water sources, one of the effects of warmer temperatures would be a decrease in rainfall.

Furthermore, the Draft EIS discusses the implications of climate change on the Proposed Action specific to the three geographic areas discussed in the Draft EIS and Section 3.4.7 (Natural Hazards) discusses climate change through a comparative analysis of the various alternatives considered in the Draft EIS. Ultimately, the Draft EIS concludes that the Proposed Action will not have significant impacts on the climate or contribute to climate change. The EMI Aqueduct System is gravity fed and is extremely energy efficient. The Draft EIS does note, however, that the exact nature of how the climate will change and impacts from any changes is unknown, and that as research into this area continues, there will be increased knowledge of the most effective ways to focus efforts toward adaptation strategies to address climate change.

However, Section 4.3.1 of the Final EIS has been expanded to include information from the LRFI, CIA, and the Terrestrial Flora and Fauna Technical Report conducted in conjunction of

10238-04
Letter to Robyn Blaisdell

this EIS as shown on pages 4-89 to 4-91 of the EIS as it relates to climate change impacts to each of respective environmental resource category technically assessed.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Rona Bennett:

Thank you for comments dated October 18, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. I honestly cannot believe this is happening after all the opposition of Hawaii State residents. Do not give away water to A&B. It is unethical*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams

to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Saturday, October 12, 2019 10:34:07 AM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

When will these large agricultural corporations learn to SHARE RESOURCES with the people who depends on that water? Water is a human right and diverting this precious resource for the profits of one company is a disgrace.

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Stacey Johnston

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Stacy Johnson:

Thank you for comments dated October 12, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *When will these large agricultural corporations learn to SHARE RESOURCES with the people who depends on that water? Water is a human right and diverting this precious resource for the profits of one company is a disgrace.*

Response 2: With respect to the Draft EIS, Chapter 4 (Description of Existing Environment, Impact, and Mitigation Measures), provides a comprehensive description and impact analysis of the East Maui License Area, as well as in Upcountry Maui and the Central Maui agricultural fields. That analysis considered conditions, impacts, and mitigations under numerous environmental measurements, e.g., Geology and Topography, Soils, Hydrology, Surface Waters, Groundwater, Coastal Waters, Drainage, Natural Hazards, Climate and Climate Change, Sea Level Rise, Flood and Tsunami Hazard, Hurricanes and Wind Hazard, Seismic Hazard, Natural Environment, Flora, Fauna and Invertebrates, Historic and Archaeological Resources, Cultural Resources and Practices, Socio-Economic Characteristics, Population/Demographics, Social Characteristics, Economic and Fiscal Impacts, Agricultural Economic Impacts, Recreational Uses and Park Facilities, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Services and Facilities, Police, Fire, and Medical Services, Education, Solid Waste Collection and Disposal, Infrastructure and Utilities, Water Systems, Wastewater Systems, and Electrical Systems. The analysis identifies those environmental criteria where no significant effects are expected, and where there may be impacts. As it relates to environmental impacts anticipated to occur under the Proposed Action, the majority of these occur within the License Area. These impacts are related to stream habitat, as there will be a reduction from natural flow conditions which can be mitigated by adjustments in diversions to minimize entrainment; terrestrial flora and fauna resources, as well as historic and archeological resources, from access into the License Area which can be mitigated by avoidance and minimization measures related to management and protocol for access; cultural resources and practices which can be mitigated by a myriad of recommendations proposed by Cultural Surveys Hawai‘i; and socio-economic characteristics which can be mitigated by further public outreach and consultation.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Water Diversion Environmental Impact Statement
Date: Friday, November 1, 2019 6:21:00 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to continue diverting the streams of East Maui. It is time to stop these practices! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

Federal organizations like the Forest Service are now looking at ways to redress the harms caused by colonization and disregard for the rights of Native Hawaiians. Rather than continue practices which are not pono we should be looking to redress past wrongs. How does your impact statement address the rights of indigenous people to their historic waterways.

The proposal will not allow hiking unless someone requests permission. Why does a private entity have control of the right for citizens to hike on these public lands?

The DEIS does not address the need for invasive species control on the land around these waterways. Given the magnitude of the invasive species problem on Maui this is an unacceptable omission. Please require that this be addressed.

I live on the Big Island where large swaths of our Ohia trees are dead because of ROD. The DEIS should address the procedures for dealing with Rapid Ohia Death prevention measures on the controlled lands. This should be required.

Today is a good way for human beings to stop assuming that we should control the resources of the Earth and overlook the damage that we are causing. Please do not allow this to happen.

