Grossly impacted soil (consisting of medium black sand with odor, staining, relatively high VOC readings from field PID screening, and LNAPL) was observed within the capillary fringe/shallow aquifer in most of DU DS01 and limited portions of DUs DS02 and DS03, as follows (for more details refer to the cross sections in Figures 3-2a through 3-2d, the extent of grossly impacted soil on Figure 4-2, and boring logs in Appendix C):

- DU DS01
 - Vertical DU layer S002H (approximately 7.5 to 9 feet bgs) – All boreholes except for 21, 22, 23, and 24.
- DU DS02
 - Vertical DU layer S002G (approximately 6 to 7.5 feet bgs) – Boreholes 12, 20, and 21.
 - Vertical DU layer S002H (approximately 7.5 to 9 feet bgs) – Boreholes 5, 6, 12, 13, 15, 16, 17, 18, 19, 20, 21, 27, 29, and 30.

- DU DS03
 - Vertical DU layer S002H (approximately 7.5 to 9 feet bgs) – Boreholes 1 and 2.

The approximate lateral extent of grossly impacted soil based on field evidence (see boring logs in Appendix C and photo log in Appendix B) is represented on Figure 4-2. Based on historical information, Sanborn maps, and aerial photographs (see Section 2.1 and Appendix A for more details), USTs and ASTs were present on site in the past, including one 6,000-barrel and one 2,000-barrel fuel ASTs that were present within the site boundaries between the 1920s and the 1950s. When overlapping the shape of the lateral extent of the grossly impacted soil to the approximate location of the two former ASTs, the footprints match very closely suggesting that the grossly impacted soil onsite is most likely associated with the two former ASTs. Given the uniform distribution, the impact is believed to be associated with construction design rather than releases as oil sand was often used in the past to protect AST bottoms from corrosion (American Petroleum Institute, 1997), especially in shallow coastal aquifer conditions.

As shown in the cross sections (Figures 3-2a through 3-2d) and boring logs (Appendix C), at the locations where grossly impacted soil was observed in the field, direct-push system (DPS) drilling hit refusal immediately beneath the grossly impacted layer (at approximately 8.5 to 9.5 feet bgs) on what appeared to be surge rock/basalt cobbles, which coincide with the bottom of the fill material. At locations where grossly impacted soil was not observed, DPS was successful in drilling deeper than 9.5 feet bgs, no refusal (or surge rock/basalt cobbles) was encountered, and native soil consisting of up to approximately 2 feet of volcanic cinder on top of coralline sand and gravel was observed immediately beneath the unconsolidated fill material. Completed borings confirm that vertical delineation of fill material was achieved. Although concentrations in saturated native soil immediately beneath the surge rock/basalt cobbles are unknown in portions of the site because drilling refusal did not allow sampling beneath the surge rock/basalt cobbles layer, the surge rock/basalt cobbles layer appears to demarcate the vertical limit of grossly impacted soil observed. Furthermore, since groundwater results (not soil) should be considered to evaluate aquifer conditions, and groundwater concentrations are below the HDOH unrestricted Tier 1 EALs, it is therefore concluded that vertical delineation of petroleum-related impacts was generally achieved in both soil and groundwater.

Although some of the MIS samples collected in vertical DU layers G, H, and I were composed from less than 30 increment locations, and therefore not fully consistent with the HDOH TGM guidance, the following confirm that adequate vertical delineation was achieved at the site and collected data are representative of site conditions:

- Presence or absence of contamination should be evaluated through soil samples collected in the vadose zone and groundwater samples collected within the aquifer/saturated zone. Samples collected within the vadose zone at the site were composed from 30 increment locations, in accordance with the approved Project Work Plan and the HDOH TGM guidance. Likewise, groundwater samples were also collected in accordance with the Project Work Plan and HDOH TGM guidance.
- Although some of the MIS samples collected within the shallow aquifer were not fully consistent with the HDOH TGM guidance (that is, were composed of less than 30 increments) and would be considered only for screening purposes, their use for delineation of fill and grossly impacted soil, and evaluation of soil disposal options is believed to be appropriate.
- Soil samples from the S001I interval (10 to 11 feet bgs), composed from a limited number of increment locations within the native soil of the shallow aquifer, were collected in close proximity to grossly impacted soil. Samples collected from the S001I interval show no field evidence of gross contamination. This, together with historical information and maps/aerial photos, confirm that grossly impacted soil is limited to the approximate 1.5-foot layer of medium black sand observed in

the shallow aquifer and it is not expected to be present beneath the surge rock/basalt cobbles found immediately beneath the grossly impacted layer.

- Soil samples collected from the S001I interval within DUs DS01 and DS02, and from the B interval in DU DS03 (native soil between 10 and 20 feet bgs) reported COPC concentrations that are mostly nondetects or very low, and well below the HDOH unrestricted Tier 1 EALs.
- Groundwater samples collected at one temporary well and three permanent wells screened within the shallow aquifer show no evidence of gross contamination and concentrations of COPCs below the HDOH unrestricted Tier 1 EALs. This provides indirect evidence that grossly impacted, petroleum contaminated soil has little to no impact on the shallow aquifer at the site.

4.1.4 Source of Contamination

As described in Section 2.1 and Section 4.1.3, the site has been part of the Hawaiian Electric Honolulu Power Plant since the early 1900s. Two fuel ASTs (6,000 and 2,000 barrels each) were present onsite between the 1920s and the 1950s; propane ASTs, a kerosene AST, a gasoline UST, water USTs, and an acid and caustic UST had also been active at different times within the site boundaries in the past.

As discussed in Section 4.1.3, based on field evidence and historical information, oil sand likely used for corrosion control at the bottom of the two large ASTs between the 1920s and the 1950s is the most likely source of grossly impacted, petroleum-contaminated soil found within fill material at the capillary fringe and shallow aquifer at the site. The most plausible source for concentrations of petroleum compounds and VOCs found at shallower depths in the vadose zone are possibly site activities and small tank leaks that potentially occurred onsite in the past.

4.1.5 Transport Mechanism, Potential Receptors, and Exposure Pathways

The COPCs identified for the site include VOCs, TPHs, PAHs, and lead. COPCs are believed to be mostly related to fuel storage activities conducted at the site in the past. Once they are released to the subsurface, VOCs and lower-chain petroleum hydrocarbons are expected to partition to the vapor phase, remain as a separate nonaqueous phase, or travel vertically to the water table and shallow aquifer. Once they reach the aquifer, chemicals dissolve in the liquid phase, remain as a separate nonaqueous phase, or both. Dissolved chemicals travel in groundwater via advection, dispersion, and diffusion mechanisms depending on the chemical and aquifer physical and chemical properties. With very few exceptions, the petroleum hydrocarbons found in soil at the site are the heavier-chain hydrocarbons, which are generally less volatile and not very soluble or mobile compared to lighter-chain hydrocarbons.

Concentrations below the HDOH Tier 1 EALs in groundwater and below the HDOH site-specific EALs in soil vapor, suggest that elevated concentrations of petroleum hydrocarbons (mainly higher-chain hydrocarbons and PAHs) in soil within the capillary fringe and shallow aquifer are related to old and weathered petroleum products that are not partitioning to the liquid or vapor phase. Low levels of PCE reported in shallow soil vapor at concentrations below the HDOH site-specific EALs suggest that past activities conducted at the site or the fill material in the shallower portions of the subsurface soil are the most plausible sources of soil vapor contamination.

Based on current and reasonably anticipated future land use of the site and the historical data, the following potential receptors and exposure pathways exist at the site (Figure 4-1):

- **Hypothetical future residents:** If contaminated soil was removed from the site and reused in a residential area, or in the hypothetical (though unexpected) scenario that the site was redeveloped for residential use, exposure of hypothetical residents could occur by incidental ingestion, dermal contact, and potentially inhalation via vapor intrusion.

- **Occupational and construction workers:** Current and future occupational and construction workers could be exposed to potentially contaminated soil and soil vapor during future construction and maintenance activities. Exposure could occur through accidental ingestion, dermal contact, and inhalation. While the exposure pathway for trench/construction workers to surface and subsurface soil is complete, the pathway for occupational workers is only considered potentially complete because the site is paved and these receptors would not be exposed under normal conditions.
- **Ecological exposure pathways:** The exposure pathway for terrestrial receptors is considered incomplete because there is no suitable habitat onsite. Although the proximity of the Honolulu Harbor could represent a potential aquatic habitat, concentrations in groundwater beneath the site are below the HDOH unrestricted Tier 1 EALs and the exposure pathway for aquatic receptors is also considered incomplete.

4.2 Environmental Hazard Evaluation

This section evaluates potential hazards associated with the site-specific COPCs in soil and soil vapor at Downtown Station Makai Lot. After the Tier 1 evaluation discussed in Section 3, those chemicals exceeding the HDOH unrestricted Tier 1 EALs are carried over to this Tier 2 EHE. During Tier 2, results are compared against hazard-specific EALs to evaluate the different potential exposure scenarios. This EHE is conducted considering the most recent data collected at the site from August through October 2020.

Because no exceedances of the HDOH unrestricted Tier 1 EALs were reported in groundwater at the site, groundwater is not evaluated in this EHE and, as further discussed in Section 4.1.5 and Section 4.2.1.3, the leaching pathway is considered incomplete at the Downtown Station Makai Lot. This EHE should be revisited if new data become available.

4.2.1 Soil

After the initial Tier 1 evaluation, VOCs, TPHs, PAHs, and lead were reported at concentrations above the HDOH Tier 1 EALs and carried over to this Tier 2 evaluation, with analytical data being compared to the following HDOH hazard-specific EALs under different land use exposure scenarios:

- Human direct exposure
- Gross contamination
- Leaching to groundwater
- Vapor intrusion to indoor air

As discussed in Section 4.1.5, no terrestrial ecological receptors are present (or expected to be present) within the site boundaries, while aquatic receptors are not exposed because concentrations in groundwater are below the HDOH unrestricted Tier 1 EALs. Therefore, soil ecotoxicity is not considered a potential hazard at the site. Different land use and exposure scenarios evaluated in this EHE include the following:

- Unrestricted land use (that is, no restrictions).
- C/I Tier 1 scenario (that is, C/I sites located less than 150 meters from surface water where drinking water is threatened). Although not applicable, this scenario is considered to evaluate potential reuse of soil at sites located over drinking water resources within the rail corridor.
- Site-specific land use (that is, C/I sites located less than 150 meters from surface water, where DWNT).
- Construction workers scenario.

The outcomes of this EHE are discussed in the following subsections and are summarized in Table 4-1 and on Figure 4-3.

4.2.1.1 Human Direct Exposure

Concentrations in soil samples above the HDOH unrestricted Tier 1 EAL are compared to the direct exposure EALs (Table I-1 through I-3 in the HDOH EAL Surfer [HDOH, 2018]), to evaluate whether COPCs in soil pose potentially unacceptable risks to human health by direct contact or accidental ingestion.

Based on a comparison to the HDOH EALs (Table 4-1), potential direct exposure concerns are identified under different land use scenarios for the following DUs, vertical DU layers, and chemicals:

- Unrestricted Land Use Scenario
 - DU DS01
 - S001A (1 to 2 feet bgs) - lead
 - S001C (2 to 3 feet bgs) - TPH-d
 - S001E (4 to 5 feet bgs) - TPH-d
 - S002H (7.5 to 9 feet bgs) – TPH-d
 - DU DS02
 - S001E (4 to 5 feet bgs) – benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, dibenzo[a,h]anthracene, indeno[1,2,3-c,d]pyrene, and lead
 - S001G (6 to 7.5 feet bgs)³ – TPH-d
 - S002G (6 to 7.5 feet bgs) – TPH-d
 - S001H (7.5 to 9 feet bgs) – TPH-d
 - S002H (7.5 to 9 feet bgs) – TPH-d
 - DU DS03
 - S002H (7.5 to 9 feet bgs) – TPH-d
- C/I Tier 1, Site-specific Land Use, and Construction Workers Scenarios
 - DU DS01
 - S002H (7.5 to 9 feet bgs) – TPH-d
 - DU DS02
 - S001E (4 to 5 feet bgs) – benzo[a]pyrene
 - S002G (6 to 7.5 feet bgs) – TPH-d
 - S002H (7.5 to 9 feet bgs) – TPH-d
 - DU DS03
 - S002H (7.5 to 9 feet bgs) – TPH-d

³ As outlined in Section 3.1 and further discussed in Section 4.1.3, because of presence of grossly impacted soil in a limited number of boreholes, DU DS02 vertical DU layers S001G (6 to 7.5 feet bgs) and S001H (7.5 to 9 feet bgs) were further subdivided in S001G (no grossly impacted soil – 27 boring/increment locations) and S002G (presence of grossly-impacted soil – 3 boring/increment locations); and S001H (no grossly impacted soil – 16 boring/increment locations) and S002H (presence of grossly impacted soil – 14 boring/increment locations).

Therefore, potential direct exposure hazards are identified for the Downtown Station Makai Lot site under the four land use scenarios evaluated. Concerns under the site-specific and construction workers scenarios are limited to vertical DU layer S001E (4 to 5 feet bgs) and S002G (6 to 7.5 feet bgs – capillary fringe/shallow aquifer) in DU DS02, and vertical DU layer S002H (7.5 to 9 feet bgs – within shallow aquifer) in all three DUs (Figure 4-3).

4.2.1.2 Gross Contamination

Gross contamination of soil generally refers to the presence of nonaqueous phase liquid, offensive odors, unaesthetic appearance, general resource degradation, and generation of explosive vapors (HDOH, 2017). Soil data are initially compared to the gross contamination EALs for "Exposed or Potentially Exposed Soil" provided as Table F-2 in the HDOH EAL Surfer (HDOH, 2018). Where a potential concern is identified based on concentrations in soil above the gross contamination EALs, further assessment is conducted to confirm that presence of gross contamination exists. Further assessment is based on evidence observed in the field, such as presence of LNAPL, strong staining or odor, or elevated (greater than 10 ppm) VOC readings as measured with a field-portable PID.

Based on a comparison to the HDOH EALs (Table 4-1), potential gross contamination concerns are identified under different land use scenarios for the following DUs, vertical DU layers, and chemicals:

- Unrestricted Land Use Scenario
 - DU DS01
 - S001C (2 to 3 feet bgs) - TPH-o
 - S001D (3 to 4 feet bgs) - TPH-o
 - S001E (4 to 5 feet bgs) - TPH-o
 - S001F (5 to 6 feet bgs) - TPH-o
 - S002H (7.5 to 9 feet bgs) – TPH-d and TPH-o
 - DU DS02
 - S001E (4 to 5 feet bgs) - TPH-o
 - S001F (5 to 6 feet bgs) - TPH-o
 - S001G (6 to 7.5 feet bgs)⁴ – TPH-o
 - S002G (6 to 7.5 feet bgs) – TPH-d and TPH-o
 - S001H (7.5 to 9 feet bgs) – TPH-d and TPH-o
 - S002H (7.5 to 9 feet bgs) – TPH-d and TPH-o
 - DU DS03
 - S002H (7.5 to 9 feet bgs) – TPH-d and TPH-o
- C/I Tier 1 and Site-Specific Land Use Scenarios
 - DU DS01

⁴ As outlined in Section 3.1 and further discussed in Section 4.1.3, DU DS02 vertical DU layers G (6 to 7.5 feet bgs) and H (7.5 to 9 feet bgs) were further subdivided in 1G (no grossly impacted soil – 27 boring/increment locations) and 2G (presence of grossly impacted soil – 3 boring/increment locations), and 1H (no grossly impacted soil – 16 boring/increment locations) and 2H (presence of grossly impacted soil – 14 boring/increment locations).

- S002H (7.5 to 9 feet bgs) – TPH-d and TPH-o
- DU DS02
- S002G (6 to 7.5 feet bgs) – TPH-d
- S002H (7.5 to 9 feet bgs) – TPH-d and TPH-o
- DU DS03
- S002H (7.5 to 9 feet bgs) – TPH-d and TPH-o

Based on concentrations of TPH-g, TPH-o, and field evidence, with presence of strong odor, staining, elevated VOC readings, or LNAPL (see boring logs in Appendix C, cross sections on Figures 3-2a through 3-2d, and lateral extent of contamination on Figure 4-2), gross contamination concerns appear to exist at the Downtown Station Makai Lot for the following DUs/vertical DU layers under all four land use scenarios evaluated (Figure 4-3):

- DU DS01
 - S002H (7.5 to 9 feet bgs)
- DU DS02
 - S002G (6 to 7.5 feet bgs)
 - S002H (7.5 to 9 feet bgs)
- DU DS03
 - S002H (7.5 to 9 feet bgs)

4.2.1.3 Leaching to Groundwater

To evaluate whether the COPCs detected in soil could potentially leach to groundwater, soil data are generally compared to the HDOH leaching EALs (Table E in the HDOH EAL Surfer [HDOH, 2018]). Although concentrations of acetone (DU DS01 only), TPH-d, TPH-o, and some PAHs are above the HDOH leaching EALs under the unrestricted Tier 1, C/I Tier 1, and/or site-specific land use scenarios, the soil to groundwater leaching pathway is not considered an active pathway at the site because concentration of COPCs are below the HDOH unrestricted Tier 1 EALs in groundwater at the upgradient, source, crossgradient, and downgradient locations (see Section 3.4 and Table 3-7 for details).

Therefore, leaching of COPCs from soil to groundwater is not considered to be a concern at the Downtown Station Makai Lot (Figure 4-3).

4.2.1.4 Vapor Intrusion to Indoor Air

To evaluate whether the COPCs detected in soil could create a vapor intrusion concern potentially impacting indoor air of future buildings, soil data are generally compared to the HDOH vapor intrusion EALs (Table C-1b in the HDOH EAL Surfer [HDOH, 2018]). For soil COPCs associated with potential vapor intrusion concern, further assessment is conducted by evaluating shallow soil vapor results (where available).

Based on a comparison to the HDOH EALs (Table 4-1), potential vapor intrusion concerns are identified for soil under different land use scenarios for the following DUs, vertical DU layers, and chemicals:

- Unrestricted Land Use Scenario
 - DU DS01
 - S001A (1 to 2 feet bgs) - PCE

- S001B (1 to 2 feet bgs) - PCE
- S001C (2 to 3 feet bgs) - PCE
- DU DS02
- S001C (2 to 3 feet bgs) - PCE
- S001E (4 to 5 feet bgs) – PCE and pyrene
- S002G (6 to 7.5 feet bgs) – 1,2-DCA
- DU DS03
- S001A (0 to 10 feet bgs) - PCE
- S002H (7.5 to 9 feet bgs) – naphthalene
- C/I Tier 1 and Site-Specific Land Use Scenarios
 - DU DS02
 - S001E (4 to 5 feet bgs) – pyrene

Soil vapor samples were collected only within DU DS01, where future station enclosed buildings are planned based on current design. As further discussed in Section 4.2.2 and summarized on Figure 4-3, based on soil vapor data, potential vapor intrusion concerns are confirmed under the unrestricted land use scenario within DU DS01 and cannot be excluded for DUs DS02 and DS03 (that is, no soil vapor data available). Under the site-specific scenario, potential vapor intrusion concerns are not considered to be present within DU DS01, but cannot be excluded for DU DS02 (no soil gas data available).

4.2.2 Shallow Soil Vapor

After the initial Tier 1 evaluation, PCE was found at concentrations above the HDOH Tier 1 EALs and is confirmed as the only COPC for Downtown Station Makai Lot site. However, soil vapor sampling was conducted only within DU DS01, where future buildings will be constructed within the site boundary. This Tier 2 evaluation considers available shallow soil vapor data and soil sample results to further evaluate vapor intrusion concerns at the Downtown Station Makai Lot.

As summarized on Figure 4-3, potential vapor intrusion concerns exist at the site under different land use scenarios within the following DUs:

- Unrestricted Land Use Scenario
 - DU DS01 – Potential vapor intrusion concerns identified because of concentrations of PCE in soil above the vapor intrusion EAL between 0 and 3 feet bgs are confirmed by shallow soil vapor samples above the HDOH unrestricted Tier 1 EAL.
 - DU DS02 – Potential vapor intrusion concerns identified because of concentrations of 1,2-DCA, PCE, and pyrene in soil above the vapor intrusion EALs between 2 and 5 feet bgs and between 6 and 7.5 feet bgs cannot be excluded because no shallow soil vapor data are available for this DU. If station design changes or soil is removed to be reused offsite (not expected) additional soil vapor sampling may be required to further evaluate vapor intrusion concerns.
 - DU DS03 – Potential vapor intrusion concerns identified because of concentrations of PCE and naphthalene in soil above the vapor intrusion EALs between 0 and 10 feet bgs cannot be excluded because no shallow soil vapor data are available for this DU. If design station

design changes or soil was removed to be reused offsite (not expected) additional soil vapor sampling may be required to further evaluate vapor intrusion concerns.

- Site-Specific Land Use Scenario

- DU DS01 - Shallow soil vapor sampling reported COPC concentrations below the HDOH site-specific EALs within DU DS01. No vapor intrusion concern exists in this DU under the site-specific land use scenario. Based on available data, occupational workers potentially working in future buildings within the Downtown Station Makai Lot are not expected to be exposed to unacceptable risk due to the presence of COPCs in soil vapor.
- DU DS02 – Because no shallow soil vapor data are available within this DU, the potential vapor intrusion concerns identified because of concentrations of pyrene in soil above the site-specific vapor intrusion EALs between 4 and 5 feet bgs cannot be excluded under the site-specific scenario. Although pyrene is not considered very volatile (Henry's Law constant of 1.2×10^{-5} atmosphere cubic meter per mole [atm m³/mol] and molecular weight of 202)⁵, if design plans change, shallow soil vapor sampling may be necessary within this DU to further evaluate vapor intrusion concerns.
- DU DS03 – Although no soil shallow soil vapor data are available within this DU, soil concentrations are below the site-specific vapor intrusion EALs. No vapor intrusion concern exists in this DU under the site-specific land use scenario. Based on available data, occupational workers potentially working in future buildings within the Downtown Station Makai Lot are not expected to be exposed to unacceptable risk because of the presence of COPCs in soil vapor.

⁵ Per HDOH Table C-1b of the HDOH EAL Surfer (HDOH, 2018), a chemical is considered to be volatile if its Henry's Law constant is greater than 1×10^{-5} atm m³/mol and its molecular weight is greater than 200.

This page is intentionally left blank.

5.0 Environmental Hazard Management Plan

The EHE described in Section 4.2 identified potentially unacceptable risks and hazards remaining in soil and soil vapor at the Downtown Station Makai Lot under the unrestricted and site-specific land use scenarios. As indicated in HDOH Technical Guidance Manual (HDOH, 2008), potential risks remaining at the site should be addressed through an EHMP. This site-specific EHMP describes the proposed strategy for long-term management of contaminated soil and soil vapor within different DUs at the Downtown Station Makai Lot.

Although the HART Programmatic EHE-EHMP (HART, 2014) generally applies for anything that is not covered under the site-specific EHMP elements discussed herein, information provided in Section 5.2 supplements the guidance provided in the programmatic EHMP.

5.1 Summary of Environmental Hazards

Based on the Phase II ESA investigation conducted in August and October 2020 and the EHE presented in Section 4, potential vapor intrusion, direct exposure, and gross contamination concerns exist at the site. The following environmental concerns (by DU) at the site require long-term management (see Figure 4-3):

- DS01
 - Unrestricted Land Use Scenario
 - Human direct exposure for vertical DU layers S001A (0 to 1 feet bgs), S001C (2 to 3 feet bgs), S001E (4 to 5 feet bgs), and S002H (7.5 to 9 feet bgs)
 - Gross contamination for vertical DU layer S002H (7.5 to 9 feet bgs). The areas where grossly impacted soil was observed are represented on Figure 4-2.
 - Vapor intrusion concerns for vertical DU layers S001A (0 to 1 feet bgs), S001B (1 to 2 feet bgs), and S001C (2 to 3 feet bgs).
 - Site-specific Land Use Scenario
 - Human direct exposure for vertical DU layer S002H (7.5 to 9 feet bgs).
 - Gross contamination for vertical DU layer S002H (7.5 to 9 feet bgs). The areas where grossly impacted soil was observed are represented on Figure 4-2.
 - Construction Workers Scenario
 - Human direct exposure for vertical DU layer S002H (7.5 to 9 feet bgs).
- DS02
 - Unrestricted Land Use Scenario
 - Human direct exposure for vertical DU layers S001E (4 to 5 feet bgs), S001G and S002G (6 to 7.5 feet bgs), and S001H and S002H (7.5 to 9 feet bgs).
 - Gross contamination for vertical DU layers S002G (6 to 7.5 feet bgs) and S002H (7.5 to 9 feet bgs). The areas where grossly impacted soil was observed are represented on Figure 4-2.

- Vapor intrusion concerns for vertical DU layers S001C (2 to 3 feet bgs), S001E (4 to 5 feet bgs) and S002G (6 to 7.5 feet bgs).
- Site-Specific Land Use Scenario
 - Human direct exposure for vertical DU layers S001E (4 to 5 feet bgs), S002G (6 to 7.5 feet bgs), and S002H (7.5 to 9 feet bgs).
 - Gross contamination for vertical DU layers S002G (6 to 7.5 feet bgs) and S002H (7.5 to 9 feet bgs). The areas where grossly impacted soil was observed are represented on Figure 4-2.
 - Vapor intrusion concerns for vertical DU layer S001E (4 to 5 feet bgs).
- Construction Workers Scenario
 - Human direct exposure for vertical DU layers S001E (4 to 5 feet bgs), S002G (6 to 7.5 feet bgs), and S002H (7.5 to 9 feet bgs).
- DS03
 - Unrestricted Land Use Scenario
 - Human direct exposure for vertical DU layer S002H (7.5 to 9 feet bgs).
 - Gross contamination for vertical DU layer S002H (7.5 to 9 feet bgs). The areas where grossly impacted soil was observed are represented on Figure 4-2.
 - Vapor intrusion concerns for vertical DU layer S001A (0 to 10 feet bgs).
 - Site-Specific Land Use Scenario
 - Human direct exposure for vertical DU layer S002H (7.5 to 9 feet bgs).
 - Gross contamination for vertical DU layer S002H (7.5 to 9 feet bgs). The areas where grossly impacted soil was observed are represented on Figure 4-2.
 - Construction Workers Scenario
 - Human direct exposure for vertical DU layer S002H (7.5 to 9 feet bgs).

As discussed in Section 4.2, leaching from soil to groundwater, and groundwater pathways are not considered to be a concern at the Downtown Station Makai Lot.

Based on the EHE evaluations, the following chemicals are confirmed as COCs for the Downtown Station Makai Lot:

- Soil
 - 1,2-DCA⁶
 - PCE⁶
 - TPH-d
 - TPH-o
 - Benzo[a]anthracene⁶
 - Benzo[a]pyrene
 - Benzo[b]fluoranthene⁶

⁶ Chemical is a concern only under a hypothetical unrestricted land use scenario (not a concern under the site-specific land use scenario).

- Dibenzo[a,h]anthracene⁶
- Indeno[1,2,3-c,d]pyrene⁶
- Naphthalene⁶
- Pyrene
- Lead⁶
- Soil vapor
 - 1,2-DCA⁶
 - PCE⁶
 - Naphthalene⁶
 - Pyrene

5.2 Site Controls Implementation and Long-term Management of Contaminated Media

The EHE identified potential hazards under unrestricted, site-specific, and construction workers land use scenarios. Environmental management areas are identified on Figures 5-1 and 5-2. This EHMP describes management options for contaminated soil and soil vapor, including a combination of management in place and excavation and disposal, which should be implemented at the Downtown Station Makai Lot during construction of the planned transit station and in the long term after construction activities are completed.

Contaminated soil excavated during future construction activities will be managed in accordance with this site-specific EHMP. Soil vapor concern exist only if design changes, soil is reused offsite in a residential area, or the site is redeveloped for residential use (not expected). Based on available data, no concerns exist, and no site controls or long-term management requirements apply for groundwater at the site.

Because different activities will occur in different portions of the site in the future, site controls and soil management practices may differ within each DU as well. Recommended site controls are summarized on Figures 5-1 and 5-2 and are outlined for each DU/vertical DU layer as follows:

Soil (Figure 5-1)

- DU DS01
 - Vertical DU layers S001A through S001E (0 to 5 feet bgs) – No action is needed if soil is left in place and land use remains C/I. If excavated, soil can be reused onsite (and along the rail corridor at all locations [that is, no concerns identified for soil under any C/I land use scenario because the soil to groundwater leaching pathway is incomplete]) or disposed of at on-island disposal facility as nonhazardous waste.
 - Vertical DU layers S001F and S001G (5 to 7.5 feet bgs) – No restrictions.
 - Vertical DU layer S002H (7.5 to 9 feet bgs) – Soil can be managed in place if not excavated (that is, concentrations in groundwater are below the HDOH unrestricted Tier 1 EALs and leaching of grossly impacted soil to groundwater is not a concern). If excavated, soil within the grossly impacted area will need to be disposed of at an on-island disposal facility as nonhazardous waste. Soil outside of the grossly impacted area will need to be sampled for reuse or disposed of at an on-island disposal facility as nonhazardous waste. Soil sampling

will be conducted at a frequency of one sample every 200 cubic yards for reuse within the rail corridor; if reuse outside of the corridor is considered, sampling will be conducted in accordance with the HDOH Guidance for Evaluation of Imported and Exported Fill Material (HDOH, 2017).

- Vertical DU layer S001I (10 to 11 feet bgs) – No action is needed if soil is left in place. If excavated, soil can be reused onsite. Additional sampling may be necessary if soil is reused offsite because limited data is available from the Phase II ESA investigation. Soil sampling will be conducted at a frequency of one sample every 200 cubic yards for reuse within the rail corridor; if reuse outside of the corridor is considered, sampling will be conducted in accordance with the HDOH Guidance for Evaluation of Imported and Exported Fill Material (HDOH, 2017).
- Other depths – Soil that has not been sampled during the Phase II ESA investigation (that is, surge rock between 9 and 10 feet bgs and soil deeper than 11 feet bgs) is expected to be at concentrations below the HDOH unrestricted Tier 1 EALs. Although the soil can be reused onsite, because no or limited information is available for the specific layer or the layer immediately above, sampling may be necessary if soil is excavated and reused offsite. Soil sampling will be conducted at a frequency of one sample every 200 cubic yards for reuse within the rail corridor; if reuse outside of the corridor is considered, sampling will be conducted in accordance with the HDOH Guidance for Evaluation of Imported and Exported Fill Material (HDOH, 2017).
- DU DS02
 - Vertical DU layers S001A and S001B (0 to 2 feet bgs) – No restrictions.
 - Vertical DU layer S001C (2 to 3 feet bgs) – No action is needed if soil is left in place and land use remains C/I. If excavated, soil can be reused onsite (and along the rail corridor at all locations [that is, no concerns identified for soil under any C/I land use scenario because the soil to groundwater leaching pathway is incomplete]) or be disposed of at on-island disposal facility as non-hazardous waste.
 - Vertical DU layer S001D (3 to 4 feet bgs) – No restrictions.
 - Vertical DU layer S001E (4 to 5 feet bgs) – No action is needed if soil is left in place and land use remains C/I. If excavated, soil can be reinterred onsite or be disposed of at an on-island disposal facility as non-hazardous waste.
 - Vertical DU layer S001F (5 to 6 feet bgs) – No restrictions
 - Vertical DU layers S001G, S002G, S001H, and S002H (6 to 9 feet bgs) – Soil can be managed in place if not excavated (that is, concentrations in groundwater are below the HDOH unrestricted Tier 1 EALs and leaching of grossly impacted soil to groundwater is not a concern). If excavated, soil within grossly impacted area will need to be disposed of at an on-island disposal facility as nonhazardous construction soil waste. Soil outside of the grossly impacted area can be reused onsite (if no gross contamination is observed) or disposed of at an on-island disposal facility as nonhazardous waste.
 - Vertical DU layer S001I (10 to 11 feet bgs) – No action is needed if soil is left in place. If excavated, soil can be reused onsite. Additional sampling may be necessary (1 sample every 200 cubic yard) if soil is reused offsite because limited data is available from the Phase II ESA investigation.

- Other depths – Soil that has not been sampled during the Phase II ESA investigation (that is, surge rock between 9 and 10 feet bgs and soil deeper than 11 feet bgs) is expected to be at concentrations below the HDOH unrestricted Tier 1 EALs. Although the soil can be reused onsite, because no or limited information is available for the specific layer or the layer immediately above, sampling may be necessary if soil is excavated and is reused offsite. Soil sampling will be conducted at a frequency of one sample every 200 cubic yards for reuse within the rail corridor; if reuse outside of the corridor is considered, sampling will be conducted in accordance with the HDOH Guidance for Evaluation of Imported and Exported Fill Material (HDOH, 2017).
- DU DS03
 - Vertical DU layer S001A (0 to 7.5 feet bgs) – No action is needed if soil is left in place and land use remains C/I. If excavated, soil can be reused onsite (and along the rail corridor at all locations [that is, no concerns identified for soil under any C/I land use scenario because the soil to groundwater leaching pathway is not active]) or be disposed of at on-island disposal facility as non-hazardous waste.
 - Vertical DU layer S002H (7.5 to 9 feet bgs) – Soil can be managed in place if not excavated (that is, concentrations in groundwater are below the HDOH unrestricted Tier 1 EALs and leaching of grossly impacted soil to groundwater is not a concern). If excavated, soil within grossly impacted area will need to be disposed of at an on-island disposal facility as non-hazardous waste. Soil outside of the grossly impacted area can be reused onsite (if no gross contamination is observed) or disposed of at an on-island disposal facility as non-hazardous waste.
 - Vertical DU layer S001A (9 to 10 feet bgs) – No action is needed if soil is left in place and land use remains C/I. If excavated, soil can be reused onsite (and along the rail corridor at all locations [that is, no concerns identified for soil under any C/I land use scenario because the soil to groundwater leaching pathway is not active]) or be disposed of at on-island disposal facility as non-hazardous waste.
 - Vertical DU layer S001B (10 to 20 feet bgs) – No restrictions.

Soil Vapor (Figure 5-2)

- DU DS01
 - Vertical DU layers S001A through S001E (0 to 5 feet bgs) – No action is needed if soil is left in place and land use remains C/I. If land use changed to residential, a vapor barrier would be needed for residential buildings potentially constructed within DU DS01 or soil would need to be removed to address vapor intrusion concerns.
 - Vertical DU layers S001F and S001G (5 to 7.5 feet bgs) – No restrictions.
 - Vertical DU layers S002H and S001I (greater than 7.5 feet bgs) – No actions for soil vapor.
- DU DS02
 - Vertical DU layers S001A through s001E (0 to 5 feet bgs) – No action is needed if soil is left in place, land use remains C/I, and station design does not change (that is, no enclosed structure built within the DU). If land use changed to residential or station design changed, samples would need to be collected to evaluate soil vapor concentrations or a vapor barrier would be needed for enclosed structures to address potential vapor intrusion concerns.
 - Vertical DU layer S001F (5 to 6 feet bgs) – No restrictions.

- Vertical DU layers S001G through S001I (greater than 6 feet bgs) – No actions for soil vapor.
- DU DS03
 - Vertical DU layer S001A (0 to 7.5 feet bgs) – No action is needed if soil is left in place, land use remains C/I, and station design does not change (that is, no enclosed structure built within the DU). If land use changed to residential or station design changed, samples would need to be collected to evaluate soil vapor concentrations or a vapor barrier would be needed to address potential vapor intrusion concerns.
 - Vertical DU layer S002H (7.5 to 9 feet bgs) – No actions for soil vapor.
 - Vertical DU layers S001A and S001B (greater than 9 feet bgs) – No restrictions.

Under a hypothetical residential scenario, soil from vertical DU layers where a hazard is identified under the unrestricted land use scenario (see Figure 4-3) would need to be removed and either reused within the corridor or disposed of at on-island disposal facility as non-hazardous waste. The evaluation for management of soil generally complies with the Programmatic EHMP and the Project Work Plan (HART, 2019). Although some vertical DU layers exceed the soil volume sampling requirement of one sample every 200 cubic yards identified in the Project Work Plan (HART, 2019), all DUs were densely characterized with MIS samples. Where soil from a specific vertical DU layer is recommended for possible reuse with no restrictions, the decision is supported by one MIS sample collected in that interval and 30 individual borehole samples.

Since concentrations in groundwater beneath the site are below the HDOH unrestricted Tier 1 EALs, groundwater generated during construction can be re-infiltrated on site without treatment provided that no evidence of gross contamination (e.g., sheen or LNAPL) is observed on the groundwater.

As new data become available (for example, after construction  the EHMP presented in this section should be updated to ensure potential receptors are not exposed to unacceptable risk.

6.0 Summary of Results and Recommendations

The past Phase I ESAs conducted at the Downtown Station Makai Lot recommended further assessment to be conducted at the site to investigate contamination potentially present in the subsurface at the site. A Phase II ESA investigation was conducted from August through October 2020, in accordance with the Project Work Plan (HART, 2019), the HDOH TGM (HDOH, 2008 and subsequent updates), and the ASTM *Standard E1903-11* (ASTM, 2011). Activities included MIS soil, groundwater, and soil vapor sampling at three DUs.

Investigation activities reported concentrations COPCs in soil and soil vapor above the HDOH unrestricted Tier 1 EALs. Soil concentrations for acetone, TPH-d, TPH-o, 1-methyl naphthalene, benzo[a]anthracene, benzo[a]pyrene, naphthalene, and pyrene are also above the HDOH site-specific EALs at different depths, with the highest levels found within the shallow aquifer where grossly impacted soil was observed at the bottom of the fill material between approximately 7.5 and 9 feet bgs. Grossly impacted soil and highest concentrations of COPCs were associated with oil sand possibly used for corrosion control at the bottom of the former fuel oil tanks that were present on site between the 1920s and the 1950s.

Hypothetical future residents, occupational workers, and construction workers were identified as receptors potentially exposed through incidental ingestion, dermal contact, and inhalation. Because the site is in a developed area and concentrations in groundwater at the site are below the HDOH unrestricted Tier 1 EALs, terrestrial and aquatic ecological receptors are not considered a concern.

Through the development of an EHE, human direct exposure, gross contamination, and vapor intrusion concerns are confirmed to be a concern at the Downtown Station Makai Lot. Soil COCs are identified as VOCs (1,2-DCA and PCE), TPHs (TPH-d and TPH-o), PAHs (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, dibenzo[a,h]anthracene, indeno[1,2,3-c,d]pyrene, naphthalene, and pyrene), and the metal lead. COCs in soil vapor are VOCs (1,2-DCA and PCE) and PAHs (naphthalene and pyrene).

To address unacceptable risks, a combination of soil management, soil excavation and disposal, and soil vapor management is recommended at the site. An EHMP is developed to manage risk associated with soil and soil vapor during construction and long-term site activities. As new data become available (for example, after construction), the EHE and EHMP should be updated to ensure potential receptors are not exposed to unacceptable risk.

DE Hazard identified under the specific land use scenario

Notes:
 Boring/increment locations where grossly-contaminated soil was observed were segregated from those that showed no field evidence of gross contamination. Because of that, sample intervals 7.5-9 ft bgs in DU DS-01, 6-7.5 and 7.5-9 ft bgs in DU DS-02, and 10-20 and 8-9.5 ft bgs in DU DS-03 were composed from a number of increment locations lower than 30. In addition, an attempt was made in the field to collect a sample in the native coralline sand and gravel beneath the grossly-contaminated soil, but drilling hit refusal at several locations. Therefore the native coralline sand and gravel sample was collected from a limited number of increment locations.

DS01	DS-SG01	4.5	3.5 - 4.5	- Evaluate presence/absence of contamination above EALs							
DS01	DS-SG02	4.5	3.5 - 4.5	- Evaluate potential vapor intrusion pathways within footprint of future station - Assess risk to potential receptors							

TABLE 3-1. Sampling Summary

Phase II Environmental Site Assessment Report for the Downtown Station Makai Lot, Honolulu, Oahu, Hawaii

Notes:

bgs = below ground surface

DU = decision unit

EAL = environmental action level

NA = not applicable

NP = not planned

^a The DU planned area includes the portions of the site that could not be sampled because of the presence of aboveground (for example, the machine shop and storage sheds) and underground (for example, water tanks) structures (approximately 38 percent in DU DS-01 and 30 percent in DU DS-02).

^b Additional vertical DU layers were added during the implementation of fieldwork to evaluate fill material and grossly-impacted soil observed below the water table in some portion of the site. To avoid biasing sample results and delineate grossly-impacted soil, soil increments from boreholes showing no evidence of gross contamination (layers 1G and 1H) were segregated from those with grossly impacted soil (layers 2G and 2H). Therefore, some multi increment sampling soil samples were composed from a limited number of locations and two discrete samples were collected in DUs DS-01 (I interval) and

DS-03 (grossly impacted interval H).

^c The two screen intervals provided represent the actual "dry" screen depth of the well and the saturated screen interval, which is measured from the water table (as measured at the time of sampling) and the bottom of the well. Groundwater at the site is tidally influenced.

		Sample Depth	0-1 ft bgs	1-2 ft bgs	2-3 ft bgs	3-4 ft bgs	4-5 ft bgs
		Sample Date	17-Aug-20	17-Aug-20	21-Aug-20	21-Aug-20	21-Aug-20
Method	Chemical	Unit	HDOH Unrestricted Tier 1 EAL (DWT_SW<150m)	HDOH Site-Specific EAL (DWNT, SW<150m)	TCLP X20 Limit		

Notes:

Technical chlordane EAL was used for chlordane (alpha and gamma).

TCLP limits are based on the X20 rule (that is, total concentrations 20X higher than RCRA action levels).

bgs = below ground surface

DU = decision unit

DWT = drinking water threatened

DWNT = drinking water not threatened

EAL = environmental action level

ft bgs = feet below ground surface

HDOH = State of Hawaii Department of Health

ID = identification

J = Estimated result.

m = meter(s)

mg/kg = milligram(s) per kilogram

MDL = method detection limit

RCRA = Resource Conservation and Recovery Act

SW = surface water

TCLP = toxicity characteristic leaching procedure

TPH-d = total petroleum hydrocarbons, diesel range organics

TPH-g = total petroleum hydrocarbons, gasoline range organics

TPH-o = total petroleum hydrocarbons, oil range organics

U = The analyte was analyzed for, but not detected. The associated numerical value is at or below the sample-specific MDL.

Bold = detected result

Shade/bold in indicates detected result exceeds most stringent EAL action level.

Shade/bold in indicates detected result exceeds both unrestricted and C/I screening level.

Boxed indicates detected results exceeds TCLP X20 limit.

Notes:

bgs = below ground surface
DWT = drinking water threatened
DWNT = drinking water not threatened
EAL = environmental action level
HDOH = State of Hawaii Department of Health

ID = identification
m = meter(s)
mg/kg = milligram(s) per kilogram
NA = not applicable (one or more results are non detects)

SW = surface water
TCLP = toxicity characteristic leaching procedure
TPH-d = total petroleum hydrocarbons, diesel range
TPH-o = total petroleum hydrocarbons, oil range

Bold = detected result

"Non bold characters" show non detected results (with number representing the reporting limit)

Shade/bold indicates detected result exceeds most stringent EAL action level.

Shade/bold indicates detected result exceeds both unrestricted and C/I screening level.

Boxed indicates detected results exceeds TCLP X20 limit.

Notes:

Notes:

- a - VOC samples (Method SW8260C) taken on October 13, 2020.
- µg/L = microgram(s) per liter
- bgs = below ground surface
- DU = decision unit
- DWT = drinking water threatened
- DWNT = drinking water not threatened
- EAL = environmental action level
- FD = field duplicate
- HDOH = State of Hawaii Department of Health
- ID = identification
- J = Estimated result.
- m = meter(s)
- MDL = method detection limit
- mg/L = milligram(s) per liter
- N = normal
- SW = surface water
- TPH-d = total petroleum hydrocarbons, diesel range
- TPH-g = total petroleum hydrocarbons, gasoline range
- TPH-o = total petroleum hydrocarbons, oil range
- U = The analyte was analyzed for, but not detected. The associated numerical value is at or below the sample-specific MDL.
- Technical chlordane EAL was used chlordane (alpha and gamma).
- Bold** = detected result

TABLE 3-8. Soil Vapor Analytical Summary*Phase II ESA Report for the Downtown Station Makai Lot, Honolulu, Oahu, Hawaii*

DU-Soil		QA/QC		Method Group		
Vapor Point	Native ID	Type	Sample Date	VOCs TO-15	TPH-g TO-3	Methane D1945
DS01-SG01	DS-SG01-0920	N	04-Sep-20	X	X	X
DS01-SG01	DS-SG101-0920	N	04-Sep-20	X	X	X
DS01-SG02	DS-SG02-0920	N	04-Sep-20	X	X	X

Notes:

DU = decision unit

ID = identification

N = normal (that is, normal sample, not a QA/QC sample)

QA/QC = quality assurance/quality control

TPH-g = total petroleum hydrocarbons, gasoline range

VOCs = volatile organic compounds

Notes:

µg/m³ = microgram(s) per cubic meter

%V/V = percent by volume

bgs = below ground surface

DU = decision unit

EAL = environmental action level

HDOH = State of Hawaii Department of Health

ID = identification

MDL = method detection limit

TPH-g = total petroleum hydrocarbons, gasoline-range organics

U = The analyte was analyzed for, but not detected. The associated numerical value

is at or below the sample-specific MDL.

Bold = detected result

Yellow shade indicates detected result exceeds the HDOH unrestricted Tier 1 EAL.

S107023068	MANHOLE #19 AT FORT STEET MALL & NIMITZ HIGHWAY	467	Upgradient	REC	Likely to affect the environmental condition of the subject property.
S117391659	GROUP OF PEOPLE ENTERING A DOOR BYPASSING SECURITY	489	Cross Gradient	Historical REC	Has the potential to affect the environmental condition of the subject property.
U003402831	HARBOR COURT PROJECT	959	Upgradient	REC	Has the potential to affect the environmental condition of the subject property.

