Highlights:

A Phase I Environmental Site Assessment, performed by the site owner, identified RECs related to known surface soil contamination near a former boiler room, potential subsurface soil contamination related to incinerator ash, which may have been used as fill, the past presence of large above-ground storage tanks, and surface soil petroleum contamination which may or may not be associated with the tanks. A field sampling plan was prepared to further assess the RECs identified. The project was cancelled by the U.S. EPA before the sampling plan was implemented. Former Use: 1897-1950 part of Fort Armstrong; 1950-1979 warehouse and housed large above-ground storage tanks; and 1979-present temporary vehicle storage, vacant, and leased out.

A Phase I Environmental Site Assessment, performed by the site owner, identified RECs related to known surface soil contamination near a former boiler room, potential subsurface soil contamination related to incinerator ash, which may have been used as fill, the past presence of large above-ground storage tanks, and surface soil petroleum contamination which may or may not be associated with the tanks. A field sampling plan was prepared to further assess the RECs identified. The project was cancelled by the U.S. EPA before the sampling plan was implemented. Former Use: 1897-1950 part of Fort Armstrong; 1950-1979 warehouse and housed large above-ground storage tanks; and 1979-present temporary vehicle storage, vacant, and leased out.

Appendix: Database Descriptions

Environmental Risk Information Services (ERIS) can search the following databases. The extent of historical information varies with each database and current information is determined by what is publicly available to ERIS at the time of update. ERIS updates databases as set out in ASTM Standard E1527-13 and E1527-21, Section 8.1.8 Sources of Standard Source Information:

"Government information from nongovernmental sources may be considered current if the source updates the information at least every 90 days, or, for information that is updated less frequently than quarterly by the government agency, within 90 days of the date the government agency makes the information available to the public."

Standard Environmental Record Sources

Federal

National Priority List:

NPL

Sites on the United States Environmental Protection Agency (EPA)'s National Priorities List of the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action under the Superfund program. The NPL, which EPA is required to update at least once a year, is based primarily on the score a site receives from EPA's Hazard Ranking System. A site must be on the NPL to receive money from the Superfund Trust Fund for remedial action. Sites are represented by boundaries where available in the EPA Superfund Site Boundaries maintained by the Shared Enterprise Geodata and Services (SEGS). Site boundaries represent the footprint of a whole site, the sum of all of the Operable Units and the current understanding of the full extent of contamination; for Federal Facility sites, the total site polygon may be the Facility boundary. Where there is no polygon boundary data available for a given site, the site is represented as a point.

Government Publication Date: Oct 26, 2023

National Priority List - Proposed:

PROPOSED NPL

Sites proposed by the United States Environmental Protection Agency (EPA), the state agency, or concerned citizens for addition to the National Priorities List (NPL) due to contamination by hazardous waste and identified by the EPA as a candidate for cleanup because it poses a risk to human health and/or the environment. Sites are represented by boundaries where available in the EPA Superfund Site Boundaries maintained by the Shared Enterprise Geodata and Services (SEGS). Site boundaries represent the footprint of a whole site, the sum of all of the Operable Units and the current understanding of the full extent of contamination; for Federal Facility sites, the total site polygon may be the Facility boundary. Where there is no polygon boundary data available for a given site, the site is represented as a point.

Government Publication Date: Oct 26, 2023

Deleted NPL:

DELETED NPL

Sites deleted from the United States Environmental Protection Agency (EPA)'s National Priorities List. The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate. Sites are represented by boundaries where available in the EPA Superfund Site Boundaries maintained by the Shared Enterprise Geodata and Services (SEGS). Site boundaries represent the footprint of a whole site, the sum of all of the Operable Units and the current understanding of the full extent of contamination; for Federal Facility sites, the total site polygon may be the Facility boundary. Where there is no polygon boundary data available for a given site, the site is represented as a point.

Government Publication Date: Oct 26, 2023

SEMS List 8R Active Site Inventory:

SEMS

The U.S. Environmental Protection Agency's (EPA) Superfund Program has deployed the Superfund Enterprise Management System (SEMS), which integrates multiple legacy systems into a comprehensive tracking and reporting tool. This inventory contains active sites evaluated by the Superfund program that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The Active Site Inventory Report displays site and location information at active SEMS sites. An active site is one at which site assessment, removal, remedial, enforcement, cost recovery, or oversight activities are being planned or conducted. This data includes SEMS sites from the List 8R Active file as well as applicable sites from the SEMS GIS/REST file layer obtained from EPA's Facility Registry Service.

Government Publication Date: Sep 19, 2023

Inventory of Open Dumps, June 1985:

[ODI](#)

The Resource Conservation and Recovery Act (RCRA) provides for publication of an inventory of open dumps. The Act defines "open dumps" as facilities which do not comply with EPA's "Criteria for Classification of Solid Waste Disposal Facilities and Practices" (40 CFR 257).

Government Publication Date: Jun 1985

SEMS List 8R Archive Sites:

[SEMS ARCHIVE](#)

The U.S. Environmental Protection Agency's (EPA) Superfund Enterprise Management System (SEMS) Archived Site Inventory displays site and location information at sites archived from SEMS. An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time. This data includes sites from the List 8R Archived site file.

[CERCLIS](#)

CERCLIS:

Superfund is a program administered by the United States Environmental Protection Agency (EPA) to locate, investigate, and clean up the worst hazardous waste sites throughout the United States. CERCLIS is a database of potential and confirmed hazardous waste sites at which the EPA Superfund program has some involvement. It contains sites that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The EPA administers the Superfund program in cooperation with individual states and tribal governments; this database is made available by the EPA.

Government Publication Date: Oct 25, 2013

EPA Report on the Status of Open Dumps on Indian Lands:

[IODI](#)

Public Law 103-399, The Indian Lands Open Dump Cleanup Act of 1994, enacted October 22, 1994, identified congressional concerns that solid waste open dump sites located on American Indian or Alaska Native (AI/AN) lands threaten the health and safety of residents of those lands and contiguous areas. The purpose of the Act is to identify the location of open dumps on Indian lands, assess the relative health and environment hazards posed by those sites, and provide financial and technical assistance to Indian tribal governments to close such dumps in compliance with Federal standards and regulations or standards promulgated by Indian Tribal governments or Alaska Native entities.

Government Publication Date: Dec 31, 1998

CERCLIS - No Further Remedial Action Planned:

[CERCLIS NFRAP](#)

An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time. The Archive designation means that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL). This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Government Publication Date: Oct 25, 2013

CERCLIS Liens:

[CERCLIS LIENS](#)

A Federal Superfund lien exists at any property where EPA has incurred Superfund costs to address contamination ("Superfund site") and has provided notice of liability to the property owner. A Federal CERCLA ("Superfund") lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. This database is made available by the United States Environmental Protection Agency (EPA). This database was provided by the United States Environmental Protection Agency (EPA). Refer to SEMS LIEN as the current data source for Superfund Liens.

Government Publication Date: Jan 30, 2014

RCRA CORRACTS-Corrective Action:

[RCRA CORRACTS](#)

RCRA Info is the U.S. Environmental Protection Agency's (EPA) comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. At these sites, the Corrective Action Program ensures that cleanups occur. EPA and state regulators work with facilities and communities to design remedies based on the contamination, geology, and anticipated use unique to each site.

Government Publication Date: Oct 2, 2023

RCRA non-CORRACTS TSD Facilities:

[RCRA TSD](#)

RCRA Info is the U.S. Environmental Protection Agency's (EPA) comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. This database includes Non-Corrective Action sites that have indicated engagement in the treatment, storage, or disposal of hazardous waste which requires a RCRA hazardous waste permit.

Government Publication Date: Oct 2, 2023

RCRA Generator List:[RCRA LQG](#)

RCRA Info is the U.S. Environmental Protection Agency's (EPA) comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Large Quantity Generators (LQGs) generate 1,000 kilograms per month or more of hazardous waste or more than one kilogram per month of acutely hazardous waste.

Government Publication Date: Oct 2, 2023

RCRA Small Quantity Generators List:[RCRA SQG](#)

RCRA Info is the U.S. Environmental Protection Agency's (EPA) comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Small Quantity Generators (SQGs) generate more than 100 kilograms, but less than 1,000 kilograms, of hazardous waste per month.

Government Publication Date: Oct 2, 2023

RCRA Very Small Quantity Generators List:[RCRA VSQG](#)

RCRA Info is the U.S. Environmental Protection Agency's (EPA) comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Very Small Quantity Generators (VSQG) generate 100 kilograms or less per month of hazardous waste, or one kilogram or less per month of acutely hazardous waste. Additionally, VSQG may not accumulate more than 1,000 kilograms of hazardous waste at any time.

Government Publication Date: Oct 2, 2023

RCRA Non-Generators:[RCRA NON GEN](#)

RCRA Info is the U.S. Environmental Protection Agency's (EPA) comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Non-Generators do not presently generate hazardous waste.

Government Publication Date: Oct 2, 2023

RCRA Sites with Controls:[RCRA CONTROLS](#)

List of Resource Conservation and Recovery Act (RCRA) facilities with institutional controls in place. RCRA gives the U.S. Environmental Protection Agency (EPA) the authority to control hazardous waste from the "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA also set forth a framework for the management of non-hazardous solid wastes. The 1986 amendments to RCRA enabled EPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances.

Government Publication Date: Oct 2, 2023

Federal Engineering Controls-ECs:[FED ENG](#)

This list of Engineering controls (ECs) is provided by the United States Environmental Protection Agency (EPA). ECs encompass a variety of engineered and constructed physical barriers (e.g., soil capping, sub-surface venting systems, mitigation barriers, fences) to contain and/or prevent exposure to contamination on a property. The EC listing includes remedy component data from Superfund decision documents issued in fiscal years 1982-2021 for applicable sites on the final or deleted on the National Priorities List (NPL); and sites with a Superfund Alternative Approach (SAA) Agreement in place. The only sites included that are not on the NPL; proposed for NPL; or removed from proposed NPL, are those with an SAA Agreement in place.

Government Publication Date: Oct 26, 2023

Federal Institutional Controls- ICs:[FED INST](#)

This list of Institutional controls (ICs) is provided by the United States Environmental Protection Agency (EPA). ICs are non-engineered instruments, such as administrative and legal controls, that help minimize the potential for human exposure to contamination and/or protect the integrity of the remedy. Although it is EPA's expectation that treatment or engineering controls will be used to address principal threat wastes and that groundwater will be returned to its beneficial use whenever practicable, ICs play an important role in site remedies because they reduce exposure to contamination by limiting land or resource use and guide human behavior at a site. The IC listing includes remedy component data from Superfund decision documents issued in fiscal years 1982-2021 for applicable sites on the final or deleted on the National Priorities List (NPL); and sites with a Superfund Alternative Approach (SAA) Agreement in place. The only sites included that are not on the NPL; proposed for NPL; or removed from proposed NPL, are those with an SAA Agreement in place.

Government Publication Date: Oct 26, 2023

Land Use Control Information System:

LUCIS

The LUCIS database is maintained by the U.S. Department of the Navy and contains information for former Base Realignment and Closure (BRAC) properties across the United States.

Government Publication Date: Sep 1, 2006

Institutional Control Boundaries at NPL sites:

NPL IC

Boundaries of Institutional Control areas at sites on the United States Environmental Protection Agency (EPA)'s National Priorities List, or Proposed or Deleted, made available by the EPA's Shared Enterprise Geodata and Services (SEGS). United States Environmental Protection Agency (EPA)'s National Priorities List of the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action under the Superfund program. Institutional controls are non-engineered instruments such as administrative and legal controls that help minimize the potential for human exposure to contamination and/or protect the integrity of the remedy.

Government Publication Date: Oct 26, 2023

Emergency Response Notification System:

ERNS 1982 TO 1986

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories.

Government Publication Date: 1982-1986

Emergency Response Notification System:

ERNS 1987 TO 1989

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories.

Government Publication Date: 1987-1989

Emergency Response Notification System:

ERNS

Database of oil and hazardous substances spill reports made available by the United States Coast Guard National Response Center (NRC). The NRC fields initial reports for pollution and railroad incidents and forwards that information to appropriate federal/state agencies for response. These data contain initial incident data that has not been validated or investigated by a federal/state response agency.

Government Publication Date: Aug 12, 2023

The Assessment, Cleanup and Redevelopment Exchange System (ACRES) Brownfield Database:

FED BROWNFIELDS

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties protects the environment, reduces blight, and takes development pressures off greenspaces and working lands. This data is provided by the United States Environmental Protection Agency (EPA) and includes Brownfield sites from the Cleanups in My Community (CIMC) web application.

Government Publication Date: Mar 13, 2023

FEMA Underground Storage Tank Listing:

FEMA UST

The Federal Emergency Management Agency (FEMA) of the Department of Homeland Security maintains a list of FEMA owned underground storage tanks.

Government Publication Date: Dec 31, 2017

Facility Response Plan:

FRP

This listing contains facilities that have submitted Facility Response Plans (FRPs) to the U.S. Environmental Protection Agency (EPA). Facilities that could reasonably be expected to cause "substantial harm" to the environment by discharging oil into or on navigable waters are required to prepare and submit FRPs. Harm is determined based on total oil storage capacity, secondary containment and age of tanks, oil transfer activities, history of discharges, proximity to a public drinking water intake or sensitive environments. This listing includes FRP facilities from an applicable EPA FOIA file and Homeland Infrastructure Foundation-Level Data (HIFLD) data file.

Government Publication Date: May 2, 2023

Delisted Facility Response Plans:

DELISTED FRP

Facilities that once appeared in - and have since been removed from - the list of facilities that have submitted Facility Response Plans (FRP) to EPA. Facilities that could reasonably be expected to cause "substantial harm" to the environment by discharging oil into or on navigable waters are required to prepare and submit Facility Response Plans (FRPs). Harm is determined based on total oil storage capacity, secondary containment and age of tanks, oil transfer activities, history of discharges, proximity to a public drinking water intake or sensitive environments.

Government Publication Date: May 2, 2023

Historical Gas Stations:

[HIST GAS STATIONS](#)

This historic directory of service stations is provided by the Cities Service Company. The directory includes Cities Service filling stations that were located throughout the United States in 1930.

Government Publication Date: Jul 1, 1930

Petroleum Refineries:

[REFN](#)

List of petroleum refineries from the U.S. Energy Information Administration (EIA) Refinery Capacity Report. Includes operating and idle petroleum refineries (including new refineries under construction) and refineries shut down during the previous year located in the 50 States, the District of Columbia, Puerto Rico, the Virgin Islands, Guam, and other U.S. possessions. Survey locations adjusted using public data.

Government Publication Date: Sep 20, 2023

Petroleum Product and Crude Oil Rail Terminals:

[BULK TERMINAL](#)

A list of petroleum product and crude oil rail terminals from the U.S. Energy Information Administration (EIA), as well as petroleum terminals sourced from the Federal Communications Commission Data hosted by the Homeland Infrastructure Foundation-Level Database. Data includes operable bulk petroleum product terminals with a total bulk shell storage capacity of 50,000 barrels or more, and/or the ability to receive volumes from tanker, barge, or pipeline; also rail terminals handling the loading and unloading of crude oil with activity between 2017 and 2018. EIA petroleum product terminal data comes from the EIA-815 Bulk Terminal and Blender Report, which includes working, shell in operation, and shell idle for several major product groupings.

Government Publication Date: Sep 22, 2023

LIEN on Property:

[SEMS LIEN](#)

The U.S. Environmental Protection Agency's (EPA) Superfund Enterprise Management System (SEMS) provides Lien details on applicable properties, such as the Superfund lien on property activity, the lien property information, and the parties associated with the lien.

Government Publication Date: Sep 19, 2023

Superfund Decision Documents:

[SUPERFUND ROD](#)

This database contains a list of decision documents for Superfund sites. Decision documents serve to provide the reasoning for the choice of (or) changes to a Superfund Site cleanup plan. The decision documents include completed Records of Decision (ROD), ROD Amendments, Explanations of Significant Differences (ESD) for active and archived sites stored in the Superfund Enterprise Management System (SEMS), along with other associated memos and files. This information is maintained and made available by the U.S. Environmental Protection Agency.

Government Publication Date: Sep 19, 2023

Formerly Utilized Sites Remedial Action Program:

[DOE FUSRAP](#)

The U.S. Department of Energy (DOE) established the Formerly Utilized Sites Remedial Action Program (FUSRAP) in 1974 to remediate sites where radioactive contamination remained from the Manhattan Project and early U.S. Atomic Energy Commission (AEC) operations. The DOE Office of Legacy Management (LM) established long-term surveillance and maintenance (LTS&M) requirements for remediated FUSRAP sites. DOE evaluates the final site conditions of a remediated site on the basis of risk for different future uses. DOE then confirms that LTS&M requirements will maintain protectiveness.

Government Publication Date: Mar 4, 2017

State

HEER Sites of Interest:

[SHWS](#)

A listing of facilities, sites or areas in which Hazard Evaluation and Emergency Response (HEER) Office has an interest, has investigated, or may investigate under HRS 128D (including CERCLIS sites). This list includes sites for which the SDAR section has an environmental interest, including military sites and older, inactive sites that have insufficient available information to make regulatory determinations about closure. Includes records from the iHEER interactive map viewer made available by the Hawaii Department of Health HEER Office. This database is state equivalent CERCLIS.

Government Publication Date: Aug 11, 2023

Delisted HEER Sites of Interest:

[DELISTED SHWS](#)

This database contains a list of Hazard Evaluation and Emergency Response sites that were removed from the Hawaii Department of Health's Hazard Evaluation and Emergency Response (HEER) Office.

Government Publication Date: Aug 11, 2023

Landfill sites on the Hawaii Islands:

[SWF/LF](#)

A list of active Solid Waste Facilities, Landfills & Transfer Stations on Hawaii Islands. This list has been made available by Hawaii Department of Health Solid and Hazardous Waste Branch.

Government Publication Date: Nov 29, 2023

Leaking Underground Storage Tanks:

LUST

This list of Leaking Underground Storage Tanks (LUST) is made available by the Hawaii Department of Health (DOH), Solid and Hazardous Waste Branch's UST Section/UST Release Response.

Government Publication Date: Jul 17, 2023

Delisted Leaking Underground Storage Tanks:

DELISTED LUST

This database contains a list of closed Leaking Underground Storage Tanks that were removed from the Hawaii Department of Health Solid and Hazardous Waste Branch.

Government Publication Date: Jul 17, 2023

Underground Storage Tanks:

UST

This list of registered Underground Storage Tanks (UST) is made available by the Hawaii Department of Health (DOH), Solid and Hazardous Waste Branch's UST Section.

Government Publication Date: Jul 17, 2023

Delisted Sotrage Tank:

DTNK

This database contains a list of registered Underground Storage Tanks in the state of Hawaii that were removed from the Hawaii Department of Health Solid and Hazardous Waste Branch storage tank database.