Respectfully,
Star Carlin

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Star Carlin

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Star Carlin:

Thank you for comments dated November 1, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to continue diverting the streams of East Maui. It is time to stop these practices! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also

include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *Federal organizations like the Forest Service are now looking at ways to redress the harms caused by colonization and disregard for the rights of Native Hawaiians. Rather than continue practices which are not pono we should be looking to redress past wrongs. How does your impact statement address the rights of indigenous people to their historic waterways.*

Response 2: We acknowledge your comments. Section 4.6 of the Draft EIS describes several impacts associated with traditional Hawaiian cultural practices. Specifically, Section 4.6 of the Draft EIS states:

Several community participants voiced their concern regarding indigenous freshwater species that may be impacted by the act of diverting water. These species include but are not limited to 'ōpae, 'o'opu, pūpūlo'i (also known as pūpū Pākē, or Chinese snail), crayfish, prawns, and hīhīwai (endemic grainy snail; Neritina graposa), which are still gathered regularly by residents for personal consumption. Furthermore, community participants shared their concern of water not exiting stream beds and flowing into the ocean. This estuary environment creates an ecosystem where freshwater and saltwater species spawn and travel back upstream (such as e) or continue to grow in the ocean. Specific streams mentioned by community participants where this impact is identified include: Wahinepe'e, Puohokamoa, Ha'ipua'ena, Honopou (Puniawa Tributary), Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Waiokamilo, Wailuānui (Waikani Waterfall), Kopili'ula, Pa'akea, Kapā'ula, Hanawī, Makapipi, Waiohue, Waikamoi (Alo Tributary), Hanehoi, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Kualani (or Hāmau), East Wailuāiki, West Wailuāiki, Pua'aka'a Tributary, and Waia'aka. It is understood that these streams were subject to the CWRM D&O decision...

A majority of participants who are taro farmers voiced their concern of the lack of water needed to maintain a healthy and productive lo'i kalo or taro patch. A

cold, vigorous flow of water is needed for the production of kalo. Without an ample amount of water continuously flowing, many taro crops have been subject to invasive species such as the apple snail, root rot, and growths. Many taro farmers are unable to continue their traditional and generational cultural practice. Specific streams mentioned by community participants where this impact is identified include: Honopou (Puniawa Tributary), Waikamoi (Alo Tributary), Wahinepe'e, Puohokamoa, Ha'ipua'ena, Punala'u (Kōlea and Ulunui Tributaries), Honomanū, Nua'ailua, Pi'ina'au, Palauhulu (Hauoli Wahine and Kano Tributaries), 'Ōhi'a (or Waianu), Waiokamilo, Kualani (or Hāmau), Wailuānui (Waikani Waterfall), West Wailuāiki, East Wailuāiki, Kopili'ula, Pua'aka'a, Pa'akea, Waia'aka, Kapā'ula, Hanawī, Makapipi, and Waiohue. However, these streams were subject to the CWRM D&O decision.

While no human burials have been identified by previous archaeological studies within or immediately adjacent to the License Area, historical research indicates that Honomanū Valley and other areas throughout East Maui once held a sizable population. LCA documentation indicates that there were settlements along the coast, however, a pedestrian survey was also conducted where there was evidence of habitation in the higher reaches of the valley (E. M. Fredericksen and Fredericksen 1998b).

Hence, impacts to cultural resources and practices were identified during the Draft EIS. However, it is acknowledged that CWRM D&O has the potential to reduce or eliminate some of the cultural impacts associated with the Proposed Action, particularly given the full restoration of the streams in the historic taro-growing areas in East Maui. Based on comments received in response to the Draft EIS, CSH conducted additional consultation after the publication of the Draft EIS, as documented in the CIA, and summarized in EIS Section 4.6, as shown on pages 4-239 to 4-252 of the EIS. The CIA, and Section 4.6 of the EIS, have been updated to include a reformatting of the identified impacts to the regional environment, taro farming, freshwater ecosystems, cultural sites, access by cultural practitioners, and climate change as a result of the Proposed Action.

The studies to be done by qualified professions as recommended in the CIA are the very same studies that were done for this EIS. Mitigation recommendations were developed based upon community consultation, the CWRM D&O, and the other technical studies that were prepared for the EIS. In general, recommended mitigation includes specific monitoring, training, inspecting, communicating, reporting measures that have been imposed by CWRM under the D&O and recommended by CSH, and within other technical studies.

CSH offers specific recommendations summarized as follows: 1) continue monitoring and public reporting of stream flow volumes through maintenance and upgrades to the existing system of flow meters and totalizers within the License Area; 2) notify and ensure appropriate training of any persons required to enter the License Area as part of the Proposed Action or alternatives

regarding the potential for discovery of undocumented cultural sites and the procedures for reporting such finds; and 3) facilitate access via an appropriate access policy and procedure for cultural practitioners who wish to enter the License Area to practice their traditional and customary Native Hawaiian rights in accordance with applicable law.