RECs Observed During Site Recon

Concern ID	Title	Description
183	Two monitoring wells	Two monitoring well vaults are visible looking through a locked access gate. Potential additional monitoring wells unknown due to limited sight lines into subject property.
184	No access or line of sight onto majority of the subject property	No access or line of sight onto majority of the subject property. As such, it is likely that additional items, items of concern, or recognized environmental conditions were not observed. It should be noted that as part of the July 2017 HART Phase I ESA for the City Center Section, multiple monitoring wells were observed within the subject property.
185	Fuel storage tanks adjoining subject property to the south	Two bulk fuel storage tanks adjoining subject property to the south.

Sandy silt w/ gravel. Very dark grayish brown (10YR, 3/2). None to low strength, none to slow dilatancy, low toughness, none to low plasticity. ~50% Silt. ~30% Sand. ~20% Gravel (subangular, basalt). Dry. No odor or staining. Silt and sand percentage increasing with depth.

Sandy gravelly silt with clay. Very dark grayish brown to dark yellowish brown (10 YR, 3/2 to 4/4). Low to medium strength, no to slow dilatancy, low to medium toughness, no to low plasticity. Silt ~60%. Sand ~25%, Gravel ~15%. Dry. No odor or staining.

Sandy silty clay. Very dark gray (10YR, 3/1). Medium to high strength, no to slow dilatancy, medium to high toughness, medium to high plasticity. Silt and sand percentages higher in the 8-8.5 and 9.25-9.5 intervals. Moist to wet. Slight odor. No staining.

End of boring at 11 feet bgs

DESCRIPTION		Fill / Native
Gravelly sand w/ silt. Grayish brown (10YR, 5/2) to brown (10YR, 4/3). <5% Silt. ~55-60% Sand. ~35-40% Gravel (subangular basalt). Poorly graded. Dry. No odor or staining.		FILL
Silty, sandy gravel. Brown (10YR, 4/3) to dark reddish brown (2.5 YR, 3/4). ~15% Silt. ~15% Sand. ~70% Gravel, subangular, basalt, up to 2 inches in diameter. Well graded. Dry. No odor or staining.		
Staining and odor toward the bottom.		
Wet from ~7 ft bgs.		
Sandy gravel. Gray (10YR, 5/1). ~30% Sand. ~70% Gravel, well graded, subangular, basalt, up to 2 inches in diameter. Wet. Petroleum hydrocarbon staining/LNAPL and odor.		
End of boring (REFUSAL) at 8.4 ft bgs (basalt)

DESCRIPTION	Fill / Native
Gravelly sandy w/ silt. Brown (10YR, 4/3). <5% Silt. ~35-40% Gravel (subangular basalt). ~55-60% Sand. Poorly graded. Dry. No odor or staining.	FILL
Sandy gravelly silt with clay. Very dark grayish brown (10YR, 3/2). <5% Clay. Silt ~60%. Sand ~25%. Gravel ~15%. Low to medium strength, no to slow dilatancy, low to medium toughness, no to low plasticity. Dry. No odor or staining.	
Sandy gravel. Pale yellow (2.5YR, 8/3). ~20% Sand. ~80% Gravel, subangular, up to 2 inches in diameter. Poorly graded. Dry. No odor of staining.	
Sandy, clayey silt. Dark grayish brown (10YR, 4/2). None to low strength, none to slow dilatancy, low toughness, none to low plasticity. ~15 clay. ~70% Silt. ~15% Sand. Dry. No odor or staining.	
Silty sand. Gray (10YR, 5/1). ~20% Silt. ~80 Medium sand, poorly graded. Moist to wet. No odor or staining.	NATIVE
Volcanic cinder. Black (10YR, 2/1). Wet. Slight petroleum hydrocarbon odor toward the bottom.	
Coralline sandy gravel. Very pale brown (10YR, 7/3). Sand 20%. Gravel 80%, coralline, poorly graded. Wet. No odor or staining. End of boring 10.5 feet bgs.

Gravelly sand with silt. Brown (10YR, 4/3). <5% Silt. ~55-60% Sand. ~35-40% Gravel (subangular, basalt). Poorly graded. Dry. No odor or staining.		FILL
Some iron oxidation at the bottom.		
Sandy silt. Dark gray (10YR, 4/1). Low to medium strength, none to slow dilatancy, low to medium toughness, no to low plasticity. Dry. No odor or staining.		
Silty clay. Dark gray (10YR, 4/1). Medium to high strength, no to slow dilatancy, low to medium toughness, no to low plasticity. Wet from ~7.5 ft bgs.		
Volcanic cinder. Black (10YR, 2/1). Wet. Some petroleum hydrocarbon odor toward the bottom. Moist to wet. Slight hydrocarbon odor at the top.		NATIVE
Gravelly sand. Pale yellow (2.5YR, 8/3). Coralline, poorly graded. Wet No odor or staining. Gravel portion increases with depth.		
Volcanic cinder. Black (10YR, 2/1). Wet. Some petroleum hydrocarbon odor toward the bottom. Moist to wet. Slight hydrocarbon odor at the top.		
Gravelly sand. Pale yellow (2.5YR, 8/3). Coralline, poorly graded. Wet No odor or staining.		
End of boring at 20 ft bgs

Analytical Laboratory: APPL **Transported via:** Hand Overnight

Signature/Sampler: *[Signature]*

Capacity of Casing (gal/linear feet): 1'-0.04; 2'-0.1; 4'-0.65; 6'-1.47; 8'-2.61; 10'-4.08
 For low-flow purging: 0.1 to 0.5 L/min is equivalent to 0.026 to 0.132 gal/min
 * Per the TGM, well purging should be considered complete when three successive readings of all of the indicator parameters taken at 3 to 5-minute intervals stabilize to within the tolerances indicated in this form
 For turbidity - well water is clear to the unaided eye in areas where the local groundwater is known to be clear and the turbidity readings are below 10 NTU, or turbidity within ±10 percent at concentrations larger than 10 NTU in areas of known turbid groundwater
 °C = degree Celsius DO = dissolved oxygen in = inch mV = millivolt PID = photoionization detector
 bgs = below ground surface ft = foot LNAPL = light nonaqueous phase liquid NTU = nephelometric turbidity unit ppmv = part per million by volume
 btoc = below top of casing gpm = gallon per minute mS/cm = millisiemens per centimeter ORP = oxidation reduction potential VOC = volatile organic compound
 ORP measurements recorded in the field have been corrected and are also reported against the standard hydrogen electrode (SHE) applying the following formula:
 ORP_(sample) = ORP_(data) + CF, CF = Eh(Zobell's-theor) - Eh(Zobell's-ref) ; Eh(Zobell's-theor) = 430 - 2.3(T-25) - 0.0038(T-25)² ; Eh(Zobell's-ref) = -1.3(T)+260.5

Appendix D
Site Release Report

This page intentionally left blank.

Purpose of this form: This form is to be completed by HART's Contractor that encountered/observed the release during construction. If an environmental release occurs notification is required. See Section 6.0 of the EHMP for more information.

RELEASE INFORMATION

HDOH Release Identification #: 20200821-0955LG
Name and Affiliation of Person Completing Form: Frank Hopkins/Jacobs
Date and time: August 21, 2020

INCIDENT INFORMATION

Date and time of the incident: August 21, 2020 9:55AM

Weather at time of incident:

Temperature: 85°F Sunny Partly Cloudy Rainy Wind (Direction/Speed): _____

Damage to Structures: Yes/No Catastrophic Release (e.g., fire, explosion): Yes/No Other: _____

Types of environmental release (please check all that applies):

- Hydrocarbon sheen on surface water or groundwater
- Any amount of free product observed
- Discovery of a potentially hazardous material, including contaminated soil and or groundwater
- Any visual evidence of contamination (e.g., staining, ash, asphalt, construction debris, illegal dumping)
- Any olfactory evidence of contamination or a PID reading >10 ppm
- Any amount of oil >25 gallons released to the environment or <25 gallons and not contained or remediated within 72 hours
- Other: Grossly contaminated soil observed 1-2 feet below the water table but no sheen observed on groundwater

Media into which the release occurred or is likely to occur (Indicate all those that apply):

Air Soil Groundwater Stream Ocean Other: _____

Does this incident require initiation of Stop Work procedures? Yes/No

Name (trade and chemical) of the hazardous substance released: Unknown petroleum substance

Approximate quantity of the hazardous substance released: Unknown

Location of release:

GPS Coordinates: 21.30677; -157.86411
TMK Number: 2-1-014-006
Address: 170 Aloha Tower Dr., Honolulu, HI 96813

Describe how the incident occurred including the potential source:

Field crews observed what appeared to be grossly contaminated soil while performing Phase II Environmental Site Assessment sampling at the Hawaiian Electric Honolulu Power Plant property. Lithology at the site is generally characterized by fill material down to about 9.5 ft bgs, where native coralline sand and gravel is found. Groundwater is tidally influenced and generally found at approximately 7 ft below ground surface (bgs) in the mauka portion of the site and about 5 feet bgs in the makai portion (e.g., there is some difference in elevation between the two portions of the site). Fill material extends below the water table and includes a layer of grossly contaminated soil (black medium sand) that appears to continue laterally over a large portion of the site (see approximate extent in Figure 1 attached) and vertically between approximately 7.5 and 9 feet bgs (i.e., 1-2 feet below the water table, as observed in the soil cores). Within that layer, field crews noted petroleum hydrocarbon odor, staining, and elevated photoionization detector headspace measurements up to 160 parts per million (ppm).

The original sampling plan, which included soil multi-increment sampling (MIS) over three lateral decision units (DUs) and five vertical DU layers (layers A through E; 0-1, 1-2, 2-3, 3-4, and 4-5 feet bgs), was modified in the field in an attempt to delineate impacted areas to the extent practical (e.g., underground utilities/structures and aboveground structures did not allow sampling within some portions of the site, and refusal was obtained at several boring locations most likely on basalt cobbles at approximately 9.5 feet bgs).

For vertical delineation, three additional vertical DU layers were added for soil sampling (F through H, 5-6, 6-7.5, 7.5-9) across the site and, where drilling could be pushed to deeper depths (i.e., no refusal), another MIS soil sample was collected within the native coralline sand and gravel beneath the grossly contaminated soil (e.g., layer I, 9.5 to 11 feet bgs, where no field evidence of contamination was observed). For lateral delineation, while grossly contaminated soil extended over the entire extent of DU DS01, the outer portions of DU DS02 did not appear to be impacted. Therefore, the MIS soil sample from the grossly contaminated H layer within DU DS02 was split into two MIS samples (one where evidence of gross contamination was observed and one where no evidence was found).

No evidence of gross contamination was observed in groundwater.

In summary, as shown in Figure 1 and the photo log, the grossly contaminated soil extended from approximately 7.5 to 9 feet bgs over the central southeastern portions of the site.

Known or Suspected Releases/Sites in the Vicinity: A summary of previous investigations conducted for the property and known or suspected releases in the vicinity were provided in the "Work Plan for Phase II ESA at the HECO Honolulu Power Plant, Honolulu, Oahu, Hawaii, Rev. 1 (HART, 2019)" and provided below. The attached Figure 2 is taken from the Work Plan and depicts the location of these areas relative to the subject site. Knowledge of the environmental conditions at the subject site is largely based on information provided in two reports:

- Phase I PSA (HLA, 1989)
- Phase I Environmental Site Assessment for the HART City Center Section, Honolulu, Oahu, Hawaii, "Appendix G-48, Phase I Environmental Site Assessment for Property TMK 2-1-014-006" (HART, 2017)

The 1989 PSA addressed the entire 149,644-square-foot HECO property; Appendix A includes a figure from the 1989 PSA showing the Downtown Station location in relation to the entire HECO property that had been included in the PSA. Limited soil and groundwater analytical results obtained during the 1989 PSA indicated the following environmental concerns:

- Reference to two fuel storage tanks located within the HECO property (not within the Downtown Station footprint).
- A 1969 release of fuel from a bulk storage tank located approximately 200 feet east of the HECO property.
- The removal of an underground storage tank (UST) in September 1989. State of Hawaii Department of Health (HDOH) UST records indicate a 1,000-gallon gasoline tank permanently out of use within the site.
- Three aboveground storage tanks (ASTs) observed within the site during the PSA (a 500-gallon kerosene AST, a 1,000-gallon propane AST, and 500-gallon propane AST).

Several of the nearby releases have the potential to affect the Downtown Station, including the following:

- Undated release from a HECO pipeline at the intersection of Ala Moana Blvd. and Bishop Street (approximately 0.1 mile north of the site). An unknown amount of diesel fuel or oil was released.
- HART Release 20141027-0845. Potential petroleum-contaminated soil (PCS) was encountered at geotechnical boring B-733 (located approximately 0.01 mile northeast of the site) at 8 feet below ground surface (bgs). Hydrocarbon odor and staining were observed in a soil sample from this location.
- HART Release 20121126-1706. PCS was encountered in stockpiled soil from archeological survey trenches C111, C113, and C115. Total petroleum hydrocarbons, diesel-range organics (TPH-d), benzo[a]pyrene, and lead were detected above unrestricted use EALs.
- HART Release 20140225-0815. PCS was encountered at geotechnical boring B-735 (located approximately 0.01 mile to the northeast of the site) from 7 to 7.8 feet bgs, where a tar-like substance was observed in soil.
- HDOH Release 20140731-1317. A mercury spill of 1.5 ounces was reported at the HECO Honolulu Power Plant located at 170 Ala Moana Blvd. A release response was conducted and the activity result was State On-Scene Coordinator No Further Action (SOSC NFA).

HDOH also collected a split sample and reported that samples are of a hydrocarbon fraction, appears to be aged, with carbon ranging from C10 – C30 and the bulk between C14 – C25. Further discussion will be provided in the Phase II ESA Report at the HECO Honolulu Power Plant, Honolulu, Oahu, Hawaii anticipated to be available at the end of October 2020.

RESPONSE INFORMATION

Describe corrective actions taken to eliminate the source of the release:

The observation was part of an ongoing environmental investigation; results and further recommendations will be presented in the Phase II ESA at the HECO Honolulu Power Plant, Honolulu, Oahu, Hawaii.

Reuse in Work Area:

- Groundwater re injected/reinfiltrated within work area where generated? N/A
- Soil returned to excavation? N/A

Temporary Storage Details:

- Volume of soil stored: 0 cubic yards
- Volume of water stored: 0 gallons
- Location of stored stockpiles/containers/tanks: N/A
- Contaminated stockpiles segregated and labeled in accordance with EHMP? N/A
- Stockpiles/containers stored in accordance with EHMP? N/A

NOTIFICATION INFORMATION

Name	Phone
HART POC (Caller) Name: <u>Mr. Frank Hopkins/Jacobs</u>	808-349-5650
HART POC Name: <u>Ms. Wai Yi Ng</u>	808-768-6128
HDOH On-Scene Coordinator Name: <u>Liz Galvez</u>	808-586-4248
On-Site Construction POC Name: <u>Sergio Cocchia/Jacobs</u>	808-393-1584
Property Owner Name: <u>Dave Martin</u>	808-543-4504

List the names of other federal, state, or local government agencies that have been notified of the release:

No other agencies notified. The final version shall be shared with the Local Emergency Planning Committee (LEPC).

HEALTH INFORMATION

Was there any immediate danger to life and/or health posed by the release? Yes/No

Known or anticipated acute health risks:

- Was PPE used properly? Yes/No
- Was the workspace atmosphere monitored for dust and vapors? Yes/No
- Was HART's H&S Contractor consulted? Yes/No

Known or anticipated chronic health risks:

- Was PPE used properly? Yes/No
- Was the workspace atmosphere monitored for dust and vapors? Yes/No
- Was HART's H&S Contractor consulted? Yes/No

Was advice regarding medical attention necessary for exposed individuals? Yes/No

Potential impacts to public health or welfare:

- Is the release in a residential area? Yes/No
- Is the release in a commercial area? Yes/No
- Is the release below the surface? Yes/No
- Is the release covered with asphalt, cement, or vegetation? Yes/No

Potential impacts to the environment:

- Is the release less than 150 meters from surface water? Yes/No
- Is the release below the surface? Yes/No
- Is the release within groundwater? Yes/No
- Is the release covered with asphalt, cement, or vegetation? Yes/No

FOLLOW-UP INFORMATION REQUIRED:

Information to be submitted to HDOH:

- Limited reuse/waste characterization sample analytical results
- Soil disposition information including volume of soil reused, location of reused soil, volume of soil disposed of at a permitted off-site facility, and location of the permitted off-site facility
- Groundwater disposition information including volume of water disposed of at a permitted off-site facility and location of the permitted off-site facility

LEGEND

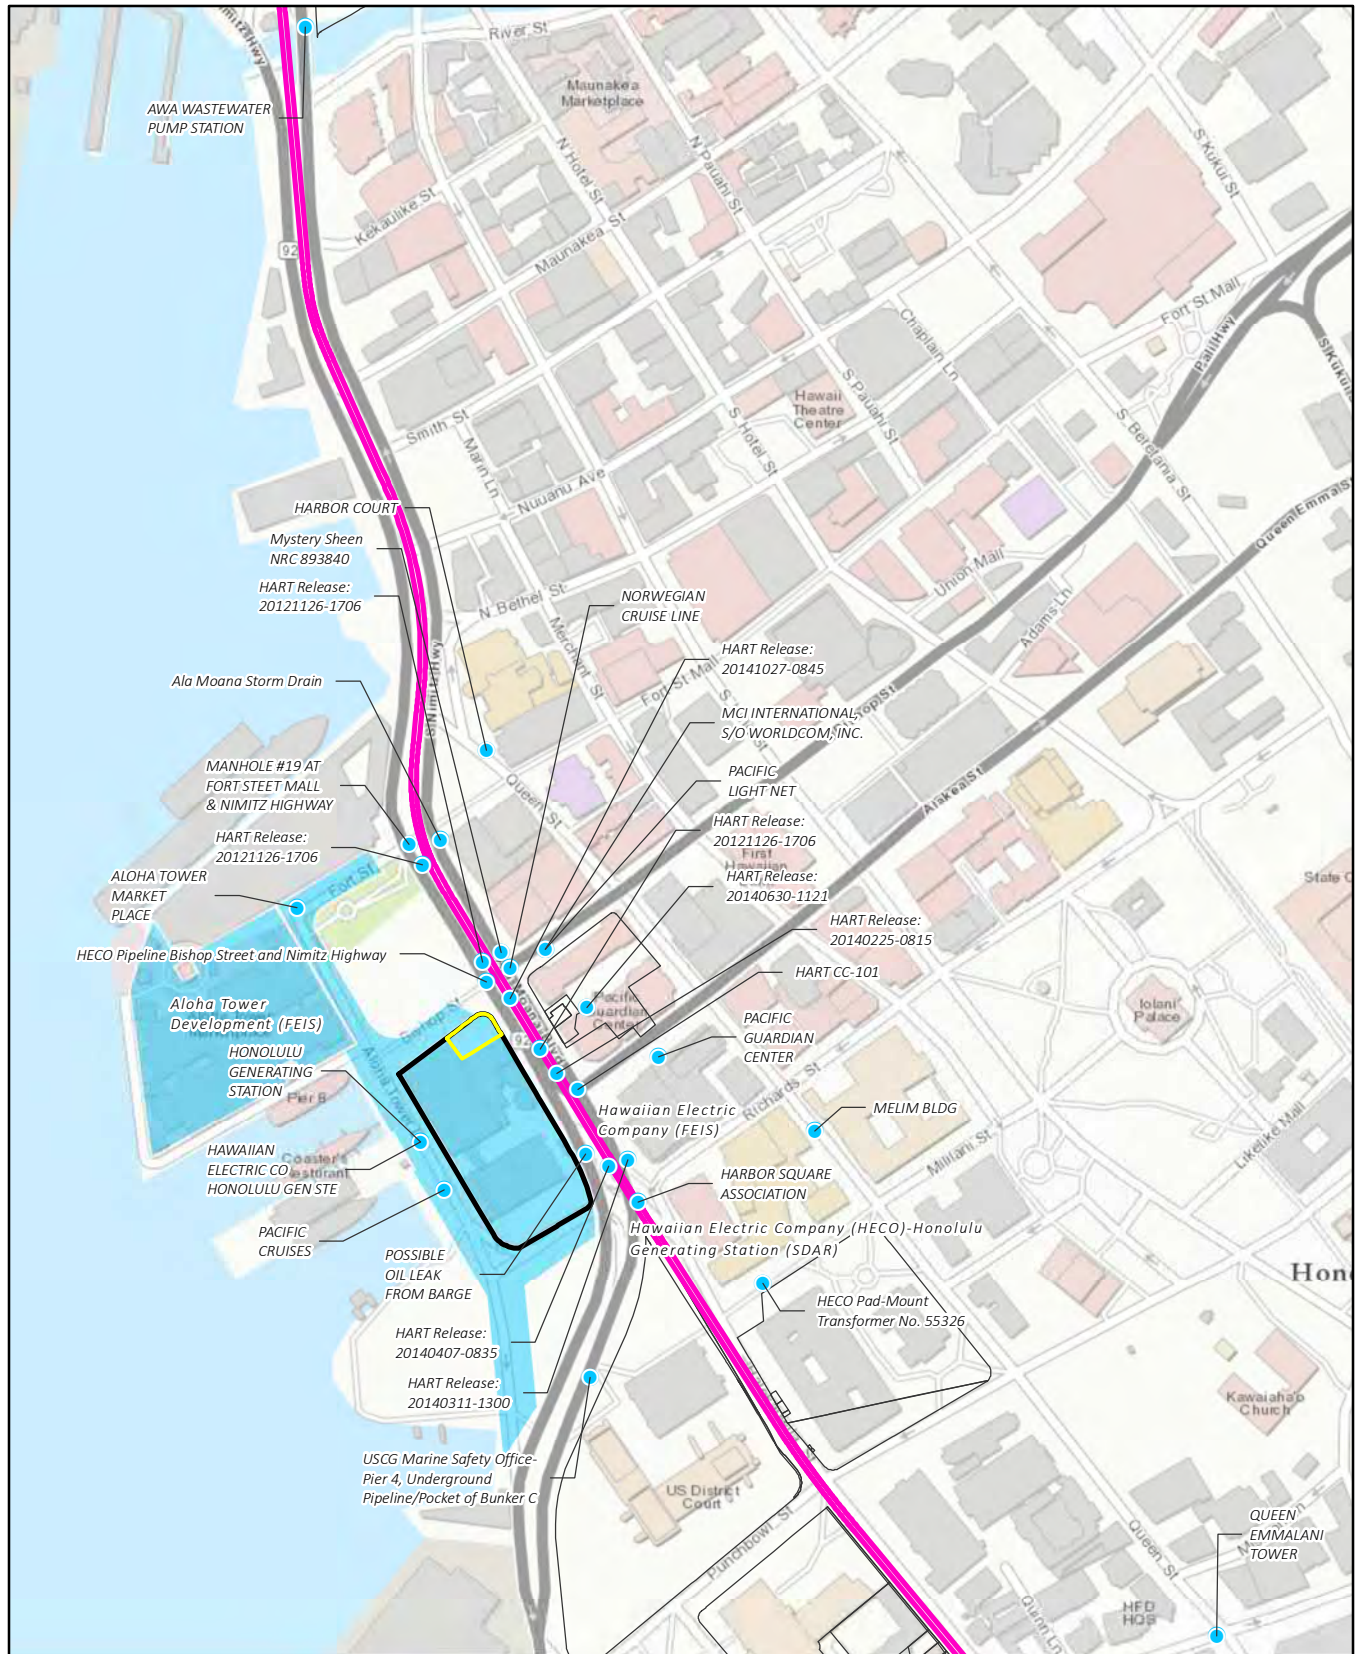

- Site boundary
- Decision unit DS-01 (decision Unit MIS)
- Decision unit DS-02 (Decision Unit MIS)
- Decision unit DS-01 (Shaft MIS)
- Approximate extent of grossly contaminated soil (i.e., petroleum hydrocarbon odor, staining, and/or elevated PID).
- Boundary is uncertain

Note:
 This figure is based on field information and locations that have not been surveyed. Investigation extended to site boundaries identified in this figure. Also, portions of the site could not be investigated based on presence of utilities and reinforced concrete. Therefore, as captured with dashed lines in the figure, uncertainties exist on the lateral extent of grossly contaminated soil.

Grossly contaminated soil, consisting of medium sand with petroleum hydrocarbon odor/staining/elevated PID, was observed from approximately 7.5 to 9 feet below ground surface.

PID = photoionization detector

I INTRODUCTION

This report presents results of chemical analyses of soil samples obtained during protective casing installation at the Aloha Tower Development (Plate 1). The casings were installed on Piers 10 and 11 in the locations shown on Plate 2. This work was verbally authorized by Aloha Tower Associates (ATA) on December 6, 1990, under the terms of HLA's proposed Master Consulting Agreement with ATA. Work was conducted in accordance with our November 6, 1990 proposal (90-486-06), and as revised in our December 7, 1990 letter to Aloha Tower Associates.

Borings 236 to 243 (Plate 2) are Phase III geotechnical borings. These borings (excluding Boring 238) were drilled and sampled to depths of 15 to 20 feet. The soil samples were analyzed for selected contaminants. The protective casings were installed in three of these borings both to isolate potentially contaminated soils, and to avoid carry-down contamination during subsequent drilling.

II FIELD PROCEDURES

Field work was conducted between December 8 and 17, 1990. An HLA geologist or engineer monitored the drilling and sampling of seven test borings, and the installation of PVC protective casings in three of these borings. Prior to drilling, the area around each proposed drilling location was surveyed ("toned") to detect possible subsurface utilities and pipes. The asphalt and concrete surface of the pier deck was then removed by coring at the boring locations.

A. Drilling and Sampling

The borings were drilled using either a Drillistics track drill or a Mobile Drill B-40 with 10-inch outside diameter hollow-stem augers. Soil samples were obtained using a Sprague and Henwood type split-barrel sampler, 18 inches long, driven by a 140-pound hammer with a 30-inch free fall. Stainless steel inserts within the sampler were used to retain the samples. The number of blows required to drive the sampler 12 inches was recorded and is noted on the boring logs. Soil samples were collected at approximately 2, 6, 10, and 15 feet below surface. Prior to commencement of drilling and between each boring, all augers, bits and other equipment used for drilling and sampling were steam-cleaned. Between each sample, the sampler, drive shoe, trash barrel, and stainless steel inserts were scrubbed clean in a detergent (Alconox) solution, and then rinsed in tap water followed by deionized water.

After each sample was retrieved from the borehole, the sample barrel was transferred to the HLA geologist. The geologist logged the sample noting the following characteristics: sample depth, blow counts, lithologic classification, color, apparent moisture content, density, stiffness, presence of hydrocarbon odors, discoloration or secondary mineralization, and other drilling details. The logs of the borings, based on

these sample descriptions, are shown on Plates 3 through 9. Soil samples were described by the HLA geologist according to the Unified Soil Classification System (Plate 10).

Soil samples were checked for petroleum vapors using a Century™ Organic Vapor Analyzer (OVA) Model 128 with a flame ionization detector (FID). These measurements were recorded on boring logs. The soil samples collected at 2 and 6 feet below ground level in each boring were retained for chemical analysis. To preserve the samples and retain volatile hydrocarbon components, the geologist capped the lower stainless steel insert from selected samples with aluminum foil and plastic caps. These samples were then labeled with the project name and number, date and time, boring number, geologist's initials, and a sequential sample number, and were placed in a reclosable plastic bag and stored on ice. At the conclusion of each sampling day, samples were rechecked and a chain-of-custody form filled out. Samples were sent by courier to Enseco-CRL, Garden Grove, California, for analysis.

B. Installation of Protective Casings

As described in our proposal, protective casings were to be installed in borings in which contamination was visually evident in cuttings or samples, or which had significantly elevated organic vapor measurements. These criteria were met in samples from Borings 236 and 237. Protective casings were installed in these borings and in Boring 240, which is located adjacent to the fuel pipeline.

Borings 236, 237 and 240 were drilled to depths of approximately 21 feet (see boring logs for exact depths). Eight-inch Schedule 40 solid PVC casings were then set in these borings on a sand or bentonite base. Tops of casings were set approximately 6 inches below the surface. The annular space between the borehole and casings were

then sealed using cement placed by tremie from the bottom of each boring. Steel plates were then nailed to the asphalt above each boring.

C. Chemical Analysis Procedures

The top two samples from each boring were sent to the laboratory for the following chemical analyses:

<u>Analysis</u>	<u>EPA Method</u>
Total volatile petroleum hydrocarbons (as gasoline)	8015
Total recoverable petroleum hydrocarbons	418.1
Volatile aromatics: benzene, toluene ethylbenzene, xylenes	8020
Base, neutral and acid (BNA) extractables	8270
PCBs and pesticides	8080
Mercury	7471
Arsenic	7061
Lead	6010
Copper	6010

To reduce laboratory analytical costs, samples from Borings 237, 240, and 242 were composited by the laboratory prior to analysis. This decision was made after reviewing field data and concluding that no anomalous or elevated contaminant concentrations were evident.

III RESULTS AND DISCUSSION

A summary of results of soils chemical analyses is listed in Table 1. Reports of chemical analysis are presented in the Appendix.

Petroleum hydrocarbons as oil (TRPH, Method 418.1) were detected in soil samples from four of the seven borings. Highest concentrations (180 milligrams per kilogram [mg/kg]) were detected in the sample near the water table from Boring 236. Smaller concentrations were detected in samples from Borings 239, 241, and 243. Petroleum hydrocarbons as gasoline (TVPH, Method 8015) were not detected in any of the soil samples.

Toluene was detected in three samples, its occurrence generally correlating with the occurrence of oil. Although toluene is a common additive in gasoline and diesel, it is unlikely that it occurs in crude or residual fuel oils. A lighter fuel oil is suspected to occur in these samples.

No polychlorinated biphenyls (PCBs) or chlorinated pesticides were detected in any of the soil samples. Of the semi-volatile organics (Method 8270), only very small concentrations of polynuclear aromatic hydrocarbons (PNAs) (phenanthrene, pyrene and fluoranthene) were detected in Boring 241. These PNAs are likely components of oil or of coal residues. One detection of di-n-octylphthalate is attributed to laboratory interference.

Metals detected in soil samples include lead (5 of 11 samples), arsenic (11 of 11 samples) and mercury (3 of 11 samples). Lead occurs in higher concentrations in the shallowest soil samples. This lead distribution with depth is similar to that seen in soil samples collected from the Pier 9 aquifer test area (results submitted in a separate

report).* It is evident that the elevated concentrations of lead in these soil samples is not due to petroleum hydrocarbons.

The distribution of arsenic in soil samples is fairly uniform spatially and with depth, a distribution similar to that seen in samples for the Pier 9 aquifer test area. This range of values is similar to that noted in other soil samples on Oahu.

The protective casings were installed in the borings which exhibited elevated organic vapors or had other evidence of occurrence of petroleum hydrocarbons on the water table surface. These casings will provide adequate isolation of these contaminated areas from the deeper deposits.

* Harding Lawson Associates, Piezometer Installation, Piers 8 to 11 Aquifer Test, Aloha Tower Development (in preparation).

CONCRETE
 BLACK SILTY BASALT GRAVEL (GM) (base course).
 DARK BROWN SILTY GRAVEL (GM) loose, dry (fill).

DARK BROWN SAND (SM) medium dense, moist,
 medium to coarse grained.

DARK GRAY SILT (MH) moist, sticky, elastic, minor
 angular basalt gravel.

Water level at 9 feet.

WHITE CORALLINE LIMESTONE hard, dense,
 saturated

Same as above

Boring terminated at 15.5 feet. Backfilled to surface.

PEARL CITY, HI 96782
ATTN: MR. JOHN WARD

Analysis No.: G-9034521-001/008
Date Sampled: 8/9-DEC-1990
Date Sample Rec'd: 11-DEC-1990
Project: (19951,007.06) ALOHA TOWER
PROT. CASINGS

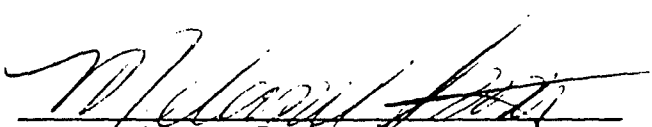

Enclosed with this letter is the report on the chemical and physical analyses on the samples from ANALYSIS NO: G-9034521-001/008 shown above.

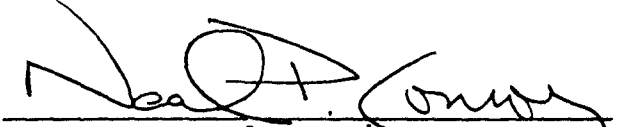

The samples were received by CRL in a chilled state, intact and with the chain-of-custody record attached.

Note that ND means not detected at the reporting limit expressed. The reporting limit is raised to reflect the dilution factor of the sample.

Solid samples are reported on "as received" basis.

Preliminary data for EPA Method 418.1, TPH and BTEX were provided on December 14, 1990 at 1:29 P.M.

CASINGS

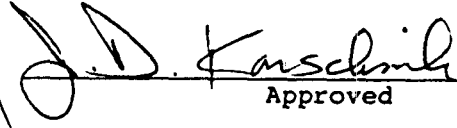

Enclosed with this letter is the report on the chemical and physical analyses on the samples from ANALYSIS NO: G-9035207-001/003 shown above.

The samples were received by CRL in a chilled state, and with the chain-of-custody record attached.

Note that ND means not detected at the reporting limit expressed. The reporting limit is raised to reflect the dilution factor of the sample.

Solid samples are reported on "as received" basis.

Reviewed

Approved

I INTRODUCTION

This report has been prepared at the request of Aloha Tower Associates (ATA) by Harding Lawson Associates (HLA), and presents a work plan for a subsurface investigation and feasibility study for the Aloha Tower Development (Plate 1).

The work plan for the subsurface investigation (RI) is based on a preliminary environmental assessment by Subsurface Consultants, Inc. (SCI) (1990a and 1990b); meetings between HLA and ATA; and on results of soils and groundwater sampling and monitoring in the Piers 8 through 11 area (HLA, 1991a; 1991b). These services were provided under the terms and conditions of the proposed Master Consulting Agreement between ATA and HLA.

A preliminary Feasibility Study (FS) has been prepared for the Aloha Tower Development.* The FS provided rough estimates of the volume and nature of contamination, identified potential remedial options, and evaluated effectiveness and costs of several remedial scenarios. The FS was based on the existing data collected by HLA and other entities. It is the intent of the Feasibility Study work plan outlined in this document (Section III) to refine and revise the preliminary FS as new data become available and as plausible remedial options are identified.

A. Purpose and Scope

The area of proposed development (the site) is shown on Plate 1. Because the site has been used for a variety of commercial activities for many years, including storage and use of petroleum products, coal and pesticides, and has also been used to

* HLA, 1991c, *Preliminary feasibility and remedial alternative study*, Aloha Tower Development, submitted to Aloha Tower Associates, January 24, HLA Job No. 19951,005.06.

store a variety of chemicals, there have been several opportunities for contaminants to enter the environment. At least two incidents of contaminant releases may have occurred on site: a break in a fuel oil pipeline near the Department of Transportation (DOT) offices on Pier 11; and a release of pesticides on Pier 10. Plate 2 shows the approximate locations of known fuel oil pipelines and environmental subsurface borings and monitoring wells constructed during the preliminary environmental assessment (SCI, 1990a, 1990b) and during recent sampling (HLA, 1991a; 1991b). The approximate areas of known or suspected soils contamination are shown on Plate 3.

Results of environmental sampling to date indicate that elevated concentrations of petroleum hydrocarbons, pesticides, and metals occurred in site soils. Additional characterization of both soils and groundwater is required prior to site construction to achieve the following objectives:

1. Evaluation of the extent, volume, and nature of contamination in on-site soils and groundwater;
2. Development of remedial options for soils that are to be excavated for site construction;
3. Development of treatment options for contaminated groundwater prior to commencement of site dewatering; and
4. Assessment of the risk to human health and the environment from remedial activities, including no further action for soils to be left in place.

The scope of services is limited to the on-site characterization of the subsurface soils and groundwater. The following areas are to be characterized:

1. Piers 5 and 6, makai of the site boundary along Ala Moana Boulevard;
2. Piers 8 through 11, including the area covered by Aloha Towers and associated warehouses, the DOT offices, and Irwin Memorial Park; and
3. Pier 12, makai of Nimitz Highway.

The vertical extent of exploration for site characterization will be from the ground surface (Elevation 6 to 7 feet above Mean Sea Level [MSL]) to approximately mean low water level (Elevation -2 to -3 feet MSL). Sampling from selected exploratory borings will establish whether the water table itself has provided a lower boundary of contamination.

The extent of this investigation is limited to those areas where planned construction activities will require removal of soils (Piers 8 through 11) or will be atop or below existing soils (Piers 5 and 6, Pier 12, Irwin Memorial Park). No off-site investigation is planned or anticipated to accomplish the goals of this project.

Evaluation of potential environmental effects from site construction activities (e.g., dust, airborne emissions, harbor siltation or turbidity) are also not included as part of this investigation.

B. Background

1. Site Description

The Aloha Tower project is along the waterfront of downtown Honolulu on Oahu, Hawaii. The site is bounded by Honolulu Harbor and Nimitz Highway, and extends from Piers 5 to 14, excluding portions of Pier 7 and the Hawaiian Electric Company substation (Plate 1).

Piers 5 and 6 are a landfilled peninsula, used primarily for public parking, with perimeter landscaping and lawns. Pier 5 supports berthing activities while Pier 6 is presently unoccupied.

Piers 8 through 11 are landfilled. Aloha Tower is a slender ten-story building in the northwest portion of the peninsula. The surrounding building contains

warehouses, passenger terminals, and commercial and governmental offices. The piers support shipping and receiving, storage and office space, parking area, and the Harbor Patrol Office.

Pier 12 is a partially collapsed landfilled pier. The remaining portion is used as a parking area for Department of Transportation employees.

Piers 13 and 14 are pile-supported and are occupied by a marine salvage company. Little or no landfill exists under these piers.

2. Site History

The following site history was taken from the SCI (1990a) environmental assessment, and from the Draft Environmental Impact Statement (ATA and Okamoto and Associates, 1990).

Piers 5 and 6: Prior to 1947, Piers 5 and 6 were two separate pier areas which were utilized by the U.S. Navy for berthing activities. In 1952 the Piers 5 and 6 peninsula was built, perhaps at the same time that the 10-inch fuel line that serviced this area was closed (Plate 2). By the end of the 1950s, the present parking area was constructed and continues to be used today.

Pier 6 berthed the Oceania (a floating restaurant) between 1972 and mid-1990. A transformer was installed on the pier to service the restaurant. The transformer was removed from the site after closure of the restaurant.

Piers 8 through 11: In the mid-1910s, the Piers 8 through 11 area supported coal storage as well as berthing activities and warehousing. In the 1920s, Aloha Tower was built, and the piers were renovated.

In the 1930s, the Board of Harbor Commissioners constructed and operated the Territorial Pipeline, an oil and diesel pipeline system. The pipeline runs

along Nimitz Highway and branches into the Piers 8 through 11 area. In 1952 the line was cut, a valve closed near Pier 5, and the portion of the line east of that valve was drained. The portion of the pipeline that services Piers 9 through 11 was last used in 1985, and the portion that services Pier 8 was last used at least ten years earlier.

In 1975 two 12,000-gallon fiberglass underground storage tanks (USTs) containing JP-5 jet fuel were installed at Pier 8 (Plate 2). The tanks have not been used since 1983 and have been reported to be emptied (SCI, 1990a).

A 550-gallon gasoline UST was installed at Pier 10 in 1963. The UST was used to service trucks for a contracting company. Based on a visual inspection of the tank site, it is believed that this tank has been removed (SCI, 1990a).

Pier 12: Pier 12 partially collapsed in 1966. The pier had previously been used to service passenger tour boats. The area also housed fumigation vaults and a fueling station.

Piers 13 and 14: The existing structure at Piers 13 and 14 was built in 1931. Within twenty years, a gas and oil fueling station occupied an area near Nimitz Highway. The fueling station may have been removed in 1952 (SCI, 1990a).

3. Future Development

The waterfront at Aloha Tower will bring together numerous activities and establishments including maritime, commercial and governmental offices, hotel, shops, and restaurants.

Piers 5 and 6: The peninsula will be extended several hundred feet into the harbor. A maritime building and passenger terminal will occupy the peninsula, with the finished floor elevation about the same as the existing grade.

Piers 8 through 11: Low-rise buildings will surround Aloha Tower, creating additional office space and an international cruise ship terminal. A high-rise building will occupy the Pier 11 area. Basement parking with finish grade at Elevation -8 feet MSL (or approximately 14 feet below existing grade) is planned for the peninsula. Maritime activities will continue at all piers.

Pier 12: Pier 12 will be transformed into Honolulu Fort Historic Park, a monument to the history of Honolulu Harbor. The park will be pedestrian-oriented with no roads or parking lots.

Piers 13 and 14: Two high-rise towers will be constructed on reconfigured and widened Piers 13 and 14. Maritime activities will continue.

C. Results of Previous Environmental Investigations

SCI conducted a preliminary environmental assessment in 1990 (SCI, 1990a; 1990b). Twenty-three exploratory borings were drilled, and twelve of these borings were converted to monitoring wells. Soil and groundwater samples were collected from these borings for chemical analysis. The following analyses were included in the testing program:

- Semi-volatile organics (Base/neutral/acid extractables)
- Polynuclear aromatic hydrocarbons (PNAs)
- Chlorinated pesticides
- Polychlorinated biphenyls
- Total extractable hydrocarbons
- Selected heavy metals
- Total oil and grease

- Cyanide
- Asbestos
- Purgeable halocarbons
- Purgeable aromatics
- Ethylene dibromide (EDB)

Petroleum hydrocarbons were detected in soils near the oil and diesel fuel pipeline at all piers. Concentrations of oil and grease in the soil ranged to 30,000 milligrams per kilogram (mg/kg). Total extractable hydrocarbons concentrations ranged to 8,100 mg/kg. The petroleum hydrocarbons occurred within 10 to 12 feet below existing grades.

Elevated concentrations of polynuclear aromatic hydrocarbons (PNAs) were also detected. PNAs were detected in the shallow fills at Piers 5 and 6, 8 through 11, and 12. Their occurrence may be associated with possible oil leaks, coal debris and fire-related debris. Heavy metals detected in the fill include arsenic, beryllium, and lead. Cyanide was found in one soil sample each at Piers 5 and 6, and 8 through 11. Low concentrations of pesticides were detected in the soil at Piers 8 through 11.

Two organic compounds were detected in groundwater samples, the pesticides delta-BHC at 0.2 micrograms per liter ($\mu\text{g/l}$) and kerosene at 0.5 milligrams per liter (mg/l). Eight heavy metals (Ba, Cr, Cu, Ni, Mo, Co, Hg, and Zn) were also detected in the groundwater samples.

Additional soils and groundwater sampling was conducted in December 1990 in support of aquifer testing and geotechnical drilling (HLA, 1991a; 1991b). Results indicate that elevated concentrations of contaminants were not detected within the Pier

9 aquifer test area, but were detected near the petroleum pipeline in the Piers 10 and 11 areas.

Preliminary estimates of the volume, nature and extent of on-site contamination have been made in a separate, accompanying report (HLA, 1991c). Areas of known or potential soils or groundwater contamination are shown on Plate 3.

II WORK PLAN FOR SUBSURFACE INVESTIGATION

A. Data Quality Objectives

Several contaminants have been detected in site soils at levels exceeding regulatory or cleanup standards. Furthermore, neither the sources nor the extent of contaminants have yet been adequately defined. A state Department of Health Office of Hazardous Evaluation and Emergency Response comment on the Draft Environmental Impact Statement (ATA and Okamoto, 1990) noted that releases of contaminants had been documented in the area, and that extensive evaluation of the extent of contamination may be necessary.

The data quality objectives (DQOs) specify the quality of the data required to support decisions to be made during subsequent phases of the investigation. Quality of data collected refers to: 1) the amount of data collected; 2) the strategy for data collection; and 3) the type of data collected relative to the chemicals of concern (COCs). Decisions to be made refer to: 1) the need for remediation; 2) the remedial alternatives; and 3) the assessment of risk from exposure to COCs. These decisions are discussed in Sections III and IV.

Specific areas have been targeted for detailed investigation:

- The petroleum pipeline on Piers 5 and 6, and 8 through 12.
- Two abandoned petroleum storage tanks on Piers 8 and 10.
- Fumigant vaults on Piers 9 and 10.
- Coal storage area on Piers 9 and 10.
- A former gasoline service station on Pier 12.
- An area of a potential release of pesticides on Pier 9.

The COCs potentially associated with each of these areas are listed in Table 1.

1. Sampling Locations

To provide the data necessary to accomplish project objectives, approximately 35 additional subsurface borings are planned (Plates 4, 5, and 6). Of these, 8 to 10 will be converted to groundwater monitoring wells for sampling and monitoring the uppermost aquifer beneath the site. Samples will also be collected from surficial soils at 10 to 15 locations. These boring and sampling points, when combined with the previously drilled borings and wells, will provide a sampling density of almost five points per acre. Numbers of borings, monitoring wells and samples to be collected are listed in Table 2.

2. Groundwater Sampling Strategy

An initial set of groundwater samples will be collected for selected existing groundwater monitoring wells on site, as described in Task 1 below. These samples will be analyzed for the constituents listed in Table 3.

This list was derived from results of previous investigations (SCI, 1990a; 1990b; 1991; HLA, 1991a; 1991b). On these bases, analytical procedures such as base/neutral/acid extractables (EPA Methods 625/8270) have been deleted from further consideration. Because the occurrences of halogenated hydrocarbons and certain priority pollutant metals have not yet been documented, a volatile organics scan (EPA Method 624), priority pollutant metals scan, and organic lead have been included in the first round of groundwater sampling.

If results of Task 1 support the deletion of certain analytes from further consideration, the scope of the chemical analyses in the remaining tasks will be reduced.

3. Soil Sampling Strategy

At most borings, three soil samples will be collected, generally between the ground surface and the water table. To achieve an overall characterization of the soil column at each boring location and to reduce analytical costs, the soil samples from selected borings will be identified for compositing by the laboratory prior to chemical analysis. Table 4 lists expected chemical analyses to be performed. If, however, field tests indicate that any of the three samples from a boring are anomalous, that sample will be analyzed separately. The field tests are organic vapor (headspace) measurements and the Hanby test for petroleum hydrocarbons (see Appendix A).