Government Publication Date: Jul 17, 2023

Facilities with Engineering Controls:

ENG

A list of sites having Engineering Controls registered with Hazard Evaluation and Emergency Response (HEER) Office. This list has been made available by Hawaii Department of Health HEER Office.

Government Publication Date: Jun 5, 2019

Facilities with Institutional Controls:

INST

A list of sites having Institutional Controls registered with Hazard Evaluation and Emergency Response (HEER) Office. This list has been made available by Hawaii Department of Health HEER Office.

Government Publication Date: Jun 5, 2019

Voluntary Response Program List:

VCP

A list of sites registered under the Voluntary Response Program with the Hazard Evaluation and Emergency Response (HEER) Office. Includes records from iHEER interactive map viewer made available by the Hawaii Department of Health HEER Office.

Government Publication Date: Aug 11, 2023

Brownfields Sites:

BROWNFIELDS

A list of brownfields sites registered with Hazard Evaluation and Emergency Response (HEER) Office in the state of Hawaii. This list has been made available by Hawaii Department of Health HEER Office.

Government Publication Date: Aug 11, 2023

Tribal

Leaking Underground Storage Tanks (LUSTs) on Indian Lands:

INDIAN LUST

This list of leaking underground storage tanks (LUSTs) on Tribal/Indian Lands in Region 9, which includes Hawaii, is made available by the United States Environmental Protection Agency (EPA). There are no federally recognized Tribes in Hawaii, according to the U.S. Department of Interior, Bureau of Indian Affairs.

Government Publication Date: Dec 31, 2017

Underground Storage Tanks (USTs) on Indian Lands:

INDIAN UST

This list of underground storage tanks (USTs) on Tribal/Indian Lands in Region 9, which includes Hawaii, is made available by the United States Environmental Protection Agency (EPA). There are no federally recognized Tribes in Hawaii, according to the U.S. Department of Interior, Bureau of Indian Affairs.

Government Publication Date: Dec 31, 2017

Delisted Tribal Leaking Storage Tanks:

[DELISTED INDIAN LST](#)

Leaking Underground Storage Tank (LUST) facilities which once appeared on - and have since been removed from - the Regional Tribal/Indian LUST lists made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Apr 26, 2023

Delisted Tribal Underground Storage Tanks:

[DELISTED INDIAN UST](#)

Underground Storage Tank (UST) facilities which once appeared on - and have since been removed from - the Regional Tribal/Indian UST lists made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Apr 26, 2023

County

No County standard environmental record sources available for this State.

Additional Environmental Record Sources

Federal

Facility Registry Service/Facility Index:

[FINDS/FRS](#)

The Facility Registry Service (FRS) is a centrally managed database that identifies facilities, sites, or places subject to environmental regulations or of environmental interest. FRS creates high-quality, accurate, and authoritative facility identification records through rigorous verification and management procedures that incorporate information from program national systems, state master facility records, and data collected from EPA's Central Data Exchange registrations and data management personnel. This list is made available by the U.S. Environmental Protection Agency (EPA).

Government Publication Date: Sep 8, 2023

Toxics Release Inventory (TRI) Program:

[TRIS](#)

The U.S. Environmental Protection Agency's Toxics Release Inventory (TRI) is a database containing data on disposal or other releases of toxic chemicals from U.S. facilities and information about how facilities manage those chemicals through recycling, energy recovery, and treatment. There are currently 770 individually listed chemicals and 33 chemical categories covered by the TRI Program. Facilities that manufacture, process or otherwise use these chemicals in amounts above established levels must submit annual reporting forms for each chemical. Note that the TRI chemical list does not include all toxic chemicals used in the U.S. One of TRI's primary purposes is to inform communities about toxic chemical releases to the environment.

Government Publication Date: Oct 19, 2022

PFOA/PFOS Contaminated Sites:

[PFAS NPL](#)

This list of Superfund Sites with Per- and Polyfluoroalkyl Substances (PFAS) detections is made available by the U.S. Environmental Protection Agency (EPA) in their PFAS Analytic Tools data, previously the list was obtained by EPA FOIA requests. EPA's Office of Land and Emergency Management and EPA Regional Offices maintain what is known about site investigations, contamination, and remedial actions under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) where PFAS is present in the environment. Limitations: Detections of PFAS at National Priorities List (NPL) sites do not mean that people are at risk from PFAS, are exposed to PFAS, or that the site is the source of the PFAS. The information in the Superfund NPL and Superfund Alternative Agreement (SAA) PFAS detection site list is years old and may not be accurate today. Site information such as site name, site ID, and location has been confirmed for accuracy; however, PFAS-related information such as media sampled, drinking water being above the health advisory, or mitigation efforts has not been verified. For Federal Facilities data, the other Federal agencies (OFA) are the lead agency for their data and provided them to EPA.

Government Publication Date: Sep 14, 2023

Federal Agency Locations with Known or Suspected PFAS Detections:

[PFAS FED SITES](#)

List of Federal agency locations with known or suspected detections of Per- and Polyfluoroalkyl Substances (PFAS), made available by the U.S. Environmental Protection Agency (EPA) in their PFAS Analytic Tools data. EPA outlines that these data are gathered from several federal entities, such as the Federal Superfund program, Department of Defense (DOD), National Aeronautics and Space Administration, Department of Transportation, and Department of Energy. The dates this data was extracted for the PFAS Analytic Tools range from March 2022 to September 2023. Sites on this list do not necessarily reflect the source/s of PFAS contamination and detections do not indicate level of risk or human exposure at the site. Agricultural notifications in this data are limited to DOD sites only. At this time, the EPA is aware that this list is not comprehensive of all Federal agencies.

Government Publication Date: Sep 5, 2023

SSEHRI PFAS Contamination Sites:

[PFAS SSEHRI](#)

This PFAS Contamination Site Tracker database is compiled by the Social Science Environmental Health Research Institute (SSEHRI) at Northeastern University. According to the SSEHRI, the database records qualitative and quantitative data from each known site of PFAS contamination, including timeline of discovery, sources, levels, health impacts, community response, and government response. The goal of this database is to compile information and support public understanding of the rapidly unfolding issue of PFAS contamination. All data presented was extracted from government websites, news articles, or publicly available documents, and this is cited in the tracker. Locations for the Known PFAS Contamination Sites are sourced from the PFAS Sites and Community Resources Map, credited to the Northeastern University's PFAS Project Lab, Silent Spring Institute, and the PFAS-REACH team. Disclaimer: The source conveys the data undergoes regular updates as new information becomes available, some sites may be missing and/or contain information that is incorrect or outdated, as well as their information represents all contamination sites SSEHRI is aware of, not all possible contamination sites. This data is not intended to be used for legal purposes. Access the following source link for the most current information: <https://pfasproject.com/pfas-sites-and-community-resources/>

Government Publication Date: Oct 9, 2022

National Response Center PFAS Spills:

[ERNS PFAS](#)

This Per- and Poly-Fluoroalkyl Substances (PFAS) Spills dataset is made available via the U.S. Environmental Protection Agency's (EPA) PFAS Analytic Tools. The National Response Center (NRC), operated by the U.S. Coast Guard, is the designated federal point of contact for reporting all oil, chemical, and other discharges into the environment, for the United States and its territories. This dataset contains NRC spill information from 1990 to the present that is restricted to records associated with PFAS and PFAS-containing materials. Incidents are filtered to include only records with a "Material Involved" or "Incident Description" related to Aqueous Film Forming Foam (AFFF). The keywords used to filter the data included "AFFF," "Fire Fighting Foam," "Aqueous Film Forming Foam," "Fire Suppressant Foam," "PFAS," "PERFL," "PFOA," "PFOS," and "Genx." Limitations: The data from the NRC website contains initial incident data that has not been validated or investigated by a federal/state response agency. Keyword searches may misidentify some incident reports that do not contain PFAS. This dataset should also not be considered to be exhaustive of all PFAS spills/release incidents.

Government Publication Date: Sep 23, 2023

PFAS NPDES Discharge Monitoring:

[PFAS NPDES](#)

This list of National Pollutant Discharge Elimination System (NPDES) permitted facilities with required monitoring for Per- and Polyfluoroalkyl (PFAS) Substances is made available via the U.S. Environmental Protection Agency (EPA)'s PFAS Analytic Tools. Any point-source wastewater discharger to waters of the United States must have a NPDES permit, which defines a set of parameters for pollutants and monitoring to ensure that the discharge does not degrade water quality or impair human health. This list includes NPDES permitted facilities associated with permits that monitor for Per- and Polyfluoroalkyl Substances (PFAS), limited to the years 2007 - present. EPA further advises the following regarding these data: currently, fewer than half of states have required PFAS monitoring for at least one of their permittees, and fewer states have established PFAS effluent limits for permittees. For states that may have required monitoring, some reporting and data transfer issues may exist on a state-by-state basis.

Government Publication Date: Nov 27, 2023

Perfluorinated Alkyl Substances (PFAS) from Toxic Release Inventory:

[PFAS TRI](#)

List of Toxics Release Inventory (TRI) facilities at which the reported chemical is a per- or polyfluoroalkyl (PFAS) substance included in the U.S. Environmental Protection Agency's (EPA) consolidated PFAS Master List of PFAS Substances. Encompasses Toxics Release Inventory records included in the EPA PFAS Analytic Tools. The EPA's TRI database currently tracks information on disposal or releases of 770 individually listed toxic chemicals and 33 chemical categories from thousands of U.S. facilities and details about how facilities manage those chemicals through recycling, energy recovery, and treatment.

Government Publication Date: Oct 19, 2022

Perfluorinated Alkyl Substances (PFAS) Water Quality:

[PFAS WATER](#)

The Water Quality Portal (WQP) is a cooperative service sponsored by the United States Geological Survey (USGS), the Environmental Protection Agency (EPA), and the National Water Quality Monitoring Council (NWQMC). This listing includes records from the Water Quality Portal where the characteristic (environmental measurement) is in the Environmental Protection Agency (EPA)'s consolidated Master List of PFAS Substances.

Government Publication Date: Jul 20, 2020

PFAS TSCA Manufacture and Import Facilities:

[PFAS TSCA](#)

The U.S. Environmental Protection Agency (EPA) issued the Chemical Data Reporting (CDR) Rule under the Toxic Substances Control Act (TSCA) and requires chemical manufacturers and facilities that manufacture or import chemical substances to report data to EPA. This list is specific only to TSCA Manufacture and Import Facilities with reported per- and poly-fluoroalkyl (PFAS) substances. Data file is sourced from EPA's PFAS Analytic Tools TSCA dataset which includes CDR/Inventory Update Reporting data from 1998 up to 2020. Disclaimer: This data file includes production and importation data for chemicals identified in EPA's CompTox Chemicals Dashboard list of PFAS without explicit structures and list of PFAS structures in DSSTox. Note that some regulations have specific chemical structure requirements that define PFAS differently than the lists in EPA's CompTox Chemicals Dashboard. Reporting information on manufactured or imported chemical substance amounts should not be compared between facilities, as some companies claim Chemical Data Reporting Rule data fields for PFAS information as Confidential Business Information.

Government Publication Date: Jan 5, 2023

PFAS Waste Transfers from RCRA e-Manifest :

[PFAS E-MANIFEST](#)

This Per- and Poly-Fluoroalkyl Substances (PFAS) Waste Transfers dataset is made available via the U.S. Environmental Protection Agency's (EPA) PFAS Analytic Tools. Every shipment of hazardous waste in the U.S. must be accompanied by a shipment manifest, which is a critical component of the cradle-to-grave tracking of wastes mandated by the Resource Conservation and Recovery Act (RCRA). According to the EPA, currently no Federal Waste Code exists for any PFAS compounds. To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: • PFAS • PFOA • PFOS • PERFL • AFFF • GENX • GEN-X (plus the Vermont state-specific waste codes). Limitations: Amount or concentration of PFAS being transferred cannot be determined from the manifest information. Keyword searches may misidentify some manifest records that do not contain PFAS. This dataset should also not be considered to be exhaustive of all PFAS waste transfers.

Government Publication Date: Oct 11, 2023

PFAS Industry Sectors:

[PFAS IND](#)

This Per- and Poly-Fluoroalkyl Substances (PFAS) Industry Sectors dataset is made available via the U.S. Environmental Protection Agency's (EPA) PFAS Analytic Tools. The EPA developed the dataset from various sources that show which industries may be handling PFAS including: EPA's Enforcement and Compliance History Online (ECHO) records restricted to potential PFAS-handling industry sectors; ECHO records for Fire Training Sites identified where fire-fighting foam may have been used in training exercises; and 14 CFR Part 139 Airports compiled from historic and current records from the FAA Airport Data and Information Portal. Since July 2006, all certificated Part 139 Airports are required to have fire-fighting foam onsite that meet certain military specifications, which to date have been fluorinated (Aqueous Film Forming Foam). Limitations: Inclusion in this dataset does not indicate that PFAS are being manufactured, processed, used, or released by the facility. Listed facilities potentially handle PFAS based on their industrial profile, but are unconfirmed by the EPA. Keyword searches in ECHO for Fire Training sites may misidentify some facilities and should not be considered to be an exhaustive list of fire training facilities in the U.S.

Government Publication Date: Jul 3, 2023

Hazardous Materials Information Reporting System:

[HMIRS](#)

The Hazardous Materials Incident Reporting System (HMIRS) database contains unintentional hazardous materials release information reported to the U.S. Department of Transportation, Pipeline and Hazardous Materials Safety Administration.

Government Publication Date: Mar 6, 2023

National Clandestine Drug Labs:

[NCDL](#)

The U.S. Department of Justice ("the Department"), Drug Enforcement Administration (DEA), provides this data as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy.

Government Publication Date: Jul 26, 2023

Toxic Substances Control Act:

[TSCA](#)

The Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule.

The CDR enables EPA to collect and publish information on the manufacturing, processing, and use of commercial chemical substances and mixtures (referred to hereafter as chemical substances) on the TSCA Chemical Substance Inventory (TSCA Inventory). This includes current information on chemical substance production volumes, manufacturing sites, and how the chemical substances are used. This information helps the Agency determine whether people or the environment are potentially exposed to reported chemical substances. EPA publishes submitted CDR data that is not Confidential Business Information (CBI).

Government Publication Date: Apr 11, 2019

Hist TSCA:

[HIST TSCA](#)

The Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule.

The 2006 IUR data summary report includes information about chemicals manufactured or imported in quantities of 25,000 pounds or more at a single site during calendar year 2005. In addition to the basic manufacturing information collected in previous reporting cycles, the 2006 cycle is the first time EPA collected information to characterize exposure during manufacturing, processing and use of organic chemicals. The 2006 cycle also is the first time manufacturers of inorganic chemicals were required to report basic manufacturing information.

Government Publication Date: Dec 31, 2006

FTTS Administrative Case Listing:

[FTTS ADMIN](#)

An administrative case listing from the Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA) and Toxic Substances Control Act (TSCA), together known as FTTS. This database was obtained from the Environmental Protection Agency's (EPA) National Compliance Database (NCDB). The FTTS and NCDB was shut down in 2006.

Government Publication Date: Jan 19, 2007

FTTS Inspection Case Listing:

FTTS INSP

An inspection case listing from the Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA) and Toxic Substances Control Act (TSCA), together known as FTTS. This database was obtained from the Environmental Protection Agency's (EPA) National Compliance Database (NCDB). The FTTS and NCDB was shut down in 2006.

Government Publication Date: Jan 19, 2007

Potentially Responsible Parties List:

PRP

Early in the site cleanup process, the U.S. Environmental Protection Agency (EPA) conducts a search to find the Potentially Responsible Parties (PRPs). The EPA looks for evidence to determine liability by matching wastes found at the site with parties that may have contributed wastes to the site. This listing contains PRPs, Noticed Parties, at sites in the EPA's Superfund Enterprise Management System (SEMS).

Government Publication Date: Oct 26, 2023

State Coalition for Remediation of Drycleaners Listing:

SCRD DRYCLEANER

The State Coalition for Remediation of Drycleaners (SCRD) was established in 1998, with support from the U.S. Environmental Protection Agency (EPA) Office of Superfund Remediation and Technology Innovation. Coalition members are states with mandated programs and funding for drycleaner site remediation. Current members are Alabama, Connecticut, Florida, Illinois, Kansas, Minnesota, Missouri, North Carolina, Oregon, South Carolina, Tennessee, Texas, and Wisconsin. Since 2017, the SCRCD no longer maintains this data, refer to applicable state source data where available.

Government Publication Date: Nov 08, 2017

Integrated Compliance Information System (ICIS):

ICIS

The Integrated Compliance Information System (ICIS) database contains integrated enforcement and compliance information across most of U.S. Environmental Protection Agency's (EPA) programs. The vision for ICIS is to replace EPA's independent databases that contain enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions and a subset of the Permit Compliance System (PCS), which supports the National Pollutant Discharge Elimination System (NPDES). This information is maintained by the EPA Headquarters and at the Regional offices. A future release of ICIS will completely replace PCS and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities that support compliance and enforcement programs, including incident tracking, compliance assistance, and compliance monitoring.

Government Publication Date: Jan 21, 2023

Drycleaner Facilities:

FED DRYCLEANERS

A list of drycleaner facilities from Enforcement and Compliance History Online (ECHO) data as made available by the U.S. Environmental Protection Agency (EPA), sourced from the ECHO Exporter file. The EPA tracks facilities that possess NAIC and SIC codes that classify businesses as drycleaner establishments.

Government Publication Date: Jul 23, 2023

Delisted Drycleaner Facilities:

DELISTED FED DRY

List of sites removed from the list of Drycleaner Facilities (sites in the EPA's Integrated Compliance Information System (ICIS) with NAIC or SIC codes identifying the business as a drycleaner establishment).

Government Publication Date: Jul 23, 2023

Formerly Used Defense Sites:

FUDS

Formerly Used Defense Sites (FUDS) are properties that were formerly owned by, leased to, or otherwise possessed by and under the jurisdiction of the Secretary of Defense prior to October 1986, where the Department of Defense (DOD) is responsible for an environmental restoration. The FUDS Annual Report to Congress (ARC) is published by the U.S. Army Corps of Engineers (USACE). This data is compiled from the USACE's Geospatial FUDS data layers and Homeland Infrastructure Foundation-Level Data (HIFLD) FUDS dataset which applies to the Fiscal Year 2021 FUDS Inventory.

Government Publication Date: May 15, 2023

FUDS Munitions Response Sites:

FUDS MRS

Boundaries of Munitions Response Sites (MRS), published with the Formerly Used Defense Sites (FUDS) Annual Report to Congress (ARC) by the U.S. Army Corps of Engineers (USACE). An MRS is a discrete location within a Munitions response area (MRA) that is known to require a munitions response. An MRA means any area on a defense site that is known or suspected to contain unexploded ordnance (UXO), discarded military munitions (DMM), or munitions constituents (MC). This data is compiled from the USACE's Geospatial MRS data layers and Homeland Infrastructure Foundation-Level Data (HIFLD) MRS dataset.