Consistent with the spirit and intent of the process surrounding cultural impact assessments, CSH also recommends that any further amendments to the Proposed Action and its potential impacts on the identified cultural resources, practices, and beliefs be fully vetted with the potentially affected community by engaging relevant stakeholders in discussion. Such discussion would keep the community informed while inviting feedback on approaches to addressing potential impacts and exploring alternatives and appropriate mitigation measures.

There are a number of protections in place for Native Hawaiian traditional and customary practices in the License Area. The 1876 agreement between the State and EMI recognized the existence of other property owners, stating that “existing rights or present tenants of said lands or occupiers along said streams shall in no wise be lessened or affected injuriously by reason of anything hereinbefore granted or covenanted.” Moreover, the prior licenses issued for the License Area issued to EMI in the past continued to recognize the rights of other property owners “for domestic purposes and the irrigation of kuleanas entitled to the same.” See CWRM D&O, FOF 55. Similarly, the relevant revocable permits issued by the State include a clause whereby “*The State reserves the right....to withdraw water from this revocable permit to meet the following requirements as determined by the State in its sole discretion may determine; Constitutionally protected water rights, instream flow standards, reservations needed to meet the Department of Hawaiian Homelands rights....as well as other statutorily or judicially recognized interests relating to the right to withdraw water.....*” It is expected that the lessee under the Water Lease would be subject to similar requirements and in any event would be obligated honor all Constitutionally protected traditional and customary rights.

Comment 3: *The proposal will not allow hiking unless someone requests permission. Why does a private entity have control of the right for citizens to hike on these public lands?*

Response 3: Please note that access into the License Area is managed in partnership by the DLNR and EMI as discussed in Section 4.8 of the Draft EIS. Hence, this is the required protocol to allow for hiking in the License Area. Note that Section 4.8 has been revised as shown on pages 4-305 to 4-309 of the EIS, which serve to better identify the recreational resources in the vicinity of the License Area and more accurately describe current access protocol for entering the License Area as it relates to recreational activities.

Moreover, Section 3.2.2.2 of the Draft EIS discusses an alternative, the “Modified Lease Area” alternative, that would allow for more public access into the proposed License Area that could conceivably still meet the objectives of the Proposed Action. Specifically, Section 3.2.2.2 of the Draft EIS states:

Although A&B's May 14, 2001 submittal referred to a License Area comprised of approximately 33,012.91 acres of State-land (subject to review and confirmation by the Department of Accounting and General Services, Survey Division), the BLNR has the discretion to set the geographic parameters of the Lease Area to an area that is smaller, but still maintains the safety and integrity of the EMI Aqueduct System. Limiting the geographic extent of the Lease Area to that which is reasonably necessary to operate the EMI Aqueduct System with appropriate buffers to ensure public safety and the security of the system, could be consistent with the objectives of the Proposed Action. EMI would not manage public access into the License Area, and that obligation will fall upon a State agency. While some have advocated for greater or unfettered public access into the License Area, potentially adverse impacts of such access could include the introduction and spreading of invasive species and damage to historic resources.

Hence, the State would presumably manage public access within State-owned lands that are not within the License Area. Please note that Section 3.2.2.2 of the Final EIS has been updated as shown on pages 3-21 to 3-24, in order to take into account DLNR-DOFAW's Draft EIS comments and to include a more robust discussion regarding the potential impacts from increased public access into the License Area.

Furthermore, Section 1.3.1 and 3.2.2.2 of the Final EIS have been updated to acknowledge that under the revocable permits (RPs) for the License Area that were in effect for 2020 and that will be in effect for 2021, the Hanawā Natural Area Reserve (NAR) was removed from the RP area as shown on page 3-22 of the EIS. Thus, it is anticipated that BLNR may remove the Hanawā NAR from the License Area under any Water Lease. The Hanawā NAR comprises approximately 7,500 acres within the approximately 33,000-acre License Area, and is part of the Nāhiku portion of the License Area. No portion of the EMI Aqueduct System is within the Hanawā NAR. It is unlikely that the removal of the Hanawā NAR from the License Area will result in additional public access to the area, as the NAR rules restrict public access. For these reasons, the EIS states that a reduction in the License Area has the potential to result in increased impacts to flora and fauna resources, but that will ultimately depend on when increased access takes place and the nature of the public access that the State, as landowner, allows.