B. Field Tasks

The following field tasks have been developed to accomplish project objectives. The order of each task may change as work proceeds, and some tasks may run concurrently. The task descriptions are brief as the conduct of field activities is described at length in the Field Sampling Plan (FSP), Section V.

1. Task 1 - Confirmatory Groundwater Sampling

The existing groundwater monitoring wells on site (Plate 2) will be examined to evaluate their integrity, depth, screened interval, and suitability for continued monitoring and sampling. To accomplish this, well depths and depth of casing perforations will be measured, surface seals will be examined, and the overall status of each well (e.g., casing cracks, collapse, severe casing bends, or completion not in apparent agreement with well construction logs) will be assessed.

Water levels and floating product will be measured in each well deemed suitable for monitoring (measurement procedures described in Appendix A). Water samples will be collected from suitable wells that do not have floating product. Sample collection procedures are described in the following FSP. These water samples will be sent for laboratory analysis of chemical constituents listed in Table 3.

Results of these chemical analyses will be reviewed prior to initiating the subsurface investigation. Changes to the sampling program may be made depending on the results of these analyses.

2. Task 2 - Site Clearances and Permitting

Proposed drilling locations (Plates 4, 5, and 6) will be checked for adequate overhead and subsurface clearances. The latest utility maps will be used, and proposed sites verified with Pankow Builders, Ltd., representatives. Final proposed sites will be cleared, and scheduling approved by DOT Harbors Division.

Well construction permit applications will be prepared and submitted to the state of Hawaii Department of Land and Natural Resources (Appendix B).

3. Task 3 - Subsurface Investigation - Piers 5 through 6

Nine borings are proposed to be drilled at this site as shown on Plate 4, designated AB-1 through AB-9. Seven of these borings will be drilled to a depth of approximately 10 to 15 feet below grade. Two borings will be drilled approximately 10 feet below groundwater level and completed as groundwater monitoring wells (AW-4 and AW-6).

Up to three soil samples will be collected from each boring according to methods described in the FSP. These will be collected at (approximately) the following depths: 1-1/2 feet, 4 to 5 feet, and at the water table. Soil samples will be field-

tested for organic vapors, lead (total) and petroleum hydrocarbons according to the methods described in Appendix A. Depending on results of these tests, the three samples will be identified for laboratory compositing or individual chemical analysis. Table 4 lists analytes selected for chemical analysis for soil samples.

Upon completion of soil sampling, each boring will be backfilled with a cement/bentonite grout mixture, or will be completed as a groundwater monitoring well. Each well will be developed, purged, and sampled according to standard methodologies described in the FSP and Appendix A. Table 3 lists analytes selected for chemical analysis groundwater samples.

4. Task 4 - Subsurface Investigation - Piers 8 through 11

Site B encompasses the Piers 8 through 11 complex bounded by the harbor, Nimitz Highway, Fort Street, and Ala Moana Boulevard. Irwin Memorial Park is also included in this area. The area is shown on Plate 5.

The planned distribution of soil borings and monitoring wells on Piers 8 through 11 (and Irwin Memorial Park) is designed to allow both overall characterization of contaminant concentrations and to provide refinement in areas where contaminants have been detected or where past site usage caused suspicion of their occurrence. In developing the sampling locations, previous sampling and analysis (e.g., SCI, 1990a, 1990b, 1991; HLA, 1991b) were used.

Twenty-two subsurface borings are anticipated to be drilled, shown as Borings BB-1 to BB-22 on Plate 5. Additionally, soils from the five planned geotechnical borings in Irwin Memorial Park, 244 through 248, will be sampled as part of the environmental program. Finally, we intend to collect several samples of surficial soil in borings to be placed between the dwarf wall and the bulkhead wall, at locations

shown as SB-2 through SB-7 on Plate 5. These are locations of planned bulkhead probes to be conducted by MRCE.

Boring depths will be approximately 10 to 15 feet below the surface. Up to six borings will be completed as groundwater monitoring wells. These borings will be drilled to approximately 10 feet below groundwater levels. Well completion procedures are described in Task 1. Groundwater samples will be collected from each newly installed well according to the procedures described in Section V.

Soil samples will be collected from each boring at the same depths and according to the same methods as described above. Soil samples will be identified for compositing by the laboratory according to the OVA, lead, and hydrocarbon field tests. The soil samples will be tested for analytes associated with the oil and diesel pipeline (Table 4), pesticide and metals.

5. Task 5 - Subsurface Investigation - Pier 12

The mauka side of Pier 12 has been investigated by SCI (1990a). However, the makai side has not. Three borings will be drilled on this pier (Plate 6). One sample of surficial soils will also be collected. Presently, no monitoring wells are anticipated to be installed. If results of groundwater sampling (Task 1) or soil sampling in this task indicate that groundwater contamination is present, one additional monitoring well will be installed.

Borings CB-1 to CB-3 will be drilled to approximately 8 feet below the surface. If deemed necessary, Boring CB-3 will be converted to a groundwater monitoring well.

One soil sample will be collected from Boring SC-1 just below the base course. The soil sample from this boring will be tested for analytes associated with the

fumigant vaults (Table 4). The soil samples from the three borings will be tested for analytes associated with the oil and diesel pipeline (Table 4).

6. Task 6 - Groundwater Monitoring

Groundwater levels and the potential occurrence of free product will be monitored on a regular basis during the course of field work. Both existing and newly installed wells will be monitored.

Measuring points of newly installed and suitable existing monitoring wells will be surveyed by a Hawaii-licensed surveyor.

7. Task 7 - Evaluation of Leachability Characteristics

During each field task, soil samples will be collected for evaluation of leaching potential as defined in Title 40, Code of Federal Regulations, Part 261 (amended March 29, 1990). It is anticipated that samples will be composited from selected borings to provide assessment of average waste characteristics. Samples from areas suspected to contain significantly elevated concentrations of contaminants will be analyzed separately. For budgeting purposes, we estimate that 15 soil samples will be analyzed (Table 3).

Because of occasional elevated concentrations of lead detected in soil samples (SCI 1990a, 1990b, 1991; HLA, 1991a, 1991b), additional analysis of samples with elevated lead concentrations will be conducted. These analyses will include organic lead determination, leachability (using the EP toxicity test for metals), and physical analysis in an attempt to evaluate the nature of these elevated lead concentrations.

We estimate that 10 soil samples will be analyzed for lead leachability and nature.

8. Task 8 - Evaluation of Cuttings/Waste Disposal

Disposal options for the drummed soil cuttings, both presently on site and those additional drums from Tasks 3 through 5, will be evaluated. Each drum will be labeled with contents and boring number (if known). After chemical analyses have been completed, drums will be segregated according to relative degrees of contamination.

It is currently planned to store drums of cuttings on site in the present drum storage area (Pier 9). During site excavation, contents of these drums will then be added to the appropriate waste stream.

9. Reporting

At the conclusion of field activities, a summary report will be prepared. Boring logs, chemical analyses and monitoring results will be presented and discussed. Final estimates of waste volume, extent and characteristics will be made. Remedial options will be briefly described.

Recommended changes in the scope of the Feasibility Study (FS) and Risk Assessment (RA) will also be discussed.

III WORK PLAN FOR REMEDIAL FEASIBILITY STUDY (FS)

A. Objectives

A feasibility study (FS) will be conducted to identify, test, and evaluate remedial options for soil and groundwater. A preliminary feasibility study has been prepared and has been submitted separately to ATA (HLA, 1991c). The purpose of that study was to provide an estimate of "worst case" conditions, based on our limited understanding of the extent and nature of the subsurface contamination, and on a restricted set of remedial options.

The objectives of this FS are to:

1. Identify the applicable or relevant and appropriate requirements (ARARs) regarding action levels, treatment, and disposal of soil and groundwater;
2. Identify a limited set of strategies that will satisfy project and regulatory requirements for waste removal and ultimate disposal;
3. Identify particular data requirements that will be used to choose and evaluate a proposed remedial alternative; and
4. Analyze and evaluate the selected alternative.

The FS is usually conducted concurrently with the remedial investigation so that data needs may be readily satisfied.

B. Tasks

The following tasks comprise the FS:

1. Task 1 - Evaluate ARARs

The development of both remedial alternatives and the risk assessment depends on identification and evaluation of governmental requirements, standards and criteria. To a limited extent, this task has been addressed during the evaluation of Data

Quality Objectives (Section IIA). Table 1 lists the assumed regulatory basis for each COC identified for this investigation. The FS study must be updated, however, once field data have been obtained. In this way, measured concentrations of COCs can be compared to ARARs, additional ARARs identified, and inappropriate ARARs dropped.

2. **Task 2 - Preliminary Identification of Remedial Alternatives**

Potential remedial alternatives range from no action, landfilling, and recycling in asphalt plants, to microbially enhanced bioreclamation, fixation, steam or solvent stripping (soil washing), sand ultraviolet (UV) oxidation, to off-island disposal. These alternatives have been discussed in our preliminary feasibility and remedial alternative study (HLA, 1991c). Each plausible remedial alternative will be listed and assigned a ranking. The ranking of each alternative will be on the basis of:

- Implementability;
- Cost effectiveness;
- Remedial effectiveness;
- Time constraints;
- Space constraints; and
- Permitting or regulatory requirements.

3. **Task 3 - Treatability and Recycling Studies**

For the set of alternatives, the treatment effectiveness will be both tested and optimized during treatability studies. For these studies, samples of the waste are subject to bench and pilot scale testing. Inputs (e.g., microbes, nutrients, temperature, moisture, type of contaminant) are varied until the optimal input mixture is obtained, both with respect to treatment effectiveness and cost effectiveness. HLA's Novato, California, laboratories would conduct biological treatability studies. Asphalt

recycling, if identified as a plausible alternative, would be evaluated in HLA's Reno laboratory.

Recycling waste in asphalt or concrete plants require both material suitability and market suitability. Testing for material suitability is described in our accompanying report (HLA, 1991c). Market suitability will be tested by surveying existing and anticipated needs on Oahu, and determining the optimal conditions for recycling this waste in road, land area reclamation, or building products.

4. Task 4 - Design Parameters

The proposed remedial alternative or set of alternatives will be presented to both ATA and the Aloha Tower Development Corporation (ATDC) for review, comment, and approval.

Once approvals have been obtained, permitting needs will be identified, and disposal/storage options will be decided. Final design criteria will then be established. Costs of transport, storage, and treatment will be estimated. Design guidance will be prepared if requested.

Groundwater remediation, if required, may be conducted on a "spot" basis, during and after soils removal. Design of groundwater remedial systems will be necessary somewhat ad hoc, so that site conditions and construction activities may be accommodated.

5. Task 5 - Reporting

Interim reports will be submitted at the end of Tasks 2 and 3. It is anticipated that oral presentations will be made to ATA, ATDC, and DOH as remedial alternatives are evaluated (Task 3) and after Task 4.

A final report will summarize results and recommendations of the FS. The report will be submitted after the subsurface investigation (Section II) has been completed, and results have been reported. Each FS task will be described and results presented.

IV WORK PLAN FOR BASELINE RISK ASSESSMENT (RA)

A. Objectives

A risk assessment (RA) is conducted to estimate potential health effects associated with exposure to chemicals associated with the site and/or migrating from the site. The RA establishes an upper bound of the potential health impacts from long-term exposures to chemicals via identified environmental pathways. Potential impacts estimated for these pathways are compared to health-based or regulatory criteria to define which pathways may be of greatest concern, should exposures occur.

The RA methods described below will be conducted for two areas:

1. Where contaminated or potentially contaminated soils and groundwater are to be left in place; and
2. Where final storage and/or treatment is to take place for soils to be removed from the project site. The storage/treatment area presently being considered is adjacent to the reef runway at Honolulu International Airport.

Because transportation routes and methods (e.g., trucking, barging) have not yet been decided, an RA associated with these activities is not included in this work plan. This item may be added if it is later determined to be important.

B. Tasks

1. Task 1 - Data Evaluation and Statistical Analysis

HLA's staff will gather, organize, and review the existing data at the site, including background information, analytical data collected to date, and site specific data necessary to accurately assess exposure assumptions.

Data will be statistically evaluated to calculate arithmetic and geometric means, variance and standard deviation of each COC. The maximum detected

concentration of each COC, 95 percent confidence limit of the mean, and the frequency of detection of each COC will also be calculated.

2. **Task 2 - Identification of Potential Routes of Migration**

The identification of potential routes of migration will take place once the locations of areas of excavation, buildings, roadways, water use and vegetated areas have been decided. The shallow hydrogeologic system will be evaluated as a potential route of migration. For excavated soils, the characteristics of the proposed storage and treatment area in addition to the hydrogeologic system will be evaluated to identify migration routes in that area. Once potential routes have been evaluated, potential receptors, including humans and marine fauna and flora will be identified.

3. **Task 3 - Contaminant Fate and Persistence**

This task will be conducted once the analytical data from the field investigation is received. This study will make use of HLA's extensive computerized data base on chemical and contaminant properties, including health-based data. The fate and persistence of COCs are highly dependent on site environmental properties such as soil properties, rate and direction of groundwater flow, ambient groundwater quality, and local climate. Site environmental properties will be included in this evaluation. This task will be conducted in HLA's Novato offices.

4. **Task 4 - Assessment of Toxicological Properties**

The toxicological properties of each COC identified in the subsurface investigation as being of concern to human health or the environment will be evaluated using HLA's data base. Those chemicals that are found to be present above background and sample blanks will be further evaluated according to the Risk Assessment Guidance for Superfund (EPA, 1989a).

HLA will review recently published information on human toxicity and effects of aquatic organisms and prepare a short summary of the available toxicity information for each of the COCs. EPA's Integrated Risk Information System (IRIS) database (EPA, 1991) will be consulted to obtain the most current toxicity information (e.g., reference doses and slope factors) for the chemicals of potential concern. The Agency for the Toxic Substances and Disease Registry (ATSDR) toxicity profile for benzene (ATSDR, 1989) and health effects assessment documents for benzene and toluene (EPA, 1989a,b) are examples of other sources from which toxicity information can be obtained. Additional toxicity, fate and transport information can be obtained, if necessary, from over 200 data bases to which HLA has access.

5. Task 5 - Identification of Exposure Pathways

Exposure pathways will be evaluated for each constituent identified above to each potential receptor identified in Task 1. Potential exposure pathways that may be evaluated are:

- Direct ingestion;
- Inhalation of dusts and gases;
- Dermal contact; and
- Ingestion of potentially impacted marine biota.

6. Task 6 - Assessment of Exposure

Generally, environmental modeling is used to evaluate the potential health impacts to receptor populations. HLA has experience using numerous models for these evaluations, including EPA's Graphical Exposure Modeling System (GSC, 1987). Through these models, HLA evaluates the migration of a chemical from the site to the receptor (exposure point), and estimates the concentration to which the receptor may

be exposed. Standard exposure assessments and published health effects (e.g., EPA, 1986a; 1986b; 1989a; 1989b, 1989c) will be used for this assessment.

7. Task 7 - Risk Characterization

Health effects for potential or known carcinogens will be evaluated using published carcinogenic slope factors. Noncarcinogenic health effects will be evaluated using the Hazard Index (EPA, 1989a). These will be calculated for each exposure pathway and potential receptor under evaluation.

8. Task 8 - Reporting

A final report will be prepared presenting a methodology, data, calculations, results and conclusions of this risk assessment. Recommendations for reductions of potential exposure will be made, if results indicate that exposure will likely occur. Recommendations for reducing exposure caused through remedial activities will be incorporated into the remedial design.

V FIELD SAMPLING PLAN (FSP)

This Field Sampling Plan (FSP) presents the procedures to be employed during the field investigation. To the extent possible, the field investigation will be guided by the FSP. Because of the uncertainties inherent in all subsurface investigations, the FSP may not cover all contingencies, and deviations from this plan may at times occur. Such deviations will be appropriately noted at the time of occurrence. Significant deviations may require amendments to this FSP.

The Quality Assurance Project Plan (QAPP, Section VI) presents the procedures to be followed to ensure that data collected are accurate, precise, complete and representative of actual field conditions. Quality assurance is an integrated program for assuring reliability of monitoring and measurement data. Environmental monitoring and laboratory analyses conducted for this project will be performed in accordance with this plan.

A. Sampling Objectives

Five primary sources of environmental concern have been identified within the project area based on our review of previous investigations and site reconnaissance.

These potential sources as shown on Plate 3 are:

1. Oil and diesel pipeline running along Nimitz Highway and the waterfront at Piers 8 through 11, and Piers 5 and 6;
2. Former coal storage areas at Piers 8 through 11;
3. Former fumigant vaults and stations at Piers 8 through 12;
4. Underground storage tank sites at Piers 8 through 11; and
5. Fill material used to landfill Piers 5, 6, 8, 9, 10, 11 and 12.

Other isolated sources of environmental concern will also be investigated at Piers 5 and 6 (PCB transformer) and at Piers 8 through 11.

The objectives to be achieved for field subsurface sampling are:

1. To obtain the broadest and most representative description of site environmental conditions;
2. To ensure that the project objectives are met; and
3. To provide necessary and complete information for the Feasibility Study.

B. Soil Sampling Procedures

Proposed sampling locations are shown on Plates 4 through 6. Prior to any drilling activities, HLA will obtain necessary permits required by the state of Hawaii, and other applicable regulatory agencies. The oil and diesel pipeline will be located by toning, and the locations of borings will be toned to check for underground utilities prior to drilling.

Soil borings will be drilled using a Mobile B-40, B-61 or B-80 truck-mounted drilling rig. Augers will be hollow-stem and have 6-inch or larger outside-diameter flights. If obstructions prevent penetration using hollow-stem augers, then solid-stem augers or air rotary methods will be used until such obstructions are penetrated. In certain instances where obstructions prevent further drilling, the boring will be abandoned, and a new location will be selected for drilling.

Borings for monitoring wells will extend approximately 10 feet below the water table, and borings for soil sampling will extend a few feet below the water table. Drilling and sampling methods will be consistent with ASTM Method D-1452-80. A geologist, engineer, or qualified field technician will monitor the drilling and shall prepare lithologic logs of the borings using the Unified Soil Classification System

(USCS) and the Munsell or GSA color system. All logs will be prepared on standard HLA form *Field Log of Boring* (Appendix B). A detailed description of lithologic logging and soil sample collection procedures is given in Appendix A.

C. Groundwater Sampling Procedures

1. Monitoring Well Construction Methods

Groundwater monitoring wells will be installed at the locations shown on the site maps, Plates 4 through 6. Monitoring wells will be installed to facilitate the evaluation of:

- Groundwater quality;
- Floating product;
- Potentiometric levels; and
- Hydrogeologic characteristics.

Once drilling is completed, the depth at which the bottom of the well is set will be measured using a fiberglass measuring tape with a weighted end. The depth of the upper and lower surface of the sand pack, bentonite seal, and grout in the annulus surrounding the well casing will be similarly measured. These measurements, along with information regarding the screened interval and types of materials used, will be recorded on the *Well Construction Summary* form.

The well casing and screen will be constructed with two 4-inch-diameter, Schedule 40, flush-joint threaded PVC materials. The screen will be of continuous wrap construction, with slot openings of 0.020 or 0.040 inches. The screen will be 10 feet long, and the top of the screen will be placed about 2 feet above the static water

level in the well. A sand pack of clean silica sand will be placed adjacent to the entire screened interval and will extend at least one foot above the top of the screen.

A 1- to 2-foot-thick seal of bentonite will be placed above the sand pack. The annulus above the bentonite seal will be filled with cement grout. The well casing will extend 2 to 3 inches below ground surface, and a protective locking lid will be placed on top of the casing. A valve box will be installed flush to the ground surface to provide access to the well.

2. Well Development and Purging

Each groundwater monitoring well will be developed by surging, bailing, pumping or air-lift. Each well will be developed until discharge is reasonably clear and free of sediment. Target turbidity is 5 to 10 Nephelometric Turbidity Units (NTUs). If free product is detected in a monitoring well, no further well development will be conducted.

If surging or bailing is insufficient to properly develop the well, a pump will be placed near the bottom of the well and pumped at a discharge rate that can be continuously maintained until turbidity of the discharge water is minimized. The adequacy of well development will be determined by the site geologist.

Groundwater sample collection will begin with upgradient wells or those anticipated to have only low levels of contaminants, and progress to wells which are anticipated have higher levels of contaminants. All measuring and sampling equipment will be decontaminated prior to sampling. Wells will be purged using a stainless steel piston pump, stainless steel bladder pump, or bailer. Purged water temperature, conductivity and pH will be monitored during the process. Approximately three water-filled casing volumes will be purged prior to sampling. If a well is purged dry before

three casing volumes have been removed, the sample will be collected after the well has recovered to within 80 percent of the pre-purging water level, or after 24 hours, whichever comes first. Purging and development fluids will be stored in drums. All purging and groundwater sampling information will be logged on the *Groundwater Sampling Form*, Appendix B.

3. Groundwater Sampling Procedures

Groundwater samples will be collected from wells in which free product has not been detected. Water samples will be collected with a Teflon or stainless steel bailer, Teflon/stainless steel bladder pump or stainless steel piston (Bennett). Methods of analyses, sample containers, preservation methods and holding times are specified in Table 5. Prior to sampling, the following field parameters will be measured: temperature, pH, conductivity, alkalinity, turbidity, and dissolved oxygen.

The following information will be entered on *Groundwater Sampling Forms* (Appendix B) at the time of sampling:

- Name of sampler, time and date of collection;
- Sample location;
- Sample and boring number;
- Volume of each sample container;
- Type of analysis;
- Preservatives;
- Purge method, volume, and time;
- Groundwater appearance (e.g., color, odor, solids);
- Groundwater level prior to sampling;
- Sampling technique; and

- Field-measured parameters (pH, temperature, alkalinity, dissolved oxygen, conductivity, turbidity).

Samples will be collected in their appropriate containers in the following order (i.e., in general accordance with decreasing volatility of the analytes):

- Containers for volatile organics and petroleum hydrocarbons;
- Pesticides;
- EDB and methyl bromide;
- PNAs;
- PCBs; and
- Metals and inorganics.

Groundwater samples to be analyzed for metals will be filtered using a disposable in-line acetate filter. Filter opening will be 0.45 microns. Filter pressure will be supplied using a Geofilter peristaltic pump with replaceable tubing. Alternatively, the in-line filter may be connected to the discharge line of the bladder or piston pump, if either of those are used for groundwater sampling.

Each sample will be packaged and transported as described in the following protocol:

- a. Collect samples in appropriate containers.
- b. Add preservatives, as necessary (Table 5) immediately following sample collection and filtering.
- c. Print in waterproof ink on the sample label (Appendix B) the preservative added, the sample number, the initials of the sample collector, and the date and time that the sample was collected.
- d. Seal and package the sample containers, as appropriate.
- e. Fill out sample log and chain of custody.

- f. Separate and place samples into coolers according to laboratory designation. Each cooler must weigh less than 70 pounds, including ice. Keep samples well protected from shipping damage.
- g. Cool samples, if required, using sealed reusable ice packs only.
- h. Label coolers "Fragile" and "This Side Up."
- i. Coolers will be delivered to the analytical laboratory by HLA or designated couriers.

D. Sample Quality Control Procedures

Quality Control (QC) during soil and groundwater sampling, handling, storage, transport, and analysis is ensured by strictly following protocols described in this FSP. In addition, certain QC samples will be collected to evaluate the potential for carry-over and cross-contamination of samples.

For soil sampling, the following QC samples will be collected:

1. Equipment Blank: Deionized (DI) water collected from the final rinse of the assembled split-barrel sampler. One equipment blank per soil sampling batch will be submitted along with the rest of the soil samples collected during that period. The equipment blank will be tested for all analytes tested with the batch.
2. Field Blank: Deionized water used for decontamination will be poured into sample containers in the field and submitted with the regular samples. Field blanks will be tested for all the analytes listed in Table 3 and 4.
3. Trip Blank: Deionized water prepared by the laboratory, unopened both from and to the laboratory. The laboratory will provide sufficient trip blanks for submission of one sample per cooler shipped with soil samples from the UST sites. The trip blanks will be collected in 40-milliliter VOA vials. Trip blanks will be tested for volatile organics, BTEX and TPH as gasoline.

For groundwater sampling, the following samples will be collected:

1. Field Blank: One blank per sampling batch will be tested for all the analytes listed in Tables 3 and 4.

2. Equipment Blank: A sample of final rinse water from the bailer or sampler will be collected and submitted with the regular samples. One equipment blank per water sampling batch will be collected and submitted. The equipment blank will be tested for all of the analytes tested with the batch.
3. Trip Blank: One trip blank per cooler will be shipped with water samples from the UST sites.
4. Duplicate: A field split of a water sample poured sequentially into two containers from a bailed sample. One duplicate per water sampling batch will be collected and submitted. The duplicate sample will be tested for all the analytes tested with the batch.

These samples will be submitted blind, with only collection sequence numbers and no further sample identity.

E. Decontamination and Disposal Procedures

1. Equipment Decontamination

All equipment that comes in contact with potentially contaminated soil, drilling fluids, or water will be decontaminated prior to and after each use. Decontamination will consist of steam-cleaning and washing with non-phosphate detergent and freshwater or deionized (DI) water, as appropriate.

Drilling, sampling and monitoring well installation equipment will be decontaminated as follows:

- a. Drill rig augers, drill rods, bits and other drilling equipment will be steam-cleaned prior to use and between borings. Visible soil and grease will be removed at this time.
- b. Soil sampling equipment will be steam-cleaned prior to each boring.
- c. Unless the factory seals have not been broken, casing, screen, couplings and caps used in monitoring well installation will be steam-cleaned prior to installation.

- d. The exterior surfaces and accessible interior portions of the centrifugal pump will be steam-cleaned prior to each use. Inaccessible interior portions will be cleaned prior to each use by purging potable water and detergent through the pump and discharge lines, followed by purging potable water.
- e. Teflon and stainless steel bailers and pumps will be washed with detergent, and rinsed with DI water prior to each use. Rope or string used with bailers will be replaced after each use. Bailer ropes will be protected from contact with the ground, contaminated equipment, and skin. An equipment blank will be periodically collected and included in the analytical program.
- f. Steel tapes, well sounders, and water quality probes will be cleaned in detergent and rinsed in freshwater or DI water prior to each use. Generally, only the wetted end of these devices will require cleaning, provided it is washed and rinsed prior to being reeled onto the takeup spool.
- g. Water-sampling containers will be cleaned and prepared by the analytical laboratory.
- h. Stainless steel soil sampling tubes will be steam-cleaned, or washed in detergent and rinsed with potable water, followed by a DI rinse and air-drying prior to use.

2. Disposal Procedures

Soils and fluids that are produced or used during the installation, development, and sampling of monitoring wells and borings and that are known or suspected to be contaminated, will be contained in drums at the site. Fluids produced or used during the above operations that appear to be uncontaminated will be disposed of at the site.

Waste fluids or sediments generated during decontamination procedures will be handled in a similar fashion. Residual substances generated during decontamination procedures will be placed in appropriate containers. Disposal of drums generated during field sampling is discussed in the Work Plan, Section II.

VI QUALITY ASSURANCE PROJECT PLAN (QAPP)

A. Quality Assurance Objectives

The overall quality assurance (QA) objectives are to develop and implement procedures for obtaining and evaluating data in an accurate, precise, and complete manner so that measurements provide information that is comparable and representative of actual conditions. Important definitions are:

- Accuracy - the degree of agreement of a measurement with an accepted reference or true value.
- Precision - a measurement of mutual agreement among individual dual measurements of the same property, usually under prescribed similar conditions. Usually expressed in terms of the standard deviation.
- Completeness - the amount of valid data obtained from a measurement system compared to the amount that was expected and needed to be obtained to meet the project data goals.
- Comparability - expresses the confidence with which one data set can be compared to another.
- Representativeness - refers to a sample or group of samples that reflects the characteristics of the media at the sampling point. It also includes how well the sampling point represents the actual parameter variations under study.

The field and laboratory practices and procedures that will be used to satisfy these requirements are described in this chapter.

B. Sample Custody Procedures

Sample custody procedures will be followed through sample collection, transfer, analysis, and ultimate disposal. The purpose of these procedures is to assure that 1) the integrity of samples is maintained during their collection, transportation, and storage prior to analysis; and 2) post-analysis sample material is properly disposed.

1. Field Documentation

Information pertinent to field surveys, measurements, and sampling will be recorded on *Field Investigation Daily Report* sheets (Appendix B). Entries on these reports will include the following:

- Name and title of author, date and time of entry, and physical/environmental conditions during field activity;
- Location of sampling or measurement activity;
- Names and titles of field crew;
- Type of sampled or measured media (e.g., soil, groundwater, air, etc.);
- Sample collection or measurement methods;
- Number and volume of samples collected (also recorded on *Groundwater Sampling Forms*, as appropriate);
- Description of sampling points;
- Description of measuring reference points;
- Date and time of collection or measurement;
- Sample identification numbers;
- Sample preservative;
- Sample distribution (e.g., laboratory);
- Field observations and comments; and
- Field measurement data (also recorded on *Groundwater Sampling Forms*, as appropriate).

Sample quantities, types, and locations will be determined before the actual field work commences. As few people as possible will handle samples. The

field sampler is responsible for the care and custody of the collected samples until they are properly transferred.

Each sample will be labeled and sealed properly immediately after collection. Sample identification documents will be carefully prepared so that identification and chain-of-custody records can be maintained, and sample disposition can be controlled. Forms will be filled out with waterproof ink.

Sample labels (Appendix B) provide identification of samples. Where necessary, the label is protected from water and solvents with clean label-protection tape. Each label will contain the following information:

- Name of collector;
- Date and time of collection;
- Place of collection;
- Job number;
- Sample number; and
- Preservative (if any).

2. Chain-of-Custody Record

A chain-of-custody record will be filled out for every sample and will accompany every sample shipment to the analytical laboratory in order to establish the documentation necessary to trace sample possession from the time of collection. An example of the *Chain-of-Custody* form to be used is shown in Appendix B. The record will contain the following information:

- Sample identification;
- Signature of collector, sampler or recorder;
- Date and time of collection;

- Sample type;
- Sample containers;
- Sample preservative;
- Signatures of persons involved in the chain of possession;
- Inclusive dates of possession; and
- Analyses requested.

The laboratory portion of the form should be completed by laboratory personnel and will contain the following information:

- Name of person receiving the sample;
- Date of sample receipt; and
- Sample condition (recorded in section labeled "miscellaneous" or "remarks").

3. Sample Transfer and Shipment

Samples are always accompanied by a chain-of-custody record. When transferring samples, the individuals relinquishing and receiving the samples will sign, date, and note the time on the chain-of-custody record. Samples will be packaged properly for shipment and dispatched to the appropriate laboratory for analysis. Custody tape will be placed on all shipping containers. The chain-of-custody record will accompany each shipment. The method of shipment, courier name, and other pertinent information will be entered in the chain-of-custody record.

4. Laboratory Custody Procedures

All samples will be received by the laboratory's Sample Control Group and will be carefully checked for label identification, and accurate completed chain-of-custody records. Each sample will then be assigned a unique laboratory identification

number through a computerized laboratory information management system that stores all identifications and essential information. The system tracks the sample from storage through the laboratory system until the analytical process is completed and the sample is returned to the custody of the Sample Control Group for disposal. Access to the laboratory is restricted to prevent any unauthorized contact with samples, extracts, or documentation.

5. Sample Disposal

Unless notified by the program manager, excess or unused samples will be disposed by the laboratory in an appropriate manner consistent with applicable government regulations and the laboratory disposal practices.

C. Corrections to Documentation

Original data recorded in field investigation daily reports, chain-of-custody records, and other forms will be written in waterproof ink. None of these documents will be altered, destroyed, or discarded, even if they are illegible or contain inaccuracies that require a replacement document.

If an error is made on a document assigned to one individual, that individual will make corrections by crossing a single line through the error, entering the correct information, and initialing and dating the change. The erroneous information will not be obliterated. Any subsequent error discovered on a document will be corrected. All corrections will be initialed and dated.

D. Instrument Calibration Procedures

Procedures described in this section pertain to the calibration of equipment and instruments to be used on the project. Included is a description of the procedure or

reference to an applicable standard operating procedure, the calibration frequency, and the calibration standards to be used. The use of these instruments in the field is described in Appendix A.

1. Water-Level Instruments

Electric sounder:	Check against steel surveyor's tape prior to use.
Steel tape:	Manufacturer-supplied temperature correction will be applied if applicable for field conditions.

2. Portable Gas Analyzers

Three types of portable gas analyzers are available for on-site use during field operations: HNu Systems PI-101 Photoionizer; Foxboro (Century) Model 128 Organic Vapor Analyzer (OVA); and a Bacharach TLV meter. Calibration procedures vary according to whether these instruments are to be used for general qualitative survey tasks, or for tasks that involve quantification of concentrations. For general survey work, the factory-supplied instruction manual will be used as a guideline for calibration.

Calibration procedures are as follows:

- Each day, prior to collecting analytical measurements, the instrument(s) to be used will be calibrated using a factory-supplied standard gas. The OVA will be calibrated using 100 ppm methane; the TLV will be calibrated using 500 ppm hexane; and the HNu may be calibrated using any factory-supplied standard gas.
- Each of these instruments will be calibrated by connecting the instrument probe to a container filled with a standard gas. The instrument will draw in a sample of the gas and will provide a reading of the gas concentration. This reading is then adjusted to the exact value of the calibration gas using the appropriate calibration knob.

3. pH Meter

An Orion Research digital pH meter will be used to measure pH. Factory-supplied buffer solution will be used to calibrate the meter daily. Two buffers that bracket expected pH values will be used. Only fresh buffer solutions (less than six months old) will be used. Temperature corrections, supplied with each buffer solution, will be applied to each measurement.

4. Specific Electrical Conductance Meter

The conductivity meter used is a YSI Model 33 S-C-T, with a 10-foot probe. The meter is factory-calibrated annually and field-calibrated prior to each day's use using a factory-supplied potassium chloride standard.

5. Temperature

Mercury thermometer calibration: factory-calibrated once, and checked with measurements from duplicate thermometer prior to use.

Temperature meter calibration (on conductivity meter): calibrated against mercury thermometer.

6. Turbidity Meter

The Hach Model 16800 Turbidimeter is calibrated using factory-supplied stable standards in sealed vials. Three turbidity ranges are used: 0-1, 0-10, and 0-100 NTUs. A turbidity standard is available for each of these ranges. Prior to each use, the meter is calibrated using the appropriate standard for the expected measurement. If that measurement is out of range, the meter will be recalibrated using a new standard.

7. Petroleum Hydrocarbons Field Test

The Hanby test for hydrocarbons in soils is a quantitative analysis using colorimetric comparison. Factory-supplied standards are used for calibration. Quality

control is applied through periodic analysis of water blanks and organics-free soil standards. No other test calibration is required.

E. Laboratory Analytical Procedures

The laboratory will employ analytical procedures provided in the Environmental Protection Agency document *Test Methods for Evaluating Solid Waste* (EPA 1986c), or in Standard Methods (APHA, latest edition). The laboratory instruments used will be calibrated according to and at the frequency indicated by the QA/QC procedures for the analytical laboratory. These QA/QC procedures will meet or exceed individual analytical method requirements.

F. Data Reduction, Validation and Reporting

Data collected during investigation tasks will be appropriately identified, validated, and recorded. When test data have been reduced, the method of reduction will be described in such reports. Field measurements and analytical results will be entered into HLA's computer Data Base Management System (DBMS). Entry of data to the DBMS will be checked using verification routines and visual inspection of hard copies of data files.

1. Field Measurement Data

Validation of data obtained from field measurements will be performed by regularly checking procedures utilized in the field and comparing the data to previous measurements. Data that cannot be validated will be so documented.

The following reporting requirements will be followed for field data:

- pH: Field measurements will be reported to 0.1 pH unit.

- Electrical conductivity: Field measurements will be read and reported to 1/50 of the meter scale.
- Temperature: Field measurements will be reported to ± 0.5 degrees Celsius.
- Turbidity: Field measurements will be reported to 1/10 of the meter scale.
- Water levels: Measurements will be repeated until at least two are in agreement to the nearest 0.02 foot.
- Soil sample depths: Tape measurements will be made to the nearest 0.1 foot; measurements made by known length of drill string will be made to the nearest 0.5 foot.

2. Laboratory Analytical Data

Validation of analytical data will be performed by a senior professional at the laboratory and by the HLA Quality Assurance (QA) Officer (or designated representative) prior to and following data entry into the DBMS and prior to subsequent procedures to be used for evaluating the precision, accuracy, and completeness of the chemical data. The purpose of implementing these procedures is to verify that the chemical data generated are accurate, precise, and complete, and representative of site conditions.

Chemical data will be validated according to accuracy, precision, and completeness criteria for both the field and analytical laboratory programs. If problems arise and the data are found to deviate from previous analyses or surrounding conditions, the data will be annotated. Sample recollection and analysis will only be used in extreme quality control problems. For example, if repeated erratic results are obtained from a particular well (variations of 100 to 200 percent) for concentrations that are at least 1 to 2 orders of magnitude above the analytical method detection limit, then the well may be redeveloped and resampled.

The laboratory analytical data will be evaluated based on the following types of control samples:

- Spikes - Intended to evaluate data accuracy.
- Blanks - Intended to evaluate whether laboratory or field procedures represent a possible source of contamination of field samples. Four types of blanks will be analyzed: trip blanks, field blanks, equipment blanks, and internal laboratory blanks.
- Duplicates - Intended to evaluate data precision. Two types of duplicate samples will be analyzed: field duplicates and matrix duplicates.

The completeness of data represents an estimate of the amount of data expected from the field programs versus the amount of data actually entered into the data base that is available for interpretation. Completeness will be assessed prior to preparation of reports and will include checking that all entries in the DBMS are properly entered. Checked data will be initialed and maintained on file. Data will not be eliminated from the DBMS based on statistical methods.

The procedures for evaluating both the field and laboratory data are presented below:

a. Spikes

The procedure for assessing spike samples will be as follows:

- 1) Tabulate spike sample data and calculate the percent recovery as shown below for each sample:

$$\text{percent recovery} = \frac{(T - X)}{A} \times 100$$

where: T = total concentration found in spiked sample
X = original concentration in sample prior to spiking
A = actual spike concentration added to sample

- 2) Calculate the percent recovery.

- 3) Identify those samples that exceed the Upper Warning Limit (UWL) or are less than the Lower Warning Limit (LWL) for the percent recovery. Identify those samples that exceed the Upper Control Limit (UCL) or are less than the Lower Control Limit (LCL) for the percent recovery. Perfect recovery is 100 percent.
- 4) Evaluate the significance of data that fall outside the control limits. If the UCL and/or LCL is exceeded, the laboratory will be notified. The data from that period will be evaluated for the compound that exceeds the limits, and corrective action will be taken, as appropriate. If the LWL and/or UWL is exceeded, the qualitative analysis will focus on the items listed in the discussion of the duplicates analysis. Data will not be removed from the data base, but may be qualified by narrative interpretations.

b. Blanks

The evaluation procedure for blanks is a qualitative review of the chemical analysis data reported by the laboratory. The procedure for assessing blank samples will be as follows:

- 1) Tabulate the data from the blank samples. A separate table will be prepared for both the field and trip blanks.
- 2) Identify any blank samples that have chemicals detected in the sample.
- 3) If no chemicals are detected in any blank samples, the tables are ready for entry into the data report.
- 4) If unacceptable concentrations of chemicals are detected in blank samples,* the QA Officer will notify the laboratory and will review other recent results from blank samples from that laboratory to determine whether this is an isolated incident. If necessary, based on the significance of the problem, the QA Officer will submit additional blank

* An example of acceptable chemicals that may be detected are common laboratory contaminants (methylene chloride, acetone, 2-butanone, toluene and bis[2-ethylhexyl] phthalate) which may be present in the blank at up to five times the reporting limit and still be considered acceptable.

samples to the laboratory to verify that the problem exists and/or determine whether the problem has been corrected.

- 5) If unacceptable concentrations of chemicals are found in blank samples, the compound and concentration will be reported, and the field data for that period will be assessed for potential problems with data interpretation. No data will be removed from the data base based on chemicals being detected in blank samples. Appropriate notations will be made in the data base reports.

c. Duplicates

The procedure for assessing duplicate samples will be as follows:

- 1) Tabulate duplicate data and calculate the positive difference, and relative percent difference (RPD) as shown below for each duplicate pair:

$$RPD = [(X_1 - X_2)/\bar{X}] \times 100$$

Where X_1 = concentration of sample 1 of the duplicate

X_2 = concentration of sample 2 of the duplicate.

\bar{X} = mean of sample 1 and 2.

- 2) Calculate the average for the RPDs for all duplicate pairs.
- 3) Calculate the standard deviation for the RPDs using the formula shown below (APHA, 1985):

$$s = [\Sigma(X - \bar{X})^2 / (n - 1)]^{1/2}$$

Where s = standard deviation

n = number of observed or calculated values

X = individual observed or calculated value

\bar{X} = mean of all observed or calculated values

- 4) Calculate the UWL and UCL for the RPDs so that the UCL represents a 95 percent confidence interval. These limits are obtained for the UCL by adding the average RPD to the result of multiplying the standard deviation by 2.77. The UWL is obtained by adding the average RPD to two-thirds

of the UCL. (NOTE: No lower warning or control limits are calculated because the distribution of data is "one tailed" away from zero.)

- 5) Identify any duplicates that exceed the UWL or the UCL.
- 6) Qualitatively evaluate the significance of the data that fall outside the control limits, and if necessary, compare such data with other sampling results. The evaluation will focus on historical variations in concentrations at the sample location, the concentrations at sampling locations, whether problems arise for one particular compound or random compounds, and whether the problem is limited to one or several sampling locations. Data will not be removed for the data base based on statistical significance, but may be qualified based on the evaluation. If data quality problems arise, the analytical laboratory will be notified for corrective action.

3. Reporting Requirements

The appropriate documents will be prepared and distributed that will summarize both the field activities performed and the results obtained. These reports will be distributed and maintained in accordance with the scope of work. These submittals, to the extent applicable, will include the following:

- Presentation of results;
- Summaries of field data;
- Lithologic description of logs;
- Schematic diagrams of monitoring well construction; and
- Tabulations of all chemical data.

G. Quality Assurance and Quality Control Audits

During the course of field investigation, audits of the field and analytical programs will be performed. The drilling and well installation program will be audited

once at each site, and the groundwater sampling and analytical program will be audited at least once according to the sampling schedule.

The audits will be performed by HLA's QA Officer or a designated representative. The field audit will focus on whether the drilling or sampling procedures outlined in this Plan have been followed. The audit will include observation of the drilling and well installation operations and an inspection of selected drilling and well installation documentation. The sampling and analysis audit will include inspection of appropriate documentation and, as mentioned above, an assessment of data quality by reviewing the results of chemical analyses of the quality control samples.

Two types of quality control (QC) checks will be employed to evaluate the performance of the analytical procedures: field QC checks and laboratory QC checks. The QC checks represent the controlled samples introduced into the sample analysis stream that are used to calculate the accuracy and precision of the chemical analysis program.

1. Field QC Checks

Field QC checks are accomplished by submission of controlled samples that are introduced blind to the laboratory from the field. Two types of samples will be used: blanks and duplicates. Each sample will be noted in the field investigation daily report. QC samples will be assigned a sample number that does not indicate to the laboratory that the sample is a QC check. Due to the heterogeneous nature of soils, it will not be appropriate to obtain soil samples for field QC checks.

2. Laboratory QC Checks

Laboratory performance QC checks are provided as a standard part of every routine laboratory analysis. The main elements of laboratory performance QC are:

- The analysis of laboratory control samples, which include duplicate control samples, single control samples, and method blanks; and
- The generation of daily calibration data.

3. Corrective Actions

If any occasion arises that indicate that field, laboratory or measuring error has occurred, the following corrective actions may take place:

- The measurements will be repeated to check the error;
- The calibrations will be checked and/or repeated;
- All adjustments will be checked for corrections to ambient conditions (such as temperature);
- If necessary, the instrument of measuring device will be replaced or repaired; and
- Resampling and retesting may be performed.

The need for corrective actions and the actions to be taken will be determined on a case-by-case basis.

VII SCHEDULE

A schedule for project tasks is given in Table 6. The proposed schedule was based on the following assumptions and time constraints:

1. Field work may commence by approximately May 1, 1991.
2. Site access problems are minimal.
3. Field activities (drilling, sampling) should be completed by mid-June, 1991.
4. No significant additional areas or sources of contaminants are detected.

The Feasibility Study and Risk Assessment should in large part be completed by September 30, 1991. Several feasibility study tasks require input and decisions from state agencies. Among the decisions affecting the progress of the FS are:

- Cleanup requirements or goals have been determined; and
- Disposal and treatment areas have been identified.

Factors that affect the progress of the risk assessment are:

- Completeness and timing of the subsurface investigation;
- Site excavation plans; and
- Preferred remedial alternative(s) determined.

VIII PROJECT MANAGEMENT

The management of this investigation is organized along the structure shown on Plate 7. The responsibilities of key project personnel are given below.

Project management will take place at HLA's Pearl City office, although other HLA offices will provide supporting expertise in the areas of feasibility studies (Reno and Novato) and risk assessments (Novato).

Principal consultant for this investigation will be Mr. Ronald Soroos (RG), principal geologist with HLA. Mr. Soroos will provide overall project guidance and act as QC reviewer for all project documents. Mr. Soroos will assist in discussions with regulatory agencies.

Principal consultant on geochemical and contaminant chemistry issues will be John Catts, Ph.D., principal geochemist at HLA. Dr. Catts will provide review and interpretation of groundwater chemistry, and the occurrence and nature of lead and other heavy metals in site soils.

Mr. John Ward (RG), associate hydrogeologist, will be overall project manager. He will be responsible for the conduct of all field activities, report preparation, coordination of activities, and liaison between ATA, DOT, and regulatory agencies. Mr. Ward will be the key contact on all project communications.