Government Publication Date: May 15, 2023

Former Military Nike Missile Sites:

FORMER NIKE

This information was taken from report DRXTH-AS-IA-83A016 (Historical Overview of the Nike Missile System, 12/1984) which was performed by Environmental Science and Engineering, Inc. for the U.S. Army Toxic and Hazardous Materials Agency Assessment Division. The Nike system was deployed between 1954 and the mid-1970's. Among the substances used or stored on Nike sites were liquid missile fuel (JP-4); starter fluids (UDKH, aniline, and furfuryl alcohol); oxidizer (IRFNA); hydrocarbons (motor oil, hydraulic fluid, diesel fuel, gasoline, heating oil); solvents (carbon tetrachloride, trichloroethylene, trichloroethane, stoddard solvent); and battery electrolyte. The quantities of material a disposed of and procedures for disposal are not documented in published reports. Virtually all information concerning the potential for contamination at Nike sites is confined to personnel who were assigned to Nike sites. During deactivation most hardware was shipped to depot-level supply points. There were reportedly instances where excess materials were disposed of on or near the site itself at closure. There was reportedly no routine site decontamination.

Government Publication Date: Dec 2, 1984

PHMSA Pipeline Safety Flagged Incidents:

PIPELINE INCIDENT

This list of flagged pipeline incidents is made available by the U.S. Department of Transportation (US DOT) Pipeline and Hazardous Materials Safety Administration (PHMSA). PHMSA regulations require incident and accident reports for five different pipeline system types. Accidents reported on hazardous liquid gravity lines (§195.13) and reporting-regulated-only hazardous liquid gathering lines (§195.15) and incidents reported on Type R gas gathering (§192.8(c)) are not included in the flagged incident file data.

Government Publication Date: Nov 6, 2023

Material Licensing Tracking System (MLTS):

MLTS

A list of sites that store radioactive material subject to the Nuclear Regulatory Commission (NRC) licensing requirements. This list is maintained by the NRC. As of September 2016, the NRC no longer releases location information for sites. Site locations were last received in July 2016.

Government Publication Date: May 11, 2021

Historic Material Licensing Tracking System (MLTS) sites:

HIST MLTS

A historic list of sites that have inactive licenses and/or removed from the Material Licensing Tracking System (MLTS). In some cases, a site is removed from the MLTS when the state becomes an "Agreement State". An Agreement State is a State that has signed an agreement with the Nuclear Regulatory Commission (NRC) authorizing the State to regulate certain uses of radioactive materials within the State.

Government Publication Date: Jan 31, 2010

Mines Master Index File:

MINES

The Master Index File (MIF) is provided by the United States Department of Labor, Mine Safety and Health Administration (MSHA). This file, which was originally created in the 1970's, contained many Mine-IDs that were invalid. MSHA removes invalid IDs from the MIF upon discovery. MSHA applicable data includes the following: all Coal and Metal/Non-Metal mines under MSHA's jurisdiction since 1/1/1970; mine addresses for all mines in the database except for Abandoned mines prior to 1998 from MSHA's legacy system (addresses may or may not correspond with the physical location of the mine itself); violations that have been assessed penalties as a result of MSHA inspections beginning on 1/1/2000; and violations issued as a result of MSHA inspections conducted beginning on 1/1/2000.

Government Publication Date: May 1, 2023

Surface Mining Control and Reclamation Act Sites:

SMCRA

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by the Office of Surface Mining Reclamation and Enforcement (OSMRE) to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). This inventory contains information on the type and extent of Abandoned Mine Land (AML) impacts, as well as information on the cost associated with the reclamation of those problems. The data is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed. Disclaimer: Per the OSMRE, States and tribes who enter their data into eAMLIS (AML Inventory System) may truncate their latitude and longitude so the precise location of usually dangerous AMLs is not revealed in an effort to protect the public from searching for these AMLs, most of which are on private property. If more precise location information is needed, please contact the applicable state/tribe of interest.

Government Publication Date: Jun 13, 2023

Mineral Resource Data System:

MRDS

The Mineral Resource Data System (MRDS) is a collection of reports describing metallic and nonmetallic mineral resources throughout the world. Included are deposit name, location, commodity, deposit description, geologic characteristics, production, reserves, resources, and references. This database contains the records previously provided in the Mineral Resource Data System (MRDS) of USGS and the Mineral Availability System/Mineral Industry Locator System (MAS/MILS) originated in the U.S. Bureau of Mines, which is now part of USGS. The USGS has ceased systematic updates of the MRDS database with their focus more recently on deposits of critical minerals while providing a well-documented baseline of historical mine locations from USGS topographic maps.

Government Publication Date: Mar 15, 2016

DOE Legacy Management Sites:

LM SITES

The U.S. Department of Energy (DOE) Office of Legacy Management (LM) currently manages radioactive and chemical waste, environmental contamination, and hazardous material at over 100 sites across the U.S. The LM manages sites with diverse regulatory drivers (statutes or programs that direct cleanup and management requirements at DOE sites) or as part of internal DOE or congressionally-recognized programs, such as but not limited to: Formerly Utilized Sites Remedial Action Program (FUSRAP), Uranium Mill Tailings Radiation Control Act (UMTRCA Title I, Title II), Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), Resource Conservation and Recovery Act (RCRA), Decontamination and Decommissioning (D&D), Nuclear Waste Policy Act (NWPA). This site listing includes data exported from the DOE Office of LM's Geospatial Environmental Mapping System (GEMS). GEMS Data disclaimer: The DOE Office of LM makes no representation or warranty, expressed or implied, regarding the use, accuracy, availability, or completeness of the data presented herein.

Government Publication Date: May 25, 2023

Alternative Fueling Stations:

ALT FUELS

This list of alternative fueling stations is sourced from the Alternative Fuels Data Center (AFDC). The U.S. Department of Energy's Office of Energy Efficiency & Renewable Energy launched the AFDC in 1991 as a repository for alternative fuel vehicle performance data, which provides a wealth of information and data on alternative and renewable fuels, advanced vehicles, fuel-saving strategies, and emerging transportation technologies. The data includes Biodiesel (B20 and above), Compressed Natural Gas (CNG), Electric, Ethanol (E85), Hydrogen, Liquefied Natural Gas (LNG), Propane (LPG), and Renewable Diesel (R20 and above) fuel type locations.

Government Publication Date: Aug 30, 2023

Superfunds Consent Decrees:

CONSENT DECREES

This list of Superfund consent decrees is provided by the Department of Justice, Environment & Natural Resources Division (ENRD) through a Freedom of Information Act (FOIA) applicable file. This listing includes Consent Decrees for CERCLA or Superfund Sites filed and/or as proposed within the ENRD's Case Management System (CMS) since 2010. CMS may not reflect the latest developments in a case nor can the agency guarantee the accuracy of the data. ENRD Disclaimer: Congress excluded three discrete categories of law enforcement and national security records from the requirements of the FOIA; response is limited to those records that are subject to the requirements of the FOIA; however, this should not be taken as an indication that excluded records do, or do not, exist.

Government Publication Date: Apr 19, 2023

Air Facility System:

AFS

This EPA retired Air Facility System (AFS) dataset contains emissions, compliance, and enforcement data on stationary sources of air pollution. Regulated sources cover a wide spectrum; from large industrial facilities to relatively small operations such as dry cleaners. AFS does not contain data on facilities that are solely asbestos demolition and/or renovation contractors, or landfills. ECHO Clean Air Act data from AFS are frozen and reflect data as of October 17, 2014; the EPA retired this system for Clean Air Act stationary sources and transitioned to ICIS-Air.

Government Publication Date: Oct 17, 2014

Registered Pesticide Establishments:

SSTS

This national list of active EPA-registered foreign and domestic pesticide and/or device-producing establishments is based on data from the Section Seven Tracking System (SSTS). The Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) Section 7 requires that each producing establishment must place its EPA establishment number on the label or immediate container of each pesticide, active ingredient or device produced. An EPA establishment number on a pesticide product label identifies the EPA registered location where the product was produced. The list of establishments is made available by the U.S. Environmental Protection Agency (EPA).

Government Publication Date: Mar 1, 2023

Polychlorinated Biphenyl (PCB) Transformers:

PCBT

Locations of Transformers Containing Polychlorinated Biphenyls (PCBs) registered with the United States Environmental Protection Agency. PCB transformer owners must register their transformer(s) with EPA. Although not required, PCB transformer owners who have removed and properly disposed of a registered PCB transformer may notify EPA to have their PCB transformer de-registered. Data made available by EPA.

Government Publication Date: Oct 15, 2019

Polychlorinated Biphenyl (PCB) Notifiers:

PCB

Facilities included in the national list of facilities that have notified the United States Environmental Protection Agency (EPA) of Polychlorinated Biphenyl (PCB) activities. Any company or person storing, transporting or disposing of PCBs or conducting PCB research and development must notify the EPA and receive an identification number.

Government Publication Date: Mar 20, 2023

State

Potential PFAS Sites:

PFAS POTENTIAL

A list of sites from the Hazard Evaluation and Emergency Response System (iHEER) that may be investigated for PFAS. This data is made available by the Hawaii Department of Health, HEER Office.

Government Publication Date: Aug 11, 2023

HEER Emergency Response Listing:

[SPILLS](#)

This list of releases reported to and managed by the Emergency Preparedness and Response section of Hazard Evaluation and Emergency Response (HEER) Office, is made available by the Hawaii Department of Health (DOH). The listing also includes spill/release records from the DOH's Environmental Health Administration (EHA) Portal, which provides access to applicable environmental information.

Government Publication Date: Jul 17, 2023

Dry Cleaning Facilities:

[DRYCLEANERS](#)

A list of permitted drycleaner facilities (active and closed) in the state of Hawaii; made available by the Department of Health.

Government Publication Date: May 5, 2021

Delisted Drycleaners:

[DELISTED DRYCLEANERS](#)

List of sites removed the list of permitted drycleaners made available by the Hawaii Department of Health.

Government Publication Date: May 5, 2021

Hazardous Waste Management Facilities:

[HWM](#)

List of facilities under the Hazardous Waste Management program. This information is made available by the Hawaii Department of Health on the Environmental Health Warehouse (EHW) public explorer.

Government Publication Date: Apr 20, 2020

Tribal

No Tribal additional environmental record sources available for this State.

County

No County additional environmental record sources available for this State.

Definitions

Database Descriptions: This section provides a detailed explanation for each database including: source, information available, time coverage, and acronyms used. They are listed in alphabetic order.

Detail Report: This is the section of the report which provides the most detail for each individual record. Records are summarized by location, starting with the project property followed by records in closest proximity.

Distance: The distance value is the distance between plotted points, not necessarily the distance between the sites' boundaries. All values are an approximation.

Direction: The direction value is the compass direction of the site in respect to the project property and/or center point of the report.

Elevation: The elevation value is taken from the location at which the records for the site address have been plotted. All values are an approximation. Source: Google Elevation API.

Executive Summary: This portion of the report is divided into 3 sections:

'Report Summary'- Displays a chart indicating how many records fall on the project property and, within the report search radii.

'Site Report Summary'-Project Property'- This section lists all the records which fall on the project property. For more details, see the 'Detail Report' section.

'Site Report Summary-Surrounding Properties'- This section summarizes all records on adjacent properties, listing them in order of proximity from the project property. For more details, see the 'Detail Report' section.

Map Key: The map key number is assigned according to closest proximity from the project property. Map Key numbers always start at #1. The project property will always have a map key of '1' if records are available. If there is a number in brackets beside the main number, this will indicate the number of records on that specific property. If there is no number in brackets, there is only one record for that property.

The symbol and colour used indicates 'elevation': the red inverted triangle will dictate 'ERIS Sites with Lower Elevation', the yellow triangle will dictate 'ERIS Sites with Higher Elevation' and the orange square will dictate 'ERIS Sites with Same Elevation.'

Unplottables: These are records that could not be mapped due to various reasons, including limited geographic information. These records may or may not be in your study area, and are included as reference.

1.0 INTRODUCTION

This report presents the results of a Phase I Preliminary Hazardous Materials Site Assessment (PSA) conducted by Harding Lawson Associates (HLA) for property located at 170 Ala Moana Boulevard, Honolulu, Hawaii. The property is presently owned by Hawaiian Electric Company, Inc. (HECO), and is occupied by a power generating station. This assessment was authorized by Hawaiian Electric Company, which is considering selling the property.

The purpose of this assessment was to provide information on the Honolulu Power Plant site and surrounding area relative to the potential presence of hazardous/toxic materials on or beneath the property. This evaluation is based on information gathered from federal, state, and local agencies; personal interviews with people familiar with the property; sub-surface soil and water sampling and analysis; and a site visit by HLA personnel.

2.0 SCOPE OF SERVICES

This assessment was authorized by Hawaiian Electric Company, Inc., under HLA's Standard Service Agreement. Project tasks were conducted in accordance with the scope of services presented in our proposal (PW 89-152-06) dated August 31, 1989.

To evaluate the potential impact of hazardous materials on the site, HLA conducted the PSA, which consisted of the following activities:

- Reviewing available documents and aerial photographs related to historical development of the site and adjacent properties;
- Contacting appropriate federal, state, and local regulatory agencies for documented hazardous materials information concerning the site and the study area, defined as the area located within a 1/4-mile radius of the site boundaries;
- Conducting an on-site review and off-site reconnaissance to assess visible evidence of the generation, use, storage, or disposal of hazardous materials;
- Reviewing available reports for information pertaining to soil and ground-water contamination at and in the vicinity of the site;
- Collecting subsurface soil and water samples to check for the presence or absence of leachable metals, petroleum hydrocarbons, or polychlorinated biphenyls (PCBs) beneath the site;
- The HLA evaluation of the potential for soil and/or ground-water contamination at the site and its immediate surroundings was based on above-ground visual observations; and
- Evaluating findings and preparing this report.

3.0 SITE DESCRIPTION

The site, which is currently owned by Hawaiian Electric Company, Inc., is a 149,644-square-foot parcel that is bordered to the north by Bishop Street, to the south by Richards Street, to the west by Ala Moana Boulevard, and to the east by Nimitz Highway. It consists of the parcel of land described by State of Hawaii, Tax Map Key 2-1-14:6.

The site is covered by the Honolulu Power Generating Plant of Hawaiian Electric Company, Inc. (HECO), which provides approximately 20 percent of the power generated on the island of Oahu. The power generating plant facilities include three large concrete-walled structures. The first, at the corner of Ala Moana Boulevard and Bishop Street, is a former generating plant which is now used primarily as offices and repair shop space. It is a four-story, concrete building which housed power generating Units 1 through 7. The second building, at the corner of Bishop Street and Nimitz Highway, is a two-story, concrete structure containing the machine and welding shops and the parts storage and tool issue warehouse. The last major building is a four-story steel-frame, concrete-walled generating station, containing the two current 15-megawatt generating units (8 and 9), and the control room for the power plant. In addition to the major structures, there are two 14,500-barrel fuel tanks and a 975-barrel diesel oil tank inside individual concrete containment walls. In the northeast corner of the site there are two above-ground propane tanks, an above-ground kerosene tank, an outdoor-storage area, and the former site of an underground gasoline storage tank, removed on September 26, 1989. Near the entry gate are an outdoor hydrogen tank storage and dispensing area, a propane tank connected to an emergency generator and a small guard station for entry control. To the east of the current generating building are a pair of demineralized water storage tanks, and tanks of acid and caustic for treating the demineralized water filter beds. On the south end of the site, there is an uncovered switch yard with large power-circuit-switching mechanisms and transformers in rows parallel to the side of the power generating building. The site has

paved parking and service areas between the larger structures and along the east side. The entire two-block site is surrounded by an 8-foot-high wall.

Beneath the site, two fuel supply pipes deliver fuel from the Iwilei Fuel Storage Area; and six pipes to the seawall of Honolulu Harbor provide an inlet/outlet for cooling water.

3.1 Topography

The site is generally flat; the elevation is approximately 3 feet above Mean Sea Level (MSL). Along the western border of the site, a four-lane street separates the site from Honolulu Harbor, near Piers 6 and 7. The city of Honolulu surrounds the other three sides of the site, rising gently as the distance from the ocean increases.

3.2 Geology

Published information regarding the specific geology of the site was available. A 1972 U.S. Department of Agriculture, Soil Conservation Service, report titled, "Soil Survey of the Islands of Kauai, Oahu, Maui, Molokai, and Lanai, State of Hawaii," shows that the site is underlain by Lualualei-Fill land-Ewa association soil, normally well-drained, fine or moderately-fine soils along the coastal plains. The fill is generally material dredged from the ocean, or hauled from nearby excavation areas.

3.3 Hydrology

Local topographic maps of the area indicate that surface drainage of the area in the vicinity of the power plant is through storm sewers with the primary entrances along the edges of streets. On the site, paved swales lead to storm drains. The storm sewers direct water to the shores of Honolulu Harbor adjacent to the site.

Harding Lawson Associates

The regional direction of ground-water flow, according to a U.S. Geological Survey report titled, "Ground-Water Resources in Southern Oahu, Hawaii," is toward the harbor. The ground water is not potable. On-site water supply wells for cooling purposes are on record with the Department of Land and Natural Resources (DLNR). According to the plant manager, the City and County of Honolulu, Board of Water Supply, provides drinking water to the site and immediately surrounding areas. The city of Honolulu obtains its water from basal water wells inland of the site.

Sewage generated at the site is discharged into a sanitary sewer that is connected to a publicly-owned treatment plant operated by the City and County of Honolulu.

Effluent from the cooling systems and demineralization filters is treated in concrete holding tanks in the older power plant building, then diluted to established effluent standards prior to discharge into Honolulu Harbor.

4.0 SITE HISTORY

4.1 Oral and Written History

The original four-story concrete Honolulu electric-power generating station was built approximately on the site of the former coal-fired generating station in the early 1900s. It has a pair of 220-foot-tall stacks. The plant was modernized and the generating capacity increased several times over the years before 1950. Seven different generators and 16 boilers were installed over the years. In 1953, a replacement plant was built (dedication was in 1955) on the block across the former portion of Alakea Street from the original plant. This block was formerly occupied by Army warehouses, a commissary, and a fish market according to the former manager of the plant (DeCorte, 1989). The original plant building was retained for offices, shops, and water treatment.

Originally, brackish ground water was used to cool the generators (Units 1 to 6) at the plant. However, 18 to 20 years ago, all generators were switched to cooling with hydrogen gas. The newer units (7, 8, and 9) were always cooled with hydrogen. However, the plant continues to use ocean water for cooling the condensers (condensing steam for the turbines) and lubricating oil pumps in a once-through system. The discharge of heated water to the ocean is regulated by a National Pollutant Discharge Elimination System (NPDES) Permit.

Demineralizers are used to produce boiler source water (for creating steam) for a closed-loop system into which the demineralized feed water is injected as needed.