Comment 4: *The DEIS does not address the need for invasive species control on the land around these waterways. Given the magnitude of the invasive species problem on Maui this is an unacceptable omission. Please require that this be addressed.*

Response 4: Section 4.4 of the EIS specifically addresses the impacts of the Proposed Action to flora and fauna resources within the License Area, including a discussion of the cumulative impacts. Appendix C (Terrestrial Flora and Fauna Technical Report) of the EIS that was

prepared by SWCA included a survey of approximately 33,000 acres of land in East Maui referred to in the SWCA report as the License Area and approximately 30,000 acres of agricultural land in Central Maui that it referred to as the Service Area. These areas were collectively referred to as the Study Area throughout the SWCA report. This report is summarized in Section 4.4 of the EIS, which has been supplemented with a discussion on potential impacts on a watershed by watershed basis, using data produced by the HSHEP model and HIGAP data provided by the State, along with surveys conducted within the region as shown on page 4-113 of the EIS.

In summary, the Proposed Action is not anticipated to have any significant impacts on the terrestrial flora and faunal resources. Section 6.3 of Appendix C in the Final EIS states that, “*The increased water flows in the streams would likely have very little impact on terrestrial flora and fauna.*” Hence, this statement refers to all existing flora and fauna within the License Area and is not limited to only native species. As discussed in Section 5.1.2.1 of Appendix C in the Draft EIS, the majority (60%) of the License Area is already composed of “Open / Closed ‘Ōhi‘a Forest,” which mainly constitutes the higher elevation areas where water is not diverted as shown by Figure A-2 of Appendix C. Moreover, the immediate area surrounding the EMI Aqueduct System tends to be composed of “alien forest” which consist of non-native species.

Moreover, as discussed in Section 2.1 of the Draft EIS, the Water Lease lessee will be subject to all applicable requirements under HRS § 171-58 regarding watershed management plans. The requirement for a watershed management plan is statutory and requires either that a watershed management plan be in place prior to the issuance of a lease, or that the lease contain a covenant requiring the joint development and implementation of a watershed management plan. In the time since the publication of the Draft EIS, the BLNR approved, on October 11, 2019, the minimum content requirements for a watershed management plan. A copy of the BLNR-approved report has been added to the EIS as Appendix O-1. Section 2.1 of the EIS has been updated to reflect this new information about the contents of an acceptable watershed management plan. See pages 2-2 to 2-4 of the EIS. The minimum content requirements under the category of "Goals" specifically addresses invasive species, including calling for removal and control of non-native hooved animals, removal or containment of damaging invasive plants and animals that threaten important watershed forests, monitoring and controlling forest threats (i.e., fires, predators, and plant diseases), restoring and out-planting native species; and community outreach and education. These goals are more specifically described in Section 2.1 of the EIS as shown on pages 2-2 to 2-4 of the EIS.

Comment 5: *I live on the Big Island where large swaths of our Ohio trees are dead because of ROD. The DEIS should address the procedures for dealing with Rapid Ohio Death prevention measures on the controlled lands. This should be required.*

Response 5: We acknowledge your comments above and they have been taken into consideration. Note that the Draft EIS did not discuss any targeted mitigation or avoidance measures as it relates to Rapid 'Ōhi'a Death (ROD) fungus. Please note that Section 4.4.1 of the Final EIS has been revised to include the recommendations from the USFWS as shown on pages 4-121 to 4-124 of the EIS.

Comment 6: *Today is a good way for human beings to stop assuming that we should control the resources of the Earth and overlook the damage that we are causing. Please do not allow this to happen.*

Response 6: We acknowledge your comments. Please note that we provide you with detailed responses to each of your comments above.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 11, 2019 9:01:19 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents. What would happen if hoarding water stopped and water was restored to the stream for the kalo farmers and the community to use? How would this affect A & B's brand and ultimately gain the company much needed community support?

Have you seen this TED talk by Rob Harmon on how the market can keep streams flowing?

<https://youtu.be/YeJhVtJKJU8>

What would this model do for Maui's streams? Have you taken time to apply a model like this?

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Teri Skillman

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Teri Skillman:

Thank you for comments dated October 11, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018. The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through

several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural

integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *The DEIS doesn't talk about how to restore the 13 streams in the Honopou to Kailua area where lots of people live and farm and gather. All that is said is that its estimated that all of the water will be diverted from the streams 60% of the time. Those diversions will decimate 85% of native streamlife habitat and impact thousands of local residents.*

Response 2: You are correct that the Draft EIS does not talk specifically how to restore the non-petitioned streams in the Honopou to Kailua area as that is not part of the Proposed Action. These streams are anticipated to be diverted as they have been. Please note that while the Draft EIS does in fact identify 13 non-petitioned streams, it has been determined since that time that there are only 12 non-petitioned streams within the License Area. Puakea Stream was mistakenly identified as a separate stream. However, since that time, it has been determined that Puakea is actually a tributary to Pa'akea Stream which is classified under the CWRM D&O as a "connectivity stream."