Mr. Bruce Wedgeworth, project geologist, will be responsible for all tasks associated with the field investigation. He will coordinate and control site preparation, soil borings, well installation, and sampling. He will oversee subcontracted drilling and analytical services.

Throughout the investigation, project health and safety activities will be the responsibility of the Hawaii office Designated Health and Safety Officer, Mr. Masayoshi

Ogata, a Certified Industrial Hygienist. In addition to preparing the Health and Safety Plan for the field investigation, Mr. Ogata will review the selection of sampling methods and chemical analyses and the results of the analyses for potential effects.

Resumes of key personnel are provided in Appendix D.

APPENDIX A
FIELD MEASUREMENT PROCEDURES

FIELD MEASUREMENT PROCEDURES

The procedures for collecting field measurements described below are to be followed by all field personnel. These methods are presented in detail to ensure that field measurements are consistent and reproducible when performed by various individuals. Appendix B contains examples of sample forms to be used by field personnel for recording field measurements.

A. Organic Vapor Measurements

1. Ambient and Borehole Air Monitoring

During drilling, the ambient air in the vicinity of drilling activities, and the open borehole air will be monitored using a Century™ Organic Vapor Analyzer (OVA) Model 128 with a flame ionizing detector (FID), or a Bacharach™ TLV combustible gas meter. These measurements will be used for safety purposes (Appendix C) and also to indicate the existence of possible organic contaminants. The OVA is calibrated using a 100 part per million (ppm) methane standard. The TLV is likewise calibrated using a 500 ppm hexane standard. All measurements will be recorded on Field Investigation Daily Reports by the field geologist or engineer.

2. Static Headspace Analysis - Soil Samples

Organic vapor measurements from soil samples are obtained as follows: soil samples are dislodged from the sampler's drive shoe after each sample is collected. This soil is crumbled and stored in a glass jar, with about 1 inch of headspace, capped with aluminum foil, and placed in the sun. After ten minutes, vapor readings are measured in the headspace by puncturing the foil with the OVA or TLV probe. In most cases, the sun's warmth causes increased volatility of organic vapors in the soil

sample, allowing relatively high sensitivity. The maximum meter reading is noted and recorded on the boring logs.

B. Soil Sampling Procedures

Subsurface soil samples will be collected for lithologic description and chemical analysis. Samples will be collected during drilling of the borehole by driving a split-barrel sampler lined with stainless steel tubes into the undisturbed material below the drill bit. Samples will commonly be collected on 5-foot intervals, with additional samples collected near the water table. Soil sampling intervals are described in the Work Plan (Section II).

A complete log of conditions encountered during drilling will be maintained by the geologist or engineer observing the operation. *Field Log of Boring* forms will be used to record observations. Example borehole log forms are provided in Appendix B. The soil samples will be described according to the Unified Soil Classification System, and the following characteristics will be noted on the boring log:

- Borehole designation;
- Borehole location;
- Sample depth;
- Color of soil sample (Munsell soil color index);
- Unified Soil Classification System designation of soil type;
- Stiffness or density;
- Moisture content (qualitative);
- Drive-sample blow count;
- Descriptive comments;

- Depth at which groundwater is first encountered;
- Variations in drilling rates and rig behavior; and
- Initials of logger (geologist or engineer).

C. Monitoring Well Inspection

Existing monitoring wells previously installed by others will be inspected to determine their usefulness in groundwater and free-product monitoring and sampling. The surface condition of these wells will be inspected, and the well depth will be measured using a weighted fiberglass tape. The depth of the screen interval will be verified using a one-inch PVC pipe with a small nail or spring steel at one end. The end with the nail or spring will be lowered into the well, moving down along the inner wall of the casing. The depth of screen will be determined by the change in texture of the casing wall.

D. Water Level and Free-Product Measurements

Fluid levels will be measured using an electric sounder, steel tape, or an oil/water interface probe. Measurements will be referenced to the top of the well casing and will be recorded on water-level data sheets. The following protocol will be followed while collecting fluid-level measurements.

1. Electric Sounder

The electric water-level sounder utilizes a battery-powered sensor that activates a buzzer when the sensor comes in contact with water, and a tape for lowering the sensor into the well. The tape is graduated at intervals of 0.05 foot, and measurements are recorded to the nearest 0.01 foot.

Two calibration checks are necessary. First, the markings are checked for proper spacing by physically comparing the spacings with a graduated steel tape. The second calibration check is made in the field by checking depth to water by both electric sounder and a steel tape. All calibration checks will be logged in the instrument calibration log. The calibration check will be made after any incident that may alter calibration, such as cable stretching, entanglement, or sensor tip replacement.

2. Steel Tape

The steel tape is used to measure water levels by applying chalk to the first 1 or 2 feet of tape if the approximate depth to water is known, or the first 5 feet if the approximate depth is not known. The tape is then slowly lowered in the well to avoid contact with wet casing and held at the surveyed and marked measuring point on the well casing. When the tape is removed from the well, the water level is determined by the water line on the chalked section of tape. Separate measurements must be taken until successive measurements differ by less than 0.02 foot.

A graduated steel tape may also be used when required for quality control check of other measuring instruments.

If oil and petroleum hydrocarbon products or films exist atop the water table, a separate measurement with water-finding paste, a clear acrylic or PVC bailer, or a oil-water interface probe will be made to determine both depth to oil and depth to water.

3. Oil-Water Interface Probe

If free product is encountered in a monitoring well, the level and thickness of the product will be measured using an oil-water interface probe, in addition to, or in place of, an acrylic bailer or steel tape. The battery-operated probe is

graduated at 0.05-foot intervals and works similarly to the electrical water-level sounder. At the end of a fiberglass tape is a housing with two probes, one for free product and one for water. As each is encountered, an electric circuit is completed and an audible signal emitted. At the same time the audible signal is emitted, a colored bulb on the instrument becomes lit. The signals and lights for water and free product are different to allow the operator to recognize which is being detected.

E. Field Chemical Parameters

1. Hanby Petroleum Field Test for Soil

The Hanby Field Test is a colorimetric procedure for the analysis of petroleum hydrocarbons in soil and water. For analysis of soils, a sample will be collected from the split-barrel sampler. The procedure is as follows:

- a. A 100-gram sample of soil will be placed in a clean jar; handling of the sample will be minimized to prevent loss of volatile components.
- b. Add one packet of clarifying reagent and 500 ml of water; seal jar with cover and shake periodically for 20 to 30 minutes.
- c. Pour mixture into Imhoff cone; let clarify 15 to 20 minutes.
- d. Decant top layer of clear water into funnel; add 5 ml extraction reagent and let liquids separate for 2 minutes.
- e. Drain extractant (lower) layer into test tube; add contents of catalyst vial and shake tube for 30 seconds.
- f. Compare color in test tube to color chart provided with kit to determine concentration of aromatic hydrocarbons.

2. Conductivity and Fluid Temperature

Specific conductance and water temperature will be measured when water samples are collected and during purging prior to sampling. A conventional

conductivity meter (YSI Model 33) will be used for field specific conductance measurements. Temperature will be measured using an ASTM mercury thermometer. If agreement within 0.5 degrees C is maintained between the thermometer on the conductivity probe and the mercury thermometer, either may be used.

Field conductivity measurements will be converted to conductivity at 25 degrees C by:

$$SC(25) = \frac{SC(\text{meas})}{((T-25) * 0.02) + 1}$$

where:

SC(25) = Conductivity at 25°C
SC(meas) = Measured Conductivity
T = Temperature in °C

Instruments will be calibrated and inspected prior to each day's use. The values for conductivity standards used in calibration will be recorded on the calibration logs and, in the field, on the daily field logs.

3. Fluid pH

The pH of the water samples will be measured during purging and sampling. An Orion Research digital pH meter will be used for these measurements. The pH is measured using a combination electrode.

Sample water is placed in a non-conductive (plastic or glass) container immediately after bailing or pumping from the well. The electrode is placed in the water and is gently stirred. When the pH reading stabilizes, the measurement is recorded to the nearest 0.05 pH units.

If the pH reading will not stabilize within two to three minutes after sample collection, the measurement will be repeated with fresh sample. Non-stable pH readings will be recorded as such, together with the initial readings and trend.

The pH meter and probe will be regularly calibrated using two buffer solutions according to the methods described in Section VI.

4. Alkalinity

Alkalinity will be measured in the field on water collected from wells immediately prior to sample collection. After field-measured parameters have stabilized, alkalinity will be measured.

The measurement will be made using a Hach Digital Titrator and Hach-supplied sulfuric acid titrant. All containers will be thoroughly cleaned and rinsed in DI water prior to each use.

The titration will proceed according to standard methods. One hundred milliliters (ml) of the fluid will be measured into a 250-ml flask using a 100-ml (TD) graduated cylinder. The titrant used will be either 1.6 Normal or 0.16 Normal sulfuric acid. The strength of titrant used will depend on the expected alkalinity. The volume of titrant added will be regularly recorded along with the stable pH. Because titrations are influenced by high concentrations of silica, phosphate and organic acid anions (primarily acetate and proprionate), the pH end point will be lowered beyond the usual 4.5 pH units, so that the total alkalinity inflection point can be determined from the titration curve. A recommended end point pH value of 3.0 will be used. The alkalinity titration curve will be used to determine the alkalinity value.

5. Dissolved Oxygen

Dissolved oxygen in groundwater will be measured to assist in evaluating the oxidation state of the fluid. The measurements will be performed at the well head along with the alkalinity titrations. Either a dissolved oxygen meter or a titrimetric procedure will be used to measure the dissolved oxygen.

a. Dissolved Oxygen (D.O.) Meter

The instrument used for measuring D.O. will be the YSI Model 57 Dissolved Oxygen Meter. Prior to each day's use, the meter will be calibrated.

D.O. will be measured directly from the pump discharge if a bladder pump is used, or from bailed water. The water will immediately be placed into a 250-500-ml beaker; turbulence will be minimized during collection and transfer. The D.O. reading will be made within 30 seconds of transfer into the beaker. D.O. is measured by stirring the probe in the filled beaker, allowing no turbulence or entry of air bubbles.

Corrections for salinity and temperature will be made based on probe temperature, and on salinity measured from the conductivity meter. The reading will be recorded to the nearest 0.1 ppm.

b. Titrimetric Procedure

The colorimetric titrimetric procedure will use Hach-supplied chemicals and titrants, with the oxygen determination based on a colorimetric end point. Specific instructions are given in the Hach manual. The procedure is as follows:

- 1) A water sample will be carefully collected in a clean 300-ml BOD bottle, allowing water to flow into the bottle for several minutes to remove any air bubbles.

- 2) Add divalent manganese (manganous sulfate, 1 Hach pillow) and alkali-iodide-azide reagent pillow to reduce D.O. and liberate a mole equivalent of iodine.
- 3) Acidify contents using sulfuric acid (1 Hach pillow).
- 4) Pour 200 ml of the solution into a 250-ml flask.
- 5) Titrate using sodium thiosulfate to a pale yellow color.
- 6) Add starch indicator (2 drops); solution will turn blue.
- 7) Continue the titration to a colorless end point.
- 8) Dissolved oxygen is calculated using the amount titrated and the strength of the sodium thiosulfate.

6. Turbidity Measurements

The intent of well development is to remove suspended matter from the groundwater prior to sampling. Water turbidity will be monitored during well development and purging, and samples will be collected when water turbidity is minimized.

Turbidity will be measured using a Hach Portable Turbidimeter Model 16800. A Formazine stock suspension rated at 4000 Nephelometric Turbidity Units (NTU) is provided by the manufacturer to be used for preparing standard solutions. The machine calibration will be checked daily. Zero-adjustment will be made using turbidity-free water.

The measurement is made using discharge water that is free of debris and settling coarse sediments. The measurement vial will be clean and free of scratches or markings. The vial will not be used if it is dirty or damaged. Air bubbles will not be entrained on the side of the vial during measurement.

The measurement is made by inserting the sample-filled vial in the meter and directly reading the resultant turbidity. Turbidity will be recorded to the nearest 1 percent of the meter scale.

7. Hanby Field Test for Water Hydrocarbons

The Hanby Field Test, as described in the Soil Sampling Procedures section, is a colorimetric procedure for determining concentration of aromatic petroleum hydrocarbons. The procedure for the analysis of water samples is simpler than that for soil samples because no extraction needs to be performed. Instructions for the analysis of water samples is described in detail in the Hach manual. The procedure is as follows:

- a. A water sample is collected from the boring by bailing or pumping.
- b. Pour a 500-ml sample into the separatory funnel and add 5 ml extractant reagent.
- c. Agitate funnel for two minutes; let liquids separate for two to three minutes.
- d. Drain extractant (lower) layer into test tubes; add contents of catalyst vial to test tube and agitate for 30 seconds.
- e. Compare liquid to color chart provided with kit to determine aromatic hydrocarbon concentration.

I INTRODUCTION

Harding Lawson Associates (HLA) will conduct an environmental investigation of subsurface conditions at the Aloha Tower project. During a previous investigation, contaminants were found in soil borings in the area between Piers 5 and 14. Health and safety requirements are necessary when such contaminants are encountered to prevent worker exposure to contaminants and to prevent further contamination of the environment. All personnel at the drill sites, whether or not they are HLA employees, shall adhere to these practices, in addition to the normal health and safety practices of their trades. HLA shall provide the necessary personal protective equipment (PPE) for HLA employees. Other employers shall provide the necessary PPE for their employees.

HLA will assign a Site Safety Officer (SSO) for field operations. The SSO shall have had a 48-hour training course in hazardous materials. All Harding Lawson employees working on site shall have had a 40-hour training course in health and safety, with a yearly 8-hour refresher course. Management employees shall, in addition, have a yearly 8-hour management training course in health and safety.

The possible hazards on this job are expected to be mechanical, electrical, acoustical, and chemical. Chemicals may include polynuclear aromatic hydrocarbons (PNAs), petroleum hydrocarbons, methane, and metals.

Personal protective items and equipment that will be required for this project include: latex overshoes, silvershield aprons, nitrile gloves, and respirators with organic vapor and H₂S cartridges.

Copies of this Health and Safety Plan will remain in the field work area during field activities.

II CHEMICAL CONTAMINANTS

A. Identified Chemical Contaminants

Hazardous property information for selected chemicals appears in the appendix.

The following contaminants were found in some areas of the site:

<u>Chemical</u>	<u>Environmental Media</u>	<u>Lowest Measured Concentration</u>	<u>Highest Measured Concentration</u>
PNAs	soil, water	ND*	to 1,500 ppb**
Hydrocarbons	soil, water	ND	to 13,500 ppm***
Diesel	soil	ND	to 3,400 ppm
Lead	soil	ND	to 14,000 ppm

- *None detected.
- **Parts per billion.
- ***Parts per million.

B. Suspected Chemical Contaminants

The following contaminants are suspected in the subsurface at the site:

<u>Chemical</u>	<u>Environmental Media</u>
Methane	soil
Hydrogen Sulfide	soil

III SITE CONTROL/WORK ZONES

The area within at least one car-length around the drilling rig shall be cordoned off. Non-project personnel shall be discouraged from remaining in the area closer than three car-lengths from the drilling rig.

Yellow warning tape shall be used to cordon off the drilling area. Traffic cones may be used for delineating the area within three car-lengths.

A staging area shall be designated. In emergencies, all personnel shall assemble at the staging area. Prior to drilling in a new area, a new staging area for emergencies shall be established.

IV SITE RESOURCES

Site Resource Locations

Toilet facilities:	Available in Piers 8 through 11 area.
Drinking water supply:	Available in Pier 9 area.
Telephone:	Available in Pier 10 area.

V HAZARD ANALYSES

<u>Activity Number</u>	<u>Job Task</u>	<u>Mechanical</u>	<u>Electrical</u>	<u>Chemical</u>	<u>Temperature</u>	<u>Acoustical</u>	<u>O2 Deficiency</u> <u>Radioactive</u>	<u>Confined Space</u>	<u>Biohazard</u>
1	Clean auger, drill bit, sample containers,	NE	NE	Chemicals present in soil, sludge, groundwater	NE	NE	NE	NE	NE
2	Drilling, monitoring well installation	Drill Rig	Power take-offs, generators	Chemicals present in soil, sludge, groundwater	NE	Rig noise	NE	NE	NE
3	Sample handling	NE	NE	Chemicals present in soil, sludge, groundwater	NE	NE	NE	NE	NE
4	Observe activities	NE	Generators	NE	NE	NE	NE	NE	NE
5	Ventilate area	NE	Generators, fans	NE	NE	NE	NE	NE	NE

C-6

NE = Not expected.

VI CHEMICAL HAZARDS MITIGATION

<u>Activity Number</u>	
1, 2, 3, 4, 5	Use personal protective equipment indicated in Section VIII.
1, 2, 3, 4, 5	Monitor the air in the breathing zones for contaminants, respiratory hazards and explosion hazards. Ventilate areas where airborne hazards are detected. See Section VIII of this plan.

VII AIR MONITORING

Air monitoring shall be conducted to measure contaminants to which employees may be exposed. Measurements shall be taken within the breathing zone of workers and where explosive concentrations of gases may be present. If action levels are reached for a one-minute reading, take appropriate action.

A. Gases and Vapors

Instrument	Calibration Gas Standard	Frequency/Duration of Air Monitoring	Action Level Above Background (Breathing Zone)	Action
OVA	Methane	When doing Tasks 2,4,5,6	5 ppm	Introduce engineering controls
			10 ppm	Don respirator (Level C)
			25 ppm	Leave area

B. Explosion Hazard

Instrument & Date of Calibration	Action Level Above Background (Ambient Air)	Frequency/Duration of Air Monitoring	Action
OVA or TLV Meter	Greater than 2,000 ppm	Continuous	Leave Area

C. Oxygen Deficiency

Not expected.

VIII PERSONAL PROTECTIVE AND RELATED SAFETY EQUIPMENT

Personal safety equipment must meet ANSI standards or equivalent.

LEVEL: _____ A _____ B _____ C X D

HAND:

NEOPRENE _____ NITRILE X PVC _____
VITON _____ UNDERGLOVE _____ OTHER _____

BODY:

APRON: 1,2,3

LUNG:

HALF-MASK RESPIRATOR, CARTRIDGE (ORGANIC VAPOR H₂S*) 1,2,3 (for emergencies only; e.g., when testing above action levels, when assisting in evacuating employees)

FOOT:

STEEL-TOED BOOTS, type = neoprene or similar 1,2,3,4
OR DISPOSABLE OVERBOOTS
type = latex over standard safety shoe 1,2,3,4

OTHER SAFETY EQUIPMENT:

VENTILATION BLOWER/FAN 5

Comments: When contaminants are suspected, ventilating fans will be turned on. Activities shall be conducted so that ventilation air flow will be perpendicular to a line drawn from a worker to the contaminant source. Ventilating air shall supplement existing natural ventilation.

*H₂S cartridge available for MSA respirators only.

IX EQUIPMENT DECONTAMINATION PROCEDURES

A. Equipment

Equipment used for sampling will be cleaned with an Alconox solution and water rinse. Heavily contaminated equipment can be wiped clean and then washed. Drippings, wash water, soils, sludges and used cleansing supplies shall be drummed.

B. Personnel

Contaminated disposable clothing shall be drummed with equipment rinseate. Non-disposables shall be decontaminated. Reusable steel-toed Neoprene boots shall be cleaned with an Alconox solution and water rinse.

C. Investigation-Derived Material Disposal

1. Possibly contaminated drill cuttings: Drill cuttings shall be placed in 55-gallon drums. Contents shall be tested prior to disposal.
2. Drummed drippings, wash water, soils, supplies and disposable clothing shall be tested.

XI CONTINGENCY/EMERGENCY INFORMATION

A. Emergency Telephone Numbers

Ambulance	911	
Police:	911	
Fire Department:	911	
Hospital:	Queen's Medical Center (Emergency)	
	(808) 574-4311	
Client Contact:	Mr. Eric K. Smith, (808) 532-1500	
Poison Control Center:	(800) 233-3360	
	in Honolulu	(808) 821-8324
CHEMTREC:	(800) 424-9300	
Project Manager:	Office: 455-6551	Home: 455-6124
DHSO:	Office: 455-6551	

B. Standard Procedures for Reporting Emergencies

When calling for assistance in an emergency situation, the following information should be provided:

1. Name of person making call;
2. Telephone number at location of person making call;
3. Name of person(s) exposed or injured;
4. Nature of emergency; and
5. Actions already taken.

Recipient of call should hang up first -- NOT the caller.

C. Emergency Routes

See Plate 1.

D. Contingency Plan

1. In an emergency, all personnel shall evacuate to the pre-determined staging area. No employee shall remain in the drilling area.
2. The SSO, designated health and safety officer, or the project manager shall account for all employees who were in the drilling area, using as a reference the employer, contractor, and visitor logs.
3. Injured personnel shall be evacuated at the same time as other personnel.
4. When necessary to warn personnel not in the immediate vicinity, a series of short blasts on the vehicle horn or air horn shall be used.
5. All supervisors shall assist in the safe and orderly evacuation of personnel.
6. If necessary to evacuate injured personnel and an ambulance is unavailable or unnecessary, company vehicles shall be used.
7. The nature of the emergency shall be evaluated by the project manager and the SSO or DHSO. Operations can resume, provided that risks to employees due to the emergency are eliminated or controlled.
8. The client contact shall be notified as soon as possible when operations cannot be resumed in a reasonable time.

XII HAZARDOUS PROPERTY INFORMATION EXPLANATIONS AND FOOTNOTES

Water solubility is expressed in different terms in different references. Many references use the term "insoluble" for materials that will not readily mix with water, such as gasoline. However, most of these materials are water soluble at the part per million or part per billion level. Gasoline, for example, is insoluble in the gross sense, and will be found as a discrete layer on top of the groundwater. But certain gasoline constituents, such as benzene, toluene, and xylene, will also be found in solution in the groundwater at the part per million or part per billion level.

1. Water solubility expressed as 0.2g means 0.2 grams per 100 grams water at 20°C.
2. Solubility of metals depends on the compound in which they are present.
3. Several chlorinated hydrocarbons exhibit no flash point in a conventional sense, but will burn in the presence of high energy ignition source or will form explosive mixtures at temperatures above 200°F.
4. Practically non-flammable under standard conditions.
5. Expressed as mm Hg under standard conditions.
6. Explosive concentrations of airborne dust can occur in confined areas.
7. Values for Threshold Limit Value-Time Weighted Average (TLV-TWA) are OSHA Permissible Exposure Limits except where noted in h and i.
8. TLV-TWA adopted by the American Conference of Governmental Industrial Hygienists, which is lower than the OSHA PEL.
9. TLV-TWA recommended by the National Institute for Occupational Safety and Health (NIOSH) A TLV or PEL has not been adopted by ACGIH or OSHA.

10. A - corrosive
B - flammable
C - toxic
D - volatile
E - reactive
F - radioactive
G - carcinogen
H - infectious

11. Dermal toxicity data are summarized in the following three categories:

Skin Penetration:

- A - negligible penetration (solid-polar)
- + B - slight penetration (solid-nonpolar)
- + + C - moderate penetration (liquid/solid-nonpolar)
- + + + D - high penetration (gas/liquid-nonpolar)

Systemic Potency

- E - slight hazard - LD₅₀ = 500-115,000 mg/kg
lethal dose for a 70 kg man = 1 pint-quart
- F - moderate hazard - LD₅₀ = 50-500 mg/kg
lethal dose for 70 kg man = 1 ounce-1 pint
- F - extreme hazard - LD₅₀ = 10-50 mg/kg
lethal dose for 70 kg/man = drops to 20 ml

Local Potency

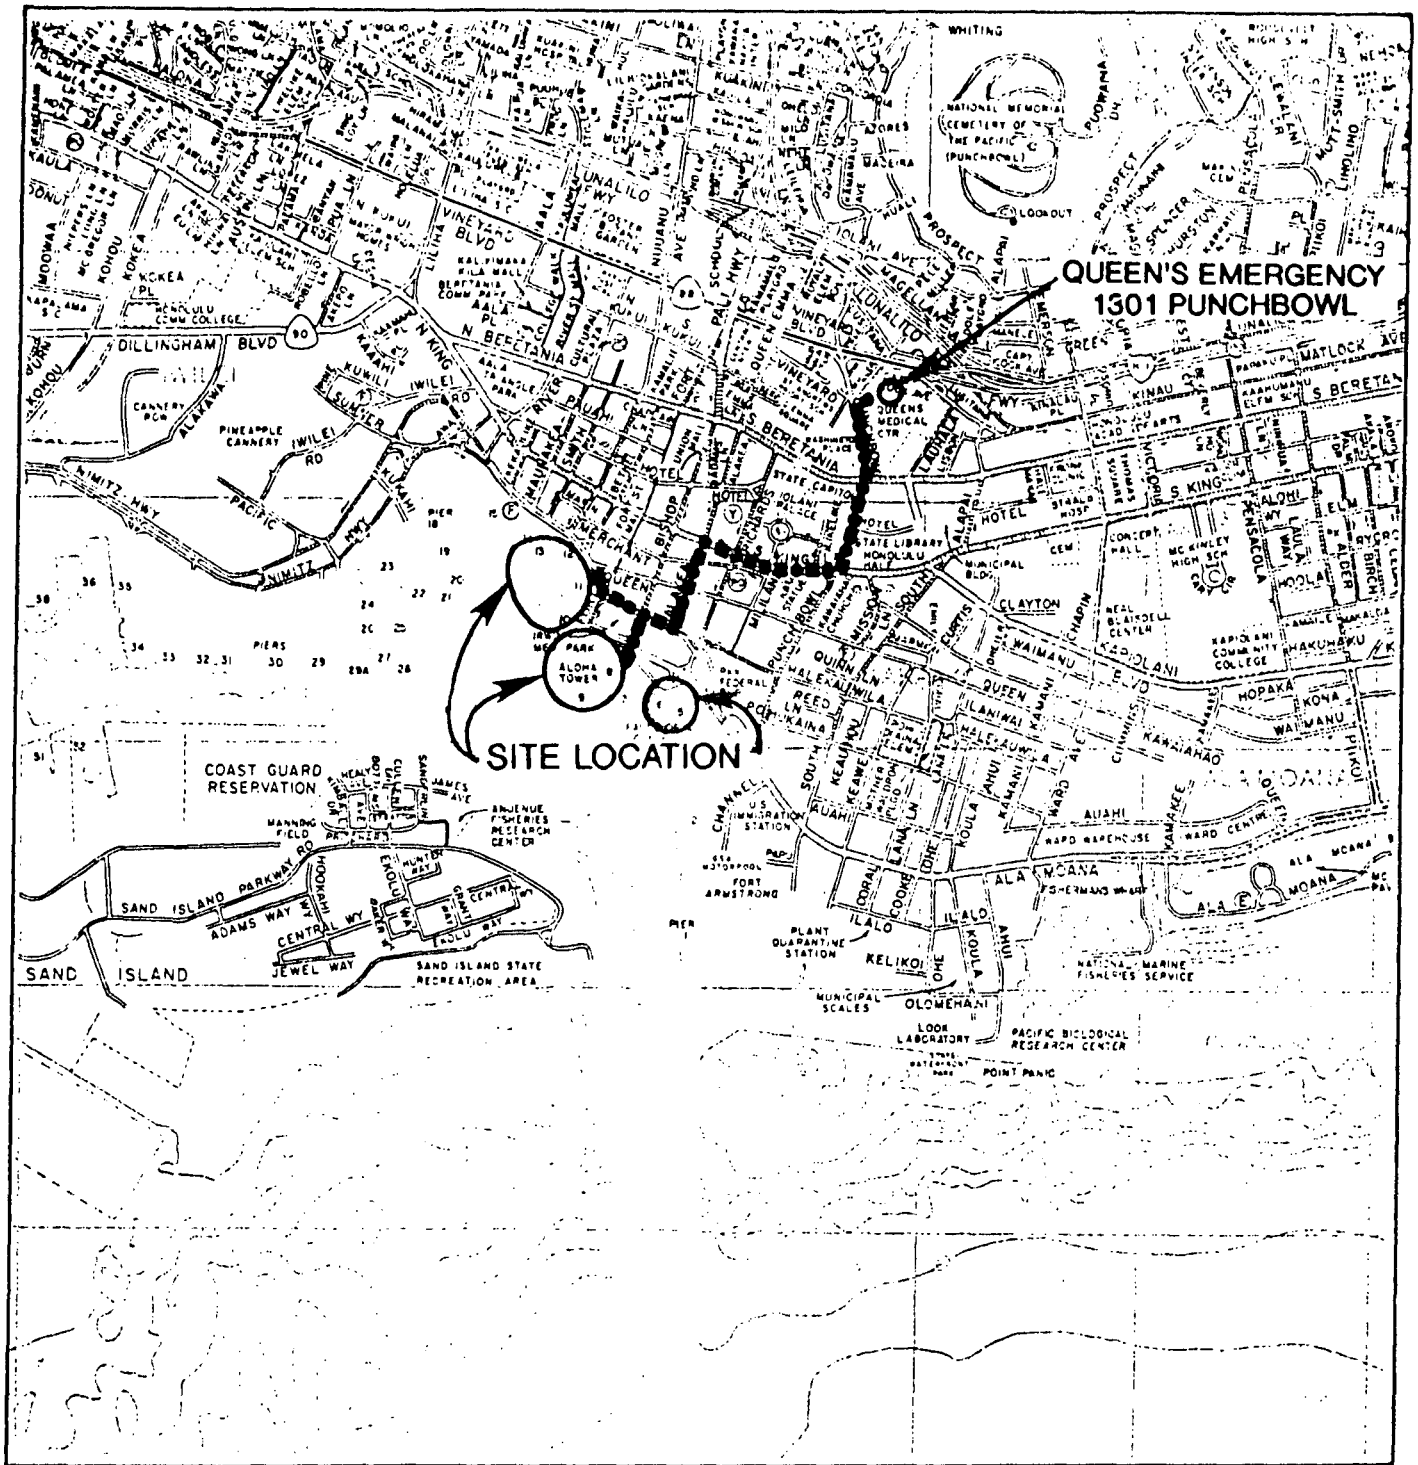

- H - slight - reddening of skin
- I - moderate - irritation/inflammation of skin
- J - extreme - tissue destruction/necrosis

12. Acute Exposure Symptoms

- A - abdominal pain
- B - central nervous system depression
- C - comatose
- D - convulsions
- E - confusion
- F - dizziness
- G - diarrhea
- H - drowsiness
- I - eye irritation
- J - fever
- K - headache

L - nausea
M - respiratory system irritation
N - skin irritation
O - tremors
P - unconsciousness
Q - vomiting
R - weakness

RESUMES OF KEY PERSONNEL

JOHN G. CATTS, Ph.D.

**Vice President
Principal Geochemist**

Dr. Catts has more than 12 years of professional experience in the design, implementation, and management of multi-disciplinary environmental investigations. With educational and professional training that spans the disciplines of chemistry, geochemistry, hydrology, and geology, his primary area of specialization is in the interpretation of soil and water quality data, which frequently requires the prediction of contaminant fate and transport. He has relevant experience in the fate of a wide range of organic and inorganic contaminants. In addition to managing large multi-disciplinary environmental programs for both industrial and government clients, Dr. Catts functions in the capacity of technical advisor for a wide variety of scientific disciplines. Such environmental programs include Remedial Investigations, Feasibility Studies, Endangerment and Risk Assessments, RCRA permitting, mineral exploration and development, geothermal resource evaluations, and water resource evaluations.

The majority of Dr. Catts' professional experience with HLA has been in the management of multidisciplinary RI/FS programs performed under CERCLA/SARA guidelines. During the course of these activities, Dr. Catts has been required to design investigative and remedial programs in concert with various state and federal agencies as well as groups of potentially responsible parties (PRPs). Dr. Catts has participated in the negotiation of site specific action levels, administrative orders, and consent decrees. He has also provided expert testimony on issues related to soil and water quality and the fate and migration of contaminants.

EDUCATION

Ph.D., Geochemistry, Colorado School of Mines, Golden, 1982
B.A., Chemistry, University of Delaware, Newark, 1976

EMPLOYMENT HISTORY

1983 - present:	Harding Lawson Associates
1982 - 1983:	Ertec Western, Inc.
1980 - 1982:	Hydrochemical Systems Corporation, consultant
1979 - 1982:	Department of Geochemistry, Colorado School of Mines, research assistant
1979 - 1982:	Water Resources Division, U.S. Geological Survey, geochemist
1978 - 1979:	Department of Geochemistry, Colorado School of Mines, teaching assistant

EMPLOYMENT HISTORY (continued)

1976 - 1978: Gulf Oil Co., environmental chemist

REPRESENTATIVE PROJECTS

Tacoma Tar Pits (NPL) site, Tacoma, Washington - Project manager for development of work plan for RI/FS to define the nature and extent of groundwater contamination by coal tars, other hydrocarbons, heavy metals, and PCBs. Provided oversight to U.S. EPA in multiple PRP situation which included review of Risk Assessment and Feasibility Study. Assisted in selection of the preferred remedial alternative, negotiation of site action levels, and administrative order. Author of Proposed Plan for Remedial Action and Record of Decision. Client: CH2M Hill for U.S. EPA

Milltown Reservoir (NPL) site, Milltown, Montana - Co-manager of feasibility study for site contaminated with arsenic and heavy metals. Responsible for assessing metals content of reservoir sediments, fate and transport of toxic metals through groundwater and surface water, assessment of public health risk, and evaluation of remedial alternatives. Client: Montana Department of Health and Environmental Services

Rocky Mountain Arsenal (NPL), Colorado - Technical manager for task order Remedial Investigation contract to perform soil and groundwater investigations in support of litigation. Responsible for design of soil and groundwater investigations, preparation of technical plans, technical oversight of resultant work, data interpretation, and report preparation. Responsible for evaluation of mechanisms and rates of contaminant migration in soil and groundwater. Contributed to design of many of the 47 identified tasks performed by several groups of contractors. Technical review of majority of program deliverables. Client: ESE for USATHAMA

Rocky Mountain Arsenal (NPL), Colorado - Project manager for continued groundwater monitoring of 27 square mile site. Responsible for design of groundwater monitoring network from 2,000 available monitoring wells, selection of analytical methods, interpretation of data, and network modification. Monitoring of multiple contaminant sources and plumes as well as groundwater extraction/treatment systems. Client: R.L. Stollar for U.S. Army

Rocky Mountain Arsenal (NPL) Site, Colorado - Technical advisor for multi-disciplinary task order contract to provide support for interim remedial actions and feasibility study. Provides guidance for task planning, data assessment, and remedial alternative selection. Client: U.S. Army

Eielson Air Force Base, Fairbanks, Alaska - Technical advisor and QC reviewer for RI/FS program performed under Air Force Installation Restoration Program (IRP) in conformance with CERCLA/SARA. Responsible for design of RI program for over 30 potentially contaminated sites. Included specification of sample media, analytical methods, and interpretation of resultant data. Contamination of soil and groundwater by metals, petroleum hydrocarbons, and chlorinated solvents. Client: U.S. Air Force

California Low Level Radioactive Waste (LLRW) Disposal Site, Ward Valley, California - Responsible for design of geochemical sampling and analysis for siting and permitting of LLRW disposal site in conformance with guidelines and procedures stipulated by U.S. Department of Energy (DOE). Responsible for interpretation of soil and water quality data including data for radioactive isotopes. Prediction of probable rates and extent of radionuclide migration under various release scenarios. Client: Confidential

Geothermal resource evaluation, Desert Hot Springs, California - Responsible for design and implementation of groundwater quality survey to assess feasibility of geothermal resource development. Responsible for selection of analytical methods and interpretation of resultant data. Used inorganic water quality data, stable isotopes of oxygen and hydrogen, and multiple geothermometry techniques to evaluate potential for connection with deep geothermal reservoirs. Client: Confidential

Hickam and Wheeler Air Force Bases, Oahu, Hawaii - Technical advisor and geochemist responsible for design of soil and water sampling programs in conformance with CERCLA/SARA guidelines under Air Force IR Program. Responsible for interpretation of soil and water quality data, assessment of extent of contamination, and recommendations for additional sampling. Client: U.S. Air Force

Reserve pit evaluations, Kenai Peninsula, Alaska - Designed and managed investigations to quantify movement of inorganic and petroleum contaminants from reserve pits on Kenai Peninsula. Evaluation of partitioning for contaminants between groundwater, reserves, and gravels. Modeling of contaminant release to local groundwater. Client: Unocal

NPL Site, San Jose, California - Technical advisor for 500 acre RI/FS groundwater remediation program. Responsible for interpretation of water quality data, evaluation of water quality impacts during recharge of treated water, modifications to analytical program. Client: Confidential

Reserve pit evaluations, North Slope, Alaska - Responsible for design of environmental study to evaluate and quantify leaching of petroleum hydrocarbons and metals from drilling reserves and gravels used to construct drilling pads. Impacts to local groundwater and surface water were measured and data interpreted in permafrost environment. Discharges from reserve pits were quantified with flow/transport model. Client: Arco

Leachability and disposal of dredge material, Sacramento River Delta, California - Technical advisor responsible for design and implementation of field and laboratory program to determine quality of sediments to be dredged and potential for presence of organic and inorganic contaminants. Evaluation of oxidation and leaching potential for sediments when placed in fresh water environment. Estimation of rates and concentrations of contaminant discharge. Client: Port of Oakland

Groundwater contamination investigation, Estes Landfill, Arizona - Responsible for design of groundwater quality evaluation to assess extent to which landfill has affected local water quality. Used inorganic and organic data to quantify contributions of landfill leachate. Examined degradation of chlorinated solvents through time and distance from landfill. Client: City of Phoenix

Groundwater investigation, Pima County Landfills, Arizona - Technical advisor responsible for design of water quality evaluation and interpretation of water quality data. Use of organic, inorganic, and isotopic data to assess impacts of landfill leachate on local groundwater quality. Evaluated degradation of chlorinated hydrocarbons in groundwater with time and distance from landfill. Client: Pima County

Office of Nuclear Waste Isolation (ONWI) - Designed geochemical program including specification of sampling procedures for major and minor aqueous constituents, dissolved gases, and isotopes, and selected analytical methods. Used groundwater data to evaluate radionuclide migration from Gulf Coast salt domes and used microfractures, alteration products, and fluid inclusions to predict radionuclide migration from granitic plutons.

Has worked on several projects involving hydrogeologic aspects of landfill design. Has predicted quality of landfill leachate from wastes stabilized by several commercially available processes. Has examined interaction and compatibility of wastes and waste leachates with clay liner materials. Has evaluated attenuative capacity of naturally occurring minerals, including clays and metal oxyhydroxides. Has reviewed hydrogeologic and geochemical aspects of landfill design for U.S. EPA, including waste/liner compatibility, leachate collection systems, groundwater monitoring programs, and migration of inorganic and organic contaminants.

MASAYOSHI OGATA

Associate Industrial Hygienist

Mr. Ogata has 24 years of professional experience in occupational health and safety. For the past 16 years, he was the manager of the Occupational Health Branch of the Division of Occupational Safety and Health, Hawaii Department of Labor and Industrial Relations. He was responsible for enforcement of occupational health regulations throughout the state of Hawaii. He also trained all new employees of his branch for industrial hygiene policies and procedures. Mr. Ogata consulted with other state agencies regarding industrial hygiene and provided advice for the creation and promulgation of new Occupational Health regulations. He has been a Clinical Instructor at the University of Hawaii School of Public Health since 1976.

EDUCATION

Graduate Study, Math/Chemistry/Epidemiology, University of Hawaii, Honolulu, 1962 and 1978
B.A., Chemistry, University of Hawaii, Honolulu, 1961

REGISTRATION AND CERTIFICATION

Certified Industrial Hygienist (Comprehensive Practice) - 1972, No. 720
Registered Sanitarian - Hawaii 1970
AHERA Inspector and Management Planner - 1989, Refresher - May 2, 1990
40-Hour Hazardous Material/Waste Training - 1989, Refresher - November 26, 1990

EMPLOYMENT HISTORY

1989 - present: Harding Lawson Associates
1973 - 1989: Hawaii Department of Labor and Industrial Relations, manager of Occupational Health Branch
1965 - 1973: Hawaii Department of Health, environmental health specialist
1962 - 1965: Hawaii Department of Health, chemist

REPRESENTATIVE PROJECTS

Directed an AIHA accredited industrial hygiene laboratory.

Conducted training in air sampling procedures and the use and calibration of equipment such as ozone monitor, mercury vapor detector, portable IR spectrophotometer, noise meters, other devices for sampling dusts, fumes, gases, asbestos, microbiological organisms.

Served on committees such as Radiation Safety Committee, University of Hawaii, Asbestos Advisory Task Force (AHERA), Ad Hoc Committee on Genetically Engineered Organisms, Governor's Conference on Health in 1990.

Directed staff in investigations of indoor air quality, accidents and discrimination complaints.

Participated in numerous seminars conducted by industry, educational institutions, and government agencies.

Conducted inspections of various establishments, evaluating employee exposures to noise, heat, asbestos, lead, chlorine, silica, pesticides, zinc, mercury, and other dusts, fumes, mists, gases, and vapors.

Conducted laboratory analyses of air, water, and milk for radionuclids; asbestos counting and identification, metal dusts, fumes, organic solvents, and other organic compounds.

Health and Safety Officer for Pacific region of HLA.

Co-trainer in HLA's 40-Hour Haz-Mat/Waste, Supervisory and Refresher Training.

Prepare Job Safety Plans for hazardous waste sites.

Co-preparer of specifications for asbestos abatement project.

Plan and supervise asbestos air monitoring for HLA Hawaii.

Directed staff in investigations of indoor air quality.

Conducted inspections of various establishments, evaluating employee exposure to contaminants such as asbestos, mercury, noise, lead.

Conducted laboratory analyses of air, water, and milk for radionuclids, dust samples for asbestos and organic solvents.

Performed asbestos management planning and asbestos inspections.

Prepared NRDC Guam preliminary risk assessment.

Prepared Kewalo Municipal Landfill RI/FS preliminary risk assessment.

Planned and managed Kewalo Municipal Landfill air monitoring.

Assisted Bellows AFS risk assessment and ARAR development.

Assisted in Hickam POL data validation and performed risk assessment.

Prepared Job Safety Plan for each hazardous waste project.

Designated Health and Safety Officer for Pacific region.

Managed Kakaako Waterfront Park air and seawater sampling program.

Prepared asbestos monitoring specifications for state of Hawaii.

Conducted site assessments related to potential contamination by solvents heavy metals and petroleum hydrocarbons.

Perform validation of data from contaminated sites.

RONALD L. SOROOS**Principal Geologist**

Mr. Soroos is the manager of environmental services for the Hawaii office of HLA. His group is responsible for remedial investigation/feasibility studies, environmental real estate assessments, underground storage tank investigations and remediations, groundwater quality studies, risk assessments, solid waste management and hazardous waste management. Mr. Soroos recently managed remedial investigations of municipal and military landfills and disposal sites for the state of Hawaii, the U.S. Air Force, and the U.S. Navy. He also has experience in the management of multidisciplinary projects dealing with aquifer protection and restoration, environmental engineering, contaminant transport, groundwater resource evaluation, and regional water quality. He has additional related experience in foundation investigations and design, geologic hazard assessments, safety evaluation of dams and other engineering geology projects. In all, Mr. Soroos has 18 years of professional experience in Hawaii, other islands of the Pacific Ocean, Southeast Asia, the southwestern United States, and Alaska.

EDUCATION

M.S., Geology and Geophysics, University of Hawaii, Honolulu, 1973

B.S., Geology and Geophysics, University of Hawaii, Honolulu, 1971

REGISTRATION AND CERTIFICATION

Geologist - California and Arizona

Engineering Geologist - California, No. 1056

SAFETY TRAINING

40-hour hazardous materials, health, and safety training course meeting EPA and OSHA requirements for contractors working on hazardous waste/materials projects.

8-hour EPA/OSHA required Hazardous Waste/Materials Supervisors Health and Safety Course (HLA-1988)

EMPLOYMENT HISTORY

1986 - present: Harding Lawson Associates
 1984 - 1985: The MARK Group, senior geologist
 1979 - 1984: Harding Lawson Associates, associate geologist
 1977 - 1979: U.S. Geological Survey, Water Resources Division, hydrologist
 1973 - 1977: Harding Lawson Associates, geologist
 1971 - 1973: University of Hawaii, Water Resources Research Center, research assistant
 1970 - 1971: Ralph M. Parsons Company, assistant to chief field engineer
 1969 - 1970: R. M. Towill Corporation, survey party chief
 1968 - 1969: Techdata, Ltd./Geotronics, Bangkok and Saigon, senior survey party chief
 1965 - 1968: U.S. Navy, Seabees, engineering aide (surveyor), third class

REPRESENTATIVE PROJECTS

Kewalo Municipal Incinerator Landfill, Honolulu, Hawaii - Remedial investigation/feasibility study to evaluate potential hazards relative to redevelopment. Field investigations included water wells; gas wells; soil, water, and gas sampling; water-level monitoring; and test pits. A risk assessment was done and remedial alternatives were developed. Client: State of Hawaii

Hawaiian Independent Refinery, Inc., Oahu, Hawaii - Installation and sampling of groundwater monitoring well network for RCRA regulated wastewater treatment ponds. Client: Hawaiian Independent Refinery, Inc.

Queen Street Commercial Development, Honolulu, Hawaii - Investigation of underground storage tanks and environmental assessment. Client: Monroe and Friedlander

Installation Restoration Program Stage 2, Hickam AFB, Hawaii - Project manager for investigation of contamination from landfills and fire fighting training areas. Client: USAF Occupational and Environmental Health Laboratory

Installation Restoration Program Stage 2, Wheeler AFB, Hawaii - Project manager for investigation of contamination from landfills and fire fighting training areas. Client: USAF Occupational and Environmental Health Laboratory

Installation Restoration Program Stage 2, Hickam POL Facilities, Hawaii Project manager for investigation of contamination from fuel storage facilities and pipelines. Client: USAF Occupational and Environmental Health Laboratory

Air Force Installation Restoration Program, Wake Island Airfield - Remedial investigation/feasibility study of suspected hazardous waste disposal sites.

Air Force Installation Restoration Program, Kaala Air Force Base, Mt. Kaala, Oahu, Hawaii - Remedial investigation/feasibility study of suspected hazardous waste disposal sites.