Demineralizer and demineralizer process regeneration wastes are treated in a neutralization tank, then pumped to wastewater sumps in the old plant building. The sumps are used to settle suspended solids and to adjust the pH of the effluent to meet NPDES requirements. Approximately once each five years, the solids (sludge) in the bottom of the settling tanks are removed and transported to drying areas. The dry residue is disposed of in a city landfill.

In addition to the demineralizer wastes, the NPDES permit for the plant allows the disposal of occasional low-volume wastes such as boiler cleaning wastes. The various wastes are mixed with the cooling water passing through the plant in compliance with NPDES-allowed rates.

The fuel storage tanks which are now located approximately midway along the eastern side of the site are replacements for 6,000- and 2,000-barrel tanks which formerly existed in the northeast corner open space. A pair of sheds in the same area was demolished in 1952. Each of the three large fuel tanks in the yard was surrounded by a containment wall and an automatic high-level alarm system sometime after a 1969 overflow of one of the tanks into a nearby power cable trench, which overflowed into the storm sewer system. Some of the fuel reached the harbor. The current and the former manager of the plant were aware of the incident, which was prevented from recurring by the walls and alarm/shut-off system (McKenzie, 1989.)

In the past, various grades of diesel fuel were used to fire the boilers providing steam for the turbines in the generators. However, today a low sulfur petroleum product (residual fuel) which resembles a gel in its natural state, is used to prevent noxious emissions from the air stacks above the site. No plume was visible from any of the large stacks on site. A small steam plume was seen occasionally from a smaller (approximately 6-inch) stack through the roof of the new plant.

4.2 Aerial Photographic Record

Historical and current land uses of the site and adjacent areas were also reviewed by examining the changing configuration of the land and the buildings in available aerial photographs. Aerial photographs of the site taken in 1970 and 1988 were available for examination.

In the 1970 photograph, the site and surrounding area appear to be the same as they are currently, except southbound traffic on Ala Moana

Boulevard was routed around the west (ocean) side of the power plant. In addition, the area south of the site, now occupied by the Prince Kūiō Federal Building, was a parking lot, apparently unpaved. Low-rise buildings between Alakea and Bishop Streets were being replaced with the current high-rise structures. On-site, the concrete containment walls had been constructed around each fuel tank. There is no evidence of oil in the shoreline waters.

The 1988 photograph portrays the site as it presently exists. Ala Moana Boulevard/Nimitz Highway had been expanded to within a few feet of the walls on the east side and rerouted around the Federal Building on the south side. High-rise structures dwarf the power plant from across Ala Moana Boulevard. The Pacific Maritime Museum has been constructed on Pier 7 adjacent to the site. There is no evidence of oil in the shoreline waters.

5.0 INVESTIGATION ACTIVITIES AND FINDINGS

HLA investigated both the site and the study area, defined as the off-site area within a radius of approximately 1/4 mile of the site.

5.1 Site Visit

A site visit was conducted by HLA personnel on October 4, 5, and 12, 1989, with Mr. Hugh McKenzie, Jr., plant manager, as an escort, to review areas of potential environmental concern related to the use of hazardous materials at the site. Periods of bright sunlight alternated with heavy rain showers, allowing the visitors to view drainage patterns.

The relatively plain concrete facade and walls of the site and buildings masked a complex network of pipes and processes within an aging power plant. The buildings also contained a large number of hazardous materials, such as acid and caustic tanks, and asbestos. However, there was no visible evidence of spills or leaks of the hazardous substances into the environment.

Mr. McKenzie provided a tour of the buildings and grounds. In the older of the two power plant structures, signs indicated there were asbestos materials present. An ongoing asbestos abatement project was in progress, preventing entry into a largely abandoned area on the north side of the building. The HECO environmental department had provided copies of asbestos removal estimates which totaled nearly \$3,000,000. This included the brick surrounding some of the boilers. HLA was directed not to duplicate the asbestos survey as part of this assessment.

The areas of primary concern within the original building were the first floor of the building and below, where open concrete sumps were used to settle suspended solids from the filter-regeneration effluent from demineralization tanks (in the new structure). Later the effluent is mixed with the condenser cooling water to produce ocean effluent levels in accordance with the NPDES permit. The sumps were originally used to treat potentially hazardous boiler cleaning water. Treatment in the sumps was

replaced by the construction and subsequent operation of Resources Conservation and Recovery Act (RCRA) - exempt wastewater treatment tanks in the newer building. Treated effluents from the treatment tanks are pumped to the sumps for settling of suspended solids.

Although potentially hazardous chemicals (caustics, acids) are being used to produce environmentally acceptable effluents when mixed with the condenser cooling water, there was no visible evidence of chemical wastes being spilled or leaked into the environment.

Tanks of acids and caustics were observed outside the east and north walls of the facility. The acids and caustics are used to adjust the pH of the water to proper operating conditions. Small containers of sulfuric acid were stored near the larger storage tanks. No evidence of spills or leaks was observed or reported.

Along the northern side of the newer building, there is an area for storage and connection of 45 tanks (bottles) of compressed hydrogen gas for correcting flue-gas oxygen concentrations. Again, there were no signs of leaks.

An 800-gallon propane tank near the entry gate provides fuel for the emergency generator a few feet away. There were no signs of leaks.

HLA called the HECO environmental department to verify that the transformers and switch gear observed in the switch-yard south of the plant structures were free of polychlorinated biphenyl (PCB) oil (Fukuda, 1989). HECO records indicated that there were no PCB-oil-containing devices at the Honolulu Power Plant site. However, to assess the potential for past spilled or leaked PCB-containing fluids, each near-surface soil sample from the plant area was analyzed for the presence of PCBs.

There was a maintenance and storage area in the northeast corner of the site which contained six 55-gallon drums of oils and solvents. The containers appeared to be relatively new and in good shape. They were upright and sitting on either a pallet or a paved surface. Two other

drums were installed on a dispensing rack with faucets installed in their bung holes. The northeast corner is also used for storing scrap metals for recycling or disposal. It is also the former site of a single-pump vehicle fueling station. A large section of pavement was missing where an underground storage tank was removed on September 26, 1989. Near the missing pavement, a 500-gallon kerosene tank was mounted on a steel stand about three feet above the ground. There are also 1000-gallon and 500-gallon propane tanks above ground.

The remaining area outside of the buildings consisted of a parking lot within the walls and sidewalks outside the fence. There were dumpsters for removal of trash in the northeast and southeast corners of the site. No odors, discolored soil, stressed vegetation, or other evidence of leaks or spills were found during the site review.

5.2 Study Area Reconnaissance

Reconnaissance of the study area (i.e., the off-site area within a 1/4-mile radius of the site) was performed on October 4, 1989, by HLA personnel. The surrounding area contains high-rise office/apartment structures to the east, a park/parking lot to the north with Aloha Tower and piers for passenger liners and cruise boats further to the north and along the western side of the site. South of the site, beyond a landscaped triangle, is the Prince Kuhio Federal Building. The entire area is maintained as a showplace for the benefit of tourists and residents. There was no surficial evidence of occurrences of contamination. There was no indication of activities which might produce significant amounts of contaminants on or beneath the site.

5.3 Review of Regulatory Agency Records

The discussion presented in this section is based on available information provided by government agencies. In addition to reviewing agency lists that contain general information about sites that have had reported problems with hazardous materials, HLA personnel reviewed agency

Harding Lawson Associates

files for detailed information on sites that appeared on these lists. HLA also contacted agency personnel for information on additional sites that have been identified but have not yet been placed on these lists, or if there are areas of potential environmental concern that may not be covered by the available lists.

5.3.1 Review of Published Regulatory Agency Lists

As part of its assessment of whether there are areas that may pose potential environmental concerns relative to the site, HLA reviewed and evaluated the following regulatory agency lists:

- U.S. Environmental Protection Agency (USEPA) National Priorities List (NPL) for Uncontrolled Hazardous Waste Sites, July 1987 and June 1988.

The NPL provides a list of Federal Superfund sites. No businesses or property in the study area were included on the NPL. There currently are no Hawaiian sites on the NPL.

- USEPA Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS), September 1988.

CERCLIS provides information for businesses or properties that are in the Federal Superfund Program. Under this program, a business or property is identified and a preliminary assessment is performed to assess whether the site shall become a Federal Superfund site.

None of the properties on this list are within the study area. There are no listed properties closer than 1 mile to the site.

- Notification of Underground Storage Tanks Listing of Owners and Operators.

The following underground storage tanks are registered with the Department of Health, Underground Storage Tank Branch, and are within the study area:

Harding Lawson Associates

- Hawaiian Electric Company
Honolulu Generating Station
170 Nimitz Highway
Honolulu, Hawaii
One tank of gasoline (removed in 1989)

Tanks within the basements of structures, such as the many high-rise facilities surrounding the site, do not have to be registered with the Department of Health. HLA does not have knowledge that such tanks exist, but considers it likely that auxiliary power units, with fuel tanks, are installed in some or all of the high-rise structures in downtown Honolulu, which is slightly uphill from the site.

5.4 Subsurface Sampling

Soil samples were collected on October 3 and 4, 1989, using a Mobile Drill model B-40 drilling rig with 6-inch, hollow-stem augers to drill to sampling depth. Then, a split-spoon sampler was driven into the undisturbed soil beneath the augers with a 140-pound drop hammer.

Ground water was sampled on October 10, 1989, following well development on October 9, 1989.

5.5 Sample Collection and Transport

Soil samples were collected in four locations (B-2 through B-5 on Plate 3). At Location B-1, HLA was unable to obtain samples of soil. The material in the boring location appeared to be concrete and asphalt from a former street alignment. In Locations B-2 through B-5, soil samples were collected with a split-spoon (S&H) sampler, approximately 12 to 18 inches below the surface. Soil was scraped into 8-ounce, wide-mouth glass jars with plastic lids and teflon seals using a metal blade. All equipment was decontaminated before sampling with a solution of Alconox detergent and a deionized water rinse. Soil sample jars were placed in an insulated cooler with fresh "blue ice." Soil samples were shipped via air freight to Analytical Technologies Laboratories in San Diego, California, for analysis. Based on boring logs, the site is underlain by approximately 2 feet of artificial fill materials (clays, silts, gravel) over a base of coral fill.

HLA was able to use an existing ground-water well (MW-1) to obtain a sample of ground water. The 17-foot-deep well, a former source of cooling water is now abandoned. Prior to sampling the water, the well was developed by pumping more than three well volumes (700 gallons) of water out of the well. One day later, three more well volumes (831 gallons) were pumped out of the well in six increments. At the completion of each increment, the pH, conductivity, and temperature of the water were measured. Measurements stabilized around a pH of 8.23, a conductivity of 2,720 micromhos per centimeter, and a temperature of 27.0 degrees centigrade. A decontaminated teflon bailer was used to fill three sample containers (40 ml glass, 1-liter glass, and 16-ounce polyurethane) with water from approximately 3 feet deep in the purged well. As the samples were collected, there was no obvious odor, nor visible sediment. The samples appeared clear. However, a slight oily sheen was noted on the surface of the well and within the 11-liter sample bottle. Each sample bottle was prepared with the appropriate acid preservative by the analytical chemistry laboratory prior to shipping the bottles to Hawaii. After capping with plastic/polyethylene lids with teflon liners, the water samples were placed in a chilled shipping container for transport to Analytical Technologies, Inc. laboratory in San Diego, California.

5.6 Discussion of Analytical Results

The soil samples were analyzed for three types of potential contaminants: petroleum hydrocarbons (fuels), polychlorinated biphenyls (PCBs), and volatile organics/solvents. The analytes detected are presented in the table, "Analytic Chemistry Results," on page 16. The full laboratory report is included in the appendix.

Petroleum hydrocarbons (fuel/oil residues) were detected in all five soil samples and in the water sample analyzed for petroleum hydrocarbons. The concentrations in soil ranged from 6 to 1800 mg/kg (ppm). The

smallest concentration at Location B-3 (Plate 3) was very close to the detection limit of 5 ppm and is considered negligible. The other concentrations are considered significant. The greatest concentration, 1300 ppm, was just below the surface near the fuel storage tanks in the area of the reported fuel spill. The concentration detected dropped to 1200 ppm 4 feet further down the same boring (B-4). A concrete water pipe was encountered just below the point of the sample with a concentration of 1200 ppm of hydrocarbons, preventing analysis at deeper points. However, ground water was detected at approximately 7 feet below the surface in a nearby well, indicating that the lower sample in Location B-4 was collected just above ground-water level.

HLA found the concentration of petroleum hydrocarbons detected at Location B-2 (340 ppm) difficult to explain. The location is outside the perimeter fence in a landscaped area next to Ala Moana Road (a former portion of Ala Moana Boulevard which was relocated to the north of the power plant). Colored glass and volcanic glass were reported in the sampled material.

Location B-5 was the former site of fuel tanks for the plant. The concentration of 87 mg/kg petroleum hydrocarbons may reflect an old spill, particularly as no related hydrocarbon compounds were detected in the volatile organics/solvents analysis.

Only 0.09 mg/l of petroleum hydrocarbons were detected in the ground-water sample. The 0.09 mg/l is just above the detection limit for the method used (0.05 mg/l).

No polychlorinated biphenyls (PCBs) were detected in the soil samples. The ground water was not analyzed for PCBs which do not readily enter solutions.

Two other organic chemicals were detected in the samples: toluene and methylene chloride. Both are commonly detected laboratory contaminants. Both were detected in blanks sent through the analysis process with the samples. Acetone, another common laboratory contaminant, was detected in a single blank but not in any of the soil or water samples.

Harding Lawson Associates

The methylene chloride detected in the soil samples approximated the concentration detected in the blanks and is considered a result of laboratory contamination. However, the toluene detected in three soil samples probably reflects a site contaminant, as the concentration is well above that detected in the blank samples. No other analytes were detected in the soil samples.

Barium was detected (0.03 mg/l) in the ground-water sample analyzed for metals. No other metals or organic compounds were detected in the ground-water sample.

Analytic Chemistry Results

6.0 OTHER AREAS OF CONCERN

During the site visit, no suspected asbestos-containing materials (ACM) other than as noted on page 9, were observed in the building on the site.

As required by the National Emission Standards for Hazardous Air Pollutants (NESHAP), suspect ACM must be sampled and analyzed for asbestos content prior to any remodeling, renovation, or demolition activities.

7.0 CONCLUSIONS AND RECOMMENDATIONS

Significant quantities of petroleum hydrocarbons were detected in the soil in the vicinity of a reported 10-year-old fuel spill. The concentrations from location B-4 are significant because they exceed the concentrations which many states have established as action levels. Neither the federal government, nor the State of Hawaii has established standards for the concentrations of petroleum hydrocarbons allowed in soils or ground water.

In the states which have established soils standards, 100 mg/kg is frequently used as an "action level." However, the "action level" is usually negotiable depending on soil conditions, location in respect to drinking water sources, and uses of the site, etc.

However, HLA has found that concentrations above 500 mg/kg usually require action. Some states have established standards for classifying petroleum-contaminated soil as a hazardous waste. For example, California uses 1,000 mg/kg of petroleum hydrocarbons as the lower limit for hazardous waste classification. The concentration in samples from location B-4, near the bulk fuel tanks (1,200 and 1,800 mg/kg), exceed these reference standards. The sample from location B-2, along the curb of Ala Moana Boulevard, outside the perimeter fence (340 mg/kg) is in the range where negotiations are possible. The other sampled areas has smaller concentrations than the limits cited.

Additional borings in the vicinity of the bulk fuel tanks would aid in defining the extent of high concentrations of petroleum hydrocarbons. A systemic search pattern could be developed in which successive sampling locations would be based on the results of previous analyses. An alternative may be to remove or treat some or all the soil above ground water on the site during or after the proposed demolition of the plant structures.

If the state Department of Health (DCH) or the EPA classifies the soil as a hazardous waste, Hawaii does not have a facility which could accept it for off-site disposal. It is possible that an on-site or off-site treatment process could be developed. Permits could be required if the soil is classified as a hazardous waste. For the contaminated soil along Ala Moana Boulevard, HLA recommends working with the DCH regarding the need for remedial action in addition to removal with other demolition debris. The small concentrations of toluene, methylene chloride, and barium detected each are less than 5 percent of the health-based criteria recently published by the EPA (EPA, 1989). The April 1989 criteria lists concentrations of 20,000 mg/kg of toluene and 93 mg/kg of methylene chloride as the health-based criteria for the contaminants in soil.

The 0.03 mg/l of barium in the ground-water sample is well below the federal maximum contaminant level for drinking water, which allows 1.0 mg/l of barium in drinking water.

Although the Honolulu Power Plant site has numerous other containers of hazardous chemicals, no evidence was found that the site had become contaminated as a result of operations employing the chemicals.

8.0 LIMITATIONS

The PSA activities were conducted in accordance with practices and procedures generally accepted in the consulting engineering field. Information presented in this report does not confirm the presence of significant subsurface contamination throughout the property, but indicates that it is present at some locations. HLA's professional judgment to assess the potential for contamination was based on limited data; no other warranty is given or implied by this report. A more extensive assessment that would include a more extensive surface and/or subsurface investigation and additional chemical analyses of soil and/or ground-water samples would provide more definitive information concerning site-specific conditions.

Project Name: Honolulu Power Plant

Project No.: 17153,034.06

Attention: David Manchester

On October 9, 1989, Analytical Technologies, Inc. received five soil samples for analyses. The samples were analyzed with EPA methodology or equivalent methods as specified in the attached analytical schedule. The symbol for "less than" indicates a value below the reportable detection limit. Please see the attached sheet for the sample cross reference.

The results of these analyses and the quality control data are enclosed.

Harding Lawson Associates
803 Kamehameha Highway #404
Pearl City, Hawaii 96782

Project Name: Honolulu Power Plant

Project No.: 17153,034.06

Attention: Ron Soroos

On October 13, 1989, Analytical Technologies, Inc. received one water sample and a trip blank for analyses. The samples were analyzed with EPA methodology or equivalent methods as specified in the attached analytical schedule. The symbol for "less than" indicates a value below the reportable detection limit. Please see the attached sheet for the sample cross reference.

The results of these analyses and the quality control data are enclosed.

1.0 INTRODUCTION

This report presents the results of a Phase I Preliminary Hazardous Materials Site Assessment (PSA) conducted by Harding Lawson Associates (HLA) for the Hawaiian Electric Company, Inc.'s Iwilei fuel storage area located at 855 Nimitz Highway, Honolulu, Hawaii. The property is presently owned by Hawaiian Electric Company, Inc., and is occupied by two large fuel storage tanks and various small support structures. This assessment was authorized by Hawaiian Electric Company, Inc., which is considering selling the property.

The purpose of this assessment was to provide information on the Iwilei fuel storage site and surrounding area relative to the potential presence of hazardous/toxic materials on or beneath the property. This evaluation is based on information gathered from federal, state, and local agencies; personal interviews with people familiar with the property; sub-surface sampling and analysis for petroleum hydrocarbons; and a site visit by HLA personnel.

2.0 SCOPE OF SERVICES

This assessment was authorized under HLA's Standard Service Agreement. Project tasks were conducted in accordance with the scope of services presented in our proposal (PW 89-151-02) dated August 31, 1989.