Regarding your comment that it is said that all the water will be diverted from streams 60% of the time, it is unclear where this statement comes from as this is not stated in the Draft EIS. However, under the Proposed Action, it is estimated that a total of approximately 87.95 mgd will be diverted from the License Area in compliance with the CWRM D&O and IIFS set for the License Area streams, and the EMI Aqueduct System will divert approximately an additional 4.37 mgd from privately owned lands between Honopou Stream and Māliko Gulch for a total of approximately 92.32 mgd of stream water.

Chapters 3 and 4 of the EIS directly address the ecological impacts of the Proposed Action and its alternatives, including the continued diversion of the non-petitioned streams. The Assessment of Impacts of Stream Diversions Using the Hawaiian Stream Habitat Evaluation Procedure, provided as Appendix A (the HSHEP model), as summarized in Section 4.2.1 of the EIS, assesses the Proposed Action's impacts to the native amphidromous stream species as well as native insect species. The Proposed Action is anticipated to decrease the number of habitat units in the License Area streams by 36.1% from the Natural Flow scenario. Please note that Section 4.2.1 has been updated to include a clearer discussion on the stream diversion impacts on native stream animal habitats as provided on pages 4-61 to 4-67.

The Natural Flow condition was the maximum boundary comparison scenario created for modeling, in which all diversions were modeled as closed with no water diversion and no impact on passage or entrainment of animals and resulted in the maximum available HU predicted. The assumption with the Natural Condition is if no modifications or diversions existed, then this

would be the maximum available HU for native stream species within the License Area. In other words, approximately 63.9% of the total amount of habitat units estimated by the HSHEP would remain under the Proposed Action.

Regarding your comment about decimation of 85% of native stream life habitat, that is not correct. As explained above, the proposed Water Lease would retain almost 64% of all possible HU within the License Area. Only when looking at the subset of the non-petitioned streams is the estimated HU retention reduced to 11.8% of HU available. Moreover, the EIS looks at impacts to all of the streams that could be diverted under a Water Lease and not just a subset of those streams, and assesses the impacts of the diversions across an array of environmental criteria.

Comment 3: *What would happen if hoarding water stopped and water was restored to the stream for the kalo farmers and the community to use? How would this affect A & B's brand and ultimately gain the company much needed community support?*

Response 3: Chapter 3 of the Draft EIS includes an analysis of: (a) a Reduced Water Volume alternative; (b) an Alternative Lease Duration alternative; (c) a Modified Lease Area alternative; and (d) a "No Action" alternative, meaning a scenario where no Water Lease is issued. Chapter 3 of the Draft EIS also identified other alternatives that have the potential to meet the objectives, such as developing new water sources to supplement or replace the water diverted under the Water Lease. For example, the development of groundwater wells, the use of reclaimed water from the Wailuku-Kahului Wastewater Reclamation Facility, and the development of a significant new water storage facility. However, as discussed in Chapter 3, those alternatives were determined to be infeasible due to expected intensification of environmental effects along with other factors, and therefore those alternatives were well-discussed, but ultimately not assessed to the same degree as (a) through (d). Additionally, Chapter 3 acknowledged an alternative scenario whereby the EMI Aqueduct System would be owned by someone other than EMI. However, that alternative was also deemed to be infeasible for the reasons discussed in Chapter 3. Moreover, based on comments received on the Draft EIS, the alternatives analysis in Chapter 3 has been further expanded within the spectrum of alternatives presented in the Draft EIS. See pages 3-2 to 3-19 in the EIS.

Chapter 3 of the Draft EIS includes a comparative evaluation of the environmental "benefits, costs, and risks" of the Proposed Water Lease and "each reasonable alternative" i.e. (a) through (d) across a spectrum of environmental factors, such as Soils, Surface Waters and Aquatic Environment, Groundwater, Coastal Waters, Drainage, Natural Hazards, Flora, Fauna, and Invertebrates, Historic Resources, Cultural Resources and Practices Social Characteristics, Economic and Fiscal Resources, Agricultural and Related Economic Resources Recreational Resources, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Water Systems, and Public Services and Facilities. However, please note that Section 3.4 of the Final EIS includes a comparative table of the various alternatives and the associated impacts of each alternative as shown on pages 3-49 to 3-80 of the EIS.