Air Force Installation Restoration Program, Bellows Air Force Base, Oahu, Hawaii - Remedial investigation/feasibility study of suspected hazardous waste disposal sites.

W.W. Grainger Warehouse, Honolulu, Hawaii - Environmental assessment of proposed warehouse site. Client: W. W. Grainger, Inc.

Contamination Investigations, various Navy facilities, Pacific Area - Installation restoration inspections and surveys. Client: Pacific Division, Naval Facilities Engineering Command

U.S. Navy MPS Facilities, Guam - Project manager for geotechnical investigation of building sites. Client: URS Corporation/John A. Blume and Associates

Wastewater sump and ponds closure, Honolulu Generating Station, Waiiau Generating Station and Kahe Generating Station, Oahu, Hawaii - Observation, consultation, and certification of RCRA closure of wastewater facilities. Client: Hawaiian Electric Company

Waikiki Prince Hotel, Honolulu, Hawaii - Foundation design for high-rise hotel and plaza. Client: Jack E. Myers

Hilton Hawaiian Village, Honolulu, Hawaii - Construction observation, testing, and consultation for major renovation program. Client: Hilton Hawaiian Village

Installation restoration program (IRP) Phase II presurvey, Wake Island Member of presurvey team to develop scope of services and cost estimate for contamination confirmation studies (remedial investigations). Client: U.S. Air Force

Spill prevention and response plan, Hickam Air Force Base, Oahu, Hawaii Project manager for preparation of oil and hazardous substance spill plan for base and associated satellite facilities. Client: 15th Air Base Wing

Waiiau wastewater ponds, Oahu, Hawaii - Groundwater assessment and review of monitoring data. Client: Hawaiian Electric Company, Inc.

Kahe wastewater ponds, Oahu, Hawaii - Groundwater assessment and review of monitoring data. Client: Hawaiian Electric Company, Inc.

Part B Permit Application for industrial client, southern Arizona Installed monitoring wells and evaluated groundwater conditions in desert environment where groundwater is several hundred feet deep.

Groundwater contamination investigation for industrial client, Scottsdale, Arizona - Investigated site located within EPA Superfund site where groundwater was contaminated with organic chemicals.

Groundwater protection and restoration studies for large industrial client, Santa Clara County, California - Defined plume, monitored groundwater, provided remedial design, and represented client with regulatory agencies.

Water resource evaluation for Chiniak School, Kodiak, Alaska - Performed geological reconnaissance over several square miles to assess water resources available for community school. Canvassed water well owners and researched hydrological literature. Recommended suitable sources and development method for preferred source. Client: Kodiak Island Borough

Groundwater resource assessment, Mountain Warfare Training Center, Pickle Meadow, California - Performed geological reconnaissance to evaluate groundwater potential. Successfully recommended drilling to test well that also served as production well. Client: Mackinlay Winnacker McNeil AIA

Soil and hydrological investigation, Puashala resort and marina development, Molokai, Hawaii - Performed exploration, testing, and engineering analyses to provide geotechnical recommendations for dredging and filling of shoreline area. Exploration included offshore test borings. Performed geological reconnaissance and literature review to assess potential for groundwater development. Client: General Hawaiian Development Corporation.

Groundwater consultation, Kaeleku Development, Hana, Maui, Hawaii Provided recommendations for development of groundwater supply for residential subdivision. Client: Kaeleku Partners

Soil and geological investigation, Truk District Capital Improvements Program, U.S. Trust Territories of the Pacific Islands - Provided exploration services for airport facilities, waterfront structures, water supply reservoirs, and pipelines. Developed geotechnical design recommendations from exploration data and engineering analysis. Client: Ralph M. Parsons Company/Austin, Tsutsumi and Associates, Inc.

Safety evaluation of existing dams (SEED program) in seven western states Investigation included review of design and construction records, review of maintenance records, research of pertinent technical literature, and field inspections of dams. Where information was lacking, recommended additional exploration and testing or engineering analysis to determine risk of failure. Client: U.S. Department of the Interior, Bureau of Reclamation

Foundation investigation, Worchester Road underpass, Honolulu International Airport, Hawaii. Client: Hawaiian Dredging and Construction Company

Ronald L. Soroos - Page 4

Construction inspection, Waiiau Gardens residential development, Pearl City, Hawaii. Client: Lear Siegler Properties, Inc.

Pavement design, Haleakala National Park Road, Maui, Hawaii. Client: Belt, Collins and Associates, Ltd.

Foundation investigation, various Hawaiian schools. Client: State of Hawaii, Department of Accounting and General Services

Foundation investigation, Kauai Surf Hotel expansion, Kauai, Hawaii. Client: Inter-Island Resorts

Construction inspection, natural gas storage tanks, Maui, Hawaii. Client: Gasco, Inc.

Soil investigation, Yap District Airport, U.S. Trust Territories of the Pacific Islands. Client: Ralph M. Parsons Company

Foundation investigation, American Security Bank Building, Honolulu, Hawaii. Client: Prime Realty, Inc.

Foundation investigation, Pago Pago Harbor improvements, Tutuila, American Samoa. Client: Government of American Samoa

Foundation inspection and instrumentation, HIRI harbor terminal for petroleum storage, Honolulu, Hawaii. Client: Keoph and Lange, Construction Engineers

Foundation inspection, Hemmeter Center, Waikiki, Hawaii. Client: Hemmeter Development Company

Soil investigation, Mount Kaala slide, Oahu, Hawaii. Client: R. M. Towill Corporation

Soil investigation, Kuhio Village Subdivision, Waimea, Hawaii. Client: R. M. Towill Corporation

Soil investigation, Haleiwa Shopping Plaza, Oahu, Hawaii. Client: Gushman and MacNaughton

Foundation investigation, Soli's Restaurant, Pago Pago, American Samoa. Client: Soli Corporation

Soil investigation, Special Weapons Magazine, West Loch, Pearl Harbor, Hawaii. Client: Alvin Zane and Associates, Inc.

Blast vibration analysis, Stangenwald Building, Honolulu, Hawaii. Client: Austin, Smith and Associates

Foundation investigation, Ponohawai Medical Center, Hilo, Hawaii. Client: Ponohawai Medical Associates

Soil investigation, Pearl Harbor sewer facilities, Hawaii. Client: Kennedy Engineers, Inc.

Foundation investigation, Laupahoehoe Sugar Mill Expansion, Hawaii. Client: Laupahoehoe Sugar Company

Foundation and geophysical investigation, Waikomo Subdivision, Koloa, Hawaii. Client: Grove Farm Company

Foundation inspection, Grosvenor Center Office Building, Honolulu, Hawaii. Client: Grosvenor International (Hawaii), Ltd.

Soil, foundation, and geophysical investigation, Mauna Loa Resort development, Kohala, Hawaii. Client: Mauna Loa Land Company

Soil investigation and pavement design, Makena Road, Maui, and Keaukaha to King's Landing Road, Hilo, Hawaii. Client: Muroda and Associates

Foundation investigation, Lucy K. Henriques Medical Center, Waimea, Hawaii. Client: Henriques Medical Center

Geological reconnaissance and consultation, Hanawi Diversion Tunnel, Nahiku, Hawaii. Client: Norman Saito Engineering Consultants, Inc.

Foundation investigation, Hanalei Post Office, Kauai, Hawaii. Client: U.S. Postal Service

Foundation investigation, Mauna Kea Observatories, Hawaii. Client: University of Hawaii/U.K. Royal Observatory

Seismic and magnetic survey, Wailuku-Alenaio Diversion 4, Hilo, Hawaii. Client: U.S.D.A. Soil Conservation Service

Soil and geological investigation, Glass Breakwater and Apra Harbor Restoration, Agana, Guam. Client: Moffatt and Nichol, Engineers

Foundation investigation, Anderson AFB Restoration Program, Guam. Client: Media Five Architects

Geotechnical investigation, Sheraton Royal Waikoloan Hotel, Anaeoomalu Bay, Hawaii. Client: First Hawaiian Development Corporation

Seismic-refraction survey, Creston Power Plant, Washington State. Client: Bechtel, Inc.

Fault investigation, Bishop Ranch, San Ramon, California. Client: Gaither and King/Sunset Properties

Phase I dam inspection, Dams 54, 58, 59, 71, and 72, Maui, Hawaii. Client: U.S. Army Corps of Engineers

Phase I dam safety inspection for four dams in Kansas. Client: U.S. Bureau of Reclamation

Upper Mahoney Lake pumped storage project, Ketchikan, Alaska - Geological mapping and prefeasibility study to site penstock and power plant. Client: U.S. Army Corps of Engineers

MEMBERSHIPS

REPRESENTATIVE PUBLICATIONS AND PRESENTATIONS

1979. Reconnaissance of potential for potable groundwater supply at Kipahulu District, Haleakala National Park, Maui, Hawaii. U.S. Geological Survey, Open File Report 79-749, May.

1979. Test monitoring of prototype injection well, Waiale, Maui, Hawaii. U.S. Geological Survey, Open File Report 79-274, January.

1979. Groundwater status report, Pearl Harbor Area, 1978. U.S. Geological Survey, Open File Report, August (with Charles J. Ewart).

1973. Evaluation of methods of pumping test analyses for application to Hawaiian aquifers. University of Hawaii, Honolulu, Technical Report No. 70, Water Resources Research Center (with J. A. Williams).

1973. Determination of hydraulic conductivity of some Oahu aquifers with step-drawdown test data. Master's thesis, University of Hawaii.

JOHN J. WARD

Associate Hydrogeologist

Mr. Ward has been an associate and project manager with HLA for the past 4 years. He has 14 years of experience as a professional hydrogeologist, managing numerous projects in conformance with state and federal environmental regulations. He has a strong background in groundwater quality, well and aquifer hydraulics, modeling and geochemistry, and is well versed in analytical and numerical solutions to well hydraulics and groundwater flow problems. He has been qualified as an expert witness and has given testimony in deposition and in court. He has participated in management, review of project work, budgeting, and proposal formulation and has managed staff hydrogeologists, engineers, and subcontractors.

EDUCATION

M.S., Hydrology, University of Arizona, 1980
B.S., Hydrology, University of Arizona, 1975

EXPERIENCE

1986 - present: Harding Lawson Associates, associate hydrogeologist
1980 - 1986: Hydro Geo Chem, Inc., Tucson, Arizona, senior hydrogeologist
1979 - 1980: University of Arizona, research assistant
1977 - 1978: National Uranium Resources Evaluation, assistant hydrologist
1976 - 1977: P.E. LaMoreaux and Associates, Lakeland, Florida, hydrogeologist
1974 - 1976: City of Tucson, Groundwater Development Division, hydrologist

REGISTRATION

Geologist - Arizona 1985, California 1986
Certified Professional Geologist, AIPG

SAFETY TRAINING

Health and Safety Training Course (48 hours) following EPA requirements. Included training in physical, chemical, and toxicological properties of hazardous materials; hazard evaluation and control; selection and use of personal protective equipment; sampling and monitoring techniques and equipment; site entrance and decontamination procedures; and safety plan development.

REPRESENTATIVE PROJECTS

Hazardous/Nuclear Waste Investigations

Project manager, hydrogeologic characterization Class I hazardous waste landfill, California - Included development of groundwater quality detection- and assessment-level systems and statistical evaluations; hydrogeochemical evaluation; development of a sampling, analysis, and quality assurance program; and review and negotiation of compliance items with California Department of Health Services and Water Quality Control Board. Client: Confidential

Project manager of hydrogeologic characterization, risk assessment, and remedial alternatives investigation for RCRA-permitted facility, Portland, Oregon. Study includes development of work plans, site safety plans, sampling, analysis, and quality assurance programs. Negotiated RCRA orders

with EPA and Oregon DEQ. Conducted extensive hydrogeologic investigation to assess source and extent of contamination, hydrogeologic properties, and assessment of potential receptors. Developed plans for Corrective and Interim Remedial Measures under RCRA Section 3008. Client: Confidential

Managed site characterization of 3/4-acre chromium dump, Arizona. Implemented in-situ chromium fixation remediation to reduce potential for unsaturated zone migration. Client: Confidential

Managed groundwater investigation of copper milling and processing operation, Arizona. Work included assessing potential regional groundwater impacts of copper tailings ponds and evaluating geochemical indices of pollution. Client: Confidential

Designed saturated/unsaturated flow model for siting of Class I hazardous waste site as part of RCRA Part B application. Predicted vadose zone flow under various release scenarios. Client: Confidential

Designed and managed aquifer tests for determination of anisotropy and groundwater tracer tests for determination of porosity and dispersivity in uranium mill tailings, Wyoming. Client: Sandia National Laboratories

Designed field program, conducted groundwater sampling and field chemical analyses, and supervised site activities for National Uranium Resources Evaluation in Arizona. Client: D.O.E.

Supervised hydrologic field work at Waste Isolation Pilot Plant (WIPP) site, New Mexico. Work included aquifer test design and interpretation, recirculating and convergent-flow tracer tests, collection and interpretation of aqueous chemistry, isotopic chemistry, measurements of flow, and salt balance computations.

Conducted remedial investigation portions of an RI/FS for an incinerator waste landfill, Honolulu waterfront, Hawaii. Investigation included waste characterization, groundwater quality and flow assessment, and predictive evaluation of concentrations of waste constituents in nearshore marine environment. Client: Honolulu Community Development Authority.

Industrial/Underground Storage Tanks Investigations

Project Manager - Characterization of industrial solvent compound migration in groundwater - California. Managed on- and off-site investigation of groundwater contamination from multiple sources of industrial solvents. Designed and implemented groundwater extraction program. Conducted environmental fate analysis of contaminants in local POTW by chemical analysis and mass balances of solvents in all POTW plant processes. Client: Confidential

Managing groundwater remedial investigations from gasoline leakage at petroleum service and terminal stations, Hawaii. Installed test and monitoring wells, tested groundwater hydraulics, identified downgradient receptors, and formulated remedial measures. Presently designing remedial systems at one station. Clients: Confidential

Designed and managed programs to evaluate occurrence of soil and groundwater contamination and designed remediation programs for a 60,000-gallon fuel oil spill in California. Client: Lawrence Livermore National Labs.

Supervised and reviewed site characterizations and remedial investigations at numerous underground storage tank facilities in Arizona and Nevada. Clients: Confidential

Water Resources Investigations

Analyzed and critiqued hydrologic impact predictions from Black Mesa Coal Mine on the water resources of the Little Colorado River Basin, Arizona. Client: Hopi Tribe

Managed data collection and analysis and assisted in groundwater computer modeling of San Juan Basin, New Mexico. Designed groundwater and surface-water monitoring program for Indian tribe and trained tribal technicians on program implementation. Client: Laguna Pueblo

Managed study to determine sources of brine contamination of New Mexico river and downstream reservoirs. Site investigation included geologic mapping, geophysical investigations, geochemical and isotopic determination of sources of brine contamination, and numerical modeling of remediation scenarios. Client: U.S. Bureau of Reclamation

Conducted numerical groundwater modeling of effects of proposed well field on water resources of Roswell Artesian Basin, New Mexico. Used stable isotopes and inverse modeling to assist model calibration. Defended this work as expert witness in court. Client: Bureau of Indian Affairs

Evaluated reclamation plans for open pit uranium mine, including predictions post-recovery water levels and changes in groundwater chemistry. Client: Bureau of Indian Affairs

Evaluated storage of groundwater from large flood control reservoir in central Arizona. Study involved characterization of regional aquifer system and groundwater/surface-water interactions using water budget and flow model techniques. Client: U.S. Army Corps of Engineers

Managed aquifer evaluations and artificial recharge studies in Florida. Responsibilities included design and supervision, aquifer testing, surface water measurements, stream gauge installation, bore-hole geophysical analysis, and production well design. Clients: Confidential

Constructed, tested and permitted multi-well groundwater supply (3.2 MGD) for large electrical generation plant on Oahu, Hawaii. Client: Kalealoa Partners.

Constructed, tested and permitted deep injection wells (2.1 MGD) on Oahu, Hawaii for disposal of cooling and boiler water. Client: Confidential.

Dewatering Investigations

Managed open-pit mine dewatering projects in Florida. Designed dewatering systems, managed installation of dewatering wells, tested and implemented systems. Clients: Confidential

Dewatering computer simulations of landfill addition, Yolo County, California. Predicted effects of landfill depth configurations based on seasonality of water levels. Client: Yolo County

Assessed feasibility of depressurization of brine aquifer in New Mexico via deep wells. Project included setting up, supervising, and evaluating results of 10 miles of seismic lines, hydrogeologic characterization, design and siting of depressurization and recharge wells, analysis of chemical interactions, and predictions of recharge rates and injection pressures. Client: U.S. Bureau of Reclamation

Conducting dewatering investigation for new Honolulu waterfront development. Investigation includes test drilling, aquifer testing and design simulation/dewatering optimization. Client: Aloha Tower Associates

MEMBERSHIPS

National Water Well Association
American Geophysical Union, Hydrology Section
American Institute of Professional Geologists

REPRESENTATIVE PUBLICATIONS AND PRESENTATIONS

1986. Studies of vapor movement in the vadose zone and their implications for determination of leakage from underground storage tanks. Presented to Arizona Departments of Water Resources and Health Services, January (with S. Veggeberg).

1984. Determination of horizontal aquifer anisotropy with three wells. *Groundwater*, vol. 22, no. 1 (with S.P. Neuman, G. Walter, H. Bentley, and D. D. Gonzalez).

1983. Heterogeneity and anisotropy in a fractured carbonate aquifer. Presented at American Geophysical Union Fall Meeting, San Francisco, December.

1983. Continuum and non-continuum aspects of groundwater movement at the Waste Isolation Pilot Plant, Southeastern New Mexico. *EOS* (abs), vol. 64(45), American Geophysical Union (with G.R. Walter, H.W. Bentley, and D.D. Gonzalez).

1983. Aquifer tests to determine the principal components of transmissivity in the Culebra Dolomite at hydropads H-4, H-5, and H-6: Waste Isolation Pilot Plant (WIPP), Southeast New Mexico. Sandia National Laboratories, SAND83-7009 (with G. Walter and D.D. Gonzalez).

1983. Field characterization of groundwater transport properties at the WIPP-SENM: Problems and progress. Workshop on Field Methods for the Assessment of Radionuclide Sorption (with G.R. Walter and H.W. Bentley).

1980. An evaluation of bank storage at Painted Rock Reservoir, Maricopa County, Arizona. Report DACW-09-80-M-0914, U.S. Army Corps of Engineers, Los Angeles District.

BRUCE S. WEDGEWORTH

Project Geologist

Mr. Wedgeworth has performed numerous subsurface investigations for both hazardous waste and geotechnical projects in Hawaii and California. He has written site inspection reports, work plans, health and safety plans, and quality assurance project plans for Installation Restoration Projects (IRPs). He has conducted soil and groundwater investigations involving petroleum products, pesticides, heavy metals, PCBs, remediation, and underground storage tanks (USTs). His geophysics experience includes participation in marine surveys aboard research vessels in the Pacific Basin and ground-penetrating radar, electrical resistivity, and seismic refraction surveys in Hawaii. He has performed geotechnical investigations for power plants, telescope facilities, military installations, medical centers, and television stations.

EDUCATION

M.S., Marine Geology and Geophysics, University of Hawaii, Manoa, 1985

B.A., Earth Science, California State University, Fullerton, 1976

Forty-hour safety training course (classroom and hands-on), in accordance with OSHA and EPA requirements, for hazardous waste site investigation and cleanup.

EMPLOYMENT HISTORY

1987 - present: Harding Lawson Associates

1986: Research vessel Moana Wave, participating scientist

1984 - 1985: Geolabs-Hawaii, soil technician

1977 - 1980: S. J. Groves and Sons, Inc., quality assurance liaison officer

REPRESENTATIVE PROJECTS

Installation Restoration Projects, Oahu - Participation in various IRPs in Hawaii. Specific responsibilities included proposal preparation, design of sampling program, coordination of field activities, field sampling of soil and groundwater, drilling supervision and borehole logging, preparation of draft and final reports, coordination with client, and project administration. Client: U.S. Navy

Installation Restoration Project, Oahu - Participation in an IRP on Oahu. Assignments included drilling and borehole logging, soil sampling, and preparation of the final report. Client: U.S. Air Force

Underground storage tanks, Oahu - Evaluated tanks for conformance with proposed regulations and developed recommendations for compliance. Client: GTE Hawaiian Telephone

Gasoline leak investigation, Oahu - Project management of a project involving gasoline contamination at a service station on Oahu. Responsibilities included proposal preparation, design of sampling program, field sampling of soil and groundwater, report preparation and project administration. Client: Unocal

Injection well testing, Hawaii - Responsibilities included preparation of the appropriate permits, conducting a field percolation test, and preparation of final report. Client: Hawaiian Electric Light Company

UST removal, Kauai - Specific responsibilities included proposal preparation, field sampling of soil according to EPA UST regulations, and preparation of report. Client: State of Hawaii, DAGS

Groundwater assessment, Oahu - Assignments included sampling of soil and groundwater, borehole logging, and preparation of report. Client: Hawaiian Independent Refinery, Inc.

UST removal, Oahu - Specific responsibilities included proposal preparation, design and sampling program, and coordination of field activities. Client: Hawaiian Electric Company, Inc.

Underground storage tank, Oahu - Monitored gasoline tank removal and made recommendations based on state and federal regulations. Client: Alamo Rent a-Car.

Installation Restoration Project, Adak, Alaska - Soil sampling at various sites for confirmation studies. Client: U.S. Navy

Groundwater assessment, Oahu - Soil and water sampling at site of proposed warehouse. Client: W. W. Grainger, Inc.

Proposed water line, Kula, Maui - Reconnaissance and soil sampling. Client: Norman Saito Engineering Consultants, Inc.

Wastewater pond closures, Kahe Point, Oahu - Monitored procedures for sampling soil in ponds and wrote closure reports. Client: Hawaiian Electric Company, Inc.

Sump closure, Fullerton, California - Supervised drilling of borings to determine possible soil contamination. Client: FMC Corporation

Gasoline leak investigation, Thousand Oaks, California - Installed monitoring wells to assess extent of gasoline migration. Client: Exxon

Proposed power plant addition, Kahe Point, Oahu - Supervised drilling of soil borings. Client: Hawaiian Electric Company, Inc.

Airport runway, Kailua-Kona, Hawaii - Performed ground-penetrating radar survey to detect voids. Client: State of Hawaii

Research/Special Studies

SeaMARC project (sea mapping and remote characterization), University of Hawaii - Computer specialist for ship-towed, side-scan sonar system capable of resolving seafloor bathymetry to 10 meters. Digital data tapes were recorded at sea, reduced using advanced FORTRAN computer algorithms, and combined into mosaics creating side-scan and colored-bathymetry maps.

Research cruise, western Samoa, Caroline Islands, and Kiribati and Tuvalu areas - Participating scientist aboard research vessel Moana Wave. Investigated proposed new subduction zone, conducted geophysical survey for new hotspot, and searched seamounts and seafloor for manganese crust and nodules to establish mineral resources of the area.

Thesis study on seamount tectonics, western Pacific - Collected and analyzed geophysical and geological data including bathymetry, gravity, seismic reflection/refraction, and Deep Sea Drilling Project (DSDP) results. Modeled crustal structures using 3-D gravity program.

Research cruise, traverse of Hawaiian Ridge - Research assistant aboard research vessel Kana Keoki. Investigation of structure beneath Hawaiian ridge, moat, and arch using multichannel seismic records.

Produced bathymetric and gravimetric maps and determined velocity-depth crustal structure using Harris 800 computer.

Federal flood control project, Kaneohe, Hawaii - Quality control engineer responsible for in situ testing of earth-fill dam, roadways, concrete, and structures. Acted as liaison officer between Army Corps of Engineers and contractor. Trained and supervised assistant soil technicians.

Qualifications

Alexis Aguilar *Project Manager*

CAREER HISTORY Experienced in conducting ASTM Standard Phase I and Phase II Environmental Site Assessments and site assessment work addressing PCBs, petroleum-related contaminants, pesticides, asbestos, metals, underground storage tanks, and non-point source contaminants and review of federal, state and county databases and regulatory files.

Experienced in writing and interpreting sampling and analysis plans (SAPs), environmental hazard evaluation/environmental hazard management plans (EHE/EHMPs).

Experienced in field work and sampling for constituents in accordance with SAPs, EHE/EHMPs, specifications, submittals, and demolition floor plans.

Experienced in soil, water, air, and hazardous materials sampling and laboratory analysis interpretation.

Experienced in conducting clearance, personal, and area air monitoring for asbestos, lead, and other particulates and lead dust wipe sample collection, in compliance with Environmental Protection Agency (EPA), Occupational Safety and Health Administration (OSHA) and HDOH regulations.

Experienced in project monitoring for removal and disturbance of hazardous materials and implementing containment engineering controls in compliance with EPA, OSHA, and HDOH regulations.

Experienced in conducting hazardous materials surveys and environmental site assessments for asbestos containing building materials and lead containing/lead-based paint.

Experience in oversight of remediation, abatement, renovation, and demolition projects.

Experienced in conducting fire assessments for fire-related hazardous constituents, including sampling, laboratory analysis interpretation, and report writing.

Experienced in conducting fungal inspection surveys for moisture intrusion, visible suspect mold and indoor air quality investigations.

Experienced in conducting post remediation verification (PRV) for mold and moisture intrusion remediation and hygienic indoor surfaces.

Experienced in conducting hazardous materials surveys and environmental site assessments for asbestos containing building materials, and lead containing paint.

Experienced in collecting multi-incremental soil samples.

Experienced in environmental research and report preparation.

Experienced in biological fieldwork and laboratory sample preparation.

Project Manager

EDUCATION B.S. Marine Biology,
University of Hawai'i at Mānoa 2021

CERTIFICATIONS AHERA Asbestos Inspector, Certification No. HIASB-5173
AHERA Project Monitor, Certification No. HIASB-5173
AHERA Project Designer, Certification No. HIASB-5173
Lead Based Paint Risk Assessor, Certification No. PB-1277

Kenton Beal
President

CAREER HISTORY More than twenty-five years of professional environmental project development and management. Strong emphasis on risk evaluation, risk ranking and environmental hazard assessment. Experienced in portfolio-wide environmental management and prioritizing resource allocation to address environmental liabilities in a cost effective manner. Has developed thousands of project budgets for planning and implementation purposes. Performed numerous RCRA hazardous waste characterization investigations, Phase I and II environmental investigations, remediation of soil and groundwater and environmental management of large construction projects. Projects have included urban renewal, remediation management at petroleum refineries, best management practices, storm water management, solid waste management, construction-related permitting, indoor air quality evaluations, closure of RCRA Treatment Storage and Disposal (TSD) facilities, remediation management for fungal contamination, evaluation of environmental issues related to lease disputes and commercial property transactions. Has performed and managed thousands of mold and moisture investigations ranging from single-family residential properties to high-rise commercial and resort properties.

PROFESSIONAL AFFILIATIONS Registered Environmental Assessor (California)
Past President, Hawaii Chapter of the Institute of Hazardous Materials Managers
Registered Geologist (California)
Certified Professional Geologist (American Institute of Professional Geologists)
American Indoor Air Quality Council (Board of Directors, Hawaii Chapter)
Certified Indoor Environmentalist (Indoor Air Quality Association)
Certified in Mold Loss Prevention (Indoor Air Quality Association)
American Industrial Hygiene Association

EDUCATION MBA, Hawaii Pacific University, 2001
M.S., Geology and Geophysics, University of Hawaii, 1987
B.A., Geology, University of California at Santa Barbara, 1984

GEOGRAPHIC EXPERIENCE Successfully completed projects throughout the major Hawaiian Islands, Guam, Saipan, CNMI, Puerto Rico, Japan, and throughout the United States

ENVIRONMENTAL INVESTIGATION/ REMEDIATION EXPERIENCE Projects have included wood treatment facilities, petroleum refineries, underground storage tank (UST) sites, agricultural facilities, urban renewal projects, petroleum bulk storage terminals impacted with free floating petroleum hydrocarbons, dry cleaners, and a variety of commercial/industrial facilities. Received No Further Action status at multiple sites from the State of Hawaii Department of Health. Successful experience with investigation and remediation projects for real property transfers and redevelopment. Design of corrective measures for indoor air quality complaints. Mold and moisture training, prevention and response planning.

I. INTRODUCTION

A. Purpose of Study

The purpose of this study is to identify and assess the traffic impacts resulting from the proposed Tradewinds Garden development within the existing Aloha Tower Complex in Honolulu, on the island of Oahu. The proposed project entails redevelopment of portions of the existing Honolulu Power Plant (Units 5 and 7 only) and Pier 7 of the Honolulu Harbor into the Tradewinds Garden, which will include a garden and art museum with associated amenities.

B. Scope of Study

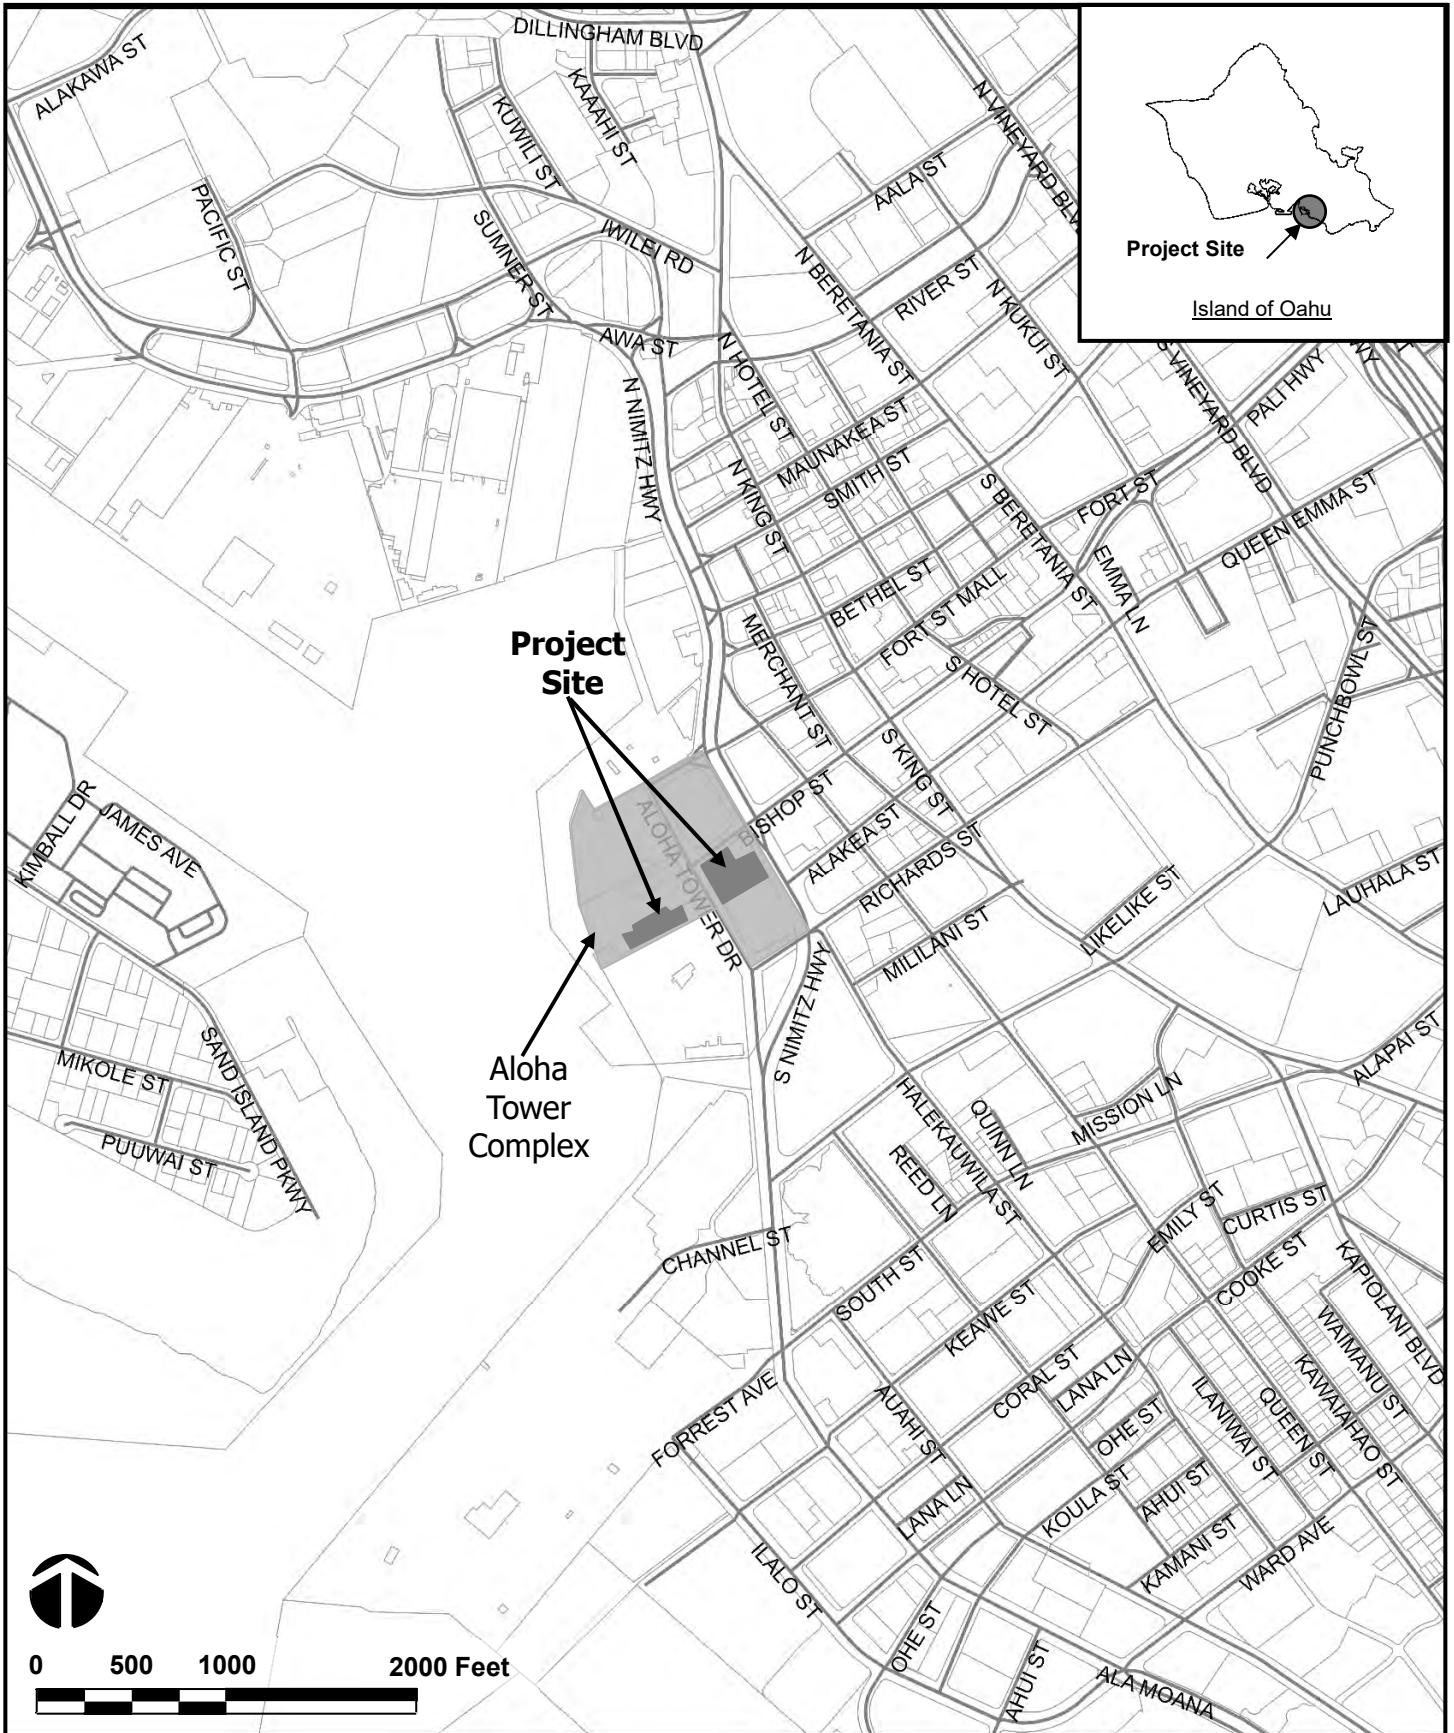

This report presents the findings and conclusions of the traffic study, the scope of which includes:

1. Description of the proposed project.
2. Evaluation of existing roadway and traffic operations in the vicinity.
3. Analysis of future roadway and traffic conditions without the proposed project.
4. Analysis and development of trip generation characteristics for the proposed project.
5. Superimposition of site-generated traffic over future traffic conditions.
6. The identification and analysis of traffic impacts resulting from the proposed project.
7. Recommendations of improvements, if appropriate, that would mitigate the traffic impacts resulting from the proposed project.

II. PROJECT DESCRIPTION

A. Location

The site for the proposed project is situated within the existing Aloha Tower Complex located adjacent to Nimitz Highway in downtown Honolulu. The site for the proposed Tradewinds Garden development straddles Aloha Tower Drive and is bounded by Nimitz Highway to the north, Bishop Street to the east, and Honolulu Harbor to the south (see Figure 1). The northern portion of the project site is comprised of portions of the existing Honolulu Power Plant, identified as Tax Map Key (TMK): 2-1-014:006 58, while the southern portion of the project site includes parts of Pier 7 of the Honolulu Harbor, identified as TMKs: 2-1-001:057 and 58.

TRADEWINDS GARDEN

LOCATION MAP AND VICINITY MAP

FIGURE

1

Access the proposed project is expected to continue being provided off Aloha Tower Drive similar to the rest of the Aloha Tower Complex.

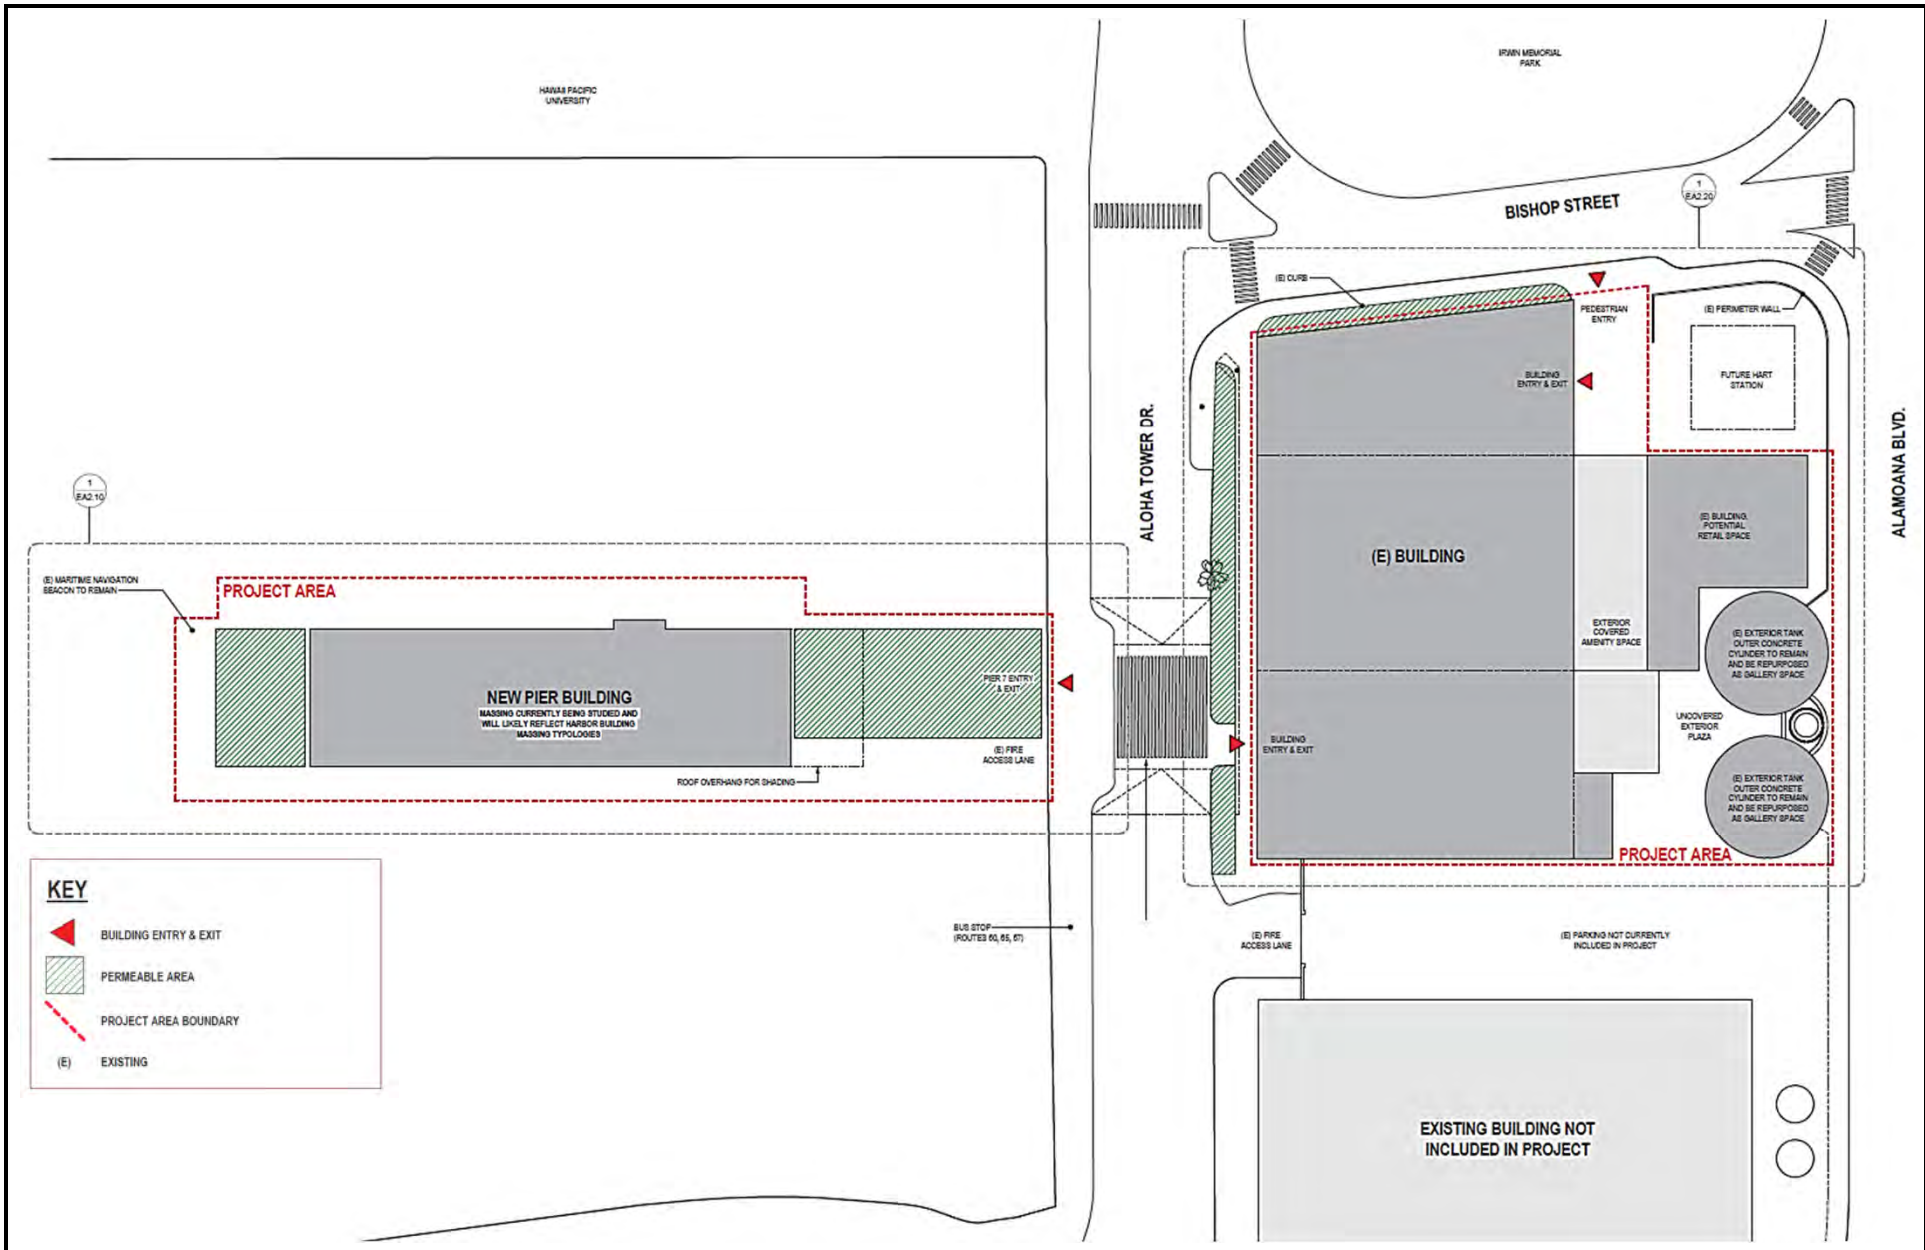

B. Project Characteristics

The proposed project entails redevelopment of portions of the existing Honolulu Power Plant building and Pier 7 to develop a garden and art museum with complementary amenities. On the northern portion of the project site, the interior of the existing Honolulu Power Plant building is expected to be renovated to include art gallery spaces, a hot shop for observing glass creation, and a bookstore/lobby. To the south, the existing Pier 7 structure is planned to be replaced with a new building to accommodate a garden with native Hawaiian vegetation, as well as a bookstore/lobby area with a bar and restaurant. In conjunction with the proposed project, a marked raised pedestrian crossing with curb extensions is expected to be installed along Aloha Tower Drive to facilitate pedestrian access between the two portions of the planned development. Parking for guests of the proposed Tradewinds Garden development is expected to be accommodated within the existing parking lots in the Aloha Tower Complex located west and east of the project site with access expected to continue being provided off Aloha Tower Drive via Fort Street, Bishop Street, and Richard Street. It should be noted that parking for staff and employees of the proposed project is not expected to be allocated on site. The proposed development is anticipated to be completed by Year 2026. See Figure 2 for the proposed site plan.