To evaluate the potential impact of hazardous materials on the site, HLA conducted the PSA, which consisted of the following activities:

- Reviewing available documents and aerial photographs related to historical development of the site and adjacent properties;
- Contacting appropriate federal, state, and local regulatory agencies for documented hazardous materials information concerning the site and the study area, defined as the area located within a 1/4-mile radius of the site boundaries;
- Conducting an on-site review and off-site reconnaissance to assess visible evidence of the generation, use, storage, or disposal of hazardous materials.
- Reviewing available reports for information pertaining to soil and ground-water contamination at and in the vicinity of the site;
- Collecting and analyzing subsurface soil and water samples to verify the presence or absence of petroleum hydrocarbons beneath the site;
- The HLA evaluation of the potential for soil and/or ground-water contamination at the site and its immediate surroundings was based on above-ground visual observations and seven subsurface soil/water samples; and
- Evaluating findings and preparing this report.

3.0 SITE DESCRIPTION

The site, which is currently owned by Hawaiian Electric Company, Inc. (HECO), is a 85,918-square-foot parcel that is bordered to the north by a refrigerated container storage yard and used auto parts warehouse, to the west and south by the entrance road to Piers 31 through 33, and to the east by Nimitz Highway. It is the parcel of land described as State of Hawaii, Tax Map Key 1-5-35:6.

The Iwilei Fuel Storage Area is used to store heavy fuel oil which is used by the boilers in the Honolulu Power Plant in downtown Honolulu. The site includes two 80,000-barrel (bbl) fuel oil storage tanks. The tanks have diameters of approximately 100 and 120 feet and a height of approximately 40 feet. Tank 1 is empty, Tank 2 receives the low sulfur fuel for the Honolulu Power Plant from a pipeline from the Chevron refinery in Ewa Beach. Low sulfur fuel is very thick and must be kept heated to remain fluid. Therefore, the steel plates of Tank 2 have been wrapped with insulation and a corrugated sheet metal outer protective skin. In addition, there is an electric heating system in the tank.

There is a metal lean-to next to each tank covering pumping systems and valves. There are above-ground pipes connecting the two pumping systems to the fuel storage tanks, to a pair of above-ground diesel oil tanks, and to a boiler building outside the containment walls. Near the boiler building and adjacent to Nimitz Highway is an asphalt-paved vehicle parking area. An underground fuel tank for the on-site boilers is located outside the western wall of the boiler building beneath the parking area.

Near the eastern corner of the site, within a chain-link fence along Nimitz Highway, is an abandoned pumping station with exposed water line connections for fire fighting operations.

Each of the large tanks is surrounded by a 16-foot-high concrete containment wall. However, the ground surface within the walls is not paved.

3.1 Topography

The site is generally flat; the elevation is approximately 5 feet above Mean Sea Level (MSL). It is surrounded by land at approximately the same elevation in all directions.

3.2 Geology

Published information regarding the specific geology of the site was available. A 1972 U.S. Department of Agriculture, Soil Conservation Service, report titled, "Soil Survey of the Islands of Kauai, Oahu, Maui, Molokai, and Lanai, State of Hawaii," shows that the site is underlain by Lualualei-Fill land-Ewa association soil, normally well-drained, fine or moderately-fine soils along the coastal plains. Fill is generally material dredged from the ocean, or hauled from nearby excavation areas. Since being deposited, the fill material has become compacted either naturally or prior to overlying construction. There was no evidence of decomposing organic material in the soil samples.

The boring indicated that beneath an asphalt or gravel surface layer, the fill consisted of a sandy, silt with up to 20 percent gravel to about ground-water level. A thin layer of clay beneath was underlain by a silty sand. The bottom of the boring was nine feet below the surface.

3.3 Hydrology

The U.S. Geological Survey publication, Water Resources Data, Hawaii and other Pacific Areas, Water Year 1987, indicates that surface water in the area flows southwest from the Koolau Mountain Range to the ocean in Honolulu Harbor. The Kapalama Drainage Canal, 1/2 mile west, provides a drainage channel for a portion of the city of Honolulu, and the district of Kalihi.

The Nuuanu Stream, 1/4 mile east of the site, provides the primary surface drainage path for the portion of Honolulu within and seaward of Nuuanu Valley.

Honolulu Harbor is within 1/8 mile of the southern boundary of the site. The shore along the piers of Iwilei is isolated from the Pacific Ocean by Sand Island (Plate 2).

The regional direction of ground-water flow, according to a U.S. Geological Survey report titled, Ground-Water Resources in Southern Oahu, Hawaii, flows from the mountains toward the ocean. The ground water, encountered within ten feet below the site, is brackish. Salt water intrusion has been observed in the near-surface ground water throughout the Iwilei district of Honolulu. The brackish water has been used for equipment cooling water by several nearby industries. The near-surface ground water is separated from deeper, basal ground water, over 1000 feet below the site by a layer of caprock.

It is not possible for rain to run off the site from within the containment dikes around the storage tanks. Water must seep into the ground or evaporate. Water was observed to seep into the ground during the rain showers which occurred during the site visit for this assessment. Run-off from the small paved parking area near the entrance off Nimitz Highway is directed to the storm drains along the edge of the street.

The City and County of Honolulu, Board of Water Supply, provides drinking water to the site and surrounding areas. The city of Honolulu obtains its water from basal-water wells a mile or more inland from the site.

No sewage is generated at the site. Sewage generated by nearby facilities is discharged into a sanitary sewer that is connected to a publicly-owned treatment plant operated by the City and County of Honolulu.

5.0 INVESTIGATION ACTIVITIES AND FINDINGS

HLA investigated both the site and the study area, defined as the off-site area within a radius of approximately 1/4 mile of the site.

5.1 Site Visit

A site visit was conducted by HLA personnel on October 4, 1969, to review areas of potential environmental concern related to the use of hazardous materials at the site. The weather on that day was overcast and frequent periods of rainfall interrupted the walk through the site; winds were approximately 5 to 10 miles per hour from the north.

The site was completely enclosed with fences. The predominant structures were Fuel Storage Tanks 1 and 2 (60,000 barrels each). Each of the two bulk fuel storage tanks was surrounded by flat, bare sand or basalt gravel and a 12-foot-high (approximate) concrete containment wall. There were thin layers of petroleum product residues in several places inside each of the containment walls. It appeared that the oil-contaminated soil, in each containment area, could be put into two or three 55-gallon drums. Tank 1 appeared to be made of steel plates covered with a black coating. Surface rust stains were obvious on all sides of the tank. One approximately 20-square-foot oil stain was observed in the containment area around Tank 1. The soil 1 foot beneath the stained area was sampled (S-4).

The steel plates of Tank 2 were covered with corrugated metal panels over an insulating material. Above-ground piping connected the tank through a series of valves to insulated pipes leading to a metal shed. Insulated pipes from the shed led to the east corner of the site. The drawings of the pipeline indicated that the insulated pipes crossed Nimitz Highway underground, and followed the curve of Nimitz Highway for approximately one mile to the Honolulu Power Plant. The above-ground portion of a cathodic protection system for the pipeline was noted on the

containment wall near Tank 1. The Honolulu Power Plant manager confirmed that the entire pipeline from Iwilei to the power plant, as well as the tank systems on both sites, were protected by an induced current cathodic protection system.

Previous episodes of fuel oil spills were reported by the manager of the Honolulu Power Plant. One occurred just inside the vehicle entrance to the site from Nimitz Highway. A Chevron pipeline failed in the soil beneath the site in 1988. He noted that little of the thick fuel escaped into the soil. Soil and ground-water samples were collected near this site (B-1).

A repeated episode occurred when the Chevron fuel line pig was removed from a section of pipe in the containment area of Tank 2. The soil in this area was covered with a thin layer of fuel at the time of our site visit. A sample was collected at a depth of 1 foot at this location (S-2).

In the containment area within Tank No. 2 were two smaller diesel fuel tanks (Nos. 3 and 4). There was no surficial evidence of leakage around either tank.

Several patches of asphalt-like material were noted on the soil near both tanks. This material appeared to be of a type which could be lifted and removed during demolition.

In the vehicle parking area along Nimitz Highway, there was a pre-engineered metal boiler house and pump control station. There was no surficial evidence of leakage or spills around this building.

During the on-site visit, HLA personnel looked for, but did not find, evidence of the following:

- Surface impoundments;
- Water or monitoring wells;

- Visual evidence of surface-water run-on or runoff;
- Treatment or disposal operations of hazardous materials and/or wastes; and
- Odors (may have been masked by rain showers).

5.2 Study Area Reconnaissance

Reconnaissance of the study area (i.e., the off-site area within a 1/4-mile radius of the site) was performed on October 4, 1989, by HLA personnel.

The site is surrounded by many bulk fuel storage tanks in "tank farms" belonging to Chevron, Aloha, Texaco, Shell, and other smaller independent oil companies. Between the site and the harbor are several block-long cargo warehouses of the Department of Transportation, Harbors Division. The site is adjacent to the point where a six-lane portion of Nimitz Highway divides around the facilities of Hilo Hattie and the macadamia nut factory. Across the highway from the site are the facilities of Dole Pineapple, Weyerhaeuser Paper, and Brewer Chemical Company. The remainder of the study area is filled with a variety of industrial facilities.

No vegetation was observed except decorative plantings around Hilo Hattie's and in front of Brewer Chemical. There was an odor of pineapple in the air. No discolored soil or other obvious signs of major surface spills or leaks were noted within the study area. Observations of these properties were made from public streets.

5.3 Review of Regulatory Agency Records

The discussion presented in this section is based on available information provided by government agencies. In addition to reviewing agency lists that contain general information about sites that have had reported problems with hazardous materials, HLA personnel reviewed agency

files for detailed information on sites that appeared on these lists. HLA also contacted agency personnel for information on additional sites that have been identified but have not yet been placed on these lists, or if there are areas of potential environmental concern that may not be covered by the available lists.

5.3.1 Review of Published Regulatory Agency Lists

As part of its assessment of whether there are areas that may pose potential environmental concerns relative to the site, HLA reviewed and evaluated the following regulatory agency lists:

- U.S. Environmental Protection Agency (USEPA) National Priorities List (NPL) for Uncontrolled Hazardous Waste Sites, July 1987 and June 1988.

The NPL provides a list of Federal Superfund sites. No business or property in the study area was included on the NPL. There currently are no Hawaiian sites on the NPL.

- USEPA Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS), September 1983.

CERCLIS provides information for businesses or properties that are in the Federal Superfund Program. Under this program, a business or property is identified and a preliminary assessment is performed to assess whether the site shall become a Federal Superfund site.

Two properties on this list are within the study area. The properties are:

- o Brewer Chemical Company
311 Pacific Street
Honolulu, Oahu, Hawaii 96810
(1/4 mile northeast of the site)
 - o Shell Oil Company
789 Nimitz Highway
Honolulu, Oahu, Hawaii 96801
(Adjacent to the east side of the site)
- Notification of Underground Storage Tanks Listing of Owners and Operators.

Harding Lawson A

The following underground storage tanks are registered with the State of Hawaii, Department of Health, Underground Storage Tank Branch, and are within the study area:

- o Hawaiian Electric Company, Inc.
Iwilei Tank Yard (this site)
855 N. Nimitz Highway
Honolulu, Hawaii
One tank for diesel fuel
- o Brewer Chemical Company
311 Pacific Street
Honolulu, Hawaii
Two tanks
- o Weyerhaeuser Paper Company
900 N. Nimitz Highway
Honolulu, Hawaii
Two tanks
- o Shell Oil Company
Honolulu Plant
789 N. Nimitz Highway
Honolulu, Hawaii
Three tanks
- o Shell Oil Company
Honolulu Asphalt Plant
795 N. Nimitz Highway
Honolulu, Hawaii
Two tanks
- o Honolulu Marine Terminal
Chevron U.S.A.
777 N. Nimitz Highway
Honolulu, Hawaii
One tank
- o Chevron U.S.A.
933 N. Nimitz Highway
Honolulu, Hawaii
Tank removed

The listing does not indicate whether or not the tanks are leaking. Although, the Department of Health has begun to record leaking tanks recently, not all leaking tanks are detected or reported. The shallow, saline water table makes the potential for leaks high in this area.

5.3.2 Other Agency Contacts

In addition to reviewing published regulatory agency lists, HLA also contacted other agencies regarding their knowledge of potential or known environmental concerns at the site and surrounding properties. A list of the agency representatives who were contacted is presented in Appendix A; files and documents that were examined are included in Section 9.0 (Bibliography).

The fire chief at Hickam Air Force Base confirmed that a major fire occurred near the site in the early eighties. He said that the fire occurred at the Chevron fuel storage area a few hundred feet from the site. During the fire, which involved several tanks, several pipe flanges failed, and the authorities were unable to control the flow for approximately one hour. He observed "up to two feet of fuel, including gasoline" in some areas. He was not aware of how long it took to remove the fuel once the fire was extinguished (Cox, 1989).

5.4 Subsurface Investigation

Samples were collected on October 4, 5, 10, and 11. Boring B1 was drilled using a Mobile Drill B-80 drilling machine with 6-inch hollow-stem augers to bore to the approximate depth of sample collection. The remaining samples were collected using hand tools.

5.5 Sample Collection and Transport

Soil samples were collected in four locations (B-1, and S-2 through S-4 on Plate 3). At Location B-1, three distinct samples were collected at approximately 1, 6, and 9 feet below the surface. At Location B-1, the samples were collected with a split-spoon soil sampler

Harding Lawson Associates

driven into undisturbed soil with a 140-pound hammer. Soil from the sampler was scraped into an 8-ounce glass jar with a plastic lid and teflon seal. All equipment was decontaminated with an Alconox solution prior to each sampling episode. Sample jars were placed in an insulated, chilled cooler with new "Blue-Ice." Samples were kept chilled (approximately 4 degrees centigrade) through air-freighting to San Diego, for analysis.

The soil samples from Locations S-2 through S-4 were collected by digging through the surface soil 12 inches with a shovel, then using a stainless-steel trowel to scoop the soil beneath into 8-ounce glass jars until full with slight packing of the soil with the trowel blade. The sample equipment was washed in Alconox prior to collecting each sample. These three samples were chilled and transported to the laboratory with the samples from Location B-1.

A temporary well was constructed by inserting a 10-foot PVC well screen (and 5-foot solid pipe casing) into Boring B-1 to a depth of 14.9 feet below the surface. The water level was measured at 7.68 feet below the surface.

Prior to sampling the water, the temporary well was developed by pumping more than three well volumes of water out of the well. One day later, three more well volumes were pumped out of the well in eight increments. At the completion of each increment, the pH, conductivity, and temperature of the water were measured. The measurements stabilized around a pH of 7.56, a conductivity of 1301 micromhos, and a temperature of 33.1 degrees centigrade.

The ground-water samples were collected by lowering a teflon 100 ml bailer into the developed and purged well approximately 6 inches below the surface. Water collected was poured into glass containers (which contained preservatives added by the laboratory). The water samples were placed in a chilled shipping container with blue-ice for transport to San Diego, via air freight.

5.6 Discussion of Analytical Results

The soil samples were analyzed for two types of potential contaminants, petroleum hydrocarbons (EPA Method 418.1) and 35 volatile organic compounds (EPA Method 8240). Petroleum hydrocarbons were detected in all six soil samples, as shown on the table, "Analytical Chemistry Results," on page 17. The complete laboratory reports are presented in Appendix B. The highest concentrations of petroleum hydrocarbons were detected in samples from Boring B-1, near the site of the reported pipeline leak. A concentration of 510 mg/kg (ppm) was detected in the near-surface samples, and 2,300 mg/kg (ppm) was detected at approximately the elevation of ground water (6 feet deep). Small concentrations were found in the near-surface samples from Locations S-2, S-3, and S-4, beneath visible fuel spill residues.

No petroleum was detected floating on the water surface during sampling. Very small concentrations (0.63 ppm) of petroleum hydrocarbons were detected in ground water. This low value supports the presence of petroleum hydrocarbons in soil, and the apparent absence on the ground-water surface.

Toluene, a component of some lighter, petroleum-based product, and 2-butanone (MEK), a solvent, were detected in the near-surface sample from Boring B1 at concentrations of 0.54 and 3.3 mg/kg, respectively.

Toluene was also detected in the near-surface sample from Location S-2 at a concentration of 0.4 ppm. Neither toluene or MEK are normally associated with the heavy fuels stored on the site. The low levels detected may be either laboratory contaminants or residuals from other petroleum products which may have spilled into the soil. We noted that a small amount of toluene was detected in each of the reagent blanks analyzed with the soil samples from this site. However, if we assume that all the toluene and MEK represent actual contaminants in the soil, the amounts detected are well below the recently published "health-based criteria for systemic toxicants" (EPA, 1988), 20,000 and 4,000 mg/kg, respectively. The methylene chloride detected in the three reagent blanks is a common laboratory contaminant which was not detected during the analysis of any of the samples from the site.

6.0 OTHER AREAS OF CONCERN

During the site visit, suspected asbestos-containing materials (ACM) were observed in the insulation beneath the metal jacket on the above-ground piping along the western boundary of the site. The ACM material was observed in an exposed area of pipe undergoing maintenance. The piping reportedly belongs to Chevron, U.S.A., which provides the fuel to the storage tank from the Chevron refinery at Campbell Industrial Park. The metal jacket appears to provide a solid covering over the friable ACM insulation, protecting the environment from fiber releases. A second area of asbestos-containing materials was the wall and roof material of the boiler building. It is a non-friable type of asbestos-cement panel, known in the industry as transite.

The insulation on the above-ground piping belonging to HECO did not appear to be asbestos. The manager at the Honolulu Power Plant confirmed that the insulation had been checked and found to be made from non-asbestos-containing materials. He also indicated that the insulation around Tank 2 was not an asbestos-containing material.

As required by the National Emission Standards for Hazardous Air Pollutants (NESHAP), suspect ACM must be sampled and analyzed for asbestos content prior to any remodeling, renovation, or demolition activities. No disassembly of fuel lines was performed during the site investigation. It is likely that the gaskets in the heated fuel lines contain asbestos fibers if the gaskets are more than 10 years old.

One underground fuel tank (UST), containing fuel for the boilers, was seen next to the boiler building. The drawings of the site indicate the tank may be more than twenty years old. The tank is scheduled for removal before December 22, 1989.

7.0 CONCLUSIONS AND RECOMMENDATIONS

The asbestos insulation on the above-ground fuel supply pipes along the western boundary of the site poses little hazard. The asbestos is usually completely covered with sheet-metal jacketing. The small area of internal insulation viewed during the site visit was exposed as a result of a maintenance action since completed. The insulation must be removed in accordance with NESHAP standards prior to removing the pipes from the site.