Comment 4: *Have you seen this TED talk by Rob Harmon on how the market can keep streams flowing?*

<https://youtu.be/YeJhVtJKJU8>

What would this model do for Maui's streams? Have you taken time to apply a model like this?

Response 3: Please note that the video you provided is not within the scope of the EIS to assess and apply. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Monday, October 21, 2019 4:50:25 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

I would also like to know if A&B/Mahi Pono:

- 1) plan to install gauges to make sure the IIFS set by CWRM are being adhered to?
- 2) Mitigate the existing seepage/loss of 41 mgd of water?
- 3) How many acres will stay in diversified agriculture in perpetuity?
- 4) How many acres are deemed Crown Land?
- 5) what are the exact acreage within the proposed lease area?
- 6) Did the ICA decision uphold the provision that no matter if the lease is approved or not that the Maui County DWS will still get at least 8 mgd from the Kamole Water Treatment Plant to ensure the public's health and safety?

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,
Toni Eaton

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Toni Eaton:

Thank you for comments dated October 21, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams

to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Comment 2: *I would also like to know if A&B/Mahi Pono:*

1) plan to install gauges to make sure the IIFS set by CWRM are being adhered to?

Response 2: Upon making the voluntary commitment to permanently restore the stream flows in the “taro streams”, EMI returned approximately 90-95% of the natural flow of the streams—all that could be done by adjusting (opening or closing) the diversion gates. The final 5-10% to achieve complete restoration requires modifications to diversions, essentially construction projects, thus triggering various permitting processes that continue to be pursued.

Potential impacts from the abandonment of structures and equipment as it relates to native stream habitat was assessed and discussed in Appendix A, the Assessment of the Environmental Impact of Stream Diversions on Instream Habitat in East Maui Streams using the Hawaiian Stream Habitat Evaluation Procedure (HSHEP) Model report.

The work related to diversion modifications required for compliance with the IIFS under the CWRM D&O is not tied to the Water Lease. Those actions are separate from the proposed Water Lease and are a requirement under the CWRM D&O with or without BLNR issuance of a Water Lease. However, for clarification, the requirement for full restoration of stream flow in several streams under the CWRM D&O does not require removal of diversion structures. It requires permanent restoration of flows.

The CWRM D&O calls for numerous modifications to the amount of water that can be diverted from the East Maui streams, but expressly did not call for the removal of diversion structures. CWRM ordered in relevant part (see CWRM D&O at p. 269):

- I. *It is intended that diversion structures only need to be modified to the degree necessary to accomplish the amended IIFS and to allow for passage of stream biota, if needed.*
- J. *This Order does not require that every diversion on every tributary be removed or modified, the Commission is only looking at modifications to main stem and major diversions to accomplish the amended IIFS set forth above. The Commission also recognizes that it is not the purpose of this proceeding to determine how the diversions will be modified. That issue will be before the Commission in a subsequent process*
- K. *The intent of the Commission is to allow for the continued use and viability of the EMI Ditch system and will not require the complete removal of diversions unless necessary to achieve the IIFS.*

CWRM will be looking at how and when specific diversions should be modified in the course of overseeing the implementation of the CWRM D&O, as the treatment of diversion structures is a matter that was addressed by CWRM in the D&O through the IIFS proceedings on the East Maui streams.

Comment 3: *Mitigate the existing seepage/loss of 41 mgd of water?*

Response 3: It is unclear where you are citing this 41 mgd of water loss. We assume that your comment relates to the physical condition of the EMI Aqueduct System. In this regard, the EMI Aqueduct System fulfills its purpose of collecting and transporting surface water from East Maui to Central Maui in a very efficient manner. It does so without any motors or machinery, the entire system works by gravity—thus it is extremely energy-efficient. Further, as noted by the USGS study titled, “Measurements of Seepage Losses and Gains, East Maui Irrigation Diversion System, Maui, Hawaii (2012)” the EMI Aqueduct System has no net losses of water over the entirety of the 72 miles of ditch and tunnel that make up the EMI Aqueduct System. In other words, net system losses are not present within the EMI Aqueduct System.

Any water losses take place beyond the EMI Aqueduct System (i.e., past Kamole-Weir WTP) and within the Central Maui Field Irrigation System. Without the planned improvements to the Central Maui Field Irrigation System, approximately 22.7% of the water delivered to the Central Maui agricultural fields is accounted for as system losses in the Central Maui Field Irrigation System (i.e., water lost to seepage and evaporation, and including other water uses, such as water used for reservoirs, fire protection, dust control, and hydroelectric uses). Seepage loss within the Central Maui Field Irrigation System is recharged back into the groundwater in the Central Maui Aquifer System.