III. EXISTING TRAFFIC CONDITIONS

A. Area Roadway System

In the vicinity of the project site, Nimitz Highway is a two-way, State of Hawaii divided arterial generally oriented in the east-west direction. Near the northwest corner of the project site, Nimitz Highway intersects Bishop Street. At this signalized intersection, the eastbound approach along Nimitz Highway includes four through lanes and an exclusive right-turn lane, while the westbound approach includes four through lanes. Bishop Street is a City and County of Honolulu roadway generally oriented in the north-south direction and starts at the intersection with S. Beretania Street as a five-lane, one-way (southbound) roadway until it intersects Nimitz Highway where it transitions as a four-lane, two-way roadway. The

TRADEWINDS GARDEN

PROJECT SITE PLAN

FIGURE

2

southbound approach on Bishop Street includes two exclusive left-turn lanes, a through lane, and an exclusive right-turn lane while the northbound approach includes exclusive turning lanes.

East of the intersection with Bishop Street, Nimitz Highway intersects Alakea Street. At this signalized T-intersection, the eastbound approach along Nimitz Highway includes two exclusive left-turn lanes and three through lanes while the westbound approach includes three through lanes and an exclusive right-turn lane. It should be noted that there is signage at the intersection allowing U-turn maneuvers from both approaches of Nimitz Highway. Alakea Street is a predominantly four-lane, one-way (northbound) City and County of Honolulu roadway between Nimitz Highway and S. Beretania Street. At the intersection with Nimitz Highway, the Alakea Street leg of the intersection has 4 receiving lanes.

East of the intersection with Alakea Street, Nimitz Highway intersects Richards Street and Halekauwila Street. At this signalized intersection, the eastbound approach of Nimitz Highway includes an exclusive left-turn lane, two through lanes and a shared through and right-turn lane, while the westbound approach includes an exclusive left-turn lane and three through lanes. Richards Street is a City and County of Honolulu roadway generally oriented in the north-south direction and is comprised of 2 separate segments, north and south of Nimitz Highway. In the vicinity of the project, Richards Street is a one-way (southbound) roadway that provides access to the Aloha Tower Complex. At the intersection with Nimitz Highway, the Richards Street leg of the intersection includes a receiving lane. The north leg of the intersection is comprised of Halekauwila Street, a City and County of Honolulu roadway generally oriented in the east-west direction. At the intersection with Nimitz Highway, the Halekauwila Street leg of the intersection also has one receiving lane.

South of the intersection with Nimitz Highway, Richards Street intersects Aloha Tower Drive. At this unsignalized intersection, the southbound approach on Richards Street includes a stop-controlled shared lane that serves all turning movements. The northbound approach of the intersection is comprised of the access roadway for a parking lot for the Aloha Tower Complex. That approach includes a stop-controlled lane that serves left-and right-turn movements. Aloha Tower Drive is

a predominantly two-lane, two-way private roadway generally oriented in the east-west direction serving uses within the Aloha Tower Complex such as the Hawaii Pacific University (HPU), various commercial uses, and the complex's parking lots. In addition, field observations also indicate that the south side of the roadway is used for commercial bus loading/unloading for passengers associated with the Star of Honolulu Cruise Terminal located off Pier 8, as well as stops for the trolleys and public transit that serve the Aloha Tower Complex. At the intersection with Richards Street, the eastbound approach of Aloha Tower Drive includes a stop-controlled lane that serves through and right-turn movements while the westbound leg of the intersection includes a receiving lane.

West of the intersection with Richards Street, Aloha Tower Drive intersects Bishop Street. At this unsignalized T-intersection, the eastbound approach includes an exclusive left-turn lane and a through lane while the westbound approach includes one lane that serves through and right-turn movements. The southbound approach of Bishop Street includes a stop-controlled shared left- and right-turn lane and an exclusive right-turn lane.

West of the intersection with Bishop Street, Nimitz Highway intersects Fort Street Mall. At this signalized T-intersection, the eastbound approach of Nimitz Highway includes three through lanes and a shared through and right-turn lane while the westbound approach includes four through lanes. Fort Street is a City and County of Honolulu roadway that is generally oriented in the north-south direction. North of Nimitz Highway, Fort Street becomes a pedestrian mall through the downtown area. The northbound approach of Fort Street includes two exclusive turning lanes.

B. Traffic Volumes and Conditions

1. General

a. Field Investigation

Field investigations were conducted on February 1, 2024 and consisted of manual turning movement count surveys during the morning peak hours between 6:00 AM and 9:00 AM and the afternoon peak hours between 3:00 PM and 6:00 PM at the following intersections:

- Nimitz Highway and Bishop Street
- Nimitz Highway, Halekauwila Street, and Bishop Street
- Richards Street and Aloha Tower Drive
- Aloha Tower Drive and Bishop Street
- Nimitz Highway and Fort Street

Appendix A includes the traffic count data.

b. Capacity Analysis Methodology

The highway capacity analysis performed in this study is based upon procedures presented in the “Highway Capacity Manual”, Transportation Research Board, 2000, and the “Synchro” software, developed by Trafficware. It should be noted that the HCM 2010 and HCM 6 methodology is available with the Synchro software; however, analysis conducted using those methodologies is unable to accommodate all the lane configurations of the study intersections. The analysis is based on the concept of Level of Service (LOS) to identify the traffic impacts associated with traffic demands during the peak periods of traffic.

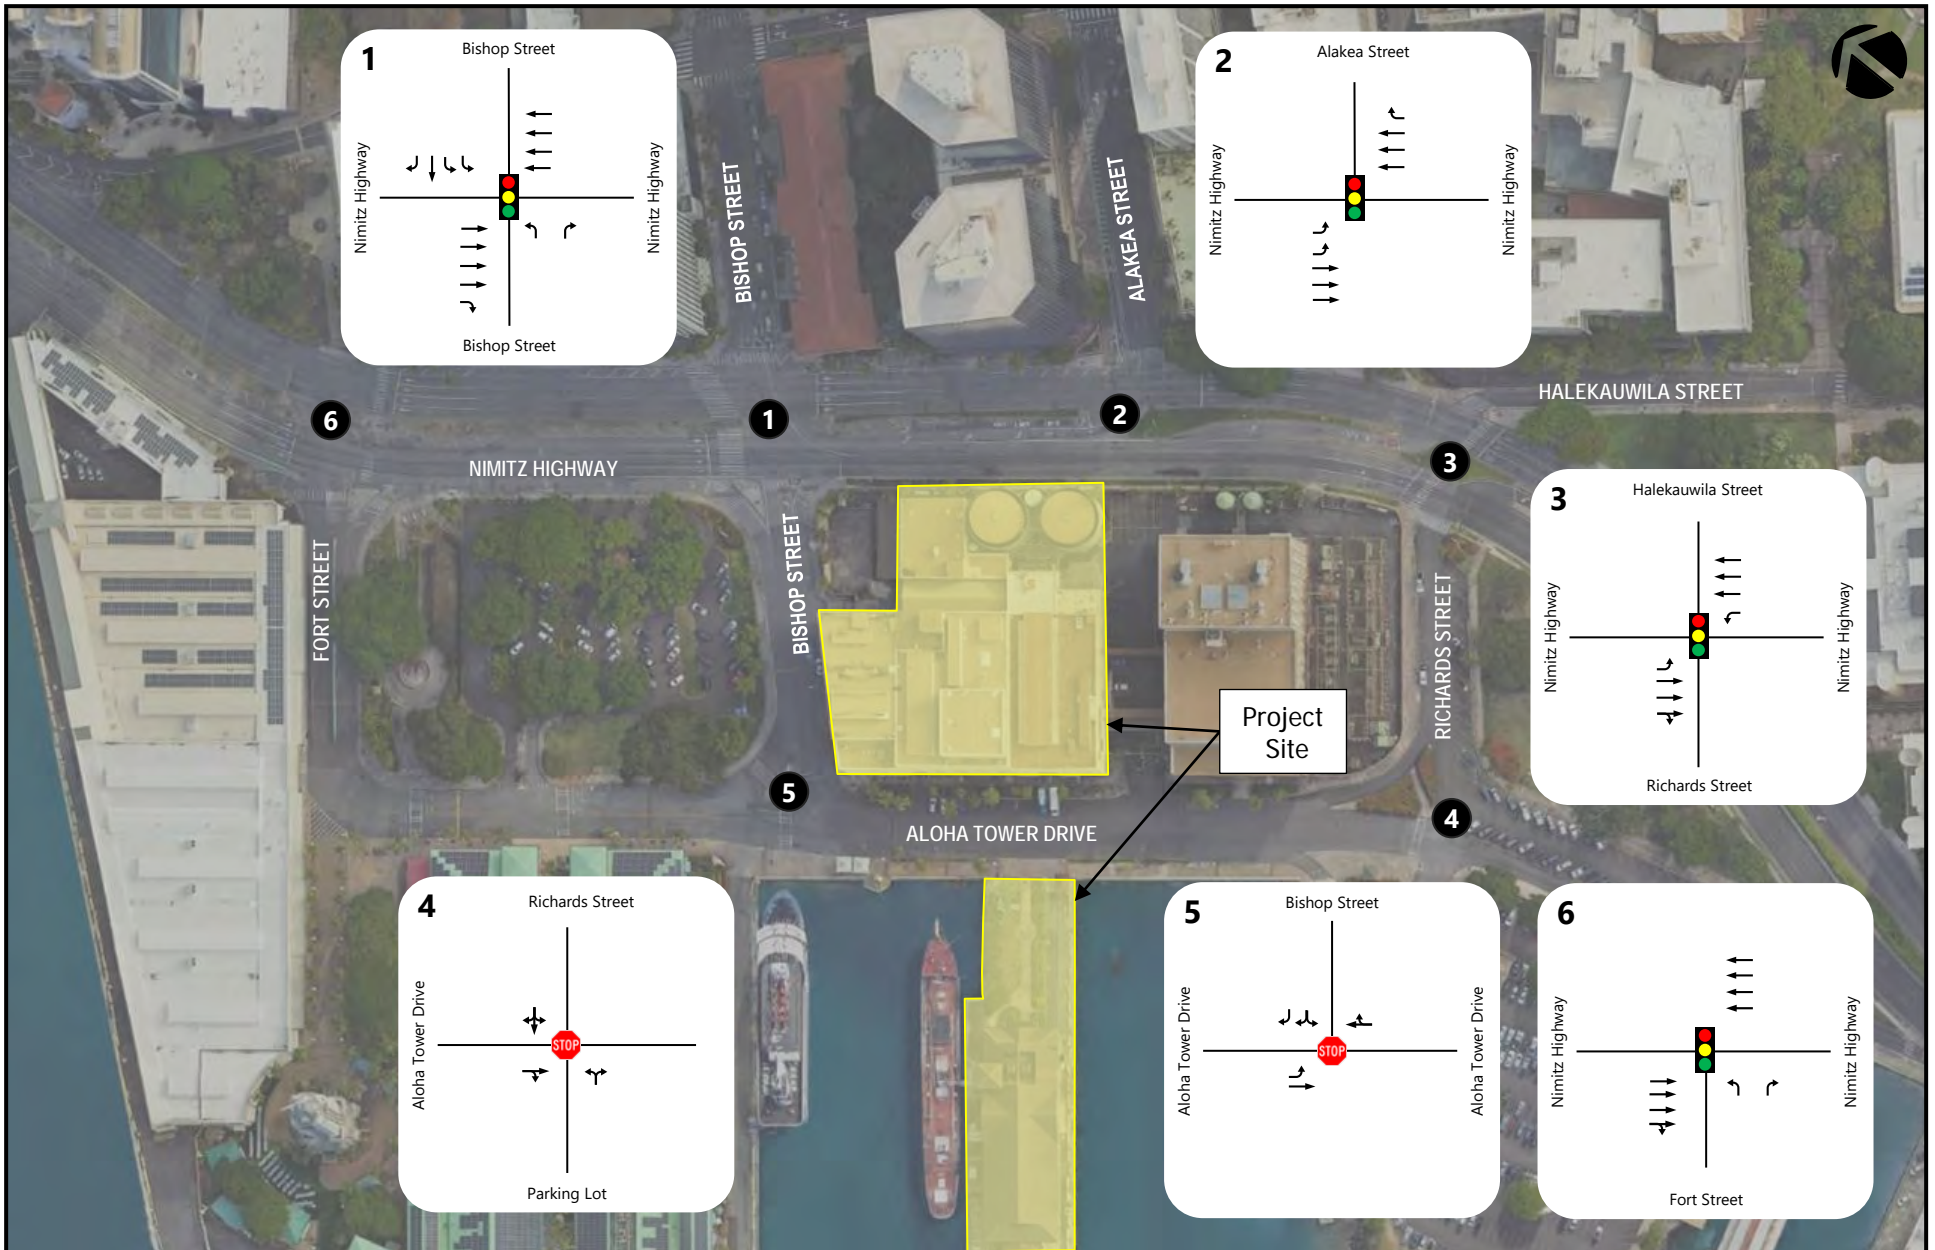

LOS is a quantitative and qualitative assessment of traffic operations. Levels of Service are defined by LOS “A” through “F”; LOS “A” representing ideal or free-flow traffic operating conditions and LOS “F” unacceptable or potentially congested traffic operating conditions.

“Volume-to-Capacity” (v/c) ratio is another measure indicating the relative traffic demand to the road carrying capacity. A v/c ratio of one (1.00) indicates that the roadway is operating at or near capacity. A v/c ratio of greater than 1.00 indicates that the traffic demand exceeds the road’s carrying capacity. The LOS definitions are included in Appendix B.

2. Existing Peak Hour Traffic

a. General

Figures 3 and 4 show the existing lane configurations and peak period traffic volumes. The AM peak hour of traffic generally occurs

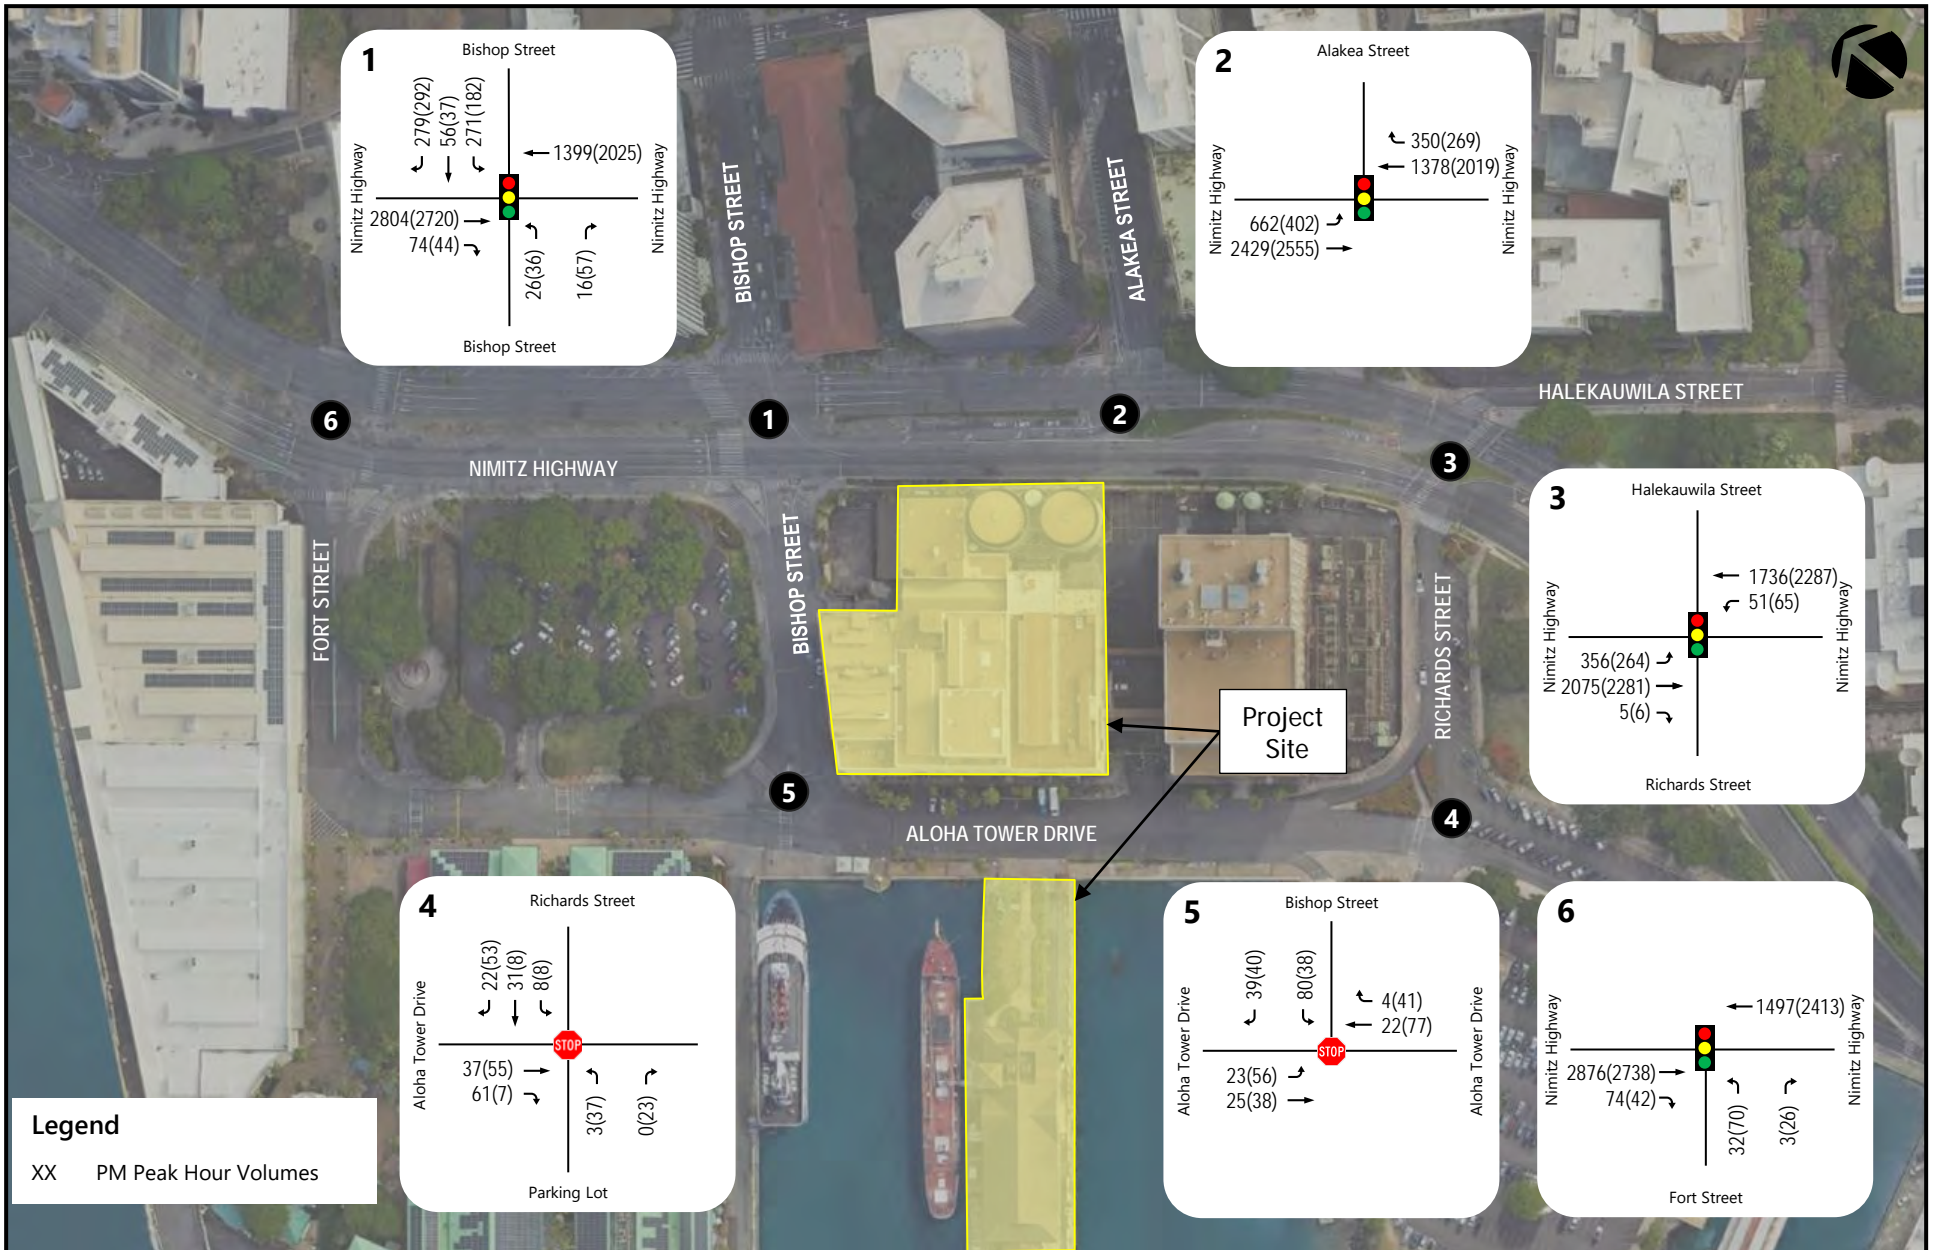

TRADEWINDS GARDEN

EXISTING LANE CONFIGURATIONS

FIGURE

3

TRADEWINDS GARDEN

EXISTING PEAK HOURS OF TRAFFIC

FIGURE

4

between 7:15 AM and 8:15 AM while the PM peak hour of traffic generally occurs between 4:30 PM and 5:30 PM. Although the peak hours of traffic generally occur at the same periods at each of the study intersections, the absolute commuter peak hour time periods for each intersection may differ slightly. The analysis is based on the absolute commuter peak hour time periods for each intersection to identify the traffic impacts resulting from the proposed project. LOS calculations are included in Appendix C.

b. Nimitz Highway and Bishop Street

At the intersection with Bishop Street, Nimitz Highway carries 2,878 vehicles eastbound and 1,399 vehicles westbound during the AM peak period. During the PM peak period, the overall traffic volume is higher with 2,764 vehicles traveling eastbound and 2,025 vehicles traveling westbound. Both approaches operate at LOS “A” during both peak periods. Traffic queues periodically formed along the highway approaches of the intersection. Average queue lengths of 7-9 vehicles were observed on the eastbound approach while average queue lengths of 10-12 vehicles were observed on the westbound approach during both peak periods. Field observations indicate that queueing along the westbound direction of the highway are influenced by the queues that form at the downstream intersection with Fort Street with these queues occasionally extending through the intersections with Bishop Street, Alakea Street, and Richards Street. Most of these queues were observed clearing the intersection after each traffic signal cycle change.

The Bishop Street approaches of the intersection carries 42 vehicles northbound and 606 vehicles southbound during the AM peak period. During the PM peak period, overall traffic volume is slightly less with 93 vehicles traveling northbound and 511 vehicles traveling southbound. The northbound approach operates at LOS “D” during both peak periods while the southbound approach operates at LOS “D”

and LOS “E” during the AM and PM peak periods, respectively. The low levels of service at these approaches are influenced by the high volume of traffic along the highway, thereby requiring a greater proportion of the green time to be allocated to facilitate throughput along the highway. Traffic queues occasionally formed on the Bishop Street approaches with the most significant queueing occurring along the southbound approach. Average queue lengths of 6-8 vehicles were observed on that approach during both peak periods. Most of these queues were observed clearing the intersection after each traffic signal cycle change.

Crosswalks are provided across Bishop Street on the north and south sides of the intersection, as well as across Nimitz Highway on the west side of the intersection. During the AM peak period, 28 pedestrians were observed crossing Bishop Street on the north side of the intersection, while 58 pedestrians were observed crossing Nimitz Highway on the west side of the intersection. During the PM peak period, 24 pedestrians and 1 pedestrian were observed crossing Bishop Street on the north and south sides of the intersection, respectively, while 73 pedestrians were observed crossing Nimitz Highway on the west side of the intersection.

c. Nimitz Highway and Alakea Street

At the intersection with Alakea Street, Nimitz Highway carries 3,091 vehicles eastbound and 1,728 vehicles westbound. During the PM peak period, overall traffic volume is higher with 2,957 vehicles traveling eastbound and 2,288 vehicles traveling westbound. The eastbound and westbound approaches of the intersection operate at LOS “A” during both peak periods. Traffic queues periodically formed along the highway approaches of the intersection with the most significant queueing occurring along the westbound direction during both peak periods. As previously discussed, these queues are influenced by queues that form at the downstream intersections during

both peak periods. Most of these queues were observed clearing the intersection after each traffic signal cycle change.

A crosswalk is provided across Alakea Street on the north side of the intersection. During the AM peak period, 37 pedestrians were observed crossing Alakea Street on the north side of the intersection. During the PM peak period, 39 pedestrians were observed crossing at the same location.

d. Nimitz Highway, Richards Street, and Halekauwila Street

At the intersection with Richards Street and Halekauwila Street, Nimitz Highway carries 2,436 vehicles eastbound and 1,787 vehicles westbound. During the PM peak period, traffic volumes are higher with 2,551 vehicles traveling eastbound and 2,352 vehicles traveling westbound. The eastbound approach operates at LOS “B” and LOS “A” during the AM and PM peak periods, respectively while the westbound approach operate at LOS “B” during both peak periods. Traffic queues periodically formed along the highway approaches of the intersection with the most significant queueing occurring along the westbound direction. As previously discussed, westbound queues from the downstream intersection with Fort Street occasionally extended to this intersection. Most of these queues were observed clearing the intersection after each traffic signal cycle change.

Crosswalks are provided across Nimitz Highway on the west side of the intersection, as well as across Richards Street and Halekauwila Street on the south and north sides of the intersection, respectively. During the AM peak period, 42 pedestrians were observed crossing Nimitz Highway on the west side of the intersection, 1 pedestrian was observed crossing Richards Street on the south side of the intersection, and 62 pedestrians were observed crossing Halekauwila Street on the north side of the intersection. During the PM peak period, 69 pedestrians were observed crossing Nimitz Highway on the west side of the intersection, while 7

pedestrians and 60 pedestrians were observed crossing Richards Street and Halekauwila Street, respectively.

e. Richards Street and Aloha Tower Drive

At the intersection with Aloha Tower Drive, Richards Street carries 61 vehicles southbound while the parking access carries 3 vehicles northbound. During the PM peak period, traffic volumes are higher with 69 vehicles traveling southbound and 60 vehicles northbound. Both approaches the southbound approach along Richards Street and the northbound approach along the parking access operate at LOS “A” during both peak periods. Minimal queues were observed along the northbound and southbound approaches of the intersection.

The Aloha Tower Drive approach of the intersection carries 99 vehicles eastbound during the AM peak period and 62 vehicles during the PM peak period. The eastbound approach operates at LOS “A” during both peak periods. Minimal queues were observed on the eastbound approach during both peak periods.

Crosswalks are provided across Richards Street on the south side of the intersection, as well as across Aloha Tower Drive on the west side of the intersection. During the AM peak period, 50 pedestrians were observed crossing Richards Street on the south side of the intersection, while 25 pedestrians were observed crossing Aloha Tower Drive on the east side of the intersection. During the PM peak period, 118 pedestrians were observed crossing Richards Street on the south side of the intersection, while 46 pedestrians were observed crossing Aloha Tower Drive on the east side of the intersection. It should be noted that although there are currently no marked crosswalks provided on the north and east sides of the intersection, 4 pedestrians were observed crossing Richards Street on the north side of the intersection and 4 pedestrians were observed crossing Aloha

Tower Drive on the east side of the intersection during the AM peak period.

f. Aloha Tower Drive and Bishop Street

At the intersection with Bishop Street, Aloha Tower Drive carries 26 vehicles westbound and 48 vehicles eastbound during the AM peak period. During the PM peak period, traffic volumes are higher with 118 vehicles traveling westbound and 94 vehicles traveling eastbound. The eastbound approach operates at LOS “A” during both peak periods. Minimal queues were observed on the Aloha Tower Drive approaches of the intersection throughout most of the duration of the field investigations. However, it should be noted that traffic operations in the vicinity of this intersection are influenced by the operations associated with the adjacent Star of Honolulu Cruise Terminal during the PM peak period. Dinner cruises from this terminal depart at 5:30 PM with passengers arriving and embarking within the hour preceding launch. During this arrival period, a portion of the north side of Aloha Tower Drive west of Bishop Street is coned off for valet operations while the south side of Aloha Tower Drive east of Bishop Street is used for commercial bus and rideshare loading/unloading for cruise passengers. Field observations indicate that queues associated with the valet operations are generally minimal (no more than 2-3 vehicles in queue on average) with sufficient width along the roadway to allow through vehicles to bypass the queues for valet parking. East of Bishop Street, a maximum queue length of 3 commercial buses was observed, occupying majority of the available curbside. These queues dissipated quickly after the cruise ship’s departure.

The Bishop Street approach of the intersection carries 119 vehicles southbound during the AM peak period and 78 vehicles southbound during the PM peak period. The southbound approach

operates at LOS “A” during both peak periods. Minimal queues were observed on the southbound approach during both peak periods.

Crosswalks are provided across Aloha Tower Drive on the west side of the intersection, as well as across Bishop Street on the north side of the intersection. During the AM peak period, 40 pedestrians were observed crossing Aloha Tower Drive on the west side of the intersection, while 10 pedestrians were observed crossing Bishop Street on the north side of the intersection. During the PM peak period, 60 pedestrians were observed crossing Aloha Tower Drive on the west side of the intersection, while 5 pedestrians were observed crossing Bishop Street on the north side of the intersection. It should be noted that although there are no marked crosswalks on the east side of the intersection, 2 pedestrians were observed crossing at this location during the AM peak period.

g. Nimitz Highway and Fort Street

At the intersection with Fort Street, Nimitz Highway carries 2,950 vehicles eastbound and 1,497 vehicles westbound during the AM peak period. During the PM peak period, the overall traffic volume is higher with 2,780 vehicles traveling eastbound and 2,413 vehicles traveling westbound. The eastbound approach operates at LOS “B” during both peak periods while the westbound approach operates at LOS “A” during both peak periods. Traffic queues periodically formed on the highway approaches of the intersection with the most significant queuing occurring during the PM peak period. Average queue lengths of 10-12 vehicles were observed on the eastbound approach during this peak period. As previously discussed, queues in the westbound occasionally extended to the upstream intersections. Most of these queues were observed clearing the intersection after each traffic signal cycle change.

Fort Street carries 35 vehicles northbound during the AM peak period and 96 vehicles during the PM peak period. The northbound

approach operates at LOS “D” during both peak periods. Although the northbound approach carries relatively low traffic volumes during both peak periods, the low levels of service are influenced by the high volume of traffic along the highway, thereby requiring more green time to be allocated to those movements. Minimal traffic queues were observed on the northbound approach with average queue lengths of 2-3 vehicles observed during both peak periods.

Crosswalks are provided across Fort Street on the south side of the intersection and across Nimitz Highway on the east side of the intersection. During the AM peak period, 6 pedestrians were observed crossing Fort Street on the south side of the intersection, while 23 pedestrians were observed crossing Nimitz Highway on the east side of the intersection. During the PM peak period, 6 pedestrians were observed crossing Fort Street on the south side of the intersection, while 47 pedestrians were observed crossing Nimitz Highway on the south side of the intersection.

IV. PROJECTED TRAFFIC CONDITIONS

A. Site-Generated Traffic

1. Trip Generation Methodology

The trip generation methodology used in this study is based upon generally accepted techniques developed by the Institute of Transportation Engineers (ITE) and published in “Trip Generation, 10th Edition,” 2021. The Tradewinds Garden development is expected to operate daily between 10:00 AM and 8:00 PM during non-peak months (Spring, Fall, and Winter) and between 8:00 AM and 8:00 PM during peak months (Summer). For the purpose of this report, the traffic assessment is based on a non-summer period since the traffic volumes along the adjacent roadways are higher when schools are in session. As such, no additional trips associated with the proposed project are expected to overlap with the AM peak period and the subsequent analysis focuses primarily on the PM peak period.

Site generated trips resulting from the proposed project are expected to be attributed to guests and employees. Based on projections provided by the developer that are consistent with other similar entertainment attractions in other states, ticket sales during peak months (Summer) are anticipated to be approximately 66,500 tickets per month with an hourly demand of 400 tickets. During off-season months (Spring, Fall, and Winter), monthly ticket sales are expected to be approximately 42,750 tickets, representing approximately 64% of the peak summer month's ticket sales. Applying that peak/non-peak ratio to the hourly demand results in an anticipated demand of approximately 257 tickets per hour during non-peak months. On average, guests to the Tradewinds Garden development are expected to spend approximately 2-3 hours on site. As such, guest departures are expected to be distributed over time with only a portion of the arrivals expected to leave within the same peak hour. The projected rate of departures was based on the assumed duration of visits and available data on other entertainment venues with similar characteristics.

The trip generation characteristics applied to the PM peak period also incorporates provisions for multi-modal trips consistent with the methodology developed by ITE. Multi-modal trips are trips made utilizing non-motorized modes of travel such as walking and biking, as well as trips made using transit. The prevailing mode split from the study "Commuting Patterns in Hawaii" published by the State of Hawaii Department of Business, Economic Development, and Tourism (DBEDT) was taken into consideration along with the existing limited access to alternative modes of transportation from the project site. Although pedestrian access is facilitated through improved sidewalks, curb ramps, crosswalks, and signalized intersection crossings, there are no designated bicycle facilities in the immediate vicinity and transit access in the immediate vicinity of the project is generally limited. Although the closest bus stop for eastbound passengers is located within the Aloha Tower Complex, the nearest stop for westbound passengers is located east of the intersection of Nimitz Highway and Halekauwila Street. It should be noted

that most of the east-west transit service through downtown Honolulu utilizes regional roadways located further north (i.e., Queen Street, South King Street, etc). The westbound stop near the intersection with Halekauwila Street is served by Routes 60, 65, 67, and 88A. Public transit services are supplemented by trolley service within the Aloha Tower Complex provided by the Waikiki Trolley (Red Line) with a trolley stop located on Aloha Tower Drive adjacent to the project site. As such, the majority of guests to the Tradewinds Garden development are expected to access the project site via a vehicular mode (includes private vehicles, rideshare, tour buses/trolleys, etc).

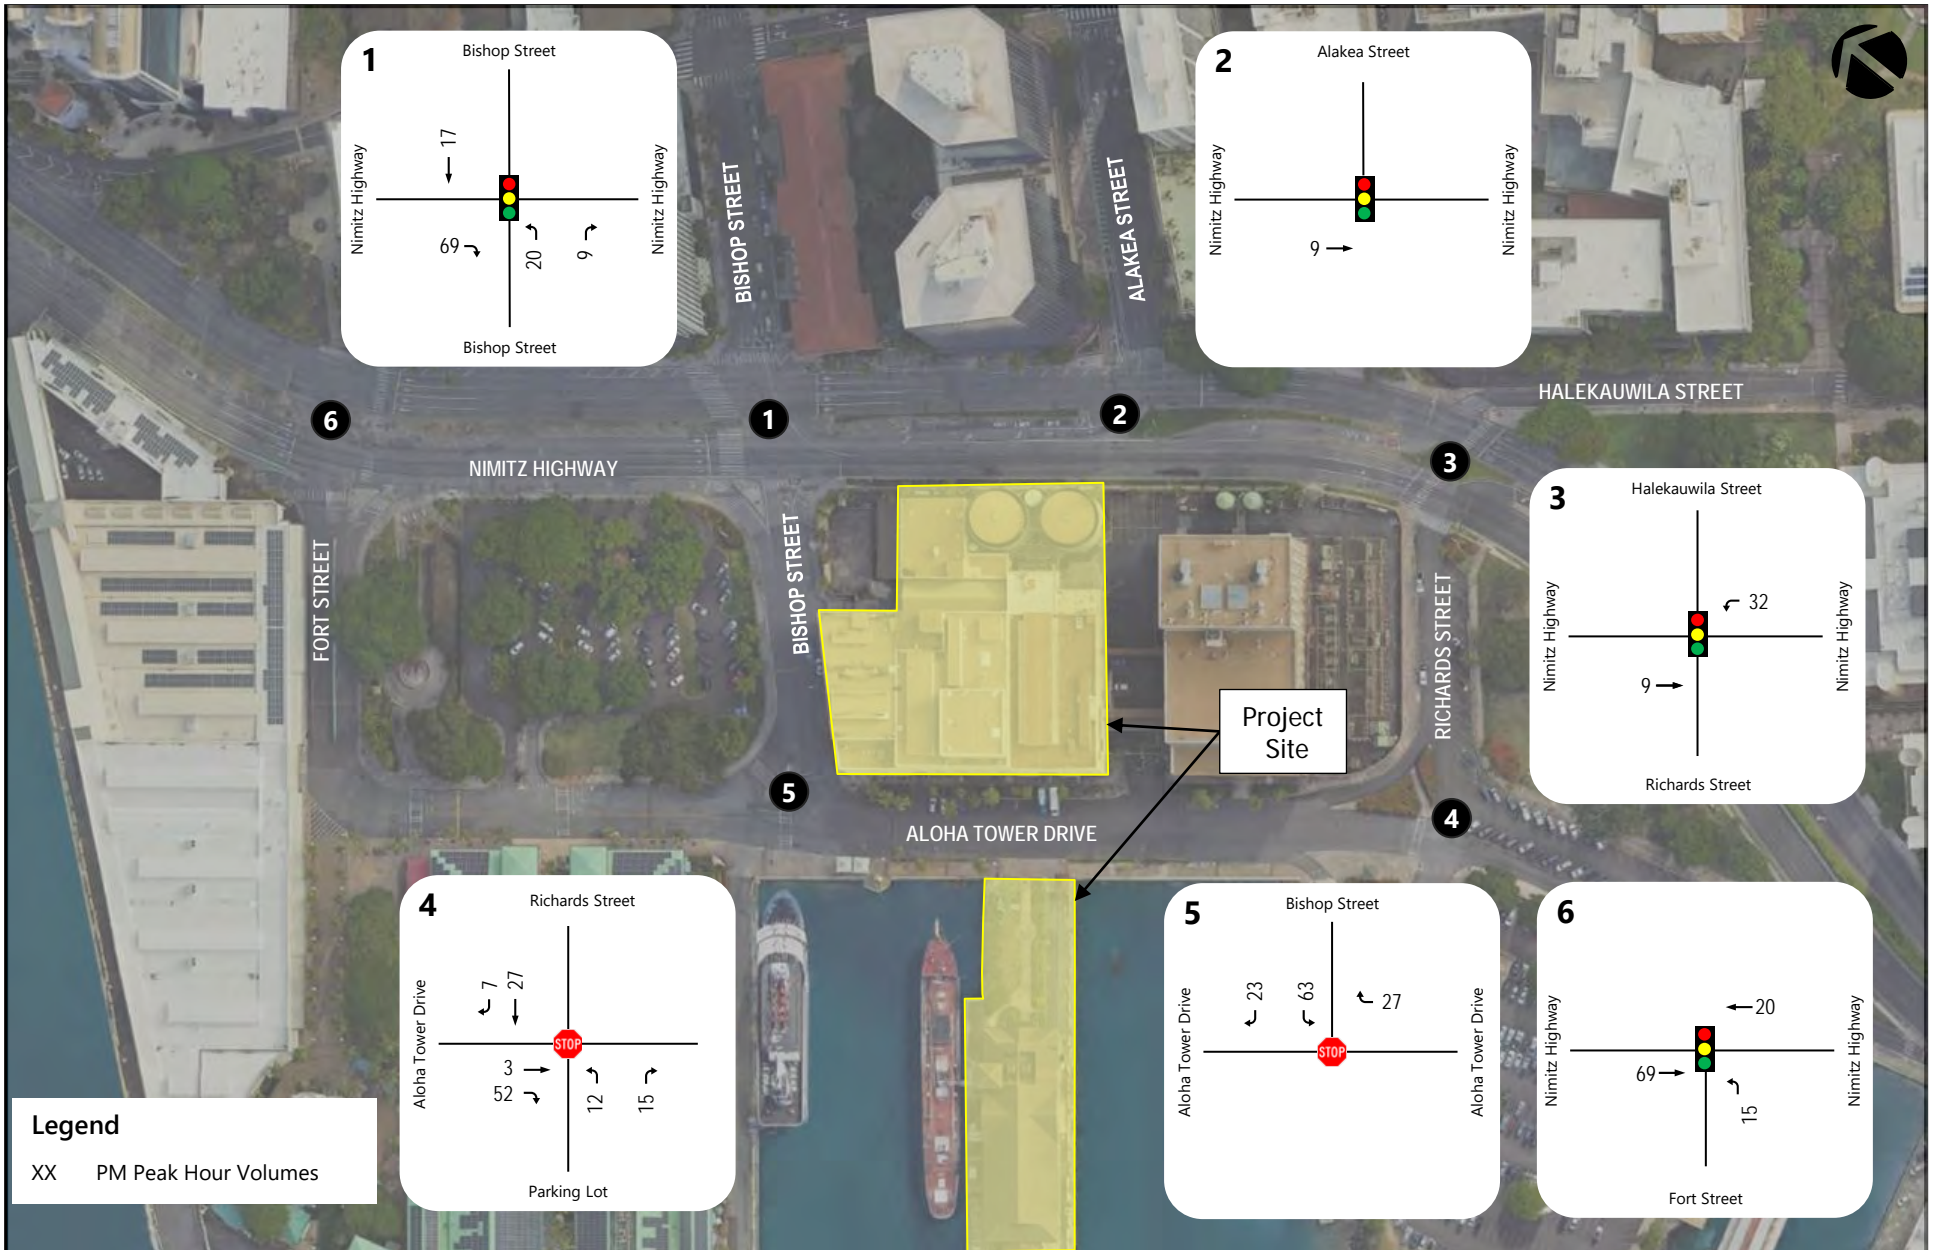

In addition, as previously discussed, no parking will be allocated on-site for employees with employees expected to be either dropped-off/picked-up from the project site or use alternative modes of transportation. Based on information provided by the developer, a total of 40 employees are expected to be on site at any point in time with their shifts occurring between 9:00 AM and 4:00 PM (Shift 1) or between 3:30 PM and 8:30 PM (Shift 2). As such, the arrivals of employees in Shift 2 are expected to overlap with the PM peak period. Table 1 summarizes the trip generation characteristics related to the proposed Tradewinds Garden development based on anticipated ticket sales, employee shifts, modal splits, and average vehicular occupancy as applied to the AM and PM peak hours of traffic.

Table 1: Peak Hour Trip Generation

GARDEN AND GLASS MUSEUM		
		PROJECTED TRIP ENDS
AM PEAK	ENTER	-
	EXIT	-
	TOTAL	-
PM PEAK	ENTER	118
	EXIT	61
	TOTAL	179

2. Trip Distribution

Figure 5 shows the distribution of site-generated traffic during the AM and PM peak periods. Parking for the proposed project is expected to be

TRADEWINDS GARDEN

DISTRIBUTION OF SITE-GENERATED VEHICLES WITH PROJECT

FIGURE

5

accommodated within the existing parking lots in the Aloha Tower Complex with access provided off Aloha Tower Drive. The directional distribution of site-generated vehicles was based on the existing distribution of traffic along Nimitz Highway. As such, 59% of trips were assumed to be traveling to/from the west and 41% of trips were assumed to be traveling to/from the east during the PM peak period. Site-generated vehicles were distributed at the study intersections based upon their assumed origin/destination, allowed turning movements, and the relative convenience of the available routes.

B. Through-Traffic Forecasting Methodology

The travel forecast is based upon historical traffic count data obtained from the State DOT, Highways Division at survey stations located along Nimitz Highway in the vicinity of the project site. Although the historical data indicates relatively stable traffic volumes along Nimitz Highway, an annual traffic growth rate of approximately 2.0% was conservatively assumed in the project vicinity given the ongoing in-fill developments occurring further east and west of the project site. Using 2024 as the Base Year, a growth rate factor of 1.04 was applied to the existing traffic demands along the roadways in the vicinity to achieve the projected Year 2026 traffic demands.

C. Other Considerations

The City and County of Honolulu is currently constructing a fixed guideway transit system that will extend from East Kapolei to Honolulu, thereby providing an alternate mode of travel through the area. Within the study area, the guideway alignment is expected to run along Nimitz Highway with the Bishop Street transit station to be in close proximity to the project site. In conjunction with the planned transit system, bus routes will be modified to provide connections to/from the transit station. At this writing, the planned transit system is expected to be completed by Year 2031 or later, several years after the completion of the proposed Tradewinds Garden development. As such, this project was not incorporated into the without project conditions.