There is an undetermined amount of petroleum beneath the site. The samples were collected in areas of suspected fuel leaks and therefore may reflect only the residual chemicals from the former spill or leak. However, the site is located in an area which has over 100 large bulk fuel storage tanks, including two heavy fuel and two diesel tanks on the property. HLA has consistently found petroleum products in the subsurface in other nearby locations. It is likely there is some concentration of petroleum hydrocarbons beneath more of the site than the areas sampled.

The highest concentrations of petroleum hydrocarbons detected are significant. Neither the federal government nor the State of Hawaii have established standards for allowable concentrations of petroleum hydrocarbons in soil or water. States which have established standards for petroleum hydrocarbons in soil frequently use 100 mg/kg as an "action level." The "action level" is usually negotiable depending on soil type, nearness to drinking water sources, and uses of the site, etc. However, HLA has found that concentrations above 500 mg/kg always require action. Some states have established standards for classifying soil as a hazardous waste. For example, California uses 1,000 mg/kg of petroleum hydrocarbons as the lower limit for hazardous waste classification. Some of the samples from this site exceed the reference standards cited above.

Additional sampling of the soil, particularly near the water table would provide a clearer picture of the extent of contamination. It is doubtful that, even with additional sampling, the source(s) of the contamination could be established.

8.0 LIMITATIONS

The PSA activities were conducted in accordance with practices and procedures generally accepted in the consulting engineering field. Information presented in this report does not confirm the presence of significant subsurface contamination throughout the property, but indicates that there is a likelihood that it is present. Our professional judgment in assessing the potential for contamination was based on limited data; no other warranty is given or implied by this report. A comprehensive assessment that would include a more extensive surface and/or subsurface investigation and chemical analyses of soil and/or ground-water samples, would provide more definitive information concerning site-specific conditions.

Project Name: Iwilei Fuel Storage Area

Project No.: 17153,033.06

Attention: David Manchester

On October 9, 1989, Analytical Technologies, Inc. received six soil samples for analyses. The samples were analyzed with EPA methodology or equivalent methods as specified in the attached analytical schedule. The symbol for "less than" indicates a value below the reportable detection limit. Please see the attached sheet for the sample cross reference.

The results of these analyses and the quality control data are enclosed.

Harding Lawson Associates
803 Kamehameha Highway #404
Pearl City, Hawaii 96782

Project Name: Iwilea Storage Area

Project No.: 17153,033.06

Attention: Ron Soroos

On October 13, 1989, Analytical Technologies, Inc. received two water samples for analyses. The samples were analyzed with EPA methodology or equivalent methods as specified in the attached analytical schedule. The symbol for "less than" indicates a value below the reportable detection limit. Please see the attached sheet for the sample cross reference.

The results of these analyses and the quality control data are enclosed.

Appendix D-12 Release Report Form

Purpose of this form: This form is to be completed by HART's Contractor that encountered/observed the release during construction. If an environmental release occurs notification is required. See Section 6.0 of the EHMP for more information.

RELEASE INFORMATION

HDOH Release Identification #: 20230406-0903 AT

Name and Affiliation of Person Completing Form: Jennifer Cruz / FVCC

Date and time: 04/14/23 2:40 pm

INCIDENT INFORMATION

Date and time of the incident: 04/05/23 10:30 pm

Weather at time of incident:

Temperature: 79 degrees Sunny Partly Cloudy Rainy Wind (Direction/Speed):

Damage to Structures: Yes (No) Catastrophic Release (e.g., fire, explosion): Yes (No) Other:

Types of environmental release (please check all that applies):

- Hydrocarbon sheen on surface water or groundwater
- Any amount of free product observed
- Discovery of a potentially hazardous material, including contaminated soil and or groundwater
- Any visual evidence of contamination (e.g., staining, ash, asphalt, construction debris, illegal dumping)
- Any olfactory evidence of contamination or a PID reading >10 ppm
- Any amount of oil >25 gallons released to the environment and not contained with 72 hours
- Other: Black Fuel/Oil

Media into which the release occurred or is likely to occur (Indicate all those that apply):

Air Soil Groundwater Stream Ocean Other: _____

Does this incident require initiation of Stop Work procedures? Yes / No

Name (trade and chemical) of the hazardous substance released: Black Fuel/Oil from abandoned 12" fuel line

Approximate quantity of the hazardous substance released: Less than a gallon

Location of release:

GPS Coordinates: -21.18245, 157.51496

TMK Number: _____

Address: Nimitz Hwy & Bishop Street Intersection

Describe how the incident occurred including the potential source:

Existing Abandoned 12" Fuel Line to be removed, approximately 7' below grade surface. A pocket of residual fuel leaked out of the 1" hole, less than a gallon of oil leaked out into surrounding excavation

Field Measurements:

Ambient PID reading
(ppm): _____

Headspace PID reading
(ppm) and depth interval:

Other: _____

Duration of the release: Less than 5 minutes

RESPONSE INFORMATION

Describe corrective actions taken to eliminate the source of the release:

Fuel Oil & affected contaminated materials were contained and disposed by Unitek who was currently on site abating the asbestos on the existing pipe. Pipe was temporarily plugged and PCS was on site Wednesday 04/12/23 & 04/13/23 to tap existing line and extract residual fuel/oil.

Reuse in Work Area:

- Groundwater reinjected/reinfiltrated within work area where generated? Yes/No
- Soil returned to excavation? Yes/No

Temporary Storage Details:

- Volume of soil stored: n/a cubic yards
- Volume of water stored: n/a cubic yards
- Location of stored stockpiles/containers/tanks: n/a
- Contaminated stockpiles segregated and labeled in accordance with EHMP? Yes/No n/a
- Stockpiles/containers stored in accordance with EHMP? Yes/No n/a

NOTIFICATION INFORMATION

Name	Phone
HART POC (Caller) Name: <u>Cori Pietrangelo</u>	808-225-9807
HART POC Name: _____	
HART Health and Safety Manager Name: <u>Dave Goeres</u>	801-635-8681
On-Site Construction POC Name: <u>Wai Yi Ng</u>	808-371-9165
Property Owner Name: _____	

List the names of other federal, state, or local government agencies that have been notified of the release:

HDOH HEER, HDOT

HEALTH INFORMATION

Was there any immediate danger to life and/or health posed by the release? Yes/No

Known or anticipated acute health risks:

- Was PPE used properly? Yes/No
- Was the workspace atmosphere monitored for dust and vapors? Yes/No
- Was HART's H&S Contractor consulted? Yes/No

Known or anticipated chronic health risks:

- Was PPE used properly? Yes/No
- Was the workspace atmosphere monitored for dust and vapors? Yes/No
- Was HART's H&S Contractor consulted? Yes/No

Was advice regarding medical attention necessary for exposed individuals? Yes/No

Potential impacts to public health or welfare:

- Is the release in a residential area? Yes/No
- Is the release in a commercial area? Yes/No

- Is the release below the surface? Yes/No
- Is the release covered with asphalt, cement, or vegetation? Yes/No

Potential impacts to the environment:

- Is the release less than 150 meters from surface water? Yes/No
- Is the release below the surface? Yes/No
- Is the release within groundwater? Yes/No
- Is the release covered with asphalt, cement, or vegetation? Yes/No

FOLLOW-UP INFORMATION REQUIRED:

Information to be submitted to HDOH:

- Limited reuse/waste characterization sample analytical results
- Soil disposition information including volume of soil reused, location of reused soil, volume of soil disposed of at a permitted off-site facility, and location of the permitted off-site facility
- Groundwater disposition information including volume of water disposed of at a permitted off-site facility and location of the permitted off-site facility

Check the box for information attached to this form:

- Photographs
- Maps
- Laboratory data
- Other: _____

1.0 Introduction

The Honolulu Authority for Rapid Transportation (HART) contracted CH2M HILL (CH2M) to perform Phase II Environmental Site Assessment (ESA) activities for the area where the Downtown Station (also known as Kuloloia Station) will be constructed along the 20-mile corridor of the Honolulu Rail Transit Project (HRTTP) (Figure 1-1). Within this area, the site under assessment includes both the mountainward (*mauka*) and oceanward (*makai*) portions of the station, as well as the locations of the shaft that will be drilled within the site boundary to install the guideway and station columns. This report covers the Phase II ESA conducted at the Downtown Station Makai Lot (also referred to as the site), in a portion of the Honolulu Power Plant property currently owned and operated by the Hawaiian Electric Company (Hawaiian Electric). The site occupies an approximately 9,778 square foot area within a portion of Tax Map Key (TMK) 2-1-014-006, located at 170 Aloha Tower Drive, Honolulu, Hawaii, 96813.

Phase I ESAs conducted at the site in the past identified environmental concerns and the need for further investigation. A Phase II ESA was therefore conducted between August and October 2020 in accordance with the Project Work Plan (HART, 2019), the State of Hawaii Department of Health (HDOH) *Technical Guidance Manual for the Implementation of the Hawaii State Contingency Plan* (TGM) (HDOH, 2008 and subsequent updates), and the methodology required by the American Society for Testing and Materials (ASTM) *Standard E1903-11 Practice for Environmental Site Assessments: Phase II Environmental Site Assessment Process* (ASTM, 2011). For the design and implementation of this Phase II ESA, HART applied for and obtained a grant from the U.S. Environmental Protection Agency (USEPA) Brownfields Section (Grant ID# 99T63501); therefore, the Project Work Plan was reviewed and approved by both HDOH and USEPA.

This report describes the activities and results of the Phase II ESA investigation conducted at the Downtown Station Makai Lot between August and October 2020.

1.1 Project Objectives and Scope

To identify and delineate the extent of potential contamination identified during previous assessments, a Phase II ESA was conducted at the site from August through October 2020. The specific objectives of the Phase II ESA included the following:

- Evaluate the potential presence of contamination in the unsaturated soil (vadose zone), groundwater, and soil vapor at the site.
- Evaluate soil and groundwater management options ahead of construction.
- Describe the conceptual site model (CSM), to identify potential sources, receptors, and exposure pathways.
- Assess risk to current and future potential receptors.
- Identify the areas and volumes of contaminated soil and groundwater potentially requiring remedial actions.

To meet the site characterization objectives, the following main activities were conducted at the site:

- Land surveying and utility clearance.
- Drilling and soil sampling.
- Installation of temporary monitoring wells and groundwater sampling.
- Installation of soil vapor probes and soil vapor sampling.

- Laboratory analysis.

1.2 Document Organization

Following this introductory section, this report is structured as follows:

- **Section 2.0, Project Background**, provides a description of the site, a summary of the history, previous relevant investigations conducted at the site and its vicinity, and a brief discussion on the applicable regulatory framework and environmental action levels (EALs).
- **Section 3.0, Site Characterization Activities and Results**, describes the investigation activities conducted at the site, outlines deviations from the Project Work Plan, and summarizes the results.
- **Section 4.0, Updated Conceptual Site Model and Environmental Hazard Evaluation**, presents the CSM and evaluates the potential environmental hazards posed by chemicals of potential concern (COPCs) detected above the HDOH unrestricted Tier 1 EALs during the Phase II ESA investigation.
- **Section 5.0, Environmental Hazard Management Plan**, describes soil and soil vapor management options to address areas and volumes where unacceptable risks or hazards were identified during the environmental hazard evaluation (EHE).
- **Section 6.0, Summary of Results and Recommendations**, summarizes activities and results of the Phase II ESA investigation and provides recommendations to manage contaminated soil and soil gas at the site.
- **Section 7.0, References**, lists documents used or referred to during the preparation of this report.

Figures, tables, and appendixes are provided following the text and present the following supporting information:

- **Appendix A, Site Historical Information and Aerial Photographs**, includes relevant information that helps to better understand history of the site and past investigation results.
- **Appendix B, Photo Log**, provides representative photographs from the Phase II ESA activities.
- **Appendix C, Field Forms**, includes relevant field forms (for example, boring logs, well construction diagram, groundwater purging logs, and soil vapor sampling log).
- **Appendix D, Site Release Report**, provides the release report submitted to the HDOH Hazard Evaluation and Emergency Response (HEER) office to notify the regulatory agency that grossly impacted soil was observed in the subsurface during the Phase II ESA activities.
- **Appendix E, Laboratory Reports**, includes the laboratory reports for soil, groundwater, and soil vapor sample analyses. *[Because of the large size of the files, the lab reports will only be provided electronically on CD-ROM.]*

2.0 Project Background

A general description, history, and information on the environmental characteristics of the site are provided in Section 2.1. A brief summary of geology and hydrogeology (Section 2.2), previous investigations (Section 2.3), and the regulatory framework (Section 2.4) are also provided to establish the basis for the Phase II ESA activities discussed in Sections 3.

2.1 Site Description, History, and Land Use

The Downtown Station Makai Lot is located within the downtown Honolulu urban area on the northern corner of the Hawaiian Electric Honolulu Power Plant property (Figure 1-1). The site occupies approximately 9,778 square feet of the plant, which totals an area of 149,644 square feet. The Honolulu Power Plant is located at 170 Aloha Tower Drive, Honolulu, Hawaii, 96813 within TMK 2-1-014-006, and is bound to the north by Bishop Street, to the south by Richards Street, to the west by Aloha Tower Drive, and to the east by Ala Moana Boulevard.

The Honolulu Power Plant dates back to 1893, when Hawaiian Electric purchased lots at Alakea and Halekauwila for construction of a new plant to supply electricity to Honolulu customers in accordance with the 10-year franchise granted by the Hawaiian Government on May 3, 1893. The Hawaiian Electric complex at Alakea began operations in 1894, and contained two boilers, two steam engines (150 horsepower [hp] and 200 hp), a 2,000 light Thompson-Houston alternating-current generator, and two 720 light Edison dynamos (U.S. Department of Interior, 2017). The 1894 Hawaiian Electric complex occupied half of the block bound by Halekauwila Street to the northeast, Kilauea Street to the Northwest, Allen Street to the Southwest, and Alakea Street to the Southeast (see Sanborn Maps in Appendix A). In the early 1900s, electricity was primarily used for lighting, with demand almost exclusively confined to the few hours before dawn and evening. An important milestone was reached in May 1909, when Hawaiian Electric first established daytime service (U.S. Department of Interior, 2017). Over the subsequent years, electric services extended throughout the day and across the island. With increasing electricity demand, the need for a larger plant arose and in 1920 Hawaiian Electric completed the first expansion of its 1894 plant to house three new 10,000-kilowatt units (Honolulu Power Plant Units 1, 2, and 3). Further expansions and modernizations continued between the 1930s and the 1950s, in response to increasing electric use in the downtown area and throughout the island.

Throughout the years, the boilers at the Honolulu Power Plant were fired with different types of oils (for example, Bunker C oil and low sulfur fuel oil) that were stored in aboveground storage tanks (ASTs) within the property, including the Downtown Station Makai Lot site boundaries. ASTs and associated pipelines containing fuel oil are known to have been present within the Hawaiian Electric property between 1906 and 1956 (HART, 2020). Other oil-filled equipment, such as electrical transformers, were stored on the property at various times during the operational history of the power plant. As evident from the Sanborn maps and historical aerial photographs of Appendix A, two large fuel oil ASTs (6,000 and 2,000 barrels) were present within the site boundaries between the 1920s and 1950s. Other fuel ASTs and underground storage tanks (USTs), as well as water tanks were present within the site boundary in the past.

The site will be used to construct the *makai* portion of the Downtown Station. Available construction design drawings indicate that the station technical building, pedestrian walkway bridge column, and an elevator shaft will be built within the site boundaries (Figure 1-1). Therefore, the site is used and will continue to be used as a commercial industrial (C/I) area.

2.2 Area Geology and Hydrogeology

According to the *Soil Survey of the Islands of Kauai, Oahu, Maui, Molokai, and Lanai, State of Hawaii* conducted by the U.S. Department of Agriculture (USDA, February 2021), the general area of the Downtown Station Makai Lot is underlain by Lualualei-Fill land-Ewa association soil. This material is characterized by deep, nearly level to moderately sloping, well-drained soils that have fine or moderately fine textured subsoil or underlying material, and areas of fill land along the coastal plains (USDA, 1972). As further discussed in Section 3.3, the shallow subsurface soil beneath the site is characterized by mixed fill material down to approximately 6 to 10 feet below ground surface (bgs); the native unconsolidated soil beneath the fill consists of a relatively thin layer of volcanic cinder underlain by coralline sand and gravel down to maximum t_{re} investigated depth of 20 feet bgs.

The site groundwater is within the Nuuanu aquifer system of the Honolulu sector and is characterized by a sedimentary, unconfined basal aquifer overlaying a confined basal aquifer occurring in horizontally extensive lavas (Mink and Lau, 1990). The upper aquifer is not considered a potential drinking water source while the lower aquifer is (Mink and Lau, 1990). The upper aquifer has moderate salinity (that is, with 1,000 to 5,000 milligrams of chloride per liter of water [mg/L Cl⁻]) and a high susceptibility to contamination and the lower aquifer has low salinity fresh water (that is, less than 250 mg/L Cl⁻) with low susceptibility to contamination (Mink and Lau, 1990). Groundwater beneath the site is found at approximately 6 to 7 feet bgs and flows southwest, toward the Honolulu Harbor.

The site is *makai* of the HDOH Safe Drinking Water Branch underground injection control (UIC) line, which means the underlying aquifer is not considered a potential source for drinking water. The Hawaii Administrative Rules Section 4 defines the UIC line as the boundary between nondrinking water aquifers and underground sources of drinking water. Aquifers *makai* of the line are not considered drinking water sources; those located *mauka* are considered potential sources of drinking water.

The closest surface water to the site is Honolulu Harbor, approximately 250 feet (75 meters) to the southwest.

2.3 Summary of Previous Investigations

Previous investigations conducted at the site include the Phase I Preliminary Hazardous Materials Site Assessment (HLA, 1989) and Phase I Environmental Site Assessment for the HART City Center Section, Honolulu, Oahu, Hawaii, “Appendix G-46, Phase I Environmental Site Assessment for Property TMK 2-1-014-006” (HART, 2020). Both Phase I ESAs recommended further assessment to be conducted at the site. The following paragraphs summarize the findings of those investigations.

Phase I Preliminary Hazardous Materials Site Assessment (HLA, 1989): Assessment of the entire 149,644-square-foot Hawaiian Electric Honolulu Power Plant property (inclusive of the 9,778 square feet of the site) included limited soil and groundwater sampling. Based on the analytical results, “significant quantities of petroleum hydrocarbons were detected in the soil...” and barium detections in the groundwater were “well below the federal maximum contaminant level for drinking water” at 0.03 mg/L (HLA, 1989). Environmental concerns were documented within and in the vicinity of the site, including two fuel storage tanks located within the Hawaiian Electric property, but outside of the Downtown Station Makai Lot; a 1969 release of fuel from a bulk storage tank located approximately 200 feet east of the Hawaiian Electric property; the removal of a UST in September 1989 (documented in the HDOH UST records as a 1,000-gallon gasoline tank permanently out of use within the site boundaries; see Figure in Appendix A); and three ASTs consisting of a 500-gallon kerosene tank, one 1,000-gallon propane tank, and a 500-gallon propane tank (see Figure in Appendix A). Additionally, two fuel supply pipelines were referenced beneath the TMK though not specifically noted to be within the footprint of the Downtown Station Makai Lot.