Comment 4: *How many acres will stay in diversified agriculture in perpetuity?*

Response 4: Please note that Mahi Pono intends to secure the proposed Water Lease to continue to transition the former sugarcane fields into a diversified agricultural operation over the next 30 years at least.

Comment 5: *How many acres are deemed Crown Land? what are the exact acreage within the proposed lease area?*

Response 5: Please note that that this is not within the scope of the EIS to analyze. The scope of the EIS assesses the anticipated environmental impacts associated with the issuance of a long-term (30 years) Water Lease by BLNR for the continued "*right, privilege, and authority to enter and go upon*" the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas for the "*purpose of developing, diverting, transporting, and using government owned waters*" through the existing EMI Aqueduct System for the uses described in the EIS. The environmental impacts of the potential Water Lease are included through Chapter 4 of the EIS.

Comment 6: *Did the ICA decision uphold the provision that no matter if the lease is approved or not that the Maui County DWS will still get at least 8 mgd from the Kamole Water Treatment Plant to ensure the public's health and safety?*

Response 6: MDWS' right to access this source on a long-term basis is contingent upon the issuance of the Water Lease. As discussed in Section 3.3 of the Draft EIS:

The existing water delivery agreements with the MDWS are contingent upon the Water Lease being issued, therefore if no Water Lease is issued, it is assumed that the delivery of water to the MDWS would terminate. As a consequence, domestic and agricultural water needs in Upcountry Maui would need to be met by alternative water sources that would need to be developed by the MDWS. At this point in time, it is unknown whether sufficient groundwater resources exist in Upcountry Maui to meet these water demands. It is anticipated that the development of alternative water-source infrastructure would be prohibitively expensive, and depending upon the specific sources, or combination of sources, could result in significant direct adverse impacts to the environment.

Hence, if no Water Lease is issued, it is assumed that the existing MDWS agreements in place would terminate.

Chapter 3 of the Draft EIS includes a comparative evaluation of the environmental "benefits, costs, and risks" of the Proposed Water Lease and "each reasonable alternative" i.e. (a) through (d) across a spectrum of environmental factors, such as Soils, Surface Waters and Aquatic Environment, Groundwater, Coastal Waters, Drainage, Natural

Hazards, Flora, Fauna, and Invertebrates, Historic Resources, Cultural Resources and Practices Social Characteristics, Economic and Fiscal Resources, Agricultural and Related Economic Resources Recreational Resources, Visual Resources, Air Quality, Noise, Hazardous Materials, Traffic, Public Water Systems, and Public Services and Facilities. However, please note that Section 3.4 of the Final EIS includes a comparative table of the various alternatives and the associated impacts of each alternative as shown on pages 3-49 to 3-80.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Zoe Pastorfield-Li:

Thank you for comments dated October 12, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui.*

This is truly outrageous. We need to put people and natural resources first, and not work in service of illegal and harmful private interests.

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoa, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams

to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also include freshets and stormwater which are not included in the calculation of the IIFS. (CWRM D&O, COL 150).

The CWRM recognized that the EMI Aqueduct System remains a valuable asset that delivers noninstream public trust benefits, such as drinking water, as well as other reasonable and beneficial uses. The reduction in diversions does not, by itself, compromise the structural integrity of the EMI Aqueduct System so long as it continues to be maintained as a single coordinated system. The CWRM considered factors that contribute to the operational capacity of the existing EMI Aqueduct System by allowing some water diversions from streams in the higher elevation eastern portion of the watershed. (CWRM D&O, COL 151).

The 2018 CWRM D&O was described in detail in Section 1.3.4 of the Draft EIS and Final EIS.

Your written comments and this response will be reproduced in the Final EIS. It is anticipated the Final EIS, including the various technical studies associated with it, will be available for review on September 8, 2021, at the Office of Planning and Sustainable Development – Environmental Review Program (formerly the Office of Environmental Quality Control) website.¹ Should you wish to request a copy of the Final EIS or portions thereof, please submit your request in writing to Wilson Okamoto Corporation, attention Mr. Dalton Beauprez at 1907 South Beretania Street, Suite 400 Honolulu, HI 96826.

We appreciate your interest and participation in this environmental review process.

Sincerely,

Keola Cheng
Director of Planning

Subject: Comments on Alexander and Baldwin's Draft Environmental Impact Statement
Date: Friday, October 11, 2019 5:16:10 PM

Dear Mr. Matsukawa,

Please accept my comments in opposition to Alexander and Baldwin's proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai.

This longstanding corporate greed for our water, a public trust, should be done once and for all. The law is clear. Stop water diversions. St

Thank you for this opportunity to submit comments on this Draft EIS.