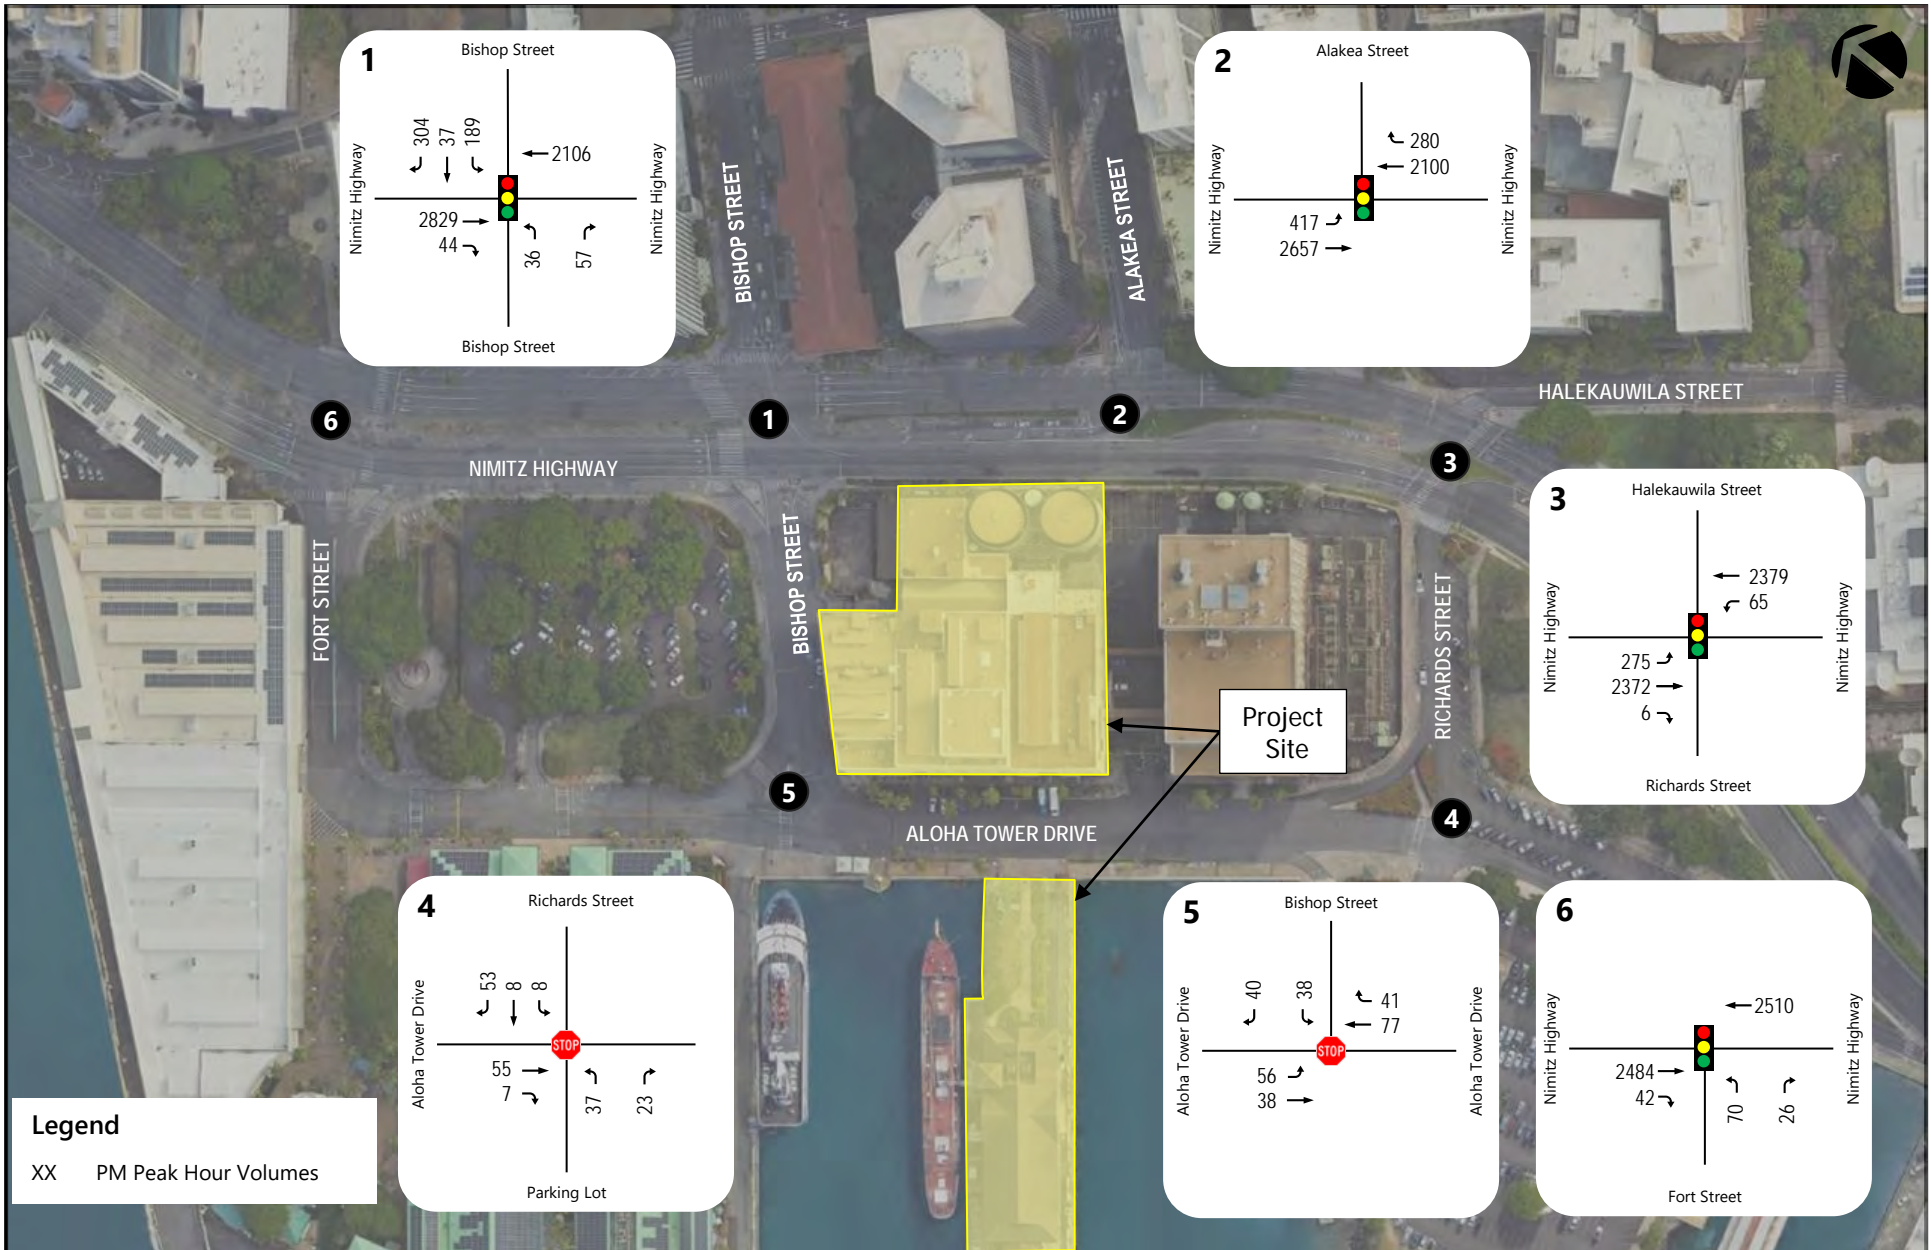

D. Total Traffic Volumes Without Project

The projected Year 2026 AM and PM peak period traffic volumes and operating conditions without the proposed Tradewinds Garden development are shown in Figure 6 and summarized in Table 3. As previously mentioned, the Year 2026 without project conditions incorporate ambient growth in traffic. In addition, no site-generated traffic are expected to overlap with the AM peak period and as such, the analysis focuses primarily on the PM peak period. The existing levels of service are provided for comparison purposes. LOS calculations are included in Appendix D.

Table 3: Existing and Projected Year 2026 (Without Project) LOS Traffic Operating Conditions

Intersection	Approach/ Critical Movement	PM	
		Exist	Year 2026 w/o Proj
Nimitz Hwy/ Bishop St	Eastbound	A	A
	Westbound	A	A
	Northbound	D	D
	Southbound	E	E
Nimitz Hwy/ Alakea St	Eastbound	A	A
	Westbound	A	A
Nimitz Hwy/ Richards St/ Halekauwila St	Eastbound	A	A
	Westbound	B	B
Richards St/ Aloha Tower Dr	Westbound	A	A
	Northbound	A	A
	Southbound	A	A
Aloha Tower Dr/ Bishop St/	Westbound	A	A
	Southbound	A	A
Nimitz Hwy/ Fort St	Eastbound	B	B
	Westbound	A	A
	Northbound	D	D

Under Year 2026 without project conditions, traffic operations are expected to remain similar to existing conditions despite ambient growth in traffic. Along Nimitz Highway, all the approaches at the intersection with Alakea Street and

TRADEWINDS GARDEN

YEAR 2026 PM PEAK HOUR OF TRAFFIC WITHOUT PROJECT

FIGURE

6

Richards/Halekauwila Street are expected to continue operating at LOS “B” or better during while those at Fort Street are expected to continue operating at LOS “D” or better during the PM peak period. At the intersection with Bishop Street, the highway approaches are expected to continue operating at LOS “A” during both peak periods while the side street approaches are expected to continue operating at LOS “E” or better during both peak periods. As previously discussed, traffic operations at this location are influenced by the high volume of traffic along the highway, thereby requiring more green time to be allocated to facilitate the through movements along the highway. The remaining study intersections are also expected to remain similar to existing conditions.

E. Total Traffic Volumes With Project

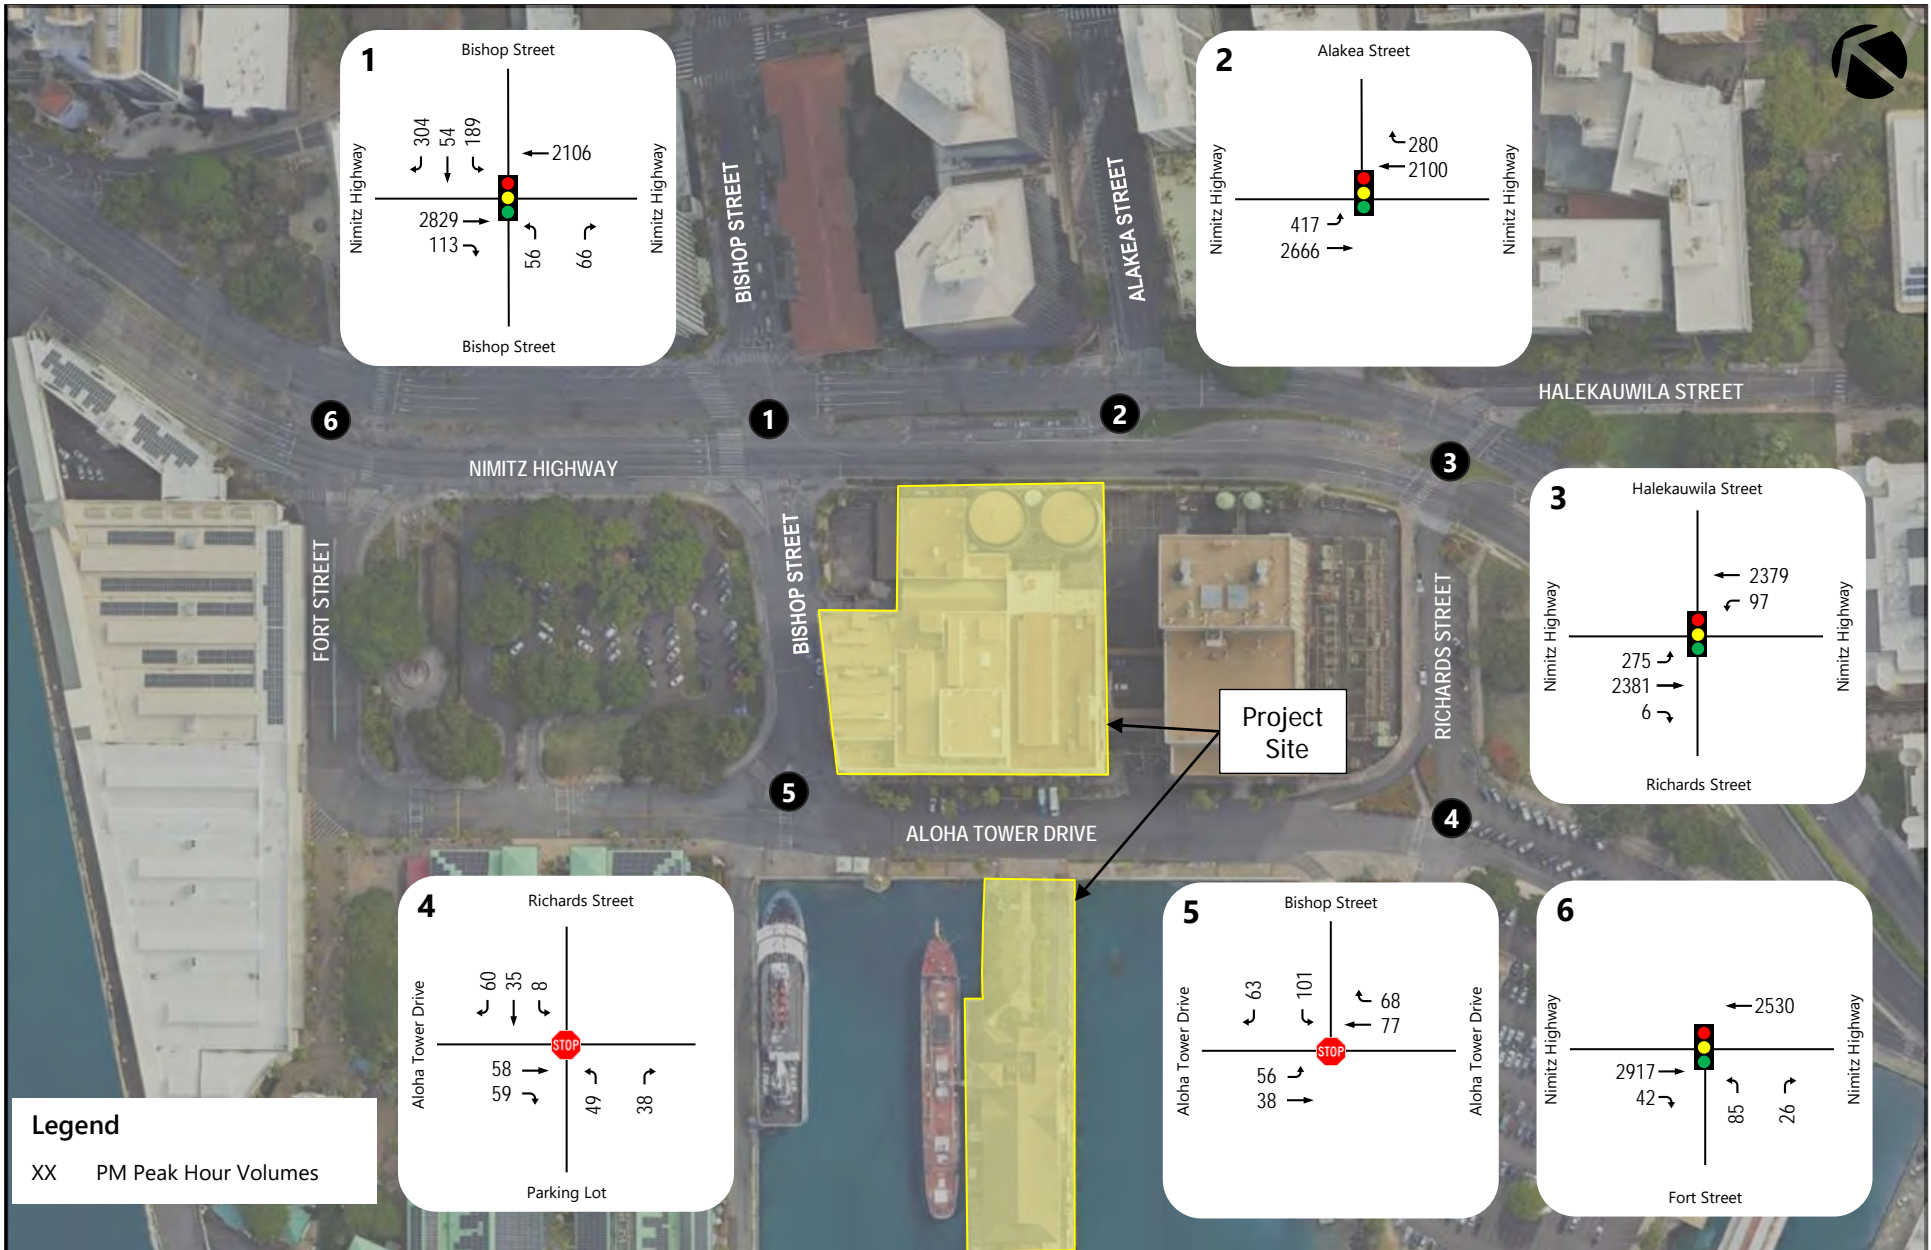

Figure 7 shows the Year 2026 cumulative AM and PM peak hour traffic conditions resulting from the projected external with the Tradewinds Garden development. The cumulative volumes consist of site-generated traffic superimposed over Year 2026 projected traffic demands. The traffic impacts resulting from the proposed project are addressed in the following section.

V. TRAFFIC IMPACT ANALYSIS

The projected Year 2026 cumulative AM and PM peak hour traffic conditions with the Tradewinds Garden development are summarized in Table 4. The existing and projected Year 2026 (Without Project) operating conditions are provided for comparison purposes. LOS calculations are included in Appendix E.

Table 4: Existing and Projected Year 2027 (Without and With Project) LOS Traffic Operating Conditions

Intersection	Approach	PM		
		Exist	Year 2026	
			w/out Proj	w/ Proj
Nimitz Hwy/ Bishop St	Eastbound	A	A	A
	Westbound	A	A	A
	Northbound	D	D	D
	Southbound	E	E	E

TRADEWINDS GARDEN

YEAR 2026 PM PEAK HOUR OF TRAFFIC WITH PROJECT

FIGURE

7

**Table 4: Existing and Projected Year 2027 (Without and With Project)
LOS Traffic Operating Conditions (Cont'd)**

Intersection	Approach	PM		
		Exist	Year 2026	
			w/out Proj	w/ Proj
Nimitz Hwy/ Alakea St	Eastbound	A	A	A
	Westbound	A	A	A
Nimitz Hwy/ Richards St/ Halekauwila St	Eastbound	A	A	A
	Westbound	B	B	B
Richards St/ Aloha Tower Dr	Westbound	A	A	A
	Northbound	A	A	A
	Southbound	A	A	A
Aloha Tower Dr /Bishop St	Eastbound	A	A	A
	Southbound	A	A	B
Nimitz Hwy/ Fort St	Eastbound	B	B	B
	Westbound	A	A	A
	Northbound	D	D	D

Under Year 2026 with project conditions, traffic operations in the vicinity are generally expected to remain similar to without project conditions despite the anticipated increases in traffic along the surrounding roadways. Along Nimitz Highway, traffic operations are generally expected to continue operating at similar levels of service with the highway approaches at Fort Street, Bishop Street, and Richards Street/Halekauwila Street expected to continue operating at LOS “B” or better during both peak periods. Along Aloha Tower Drive, traffic operations at the intersection with Richards Street are expected to continue operating at LOS “A” or better during both peak periods, while those at the intersection with Bishop Street are expected to operate at a slightly lower LOS “B” during the PM peak period. As previously discussed, traffic operations along this roadway are influenced by the operations associated with the adjacent cruise terminal with passenger loading/unloading activities occurring along this roadway. As such, given the adjacent uses, the preparation of a Transportation Management Plan should be considered with the proposed project to further minimize the project’s potential impact to the surrounding

roadways.. The levels of service at the remaining study intersection on Nimitz Highway are also expected to remain similar to without project conditions.

VI. MULTIMODAL FACILITIES

A. Pedestrian Facilities

1. Existing Conditions

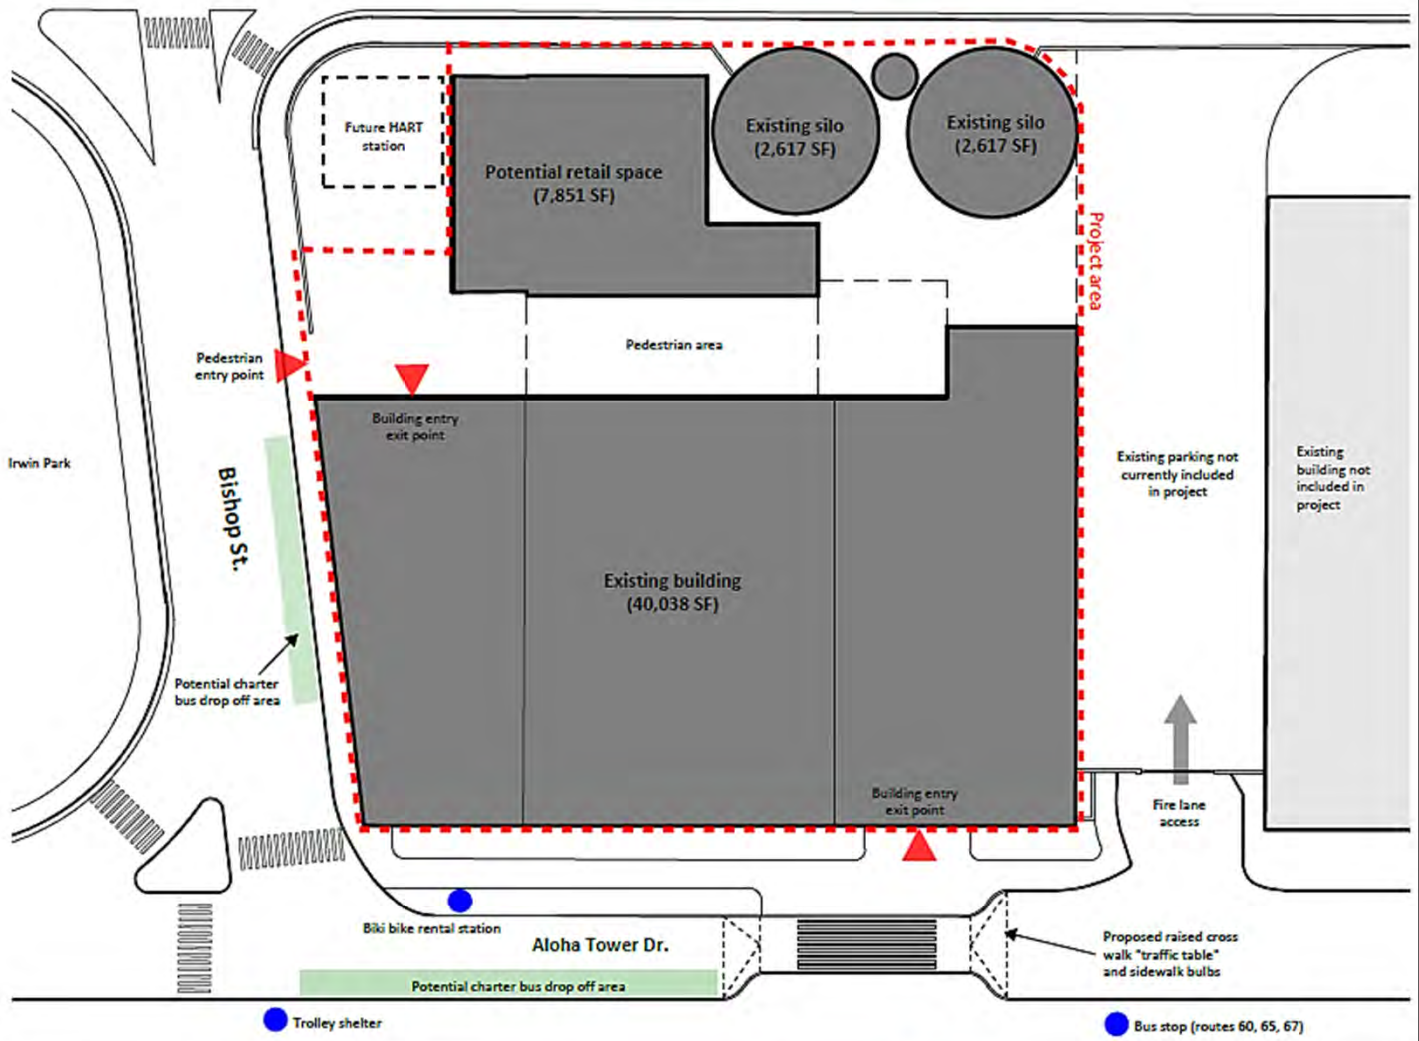

The Aloha Tower Complex includes a network of sidewalks and marked crosswalks along Aloha Tower Drive to facilitate access between the complex's parking lots, trolley/bus stops and destinations. Outside of the Aloha Tower Complex, designated pedestrian facilities such as sidewalks are provided along Nimitz Highway with designated pedestrian crossings at the signalized intersections with Fort Street, Bishop Street, Alakea Street, and Richard Street/Halekauwila Street. Further northwest of the project site, Fort Street transitions as a pedestrian mall providing convenient access through the downtown area. Although there are provided facilities, the overall pedestrian environment along Nimitz Highway is influenced by the high volume of vehicular traffic along this roadway.

2. With Project Conditions

a. General

Under with project conditions, existing pedestrian facilities along the roadways adjacent to the project are generally expected to be maintained/enhanced with the widening of the sidewalk area and the addition of landscaping treatments currently being considered along the project frontage on Bishop Street to enhance the attractiveness of the site. Pedestrian entry/exit points into northern portion of the project site is expected to be provided along Aloha Tower Drive and Bishop Street while access to the Pier 7 portion of the project is planned off Aloha Tower Drive. Figure 8 shows the proposed circulation associated with the project. In addition, in conjunction with the proposed project, a raised midblock crossing with curb extensions along Aloha Tower Drive is expected to be provided to facilitate access between the planned uses north and south of that

Ala Moana Blvd.

Note that SF areas indicated are building footprint

TRADEWINDS GARDEN
CIRCULATION PLAN

FIGURE
8

roadway. It should be noted that the addition of this improvement is expected to reduce the existing curbside width along this roadway. Given the existing use of Aloha Tower Drive as a loading/unloading area for the adjacent cruise services and with bus and trolley stops located in the vicinity of the planned midblock crossing, an assessment of this crossing was conducted as detailed below.

b. Crossing Assessment Methodology

The “Guidelines for Pedestrian Crossing Treatments,” an evaluation tool to determine pedestrian crossing treatments at unsignalized intersections. The framework for this assessment is outlined in the “National Cooperative Highway Research Program (NCHRP) Report 562: Improving Pedestrian Safety at Unsignalized Crossings,” published in 2006. The guidelines are applied via two different worksheets based on a series of variables (i.e. pedestrian peak hour volumes, pedestrian delay) to determine whether or not the subject crossing meets a pre-determined threshold, with recommended treatments if the threshold is satisfied.

c. Crossing Assessment

The number of anticipated pedestrian crossings used for the purpose of analysis was determined based on guests traveling between the north and south portions of the project site that straddle Tower Drive. With the proposed project, approximately 514 pedestrian crossings per hour are expected at the midblock crossing. Taking into account the projected pedestrian and conflicting vehicular traffic along Aloha Tower Drive, the guidelines in the NCHRP indicates that in addition to providing a marked crossing, active or enhanced crossing treatments should be implemented. It should be noted that this recommendation is consistent with the planned improvements associated with the crossing which includes a raised crosswalk with curb extensions. In addition, other enhancements/high visibility treatments should also be considered. These include in-street crossing

signs, high visibility signs/markers and advanced stop/yield lines. However, as previously discussed, the curblineline on the south side of Aloha Tower Drive is used as passenger loading/unloading for the commercial buses that serve the Star of Honolulu Cruise Terminal. There are also stops for the Waikiki Trolley and The Bus located along this roadway. During field investigations, a maximum queue of 3 commercial buses were observed, occupying majority of the available curbside. As such, coordination with the existing users of this roadway is critical during the design phase of the midblock crossing since the addition of this crossing may impact their existing operations.

B. Bicycle Facilities

1. Methodology

Bicycle Level of Traffic Stress (LTS) is a metric developed by the Mineta Transportation Institute used to classify a roadway segment or intersection. The LTS ranking system is based on the amount of traffic stress imposed on cyclists based on variables such as street width, prevailing vehicle speed, and average daily traffic volumes. The Level of Traffic Stress ranges from 1 to 4 and can be assessed for a given segment or intersection via six tables provided by the Mineta Transportation Institute. The general descriptions of the LTS levels are as follows:

- LTS 1: Characterized by strong separation from all except low speed, low volume traffic. Simple crossings. Suitable for children.
- LTS 2: Except in low speed/low volume traffic situations, cyclists have their own place to ride that keeps them from having to interact with traffic except at formal crossings. There is a physical separation from higher speed and multilane traffic. Crossings are easy for an adult to navigate. This refers to a level of traffic stress that most adults can tolerate, particularly those sometimes classified as interested but concerned.
- LTS 3: Involves interaction with moderate speed or multilane traffic, or close proximity to higher speed traffic. Refers to a level of traffic stress acceptable to those classified as enthused and confident.

- LTS 4: Involves interaction with higher speed traffic or close proximity to high-speed traffic. Refers to a level of stress acceptable only to those classified as strong and fearless.

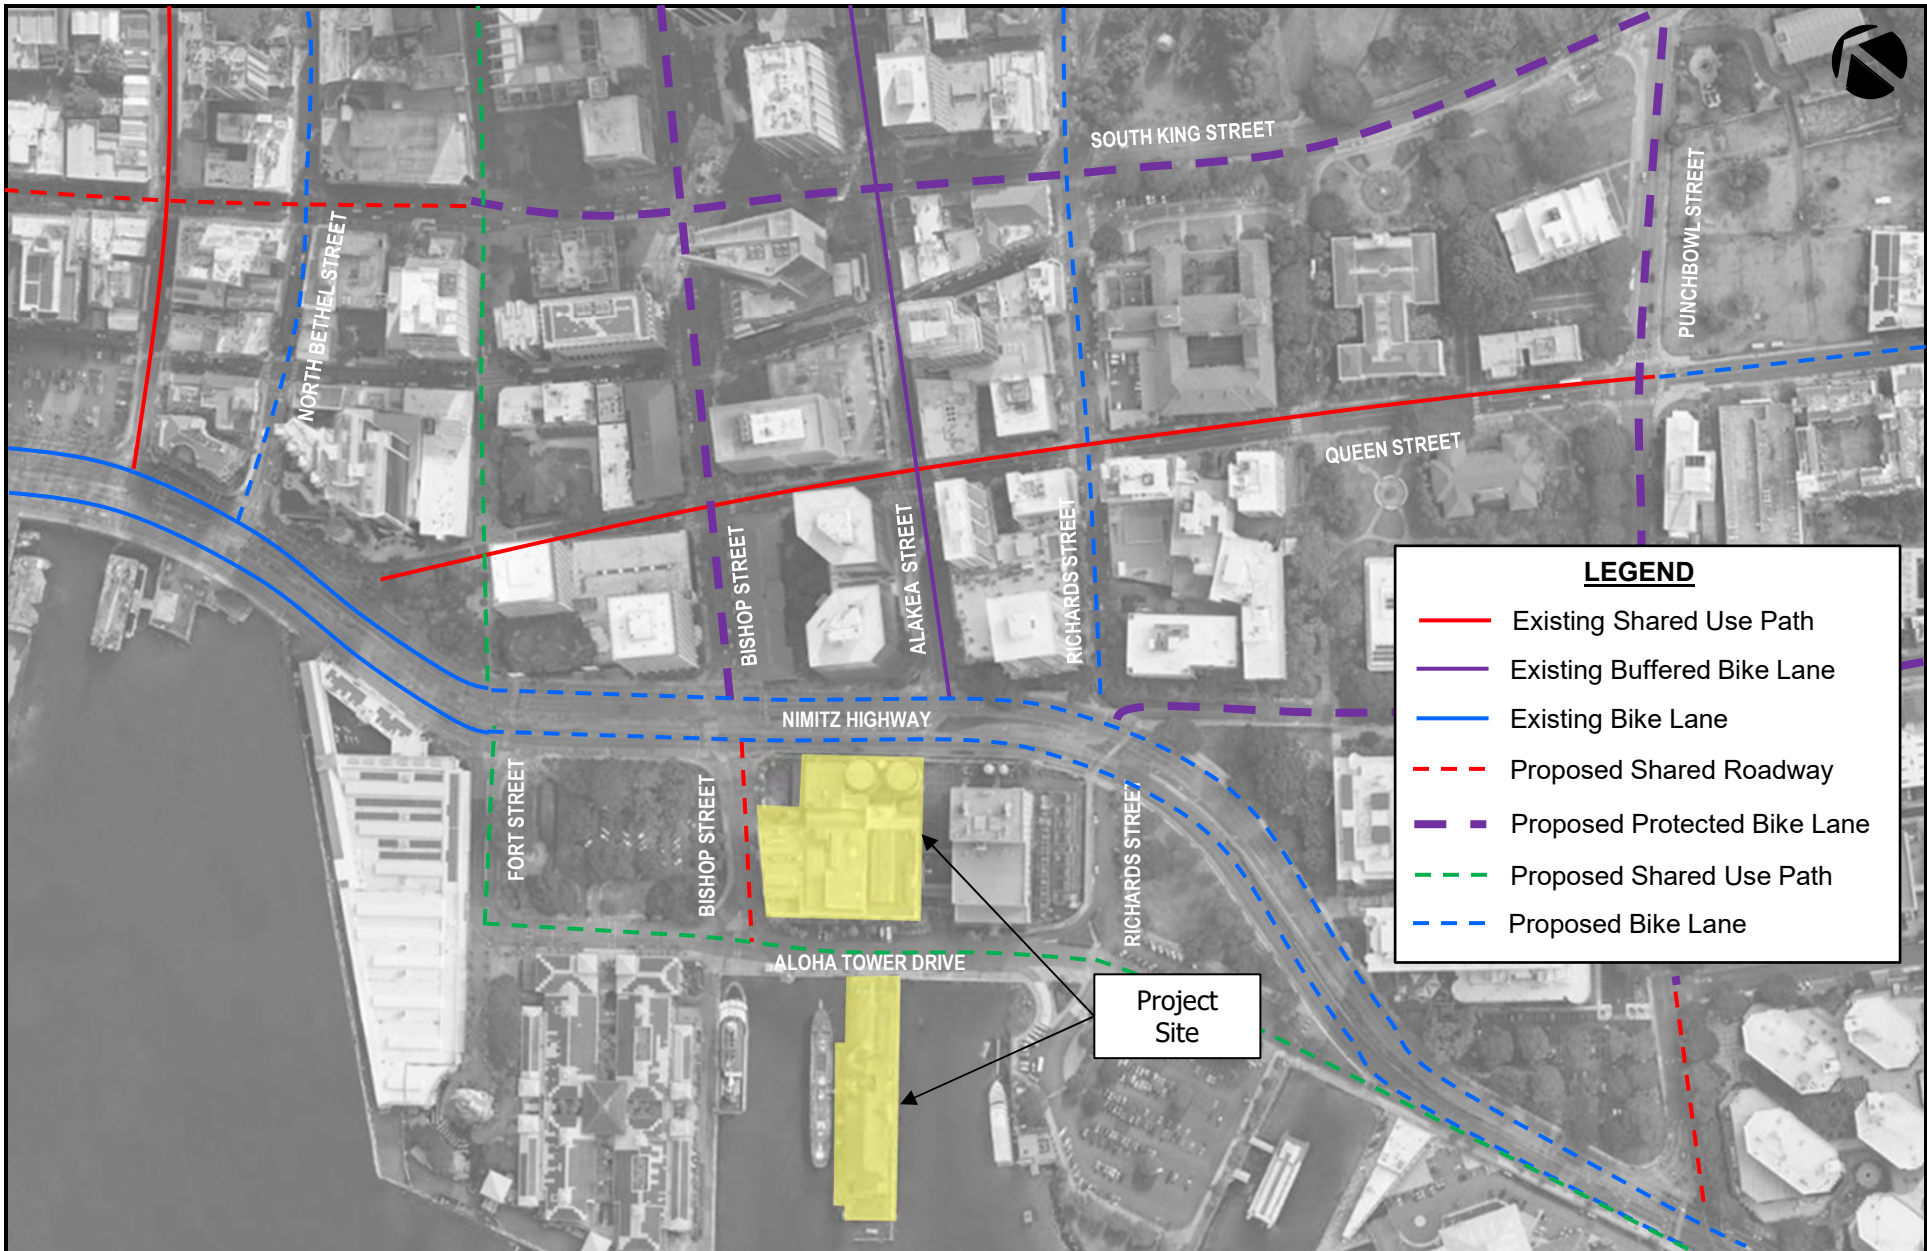

It should be noted that current LTS methodology assumes no traffic stress is imposed on cyclists at signalized intersections. Guidance provided by the Mineta Transportation Institute includes categorizing signalized intersections as a LTS 2.

2. Existing Conditions and Bicycle Level of Traffic Stress

There is a BIKI bike share station located within the Aloha Tower Complex near the intersection of Bishop Street with Aloha Tower Drive and adjacent to the project site. However, with the exception of buffered bike lanes along Alakea Street, designated bicycle facilities are currently limited along the roadways in the vicinity of the project (see Figure 9). Given the limited availability of designated bicycle facilities, most of the roadways in the vicinity of the project are rated at LTS 3 or higher. Nimitz Highway is rated at LTS 4, representing the highest level of traffic stress, while Bishop Street (north of Nimitz Highway), Richards Street are rated at LTS 3. The high LTS along these roadways are due to the high volume of vehicular traffic and the lack of dedicated facilities along these roadways, requiring bicyclists to utilize the travel way and interact with vehicular traffic. As such, the conditions along these roadways are better suited for more experienced bicyclists. Within the Aloha Tower Complex, along Aloha Tower Drive, Richards Street and Fort Street, the LTS for these roadways are rated at LTS 2 since vehicular traffic volumes are relatively less with lower prevailing speeds. Figure 10 depicts the existing LTS along the roadways in the vicinity of the project.

3. With Project Conditions

The proposed project is expected to provide bicycle facilities on-site. In addition, the existing BIKI bike share station adjacent to the north portion of the project site is expected to be maintained. Although designated bicycle facilities along the roadways in the vicinity are currently limited, there are future plans to provide bicycle facilities in the project vicinity (see Figure 9).

TRADEWINDS GARDEN

EXISTING AND PROPOSED BICYCLE FACILITIES

FIGURE

9

FIGURE
10

According to the 2019 Update of the “Oahu Bike Plan” published by the City and County of Honolulu DTS, these improvements include the following:

- Bike lanes along Nimitz Highway east of Fort Street
- Shared roadway along Bishop Street between Aloha Tower Drive and Nimitz Highway
- Buffered bike lanes along Bishop Street north of Nimitz Highway
- Bike lanes on Richards Street between Nimitz Highway and S. Hotel Street
- Shared-use path along the Aloha Tower Drive waterfront between Fort Street and Forrest Avenue

These improvements are expected to increase the availability of bicycle facilities in the vicinity of the project, but the timelines for these improvements are not known at this time.

C. Transit Facilities

1. Methodology

Transit Capacity and Quality of Service is a metric used to measure transit availability, comfort, and convenience from both the passenger and transit service provider’s points of view. The framework for this metric is outlined in the Transit Cooperative Research Program (TCRP) Report 165: Transit Capacity and Quality of Service Manual (TCQSM), 3rd Edition published in 2013 which provides research-based guidance on public transit capacity and quality of service. The quality of service concepts and methods contained in the TCQSM address real-world transit operations, comprehensive planning, and design needs. The research for and development of the TCQSM has also directly supported the development of the Multimodal Level of Service (LOS) analysis methodologies introduced in the Highway Capacity Manual (HCM) 2010 and subsequently refined in HCM 6. Multimodal LOS analyzes a roadway corridor comprised of street segments which are defined as a length of street between intersections where traffic may have to stop due to traffic control. Transit LOS can be directly compared to other transportation modes with LOS “A” representing the best quality of service and the letter “F” used to represent the worst quality of service. The assessment evaluates the quality of transit operations incorporating factors

that bear all aspect of a transit trip including the pedestrian environment along the street, service frequency and reliability, and the availability of transit amenities at those stop locations.

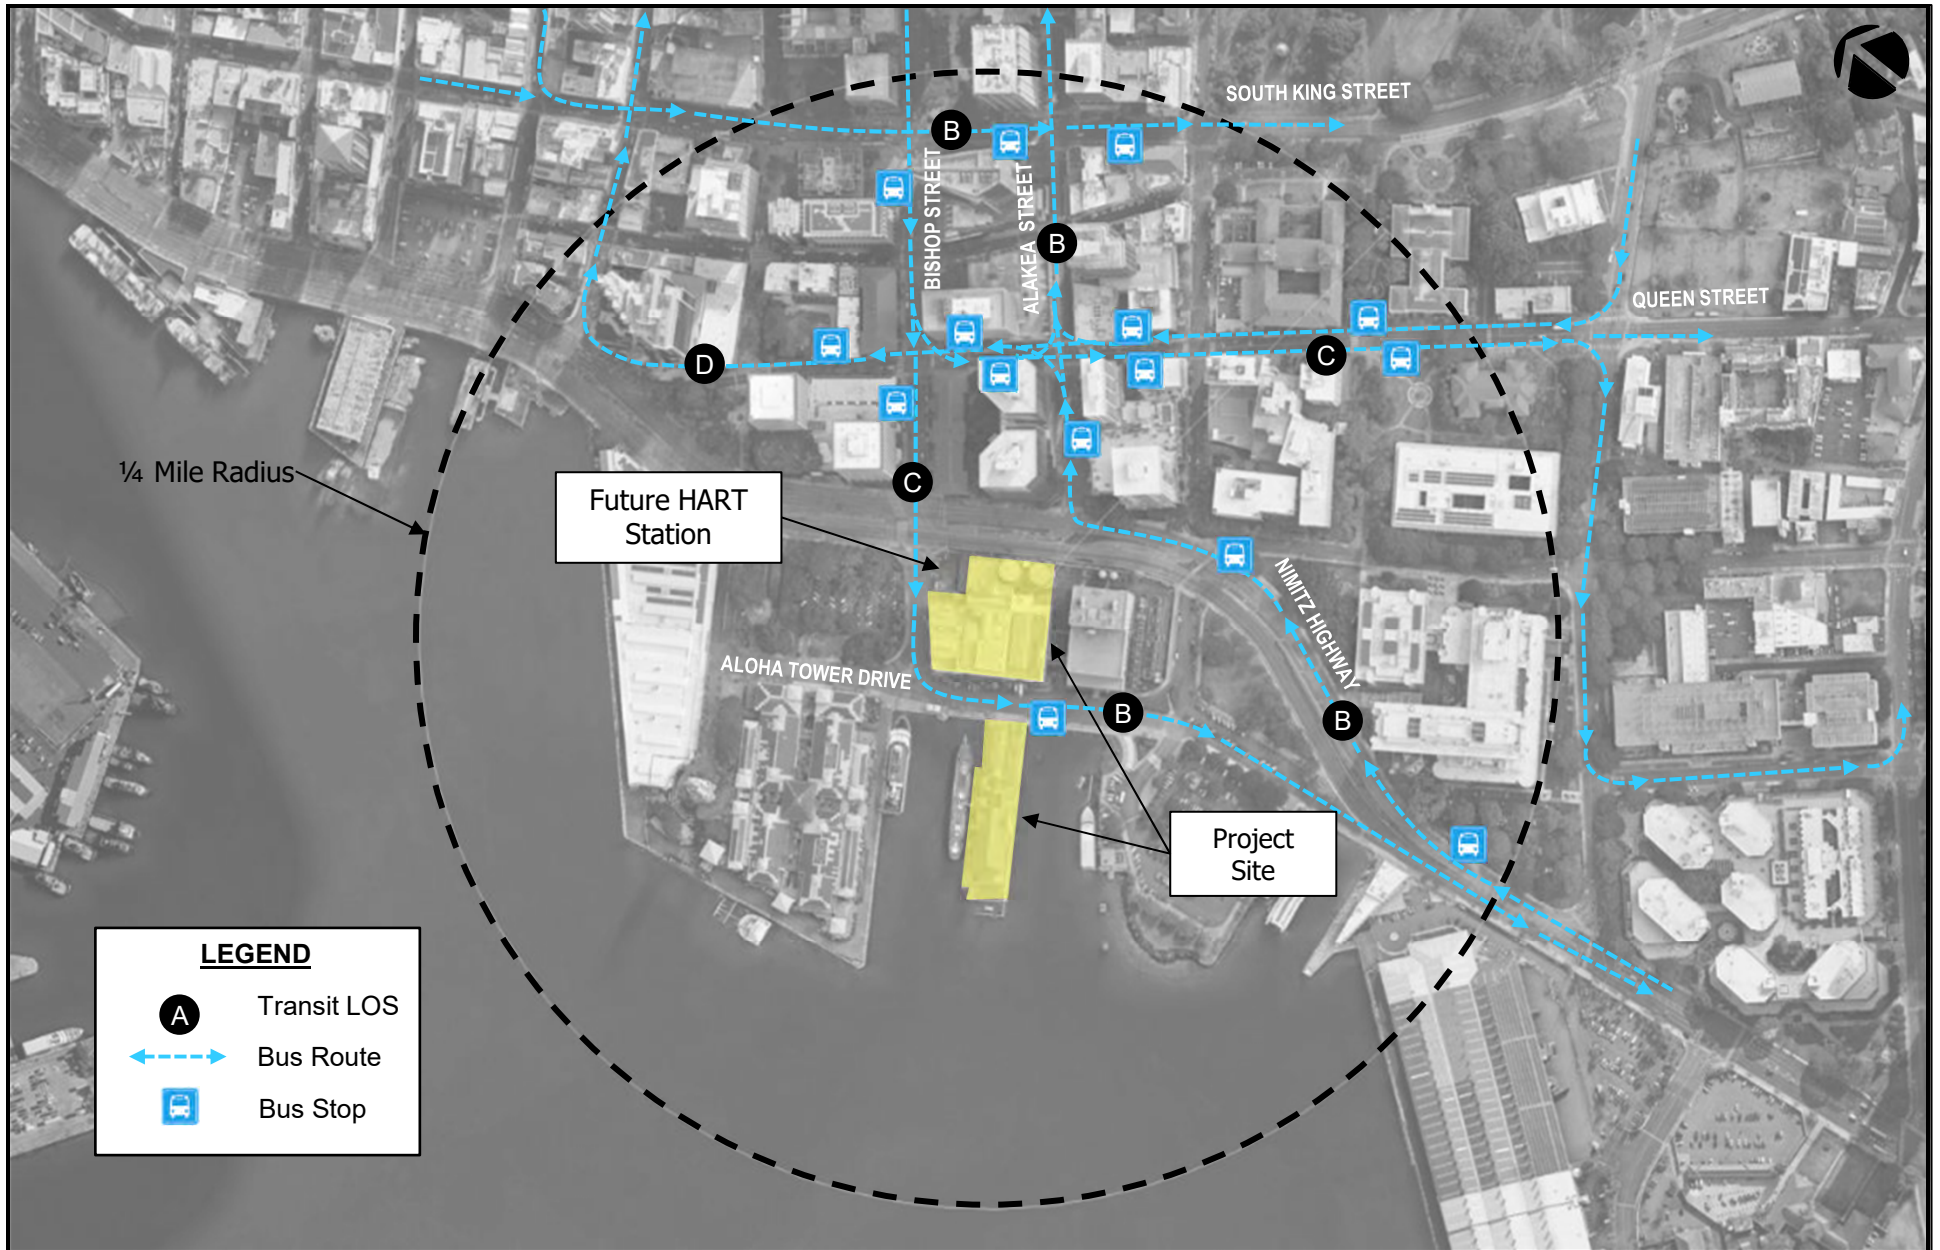

2. Transit LOS

Existing transit resources located closest to the project site include bus stops along Aloha Tower Drive, Nimitz Highway, Bishop Street, Queen Street, and Alakea Street (see Figure 11). These facilities are provided by “The Bus” which is operated by Oahu Transit Service (OTS) for the City and County of Honolulu Department of Transportation Services. The assessment indicates that transit service in the vicinity operates at LOS “D” or better since service is generally frequent with most of the routes with headways of approximately 30 minutes or less. The nearby transit stops also include amenities like benches and shelters with access to the bus stops facilitated via improved pedestrian facilities along the adjacent roadways. As previously mentioned, in addition to the Bus, the Aloha Tower Complex is also served by the Waikiki Trolley Red Line with a trolley stop located along Aloha Tower Drive. The Waikiki Trolley Red Line operates daily approximately with the first pickup at 11:25 AM and the last pickup at 4:25 PM with headways of approximately 1 hour.