The 1987 Phase I ESA concluded that because of the unconsolidated nature of the site lithology there was potential for downward migration of petroleum hydrocarbon contamination, which may have been impacting groundwater at the site.

Phase I ESA (HART, 2020): Several recognized environmental conditions (RECs) were observed in the HART Phase I ESA that indicated potential groundwater concerns and numerous nearby release sites likely or potentially affecting the Downtown Station Makai Lot. Several RECs were identified in the report, as summarized in the figure included in Appendix A. Information concerning the following releases or evidence of releases was included in the interview questionnaire:

- 1) 1,000 gallons Fuel Oil #6, February 14, 1996 (release report No. 19960214-1545);
- 2) 50 gallons of turbine oil, February 18, 1997 (19970218-1413)
- 3) 35 gallons fuel oil, April 15, 1998 (19980415-0845)
- 4) Oil sheen at seawater intake, July 8, 2004 (20040708-0700)
- 5) 10 gallons of guzzler hydraulic fluid, October 24, 2011 (20111024-1407)
- 6) 1.5 ounces of mercury, July 31, 2014 (20140731-1317)
- 7) Petroleum and polychlorinated biphenyl- (PCB-) impacted soil (PCB voluntarily cleaned up under 40 *Code of Federal Regulations* § 761.50(b)(3)) identified in the northwestern portion of the site, March 21, 2016 (20160321-1015)

Based on available information including past site usage, previous sample results, and releases surrounding the subject site, the following comprehensive list of the COPCs was identified for the site in the Project Work Plan (HART, 2019):

- Volatile organic compounds (VOCs)
- Total petroleum hydrocarbons (TPH), gasoline-range organics (TPH-g); TPH, diesel-range organics (TPH-d); and TPH, oil-range organics (TPH-o)
- Semivolatile organic compounds (SVOCs)
- Pesticides
- PCBs
- Resource Conservation Recovery Act (RCRA) 8 metals

2.4 Regulatory Framework and Environmental Action Levels

The HDOH HEER Office is the lead regulatory agency overseeing the assessment of the site. As mentioned in Section 1.1, HART obtained a grant from the USEPA Brownfields Section for this Phase II ESA; although it is also a stakeholder involved in this project, USEPA defers to HDOH for investigation and closure requirements.

To meet regulatory standards and requirements, Phase II ESA activities were conducted in general accordance with the Project Work Plan (HART, 2019), the HDOH TGM (HDOH, 2008 and subsequent updates), and the *ASTM Standard E1903-11 Practice* (ASTM, 2011).

In the *HEER Evaluation of Environmental Hazards at Sites with Contaminated Soil and Groundwater* guidance document (HDOH, 2017), HDOH provides EAL tables organized to reflect three default CSMs for contaminated sites in Hawaii based on land use (for example, unrestricted or C/I), groundwater utility (that is, nondrinking water source or potential drinking water source), and proximity to a surface water body with potentially sensitive aquatic life (that is, greater than or less than 150 meters from

surface water). Because the site is *makai* of the UIC line and is within 150 meters (that is, within approximately 500 feet) from surface water, the HDOH site-specific EALs applicable for the Downtown Station Makai Lot are those for C/I sites located within 150 meters from surface water, where drinking water is not threatened (DWNT) (HDOH, 2017). These EALs are applicable for soil and groundwater remaining onsite under current use. If land use changes (for example, to residential use), the site-specific EALs will need to be re-evaluated. If soil is reused outside of the take areas within the H RTP rail corridor, C/I EALs will still apply but distance and location with respect to the UIC line and surface water will need to be considered to select the appropriate EALs. Unrestricted Tier 1 criteria will apply if soil is reused outside of the rail corridor. 

To evaluate all possible exposure scenarios, investigation results will be screened against both the HDOH unrestricted Tier 1 and site-specific EALs. The HDOH HEER Office and the HDOH Solid and Hazardous Waste Branch provide regulatory oversight as part of management of the COPCs identified at the site and for waste disposal associated with upcoming construction activities.

3.0 Site Characterization Activities and Results

This section summarizes activities and results for the Phase II ESA conducted at the Downtown Station Makai Lot between August and October 2020. All activities were conducted in general accordance with the Project Work Plan (HART, 2019), with a few exceptions described in Section 3.6. A summary of the sampling activities conducted at the site is included in Table 3-1, while a more detailed description of the Phase II ESA activities and relative results are provided in the subsections herein. Supporting documentation is provided in Tables 3-2 through 3-8, Figures 3-1 through 3-4, and Appendixes B through E.

As mentioned in Section 1.1, Phase II ESA activities were deemed necessary to evaluate the presence and extent of COPCs, describe the CSM, and evaluate contaminated media management options ahead of construction. To meet these objectives, the following activities were conducted at the Downtown Station Makai Lot during the Phase II ESA:

- Pre-investigation activities
- Land surveying and utility clearance
- Drilling and soil sampling activities
- Temporary monitoring well installation and groundwater sampling
- Temporary soil vapor points installation and sampling
- Laboratory analysis
- Demobilization

3.1 Pre-investigation Activities

Pre-investigation activities included coordinating site access, obtaining required permits, completing site-specific training, mobilizing, and conducting site reconnaissance to identify site boundaries, mark planned boring and sampling locations, and set up work areas.

Work and site access were coordinated with HART and Hawaiian Electric. The following are descriptions of specific tasks:

- A right-of-entry agreement between Hawaiian Electric and CH2M was signed to allow CH2M staff and its subcontractors to access the site.
- The HART Cultural Planning office confirmed that archaeological monitoring was necessary; therefore, cultural and archaeological monitors were present during all intrusive investigation activities. No significant cultural or archaeological resources were observed.
- Because the site is on a power plant facility, Hawaiian Electric required stormwater pollution prevention training for all field crew. All field workers and potential substitutes completed the training before the start of investigation activities.

Clearances, necessary permits, and agency approvals were obtained before initiating any intrusive activity. This included contacting the Hawaii One Call Utility Locating Center, to identify outside underground utilities leading to the site boundaries.

3.2 Land Surveying and Utility Clearance

A professional land surveying company licensed in Hawaii (RM Towill) was contracted to conduct a land survey before starting any intrusive work. The purpose of this survey was to approximately locate existing underground utilities and structures based on existing maps, and identify the corners of the multi incremental sampling (MIS) decision unit (DU) and the locations of the temporary well and soil vapor points to be installed in accordance with the Project Work Plan. Survey equipment used included a Nikon ETM-522 and Spectra precision laser.

Third-party, independent utility toning was also conducted by GeoTek Hawaii, to confirm underground utility locations and clear planned intrusive work areas using geophysical equipment. The contractor used electromagnetic and ground-penetrating radar (GPR) equipment (for example, a Noggin SmartCart GPR system and wand). Utilities (electrical, water, stormwater, and fuel lines) and underground structures, including an abandoned in-place concrete water tank, an underground concrete water tank, and an area with heavy rebar corresponding to the location of a former gasoline UST and associated pipeline that were removed in 1989 (HLA, 1989), were identified and marked during utility toning (Figure 3-1). Investigation point locations were moved as necessary to maintain a clearance of at least 6 feet in all directions from existing utilities and underground structures. As further discussed in Section 3.6, the presence of underground and aboveground utilities and structures limited access to certain portions of the site.

3.3 Drilling and Soil Sampling Activities

Drilling and sampling activities were conducted at the Downtown Station Makai Lot in August 2020, to evaluate the nature and extent of potential contamination identified during previous studies, assess risk to current and future potential receptors, and evaluate disposal and management options for soil that may be excavated during future construction. Samples were collected using an MIS approach. Figure 3-1 illustrates the site sampling locations.

The site was divided into three lateral DUs. Each DU was further subdivided into multiple vertical DU layers to meet the Project Work Plan requirements (HART, 2019). The scope of MIS for soil characterization included sampling and laboratory analysis down to the capillary fringe and soil observations to confirm the presence and extent of fill material. As further discussed in Section 3.6, deviations to the original plan were necessary to delineate presence of gross contamination at depths greater than the capillary fringe.

One MIS soil sample was generally collected from 30 increment/boring locations within each vertical DU layer (Table 3-1). Drilling was conducted using a direct-push rig, switching to a hollow-stem auger where necessary, except for the top 2 feet bgs where hand augering was conducted for safety reasons (that is, minimizing risk of striking underground utilities). Immediately after extraction of the core at each increment location, the soil was quickly screened for visual, olfactory, and field evidence of contamination (for example, staining, odor, and elevated VOC readings using a field-portable photoionization detector [PID]), and a photograph was taken before increment subsamples were collected. Representative photos and detailed boring logs are provided in Appendixes B and C, respectively.

A graphical, simplified representation of the site lithology is provided in the cross section of Figures 3-2a through 3-2d. Beneath the 4 to 6 inches of asphalt/concrete pavement, the site shallow subsurface lithology consists of the following:

- Mixed fill material, consisting of silt, sand, and gravel with occasional debris, down to approximately 6 to 9 feet bgs. In the central portions on the site, the bottom of the fill is characterized by the

presence of grossly impacted soil (black, medium sand), with light non-aqueous phase liquid (LNAPL), staining, petroleum hydrocarbon odor, and elevated PID readings (for example, VOCs greater than 10 parts per million [ppm]). The presence of grossly impacted soil was reported to the HDOH HEER office (see release report No. 20200821-0955LG in Appendix D). Approximately 0.5 to 1 foot of basalt cobbles (surge rock) was present beneath the grossly impacted soil.

- Native soil, consisting of up to approximately 2 feet black volcanic cinder and coralline sand and gravel beneath the mixed fill down to maximum investigated depths of 20 feet bgs. Discontinuous thin layers of fine-grained material (clay) are found at some locations between the fill and the volcanic cinder.

Within each vertical DU layer at each of the 30 soil increment/boring locations in a lateral DU, the following general sampling procedure for volatile and nonvolatile analyses were used:

- Volatile analyses (VOCs and TPH-g): A dedicated 5-gram Terracore sampler was used to collect two increment subsamples within each vertical DU layer (approximately 10 grams per increment) to form one 300-gram MIS sample.
- Nonvolatile analyses: A dedicated 5-gram sampler was pushed multiple times within each vertical DU layer to collect increment subsamples to form a bulk MIS sample of approximately 1 kilogram. The increment subsamples were placed directly into 1-gallon resealable plastic bags.

Because of the presence of grossly impacted soil and/or drilling refusal, MIS soil samples within vertical DU layers S001G, S002G, S001H, S002H, and S001I of DU DS02 were composed from a number of increments less than 30, and soil samples from vertical DU layer S001I from DUs DS01 and DS03 were collected as discrete samples because of the limited number of borings that could be pushed deeper than 9 feet bgs without hitting refusal (see Section 3.6 for more details).

Soil samples were stored in coolers using proper preservation methods (methanol for volatile samples and wet ice for nonvolatile samples) and shipped to APPL Labs, in Clovis, California for VOC, TPH, SVOC, pesticide, PCB, and metal analyses (Table 3-2). Because the surface at the site is entirely paved with asphalt or concrete, surface soil samples (vertical DU layer S001A, 0 to 1 feet bgs) were analyzed for the entire suite of chemicals, including volatiles.

-  Laboratory results for MIS soil samples are presented in Table 3-3 and summarized on Figures 3-2a through 3-2d, and 3-3 (which include only concentrations above the HDOH EALs). Replicate MIS sets were collected within the 5- to 6-foot-vertical DU layer (S001F, S101F, and S201F) of DU DS01; and the 4- to 5-foot-vertical DU layer (S001E, S101E, and S201E) of DU DS02. Concentrations above HDOH unrestricted Tier 1 and/or site-specific EALs are reported for VOCs, TPH-d, TPH-o, polynuclear aromatic hydrocarbon (PAHs), and lead in the following DU and vertical DU layer:

- DU DS01 
 - **Tetrachloroethane (PCE)** concentrations up to 0.19 milligrams per kilogram (mg/kg), above the HDOH unrestricted Tier 1 EAL of 0.098 mg/kg in vertical DU layers S001A (0 to 1 feet bgs), S001B (0 to 2 feet bgs), and S001C (2 to 3 feet bgs).
 - **TPH-d** concentrations up to 3600 mg/kg, above the HDOH unrestricted Tier 1 EAL of 220 mg/kg in vertical DU layers S001C (2 to 3 feet bgs) and S001E (4 to 5 feet bgs); and above the HDOH site-specific EAL of 683 mg/kg in vertical DU layer S002H (7.5 to 9 feet bgs; that is, within the shallow aquifer).
 - **TPH-o** concentrations up to 6500 mg/kg, above the HDOH unrestricted Tier 1 EAL of 500 mg/kg in vertical DU layers S001C (2 to 3 feet bgs), S001D (3 to 4 feet bgs), S001E (4 to 5

- feet bgs), and S001F (5 to 6 feet bgs); and above the HDOH site-specific EAL of 1,500 mg/kg in vertical DU layer S002H (7.5 to 9 feet bgs; that is, within the shallow aquifer).
- **1-Methylnaphthalene** concentrations up to 2.1 mg/kg, above the HDOH site-specific EAL of 0.89 mg/kg in vertical DU layer S002H (7.5 to 9 feet bgs; that is, within the shallow aquifer).
 - **Lead** concentrations up to 255 mg/kg, above the HDOH unrestricted Tier 1 EAL of 200 mg/kg in vertical DU layer S001A (0 to 1 feet bgs).
- DU DS02
 - **1,2-Dichloroethane (DCA)** concentrations up to 0.056 mg/kg, above the HDOH unrestricted Tier 1 EAL of 0.023 mg/kg in vertical DU layer S002G (6 to 7.5 feet bgs).
 - **Acetone** concentrations up to 2.4 mg/kg, above the HDOH site-specific EAL of 1 mg/kg in vertical DU layers S002G (6 to 7.5 feet bgs) and S002H (7.5 to 9 feet bgs; that is, within the shallow aquifer).
 - **PCE** concentrations up to 0.26 mg/kg, above the HDOH unrestricted Tier 1 EAL of 0.098 mg/kg in vertical DU layers S001C (2 to 3 feet bgs) and S001E (4 to 5 feet bgs).
 - **TPH-d** concentrations up to 4,200 mg/kg, above the HDOH unrestricted Tier 1 EAL of 220 mg/kg in vertical DU layers S001G (6 to 7.5 feet bgs) and S001H (7.5 to 9 feet bgs; that is, within the shallow aquifer); and above the HDOH site-specific EAL of 683 mg/kg in vertical DU layers S002G (6 to 7.5 feet bgs) and S002H (7.5 to 9 feet bgs).
 - **TPH-o** concentrations up to 7,400 mg/kg, above the HDOH unrestricted Tier 1 EAL of 500 mg/kg in vertical DU layers S001E (4 to 5 feet bgs), S001F (5 to 6 feet bgs), and S001G (6 to 7.5 feet bgs); and above the HDOH site-specific EAL of 1500 mg/kg in vertical DU layers S002G (6 to 7.5 feet bgs), and both S001H and S002H (7.5 to 9 feet bgs; that is, within the shallow aquifer).
 - **1-Methylnaphthalene** concentrations up to 3.7 mg/kg, above the HDOH site-specific EAL of 0.89 mg/kg in vertical DU layer S002H (7.5 to 9 feet bgs; that is, within the shallow aquifer).
 - **Benzo[a]anthracene** concentrations up to 23 mg/kg, above the HDOH site-specific EAL of 10 mg/kg in vertical DU layer S001E (4 to 5 feet bgs).
 - **Benzo[a]pyrene** concentrations up to 34 mg/kg, above the HDOH site-specific EAL of 5.9 mg/kg in vertical DU layer S001E (4 to 5 feet bgs).
 - **Benzo[b]fluoranthene** concentrations up to 44 mg/kg, above the HDOH unrestricted Tier 1 EAL of 11 mg/kg in vertical DU layer S001E (4 to 5 feet bgs).
 - **Dibenzo[a,h]anthracene** concentrations up to 5 mg/kg, above the HDOH unrestricted Tier 1 EAL of 1.1 mg/kg in vertical DU layer S001E (4 to 5 feet bgs).
 - **Indeno[1,2,3-c,d]pyrene** concentrations up to 23 mg/kg, above the HDOH unrestricted Tier 1 EAL of 11 mg/kg in vertical DU layer S001E (4 to 5 feet bgs).
 - **Pyrene** concentrations up to 51 mg/kg, above the HDOH site-specific EAL of 44 mg/kg in vertical DU layer S001E (4 to 5 feet bgs).
 - **Lead** concentrations up to 261 mg/kg, above the HDOH unrestricted Tier 1 EAL of 200 mg/kg in vertical DU layer S001A (0 to 1 feet bgs).
 - DU DS03

- **PCE** concentrations up to 0.45 mg/kg, above the HDOH unrestricted Tier 1 EAL of 0.098 mg/kg in vertical DU layer S001A (0 to 1 feet bgs).
- **TPH-d** concentrations up to 2,800 mg/kg, above the HDOH site-specific EAL of 683 mg/kg in vertical DU layer S002H (7.5 to 9 feet bgs; that is, within the shallow aquifer).
- **TPH-o** concentrations up to 4,400 mg/kg, above the HDOH site-specific EAL of 1,500 mg/kg in vertical DU layer S002H (7.5 to 9 feet bgs; that is, within the shallow aquifer).
- **1-Methylnaphthalene** concentrations up to 20 mg/kg, above the HDOH site-specific EAL of 0.89 mg/kg in vertical DU layer S002H (7.5 to 9 feet bgs; that is, within the shallow aquifer).
- **Naphthalene** concentrations up to 7.5 mg/kg, above the HDOH site-specific EAL of 3.1 mg/kg in vertical DU layer S002H (7.5 to 9 feet bgs; that is, within the shallow aquifer).

Two replicate sets were collected in DU DS01 and DS02 (vertical DU layers F and E, respectively). The relative standard deviation (RSD) was calculated for detected chemicals and is shown in Table 3-4. As evident from Table 3-4, RSD values are generally below 50% showing good precision and confirming that the sampling method used was adequate to capture and reflect small-scale heterogeneity of chemical distribution within the DUs and the error in the laboratory processing and analysis methods was generally low. In some cases (for example, PAHs in replicate sample set collected in DU DS02, vertical DU layer E) the RSD is above 50% (and in three cases above 100%) possibly because of a small fraction of fill material high in PAHs (for example, asphalt) that made it into the triplicate sample (that is, concentrations in sample DS02-S201E-0820 are much higher than in the other two samples of the replicate set). To address the uncertainty on the PAH data, mean concentrations are not calculated and samples with the highest concentrations are considered for decision making (for example, in the EHE and environmental hazard management plan [EHMP] evaluations).