Sincerely,

Lori Buchanan

Subject: Draft Environmental Impact Statement
Proposed Lease (Water Lease) for the Nāhiku,
Ke‘anae, Honomanū and Huelo License Areas

Dear Ms. Buchanan:

Thank you for comments dated October 11, 2019 regarding the subject Draft Environmental Impact Statement (EIS) pertaining to the Proposed Lease (Water Lease) for the Nāhiku, Ke‘anae, Honomanū, and Huelo License Areas. We acknowledge your comments and concerns which have been considered in the preparation of the Final EIS with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules (HAR), Title 11, Chapter 200. A record of your comments has been appended to the Final EIS in Appendix N.

The following responses are provided to your comments relating to the Draft EIS:

Comment 1: *Please accept my comments in opposition to Alexander and Baldwin’s proposal to further divert the streams of East Maui. Enough is enough! East Maui streams should not be diverted for agriculture in central Maui, unless and until the streams of East Maui have a healthy flow of water mauka to makai. This longstanding corporate greed for our water, a public trust, should be done once and for all. The law is clear. Stop water diversions. St*

Response 1: We acknowledge your comments. Please note that the objectives of the Proposed Action, as stated in the DEIS, are to: (i) preserve and maintain the EMI Aqueduct System, including its access roads; (ii) continue to meet domestic and agricultural water demands in Upcountry Maui (iii) continue to provide water for agricultural purposes in Central Maui (specifically, to continue to transition fields previously used for sugarcane cultivation into new, diversified agricultural uses); and (iv) continue to serve community water demands in Nāhiku as noted in Section 1.2 of the Draft EIS. The use of this water will be subject to ensuring the flows of water in the East Maui streams under the interim instream flow standards (IIFS) that were established by the Commission on Water Resource Management (CWRM) in June 2018.

The need for the Water Lease is derived from the absence of practicable alternative sources of water and an alternative infrastructure to meet these water needs on Maui.

On June 20th, 2018, the CWRM issued its Interim Instream Flow Standards (IIFS) Decision and Order (D&O) for 27 East Maui streams that were subject to IIFS Petitions that evolved through several CWRM proceedings starting in May 2001. CWRM evaluated each of the streams subject to the IIFS Petitions individually, analyzing their flow characteristics, instream uses, offstream uses, habitat restoration, potential for fish and other stream animals, recreational opportunities, and scenic values. The subject streams were then evaluated under an integrative approach with consideration for the overall ecological ramifications of the decision. CWRM also considered the economic ramifications of its decision on offstream uses, as required by the State Water Code, with a specific focus on supporting public uses such as drinking water, as well as diversified agriculture, including support for agricultural uses of lands designated by the State as Important Agricultural Lands (IAL), as are approximately 22000 acres of the applicable Central Maui fields.

The CWRM ordered full and partial restoration of streams it concluded to have the potential to benefit greatly from the restoration of flow to 64% of the median base flow (BFQ50), which generally represents the flow necessary to restore 90% of the habitat in a stream (H90), based on the biological diversity and habitat that already exists. Restoration of these streams (Pi'ina'au, Wailuānui, Honomanū, Waikamoi, Nua'ailua, East Wailuāiki, Kopiliula, and Waiohue) was ordered to allow the stream species to flourish and reproduce, benefitting not only the natural environment but also allowing for better opportunity for the exercise of traditional and Hawaiian right (CWRM D&O, COL 131).

Various streams within the License Area have low biological ratings and or do not have the potential to improve drastically with increased flows. These streams were set at connectivity flow which is twenty percent (20%) of the instream flow (CWRM D&O, COL 30). Streams that are set at connectivity flow are: Kapā'ula, Pa'akea, Pua'aka'a, Puohokamoā, Ha'ipua'ena, Nua'ailua, and Hanawī. (CWRM D&O at 268-269). None of these streams have registered diversions for taro cultivation nor is there taro cultivation known to occur on these streams (CWRM D&O, COL 147).

The CWRM acknowledged that in the context of a proceeding to set IIFS, it does not have the authority to determine how much water may be used for noninstream use for municipal and agricultural uses. That authority lies with the BLNR in issuing a water lease pursuant to HRS § 171-58, subject to the IIFS set by the CWRM. (CWRM D&O, COL 148). Recognizing that the noninstream uses, especially municipal use, are valued uses, the CWRM set the IIFS to allow the MDWS to continue to divert water through its Upper and Lower Kula Pipelines. (CWRM D&O, COL 149). In not requiring full restoration of all streams, the CWRM has allowed some streams to continue to be diverted so that the BLNR may continue to license the diversion of water not needed to meet the IIFS from those streams for noninstream use. The available water would also