Toxicity characteristic leaching procedure (TCLP) was also performed for samples with total concentrations 20 times higher than the TCLP limit. Because total concentrations were within the same order-of-magnitude and below site-specific action levels, soil samples for TCLP analysis were composited as follows:

- Composite from samples DS01-S001A-0820, DS01-S001B-0820, DS01-S001C-0820, DS01-S001D-0820, DS01-S001E-0820, and DS01-S101F-0820 – tested for TCLP lead.
- Composite from samples DS02-S001C-0820, DS02-S201E-0820, DS02-S001F-0820, and DS02-S001G-0820 – tested for TCLP lead and chromium total.
- Composite from samples DSCOL-S001A-0820 and DSCOL-S001B-0820 – tested for TCLP lead.

As shown in Table 3-5, TCLP concentrations on TCLP results were mostly not detected. Only lead was detected in composite sample from DU DS01, but the concentration was well below the TCLP regulatory standard of 5 mg/L.

3.4 Temporary Monitoring Well Installation and Sampling

After MIS soil sampling was completed, one temporary monitoring well (TW01) was installed in DU DS01 (Figure 3-1) on August 24, 2020, to evaluate the potential impact to groundwater, assess risk to current and future potential receptors, and evaluate groundwater disposal and management options should dewatering be needed during future construction. Temporary well TW01 was installed at the northeastern boundary of the site, upgradient of the grossly impacted area.

The well consisted of a new 1.5-inch polyvinyl chloride (PVC) piping with a 10-foot prepack screen section set across the water table from 4.5 to 14.5 feet bgs, (see well completion diagram in Appendix C). The screening interval was chosen to be 4.5 to 14.5 feet bgs, to be set approximately 3 feet

above and 12 feet below the water table per the Project Work Plan (groundwater in this portion of the site is at approximately 7 feet bgs). The annular space of the well was completed with Monterey #3 sand up to 2 feet above the well screen and hydrated bentonite (pellets or tablets) to the surface. After installation, the well was developed by surging and pumping.

 Three of the existing onsite permanent monitoring wells were also selected for sampling to cover the entire site. Monitoring well MW02 was selected within DU DS01 and is representative of the grossly impacted area. Monitoring well MW03 was selected within DU DS02 and is located crossgradient of the grossly impacted area. Monitoring well MW06 was selected within DU DS02 and is representative of downgradient locations.

Sampling was conducted on August 31, 2020, at the newly installed temporary well and the three existing permanent monitoring wells using low-flow sampling techniques. Samples collected for volatiles were recollected on October 13, 2020 because the laboratory did not analyze the samples collected on August 31, 2020 within the 14-day holding time.

Before sampling, the wells were inspected for tampering and evidence of gross contamination. The wells were in good condition and no LNAPL, petroleum sheen, or odor were observed. Purging was then initiated at a rate of approximately 100 to 200 milliliters per minute, with groundwater quality parameter readings taken at 3-minute intervals, until water quality parameters stabilized within specific criteria identified in the Project Work Plan (HART, 2019).

After purging and stabilization of parameters, samples were collected from the monitoring wells, stored in coolers with ice, and shipped to APPL Labs for VOCs, TPH, SVOCs (including PAHs), PCBs, pesticides, and RCRA 8 metals analyses (Table 3-6). A field duplicate sample was collected at the crossgradient well MW03.

Laboratory  results for groundwater samples are presented in Table 3-7. The only COPCs detected are metals (arsenic, barium, cadmium, and lead), but concentrations are below the HDOH unrestricted Tier 1 EALs.

3.5 Soil Vapor Monitoring Point Installation and Sampling

Soil vapor sampling was conducted at the site to evaluate potential vapor intrusion pathways within the footprint of future station structures. Two temporary soil vapor monitoring points were installed within DU DS01, within the footprint of the future building of the Downtown Station Makai Lot, where vapor intrusion concerns could potentially be present.

Both soil vapor monitoring probes, SG01 and SG02, were installed at approximately 4.5 feet bgs, above the capillary fringe, and consisted of a 6-inch stainless-steel vapor probe set within a 18-inch sand filter pack (that is, 6 inches of sand above and below the vapor probe). Teflon tubing (1/4-inch outside diameter) was used to connect the vapor probe to the surface, and the annular space above the filter pack was sealed with hydrated bentonite.

One 2-hour soil vapor sample was collected at each soil vapor monitoring point, with a field duplicate collected from SG01. Samples were analyzed for TPH-g, methane, and VOCs (Table 3-8). Results are provided in Table 3-9. Carbon tetrachloride, ethyl acetate, PCE, and trichloroethylene are the only COPCs detected, but only PCE is above the HDOH site-specific EAL. PCE concentrations are up to 2,200 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$), above the HDOH unrestricted Tier 1 EAL of $920 \mu\text{g}/\text{m}^3$, but well below the HDOH site-specific Tier 1 EAL of $8,000 \mu\text{g}/\text{m}^3$.

3.6 Deviations from the Project Work Plan

As summarized in Table 3-1 and previously discussed, because of unexpected field conditions and presence of underground or surface structures, the investigation plan outlined in the Project Work Plan (HART, 2019) was modified during the implementation. The deviations from the Project Work Plan are summarized as follows:

- **Investigation Areas** – Site access for intrusive activities was limited by the presence of underground and surface structures (see investigated areas in Figure 3-1). Underground structures limiting access included a reinforced concrete pad located in the middle portion of DU DS-02, where an AST was present in the past, and two water USTs located in the eastern portion of DU DS-01 and the southern portion of DU DS-02. Surface structures included a machine shop located in the eastern portion of the site and four small storage sheds in the northern and western portion of the site. Because of these access constraints, the area accessible for intrusive activities was approximately 1,600 square feet (that is, about 62 percent of the total) in DU DS-01 and approximately 4,800 square feet (that is, about 69 percent of the total) DU DS-02. Despite the limited access, the originally planned sampling approach supported by additional data and historical information provide a sound foundation for the CSM of the Downtown Station site.
- **Multi Increment Sampling** – The investigation strategy outlined in the Project Work Plan (HART, 2019) included dividing each DU into five, 1-foot vertical DU layers to collect 30-increment MIS soil samples down to the capillary fringe (expected approximately at 5 feet bgs) within DUs DS-01 and DS-02, and two, 10-foot vertical DU layers within DU DS-03. This sampling approach was built on the assumption that environmental hazard evaluation within the aquifer would be evaluated through groundwater analysis. However, groundwater depth across the site was slightly deeper than expected (6 to 7 feet bgs). In addition, while sampling in DU DS-03, grossly impacted soil was observed within the saturated zone. Grossly impacted soil was characterized by the presence of LNAPL, staining, odor, and/or elevated PID VOC readings. To evaluate risk to future construction workers and fully delineate nature and extent of fill material and grossly impacted soil, four additional vertical DU layers were added to collect MIS soil samples within the saturated zone. The additional layers were as follows:
 - S001F (5 to 6 feet bgs) – Vertical DU layer representative of the capillary fringe.
 - S001G (6 to 7.5 feet bgs) – Vertical DU layer representative of the capillary fringe-shallow aquifer.
 - S001H (7.5 to 9 feet bgs) - Vertical DU layer representative of the shallow aquifer depth where fill and grossly impacted soil were observed at several boring/increment locations across the site.
 - S001I (10 to 11 feet bgs) - Vertical DU layer representative of the native coralline sand and gravel within the shallow aquifer.

Grossly impacted soil was mainly observed in vertical DU layer S002H (7.5 to 9 feet bgs) and occasionally in layer S002G (6 to 7.5 feet bgs), and was mainly concentrated in DU DS-01 (all increment/boring locations except four) and the central portions of DU DS-02. To avoid biasing samples, grossly impacted increment/boring locations within layers G and H were kept separate (samples S002G and S002H) from increment/boring locations that did not show field evidence of contamination (samples S001G and S001H). In addition, because refusal was encountered at approximately 9 feet bgs at most of the increment/boring locations across the site, soil within layer S001I (10 to 11 feet bgs) could only be collected at a limited number of locations. As a

result of this, the following samples were composed from a limited number of increments or from discrete locations (see Figure 3-1):

- DS02-S001G-0820 (no field evidence of gross contamination) – 27 increments (all boreholes except for 12, 20, and 21)
- DS02-S002G-0820 (some field evidence of gross contamination) – 3 increments (boreholes 12, 20, and 21)
- DS02-S001H-0820 (no field evidence of gross contamination) – 16 increments (boreholes 1, 2, 3, 4, 7, 8, 9, 10, 11, 14, 23, 24, 25, 26, and 28)
- DS02-S002H-0820 (field evidence of gross contamination) – 14 increments (boreholes 5, 6, 12, 13, 15, 16, 17, 18, 19, 20, 21, 27, 29, and 30)
- DS01-S001I-0820 (no field evidence of gross contamination) – discrete¹ sample (boreholes 21, 22, 23, 24, and 25)
- DS02-S001I-0820 (no field evidence of gross contamination) – 7 increments (boreholes 7, 14, 22, 23, 24, 26, and 28)
- DSCOL-S001B-0820² (no field evidence of gross contamination) – 10 increments (borehole 3)
- DS03-S002H-0820 (field evidence of gross contamination) - discrete sample (boreholes 1 and 2)

Despite the lower number of increments, these saturated zone samples are believed to be representative of field conditions and allowed collecting additional valuable data for vertical delineation, evaluation of sources, and better estimate of grossly impacted soil volumes.

- **Monitoring Wells** – The Project Work Plan (HART, 2019) included the installation of three temporary monitoring wells to evaluate groundwater conditions beneath the site. Because six permanent monitoring wells already existed onsite and were confirmed to be in good condition, only one temporary well was installed. The existing wells were all located within or downgradient of the grossly impacted areas. Therefore, the temporary well was installed at the upgradient boundary of the site (see well TW-01 in Figure 3-1) and it was sampled together with 3 of the existing wells (MW-02 and MW-03 within/crossgradient of grossly impacted areas, and MW-06 at the downgradient boundary of the site and outside of the grossly impacted area).

3.7 Demobilization

After soil, groundwater, and soil vapor sampling activities were completed, equipment and material were decontaminated and demobilized from the site. Boreholes were abandoned with soil cuttings from the same DU, with hydrated bentonite and cement grout at the surface. No grossly impacted soil was returned to the site as it was used for sampling activities and sent to the laboratory for analysis. Small volumes of water were generated during purging and decontamination activities. Because no LNAPL was observed in groundwater and concentrations were below the HDOH unrestricted Tier 1 EALs, purging and decontamination water was re-infiltrated onsite in the vicinity of the wells. After drilling and sampling activities were completed, the site was cleaned up and final site conditions documented (see photo log in Appendix B).

¹ Discrete samples were composed of multiple subsamples collected along the specific sample interval from one or a limited number of boreholes (that is, insufficient number of boreholes/volume of soil to collect an MIS sample).

² Samples labeled with prefix “DSCOL-” are from DU DS03.

Temporary well and soil vapor probe abandonment will be scheduled to occur in the near future and coordinated with Hawaiian Electric. Temporary wells will be abandoned by removing the PVC casing and screen (or destroying it if the casing breaks during removal) and filling the borehole with a bentonite-cement mix in accordance with the HDOH TGM (HDOH, 2008 and subsequent updates) and the Project Work Plan (HART, 2019). Soil vapor probes will be pulled from the ground and any portion of the borehole remaining open will be sealed with cement-bentonite grout. The top 4 to 6 inches will be repaired to match surrounding pavement.

This page is intentionally left blank.

4.0 Updated Conceptual Site Model and Environmental Hazard Evaluation

This section presents the CSM for the Downtown Station Makai Lot. This updated CSM is based on new data available from the site investigations conducted at the site from August through October 2020. A site-specific EHE is also provided to evaluate potential hazards associated with chemical concentrations detected in subsurface soil and soil vapor at the site.

4.1 Conceptual Site Model

An updated CSM for the site has been developed based on the results of the investigation conducted from August through October 2020. The elements of the CSM are described in the following sections. The CSM is graphically represented on Figure 4-1.

4.1.1 Site Land Use

As discussed in Section 2.1, the site is in a C/I area. Because HART plans to construct the *makai* portion of the Downtown Station within the property boundaries, the use of the site is and will remain C/I for the foreseeable future.

4.1.2 Chemicals of Potential Concern

As discussed in Section 13.5.1 of the HDOH TGM (HDOH, 2008 and subsequent updates), if the representative concentration of a chemical does not exceed the respective HDOH unrestricted Tier 1 EAL, then it can be reasonably assumed the chemical does not pose a significant human or environmental hazard. If the HDOH unrestricted Tier 1 EAL is exceeded, then additional evaluation of that chemical is warranted. Chemicals that exceed the HDOH unrestricted Tier 1 EALs should continue to be considered COPCs and carried through the environmental hazard evaluation process before they are confirmed as chemicals of concern (COCs). Therefore, for this updated CSM and EHE COCs are those chemicals that are confirmed to cause an unacceptable human or environmental hazard or concern after an EHE is conducted.

The list of COPCs is identified by comparing laboratory results to the HDOH unrestricted Tier 1 EALs. Based on the results of the site characterization conducted at the Downtown Station Makai Lot between August and October 2020, the following COPCs are confirmed for the site:

- Soil (Table 3-3 and Figure 3-3)
 - VOCs
 - Acetone (maximum detected concentration 2.4 mg/kg).
 - 1,2-DCA (maximum detected concentration 0.056 mg/kg).
 - PCE (maximum detected concentration 0.45 mg/kg).
 - TPH
 - TPH-d (maximum detected concentration 4,200 mg/kg).
 - TPH-o (maximum detected concentration 7,400 mg/kg).
 - PAHs

- 1-Methylnaphthalene (maximum detected concentration 3.7 mg/kg).
- Benzo[a]anthracene (maximum detected concentration 23 mg/kg).
- Benzo[a]pyrene (maximum detected concentration 34 mg/kg).
- Benzo[b]fluoranthene (maximum detected concentration 44 mg/kg).
- Dibenzo[a,h]anthracene (maximum detected concentration 5 mg/kg).
- Indeno[1,2,3-c,d]pyrene (maximum detected concentration 23 mg/kg).
- Naphthalene (maximum detected concentration 7.5 mg/kg).
- Metals
 - Lead (maximum detected concentration 261 mg/kg).
- Groundwater (Table 3-7)
 - None (chemical concentrations in groundwater are below the HDOH unrestricted Tier 1 EALs).
- Soil vapor (Table 3-9 and Figure 3-4)
 - VOCs
 - PCE (maximum detected concentration 2,200 µg/m³).

Based on available data, the main COPC and risk driver at the site are TPHs and PAHs.

4.1.3 Nature and Extent of Contamination

Contamination, presence of fill material, and grossly impacted soil in the subsurface have been delineated in the lateral and vertical directions within accessible areas of the site. As discussed below, although a portion of the site was inaccessible because of surface and subsurface structures, historical photos and maps were reviewed to help in evaluating and refining the CSM.

Distribution of contamination was delineated to the HDOH unrestricted Tier 1 EALs and is evaluated based on results of the Phase II ESA investigation conducted at the Downtown Station Makai Lot between August and October 2020. Contamination is laterally extending to the following DUs:

- Soil (Figures 3-2a through 3-2d and Figure 3-3)
 - DU DS01 (TPH-d, TPH-o, and 1-methylnaphthalene above the HDOH site-specific EALs; PCE and lead above the HDOH unrestricted Tier 1 EALs).
 - DU DS02 (TPH-d, TPH-o, acetone, 1-methylnaphthalene, benzo[a]anthracene, benzo[a]pyrene, and pyrene above the HDOH site-specific EALs; 1,2-DCA, PCE, benzo[b]fluoranthene, dibenzo[a,h]anthracene, indeno[1,2,3-cd]pyrene, and lead above the HDOH unrestricted Tier 1 EALs).
 - DU DS03 (TPH-d, TPH-o, 1-methylnaphthalene, and naphthalene above the HDOH site-specific EALs; PCE above the HDOH unrestricted Tier 1 EAL).
- Soil vapor
 - DU DS01 (PCE above the HDOH unrestricted Tier 1 EAL).

Although subsurface soil is generally evaluated through collection and analysis of unsaturated soil only, vertical delineation extended deeper than the capillary fringe and into the shallow aquifer because of the presence of fill and grossly impacted soil within the capillary fringe and first 2 to 3 feet of the

shallow aquifer. Vertical extent of soil contamination in subsurface soil is as follows (see Figures 3-2a through 3-2d and Figure 3-3):

- DU DS01: Concentrations of PCE, TPH-d, TPH-o, 1-methylnaphthalene, and/or lead in soil are above the HDOH unrestricted Tier 1 EALs (but below the HDOH site-specific EALs) from the surface down to 6 feet bgs. Concentrations of TPH-d, TPH-o, and 1-methylnaphthalene are also above the HDOH site-specific EALs in the shallow aquifer between 7.5 and 9 feet bgs (vertical DU layer S002H).
- DU DS02: Concentrations of PCE, TPH-d, TPH-o, several PAHs, and/or lead in soil are above the HDOH unrestricted Tier 1 EALs in the vadose zone between 2 feet bgs and 6 feet bgs, and within the capillary fringe/shallow aquifer between 6 and 7.5 feet bgs (limited to layer S001G, which includes all boreholes but 12, 20, and 21). Concentrations of acetone, TPH-d, TPH-o, 1-methylnaphthalene, benzo[a]anthracene, benzo[a]pyrene, and/or pyrene are also above the HDOH site-specific EALs in the vadose zone between 4 and 5 feet bgs, within the capillary fringe between 6 and 7.5 feet bgs (vertical DU layer S002G), and within the shallow aquifer between 7.5 and 9 feet bgs (vertical DU layers S001H and S002H).
- DU DS03. Concentration of PCE is above the HDOH unrestricted Tier 1 EALs between the surface and 10 feet bgs (vertical DU layer S001A). Concentrations of TPH-d, TPH-o, and 1-methylnaphthalene, and naphthalene are also above the HDOH site-specific EALs within the shallow aquifer between 7.5 and 9 feet bgs (vertical DU layer S002H).

In summary, although relatively low levels of COPCs (mostly below the HDOH site-specific EALs, except for some PAHs in the 4 to 6 feet bgs interval in DU DS02) are observed in the vadose zone, concentrations in subsurface soil are generally highest within the capillary fringe/saturated soil (vertical DU layers S002G and S002H, between 6 and 9.5 feet bgs). Based on field evidence and analytical results, the bulk of the contamination appears to be related to petroleum hydrocarbons associated with grossly impacted soil observed within the shallow aquifer between approximately 7.5 and 9 feet bgs (vertical DU layer S002H) in the center portion of the site.

The elevated concentrations of petroleum hydrocarbons (mainly higher-chain hydrocarbons) in the capillary fringe and shallow aquifer did not result in high concentrations in groundwater (that is, concentrations in the four wells sampled at the site are below the HDOH unrestricted Tier 1 EALs). PCE was detected in soil vapor samples collected within the footprint or the future station building; however, concentrations are below the HDOH site-specific EALs.