VII. RECOMMENDATIONS

Based on the analysis of the traffic data, the following are the recommendations of this study to be incorporated in the project design.

1. Maintain sufficient sight distance for motorists to safely enter and exit the project driveways.
2. Provide adequate on-site loading and off-loading service areas and prohibit off-site loading operations.
3. Provide adequate turn-around area for service, delivery, and refuse collection vehicles to maneuver on the project site and prohibit vehicle-reversing maneuvers onto Kona Street.
4. Provide sufficient turning radii at all project driveways to avoid or minimize vehicle encroachments to oncoming traffic lanes.

TRADEWINDS GARDEN

TRANSIT FACILITIES AND LEVEL OF SERVICE

FIGURE

11

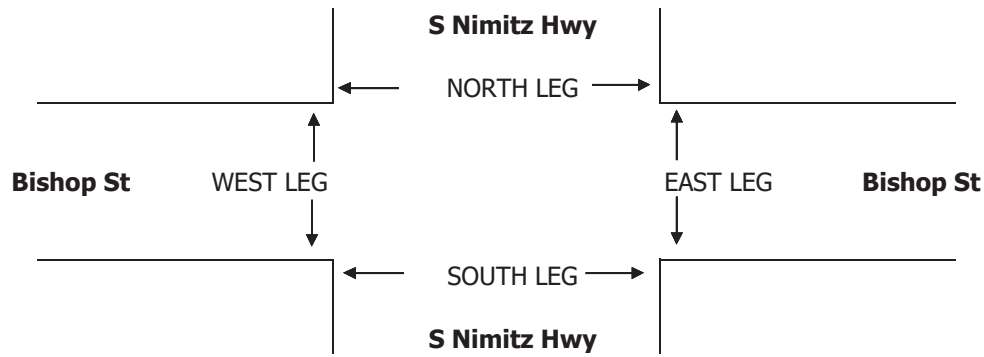

5. Coordinate with the owner and users of Aloha Tower Drive with regards to the proposed midblock raised crossing along Aloha Tower Drive and any planned improvements along that roadway. The midblock crossing is expected to limit the available space for loading/unloading along that roadway. As previously discussed, field observations indicate there is sufficient space for 3 tour buses under existing conditions. As such, coordination with the existing users of that area is critical, especially during the PM peak period. In addition, it should be noted that during project development, consideration of an additional loading/unloading area was considered along Bishop Street. However, the proposed sidewalk widening along that stretch of Bishop Street may preclude the use of this area for that function.
6. Ensure adequate transition space and sufficient clearance areas are provided to and from the adjacent City and County of Honolulu bus stop and the trolley bus loading areas on either side of the proposed midblock raised crossing.
7. Coordinate with the City and County of Honolulu Department of Transportation Services with regards to the potential relocation of the existing bus stop along Aloha Tower Drive with the implementation of the midblock crossing.
8. With regards to the proposed midblock raised crossing, provide adequate signage, advanced stop/yield lines, and high visibility signs and markings to further increase pedestrian visibility at this location.
9. Prepare a Construction Management Plan (CMP) for the development which includes discussions regarding the anticipated construction schedule and phasing, as well as traffic circulation, traffic control, and parking during the construction period given the project's location.
10. Preparing a Traffic Management Plan (TMP) for the project to further minimize the project's potential impact to the surrounding roadways given the existing loading/unloading activities along Aloha Tower Drive and the adjacent uses within the Aloha Tower Marketplace.

VIII. CONCLUSION

The proposed project entails conversion of a portion of the existing Honolulu Power Plant and replacement of the existing Pier 7 building within the Aloha Tower Complex to include an art and garden museum with complementary amenities. In conjunction with the proposed project, a raised midblock crossing along Aloha Tower Drive is also planned to be provided to facilitate access between the two project areas. Parking for guests is expected to be accommodated within the complex's existing parking areas with the project expected to be completed by Year 2026. With the implementation of the aforementioned recommendations, traffic operations with the proposed development are generally expected

to remain similar to without project conditions. Although traffic operations along the roadways in the vicinity are generally expected to remain similar to without project conditions, coordination with the existing users along Aloha Tower Drive is critical as the provision of a midblock crossing is expected to reduce the available curbside width currently used as passenger loading/unloading. In addition, given the project's location within the Aloha Tower Complex and surrounding uses, the preparation of a Construction Management Plan and a Traffic Management Plan is also recommended to identify strategies to further minimize the project's impact to the surrounding roadways.

APPENDIX B

LEVEL OF SERVICE DEFINITIONS

LEVEL OF SERVICE DEFINITIONS

LEVEL-OF-SERVICE CRITERIA FOR SIGNALIZED INTERSECTIONS

Level of Service (LOS) for signalized intersections is defined in terms of delay, which is a measure of driver discomfort, frustration, fuel consumption, and increased travel time. Specifically, level-of-service (LOS) criteria are stated in terms of the average control delay per vehicle, typically a 15-min analysis period. The criteria are given in the following table.

Table 1: Level-of-Service Criteria for Signalized Intersections

Level of Service	Control Delay per Vehicle (sec/veh)
A	≤ 10.0
B	>10.0 and ≤ 20.0
C	>20.0 and ≤ 35.0
D	>35.0 and ≤ 55.0
E	>55.0 and ≤ 80.0
F	>80.0

Delay is a complex measure and depends on a number of variables, including the quality of progression, the cycle length, the green ratio, and the v/c ratio for the lane group.

Level of Service A describes operations with low control delay, up to 10 sec per vehicle. This level of service occurs when progression is extremely favorable and most vehicles arrive during the green phase. Many vehicles do not stop at all. Short cycle lengths may tend to contribute to low delay values.

Level of Service B describes operations with control delay greater than 10 and up to 20 sec per vehicle. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.

Level of Service C describes operations with control delay greater than 20 and up to 35 sec per vehicle. These higher delays may result from only fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level. Cycle failure occurs when a given green phase does not serve queued vehicles and overflows occur. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.

Level of Service D describes operations with control delay greater than 35 and up to 55 sec per vehicle. At level of service D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.

Level of Service E describes operation with control delay greater than 55 and up to 80 sec per vehicle. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent.

Level of Service F describes operations with control delay in excess of 80 sec per vehicle. This level, considered to be unacceptable to most drivers, often occurs with oversaturation, that is, when arrival flow rates exceed the capacity lane groups. It may also occur at high v/c ratios with many individual cycle failures. Poor progression and long cycle lengths may also contribute significantly to high delay levels.

LEVEL OF SERVICE DEFINITIONS

LEVEL-OF-SERVICE CRITERIA FOR UNSIGNALIZED INTERSECTIONS

Level of Service (LOS) criteria are given in Table 1. As used here, control delay is defined as the total elapsed time from the time a vehicle stops at the end of the queue to the time required for the vehicle to travel from the last-in-queue position to the first-in-queue position, including deceleration of vehicles from free-flow speed to the speed of vehicles in the queue.

The average total delay for any particular minor movement is a function of the service rate or capacity of the approach and the degree of saturation. If the degree of saturation is greater than about 0.9, average control delay is significantly affected by the length of the analysis period.

**Table 1: Level-of-Service Criteria for
Unsignalized Intersections**

Level of Service	Average Control Delay (Sec/Veh)
A	≤ 10.0
B	>10.0 and ≤ 15.0
C	>15.0 and ≤ 25.0
D	>25.0 and ≤ 35.0
E	>35.0 and ≤ 50.0
F	>50.0

APPENDIX F
PEDESTRIAN CROSSING ASSESSMENT

TCRP Report 112 - NCHRP Report 562 - Pedestrian Crossing Treatment Worksheet

Worksheet 1: Peak-Hour, 35 MPH or Less

Analyst and Site Information

Analyst: JTM
 Analysis Date: Monday, March 11, 2024
 Data Collection Date: Thursday, February 1, 2024
 Major Street: Aloha Tower Drive
 Minor Street or Location: Midblock
 Peak Hour: PM Peak

Step 1: Select worksheet (speed reflects posted or statutory speed limit or 85th percentile speed on the major street):
 a) Worksheet 1 - 35 mph or less
 b) Worksheet 2- exceeds 35 mph, communities with less than 10,000, or where major transit stop exists

Step 2: Does the crossing meet minimum pedestrian volumes to be considered for a TCD type of treatment?

2a Peak-hour pedestrian volume (ped/h), vp **2a** 514
 o If 2a ≥ 20 ped/h, then go to Step 3.
 o If 2a < 20 ped/h, then consider median refuge islands, curb extensions, traffic calming, etc. as feasible.

Step 3: Does the crossing meet the pedestrian volume warrant for a traffic signal?

3a Major road volume, total of both approaches during peak hour (veh/h), V maj-s **3a** 284

3b o Minimum signal warrant volume for peak hour (use 3a for Vmaj-s), SC **3b** 720.93
 • SC = 0.00021 Vmaj-s² - 0.74072 Vmaj-s + 734.125/0.75 OR
 • [(0.00021 3a² - 0.74072 3a + 734.125)/0.75]

3c o If 3b < 133, then enter 133. If 3b ≥ 133, then enter 3b. **3c** 720.93104

3d o If 15th percentile crossing speed of pedestrians is less than 3.5 ft/s (1.1 m/s), then **3d** 720.93104
 reduce 3c by up to 50 percent; otherwise enter 3c.
 o If 2a ≥ 3d, then the warrant has been met and a traffic signal should be considered if not within 300 ft of another traffic signal. Otherwise, the warrant has not been met. Go to Step 4.

Step 4: Estimate pedestrian delay.

4a Pedestrian crossing distance, curb to curb (ft), L **4a** 70

4b Pedestrian walking speed (ft.s), Sp **4b** 3.5

4c Pedestrian start-up time and end clearance time (s), ts **4c** 5

4d o Critical gap required for crossing pedestrian (s), tc = (L/Sp) + ts OR [(4a/4b) + 4c] **4d** 25.00

4e Major road volume, total of both approaches or approach being crossed if median refuge island is present during peak hour (veh.h), Vmaj-d **4e** 284

4f o Major road flow rate (veh/s), v = Vmaj-d/3600 OR [4e/3600] **4f** 0.08

4g o Average pedestrian delay (s/person), dp = (e^{vtc} - vtc - 1) / v OR [(e^{4f x 4d} - 4f x 4d - 1) / 4f] **4g** 53.42

4h o Total pedestrian delay (h), Dp = (dp x Vp) / 3600 OR [(4g x 2a) / 3600] **4h** 7.63
 (this is estimated delay for all pedestrians crossing the major roadway without a crossing treatment - assumes 05 compliance). This calculated value can be replaced with the actual total pedestrian delay measured at the site.

Step 5: Select treatment based upon total pedestrian delay and expected motorist compliance.

5a Expected motorist compliance at pedestrian crossings in region, Comp = high or low **5a** HIGH

Total Pedestrian Delay Dp (4h) and Comp (5a)	Treatment Category (see Descriptions of Sample Treatments for examples)
Dp ≥ 21.3h (Comp = high or low) OR 5.3h ≤ Dp < 21.3 h and Comp = low	DO NOT USE RED
1.3h ≤ Dp < 21.3h and Comp = high or low) OR 5.3 ≤ Dp < 21.3 h and Comp = high	USE ACTIVE OR ENHANCED
Dp < 1.3 h (Comp = high or low)	DO NOT USE CROSSWALK

Roadway Configuration: 66' Wide, <35 mph, Vped = 3.5 ft/s

EXECUTIVE SUMMARY

Garden Art, LLC intends to redevelop the existing 2.43 acres of property currently occupied by the HECO Power Station & Hawaiian Maritime Museum into the proposed Tradewinds Garden and Glass located in Honolulu on the island of Oahu. The areas designated for redevelopment are occupied by the State of Hawaii and the Hawaiian Electric Co Inc (HECO). The project site is identified by Tax Map Key(s) (1) 2-1-001:057 with a portion of 058, and a portion of unit 6 identified by TMK (1) 2-1-014:006 respectively. The project proposes to transform and modernize the area into a vibrant cultural destination by establishing the Tradewinds Garden and Glass. The proposed project will introduce new art galleries, gardens, educational facilities, and additional complementary features.

In support of the EA process, and project planning efforts, a Preliminary Engineering Report (PER) was conducted by Wilson Okamoto Corporation (WOC) to evaluate site infrastructure and utility systems for the Tradewinds Garden and Glass development, review the existing site infrastructure improvements, determine the project requirements related to the roadway and parking facilities, site grading, storm drainage system, sanitary sewer system, and water system, and, based on the project requirements, determine required improvements, and identify possible opportunities and constraints for redevelopment. These findings are summarized and articulated in the contents of this Preliminary Engineering Report.

1. INTRODUCTION

1.1 Background

The existing project site spans two primary areas: Pier 7 of Honolulu Harbor and a portion from unit 6 of the HECO Power Plant.

The existing Pier 7 property occupied by the Hawaii Maritime Center is located at 171 Aloha Tower Drive in Honolulu identified by Tax Map Keys (TMK) (1) 2-1-001:057 and 58 (See Figure 1-1, 1-2, & 1-3). This portion of the project is approximately 0.9 acres or 39,918 square feet. The State of Hawaii is the owner of Pier 7 and is located in the Aloha Tower Complex managed by the Aloha Tower Development Corporation (ATDC), HDOT-Harbors controls the Pier 7 property and is the leaser. The project site is bounded by the HECO Power Plant to the northeast, and Honolulu Harbor around the rest of the site (See Figure 1-3).

Hawaiian Electric Co Inc (HECO) is the owner of the existing HECO Power Plant, identified by TMK parcel (1) 2-1-014:006. This project covers a portion from unit 6 of the parcel which is approximately 1.5 acres or approximately 65,913 square feet (See Figure 1-2). The project site is adjacent to the Hawaii Maritime Center and Honolulu Harbor to the southwest, Aloha Tower Marketplace to the west, and Irwin Memorial Park to the northwest.

1.2 Proposed Project

The Garden Art, LLC is proposing to develop the Tradewinds Garden and Glass which provides art galleries, gardens, educational facilities, and additional complementary features, fostering a supportive environment for both local and international artists, as well as established and emerging talents.

The goals and objectives of the Proposed Project are to:

- Align the Proposed Project with the Honolulu Waterfront Master Plan and development objectives of the ATDC;
- Revitalize and modernize the existing Maritime Center and the HECO Power Plant into a garden and art attraction to provide a variety of experiences at the water's edge;
- Foster and promote visual art and creative expression;
- Showcase glass art installations; and serve as an educational resource by implementing programs, classes, demonstrations, and excursions designed to educate all segments of the population about art and the science of glass art.

1.3 Purpose

This Preliminary Engineering Report (PER) is prepared in support of the EA process and project planning effort to provide an evaluation of the civil infrastructure and utility systems for Pier 7 of the Honolulu Harbor and a portion from unit 6 of the HECO Power Plant. The objective of this report is to provide a broad evaluation of the site infrastructure and utility systems present on the project site, through reviewing the existing site infrastructure improvements, determining the project requirements related to the roadway and parking facilities, site grading, storm drainage system, sanitary sewer system, and water system, and based on anticipated project requirements extrapolated from the development, determine required improvements, and identify possible opportunities and constraints for the following:

- Roadway, parking, and access
- Site grading and flood hazard
- Storm drainage system
- Sanitary sewer system
- Water supply system
- Natural gas

The assessment of existing site characteristics and utilities for the project site is based on available data obtained from the City's Honolulu Land Information System (HoLIS) database, record information, as-built plans, and a review of aerial and street level photography obtained from the Google Earth database. In addition, letters were sent to appropriate City and County of Hawaii and other utility agencies with the proposed project requirements for each development scenario to determine capacities and the agency's ability to service the redevelopment demands.

The proposed improvements are conceptual and subject to change based on further development of plans and availability of additional information. The conceptual layouts that are being analyzed for the PER do not constitute any final locations for the project but serve to create a 'case study' for analysis.

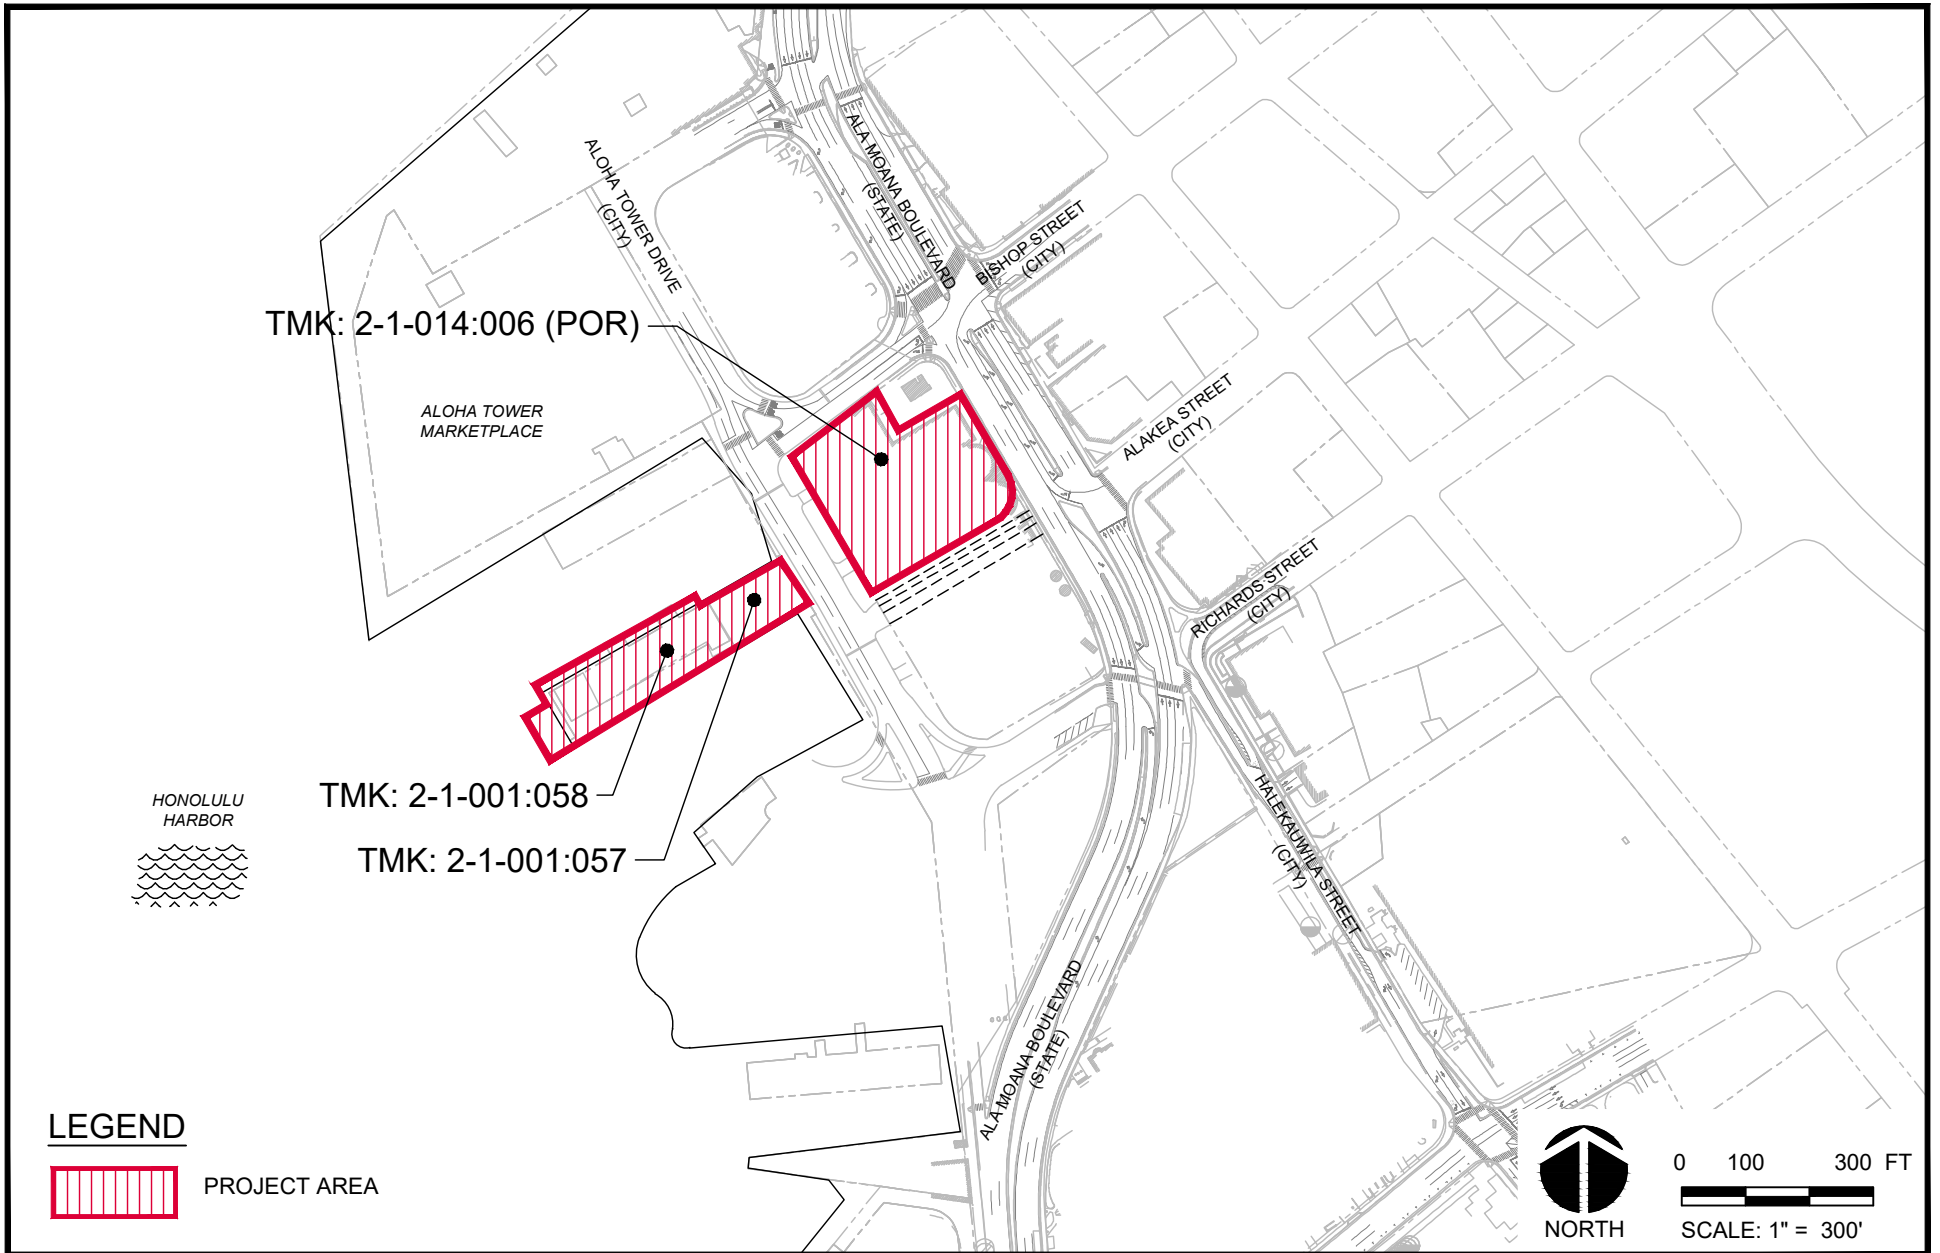

FIGURE 1-2
TMK MAP

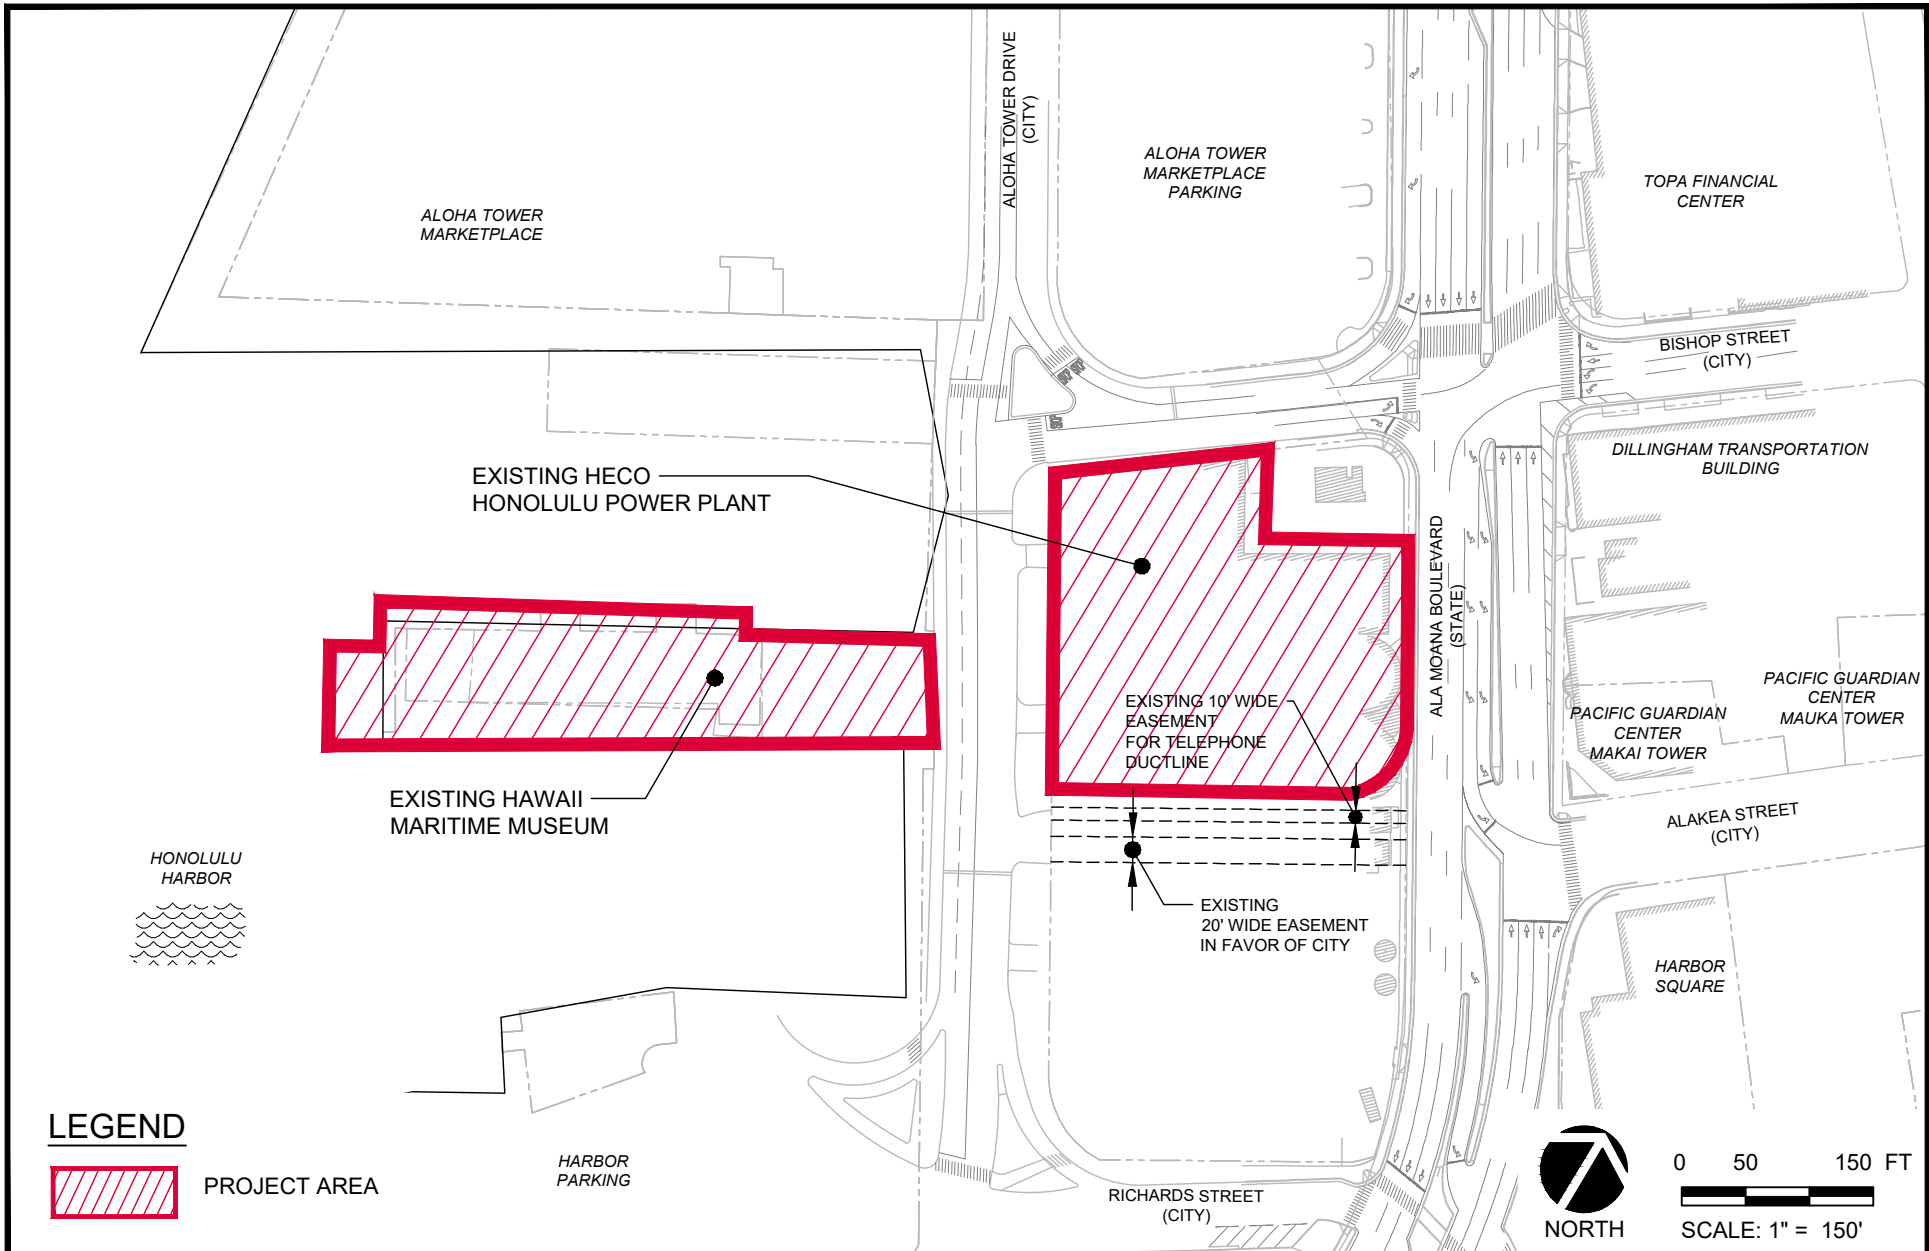

FIGURE 1-3
EXISTING SITE CONDITION

2. ROADWAY AND ACCESS

2.1 Existing Conditions

The Pier 7 portion of the project site is situated southeast of Aloha Tower adjacent to Aloha Tower Drive. Aloha Tower Drive is a two-lane, two-way roadway and is owned and maintained by the City and County of Honolulu (CCH). The existing access point to Pier 7 is located along Aloha Tower Drive fronting the existing property.

The HECO Power Plant is bounded by Bishop Street, Ala Moana Boulevard, and Aloha Tower Drive. Bishop Street is a 4-lane, two-way roadway and is owned and maintained by the City and County of Honolulu (CCH). There are two existing access ways onto the HECO Power Plant property located mid-block along Bishop Street and Aloha Tower Drive. Ala Moana Boulevard is a 6-lane, two-way state highway which does not allow access to the proposed project site.

City Bus routes run along Aloha Tower Drive, with a bus stop fronting the Pier 7 project site. There is also a westbound bus stop along Ala Moana Blvd directly across Richards Street. Pedestrian walkways are in place all along Aloha Tower Drive and two adjacent crosswalks on both sides of the HECO Power Plant property along Ala Moana Blvd.

There are two parking lots located in the vicinity of the project site allowing paid parking for the proposed project. There is an existing Aloha Tower Marketplace parking lot located north of the project site with an ingress and egress located along Aloha Tower Drive. There is also an existing parking lot located south of the project site adjacent to the Atlantic Cruises Office with an ingress and egress at the intersection of Aloha Tower Drive and Richards Street.

The Honolulu Rail Transit plans to use approximately 2,000 square feet of the HECO Power Plant property to construct the Kuloloia Station. The future station will be located at the Ala Moana Boulevard and Bishop Street intersection on the north corner of the HECO Power Plant property.

2.2 Proposed Improvements

A new crosswalk will be proposed to be located directly in front of the Pier 7 property along Aloha Tower Drive allowing pedestrians to have access to and from the existing Pier 7 and HECO Power Plant properties. The Tradewinds Garden and Glass project also proposes to extend the curb into the Bishop Street roadway to allow for a new sidewalk and planting buffer for the future Kuloloia Rail Station.

New roadways, walkways, and a crosswalk layout for the proposed project will be designed to meet applicable State and or City requirements. Geometrics and pavement structure for proposed driveways and fire lanes will need to be designed based on the appropriate design vehicles. Proposed pavement structures will follow the Soils Engineer's recommendations. Circulation walkways and parking lot layout dimensions will be laid out and installed in compliance with Americans with Disabilities Act (ADA) Accessibility Guidelines to the maximum extent practicable.

As the redevelopment progresses and site plans are developed, consultation with the appropriate jurisdictions having authority will be required to determine vehicular driveway locations, provide adequate sight distance, pedestrian sidewalk requirements, bicycle facilities, and emergency vehicle access lanes.

Evaluation of the traffic impacts associated with the proposed project are documented in the *Draft Traffic Impact Report for the Tradewinds Garden and Glass* which is appended to the EA.

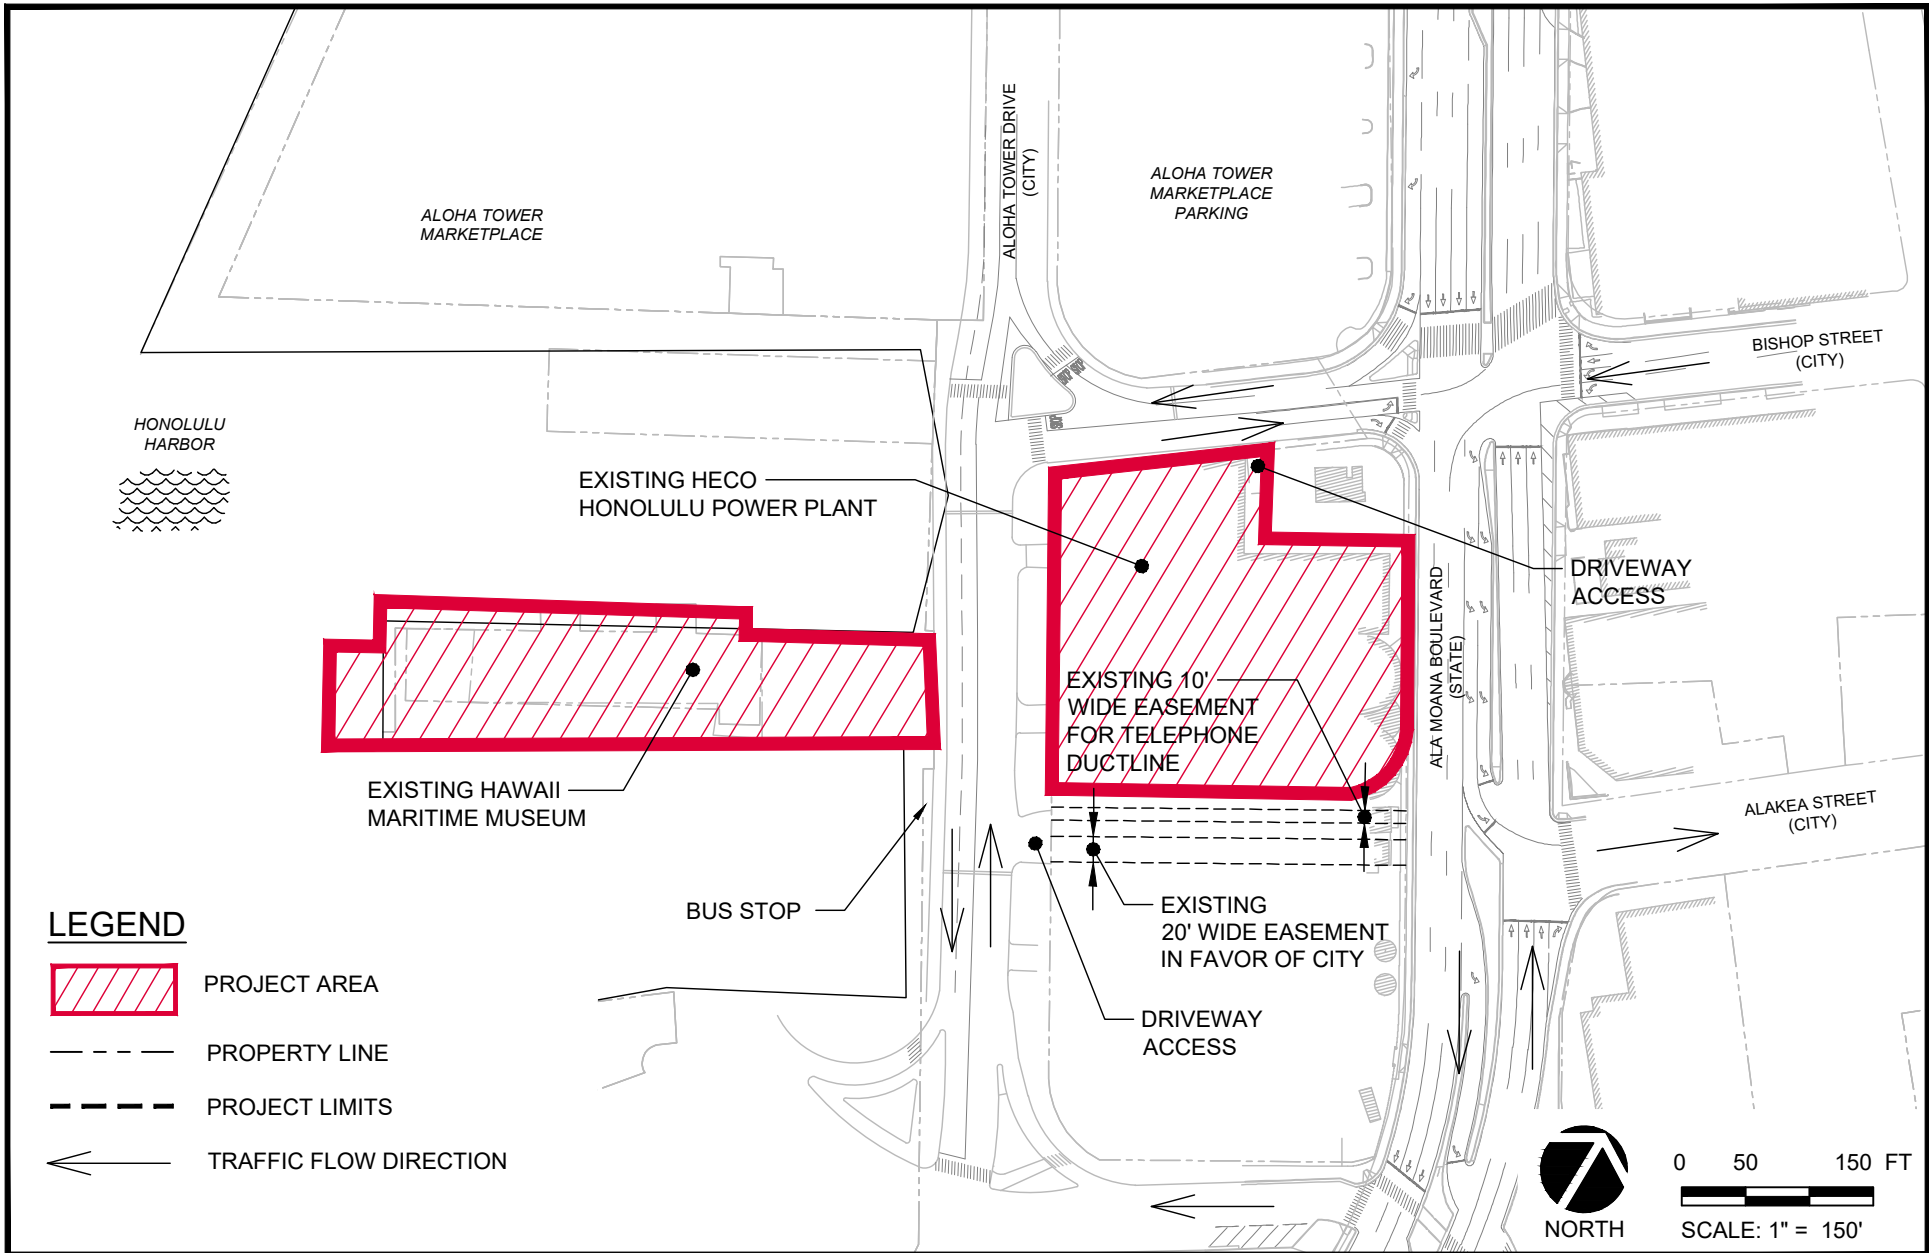

FIGURE 2-1
EXISTING ROADWAY SYSTEM

3. SITE GRADING, SOIL, AND FLOOD HAZARD

3.1 Existing Conditions

The project site was built with the prior development of the existing Maritime Center and HECO Power Plant. The project site generally slopes from east to west with elevations ranging from 5-feet to 10-feet above mean sea level (MSL).

3.1.1 Soil

Soil series and mapping units for the island of Oahu are found in maps on the United States Department of Agriculture online web soil survey, and soil physical properties are found in the "Soil Survey of islands of Kauai, Oahu, Maui, Molokai, and Lanai, State of Hawaii" dated January 1, 1972, prepared by the U.S. Department of Agriculture, Soil Conservation Service (currently Natural Resources Conservation Services). The underlying soil within the project site consists of mixed fill land (See Figure 3-1). The soil characteristics are described below:

Fill land, mixed (FL): This soil occurs as mixed areas containing gravelly sandy loam, fine sandy loam, and bedrock. Permeability is moderately low, and runoff is slow.

3.1.2 Flood Hazard

Flood hazard assessment was based on The Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) Community Panel No: 15003C0362G dated January 19, 2011. According to FEMA, a majority of the Pier 7 project site is located in the Zone VE which is defined as a "Coastal flood zone with velocity hazards." The HECO Power Plant project site is located in the Zone AE and X limits where Zone AE is defined as a "High Risk for Flooding" while Zone X is "determined to be outside of the 0.2% annual chance of flooding". Base flood elevations are determined for both zones VE and AE (See Figure 3-2).

The parcels are located in the tsunami evacuation zone as established by the Oahu Civil Defense.

3.2 Proposed Improvements

The project site will be graded to provide positive drainage for storm water runoff to flow towards onsite drain inlets or sheet flow offsite. Storm water runoff in excess of the existing conditions will need to be retained onsite. Accessible walkway layouts, dimensions, and slopes will comply with ADA Accessibility Guidelines.

Final grading will be verified during the design phase. Site grading will follow the Geotechnical Engineer's recommendations conforming to Chapter 14, Article 15 of the Revised Ordinances of Honolulu (ROH) "Grading, Grubbing and Stockpiling" as amended. All grading and construction activities will comply with the Rules Relating to Water Quality, Department of Planning and Permitting (DPP), CCH, amended September 17, 2018, to control soil erosion and ensure that the discharge of pollutants from the construction site will be reduced to the maximum extent practicable (MEP).

Temporary erosion control measures will be installed prior to any demolition and/or construction activities. Recommended Structural Best Management Practices (BMPs) include silt fence, filter sock, stabilized construction ingress/egress, and sediment control filters at drain inlets and catch basins as required.

FLOOD INSURANCE RATE MAP

4. UTILITY ANALYSIS

4.1 Storm Drainage

4.1.1 Existing Conditions

The Pier 7 project site currently has no onsite underground storm drainage system and is graded such that stormwater from the site sheet flows directly into Honolulu Harbor.

The HECO Power Plant collects stormwater onsite via drain inlets and downspouts which connect to either the 66" box culvert at the northwest corner of the property or to 36" main running through a 20' wide city utility easement running between the existing HECO Power Plant. Both systems eventually discharge into Honolulu Harbor.

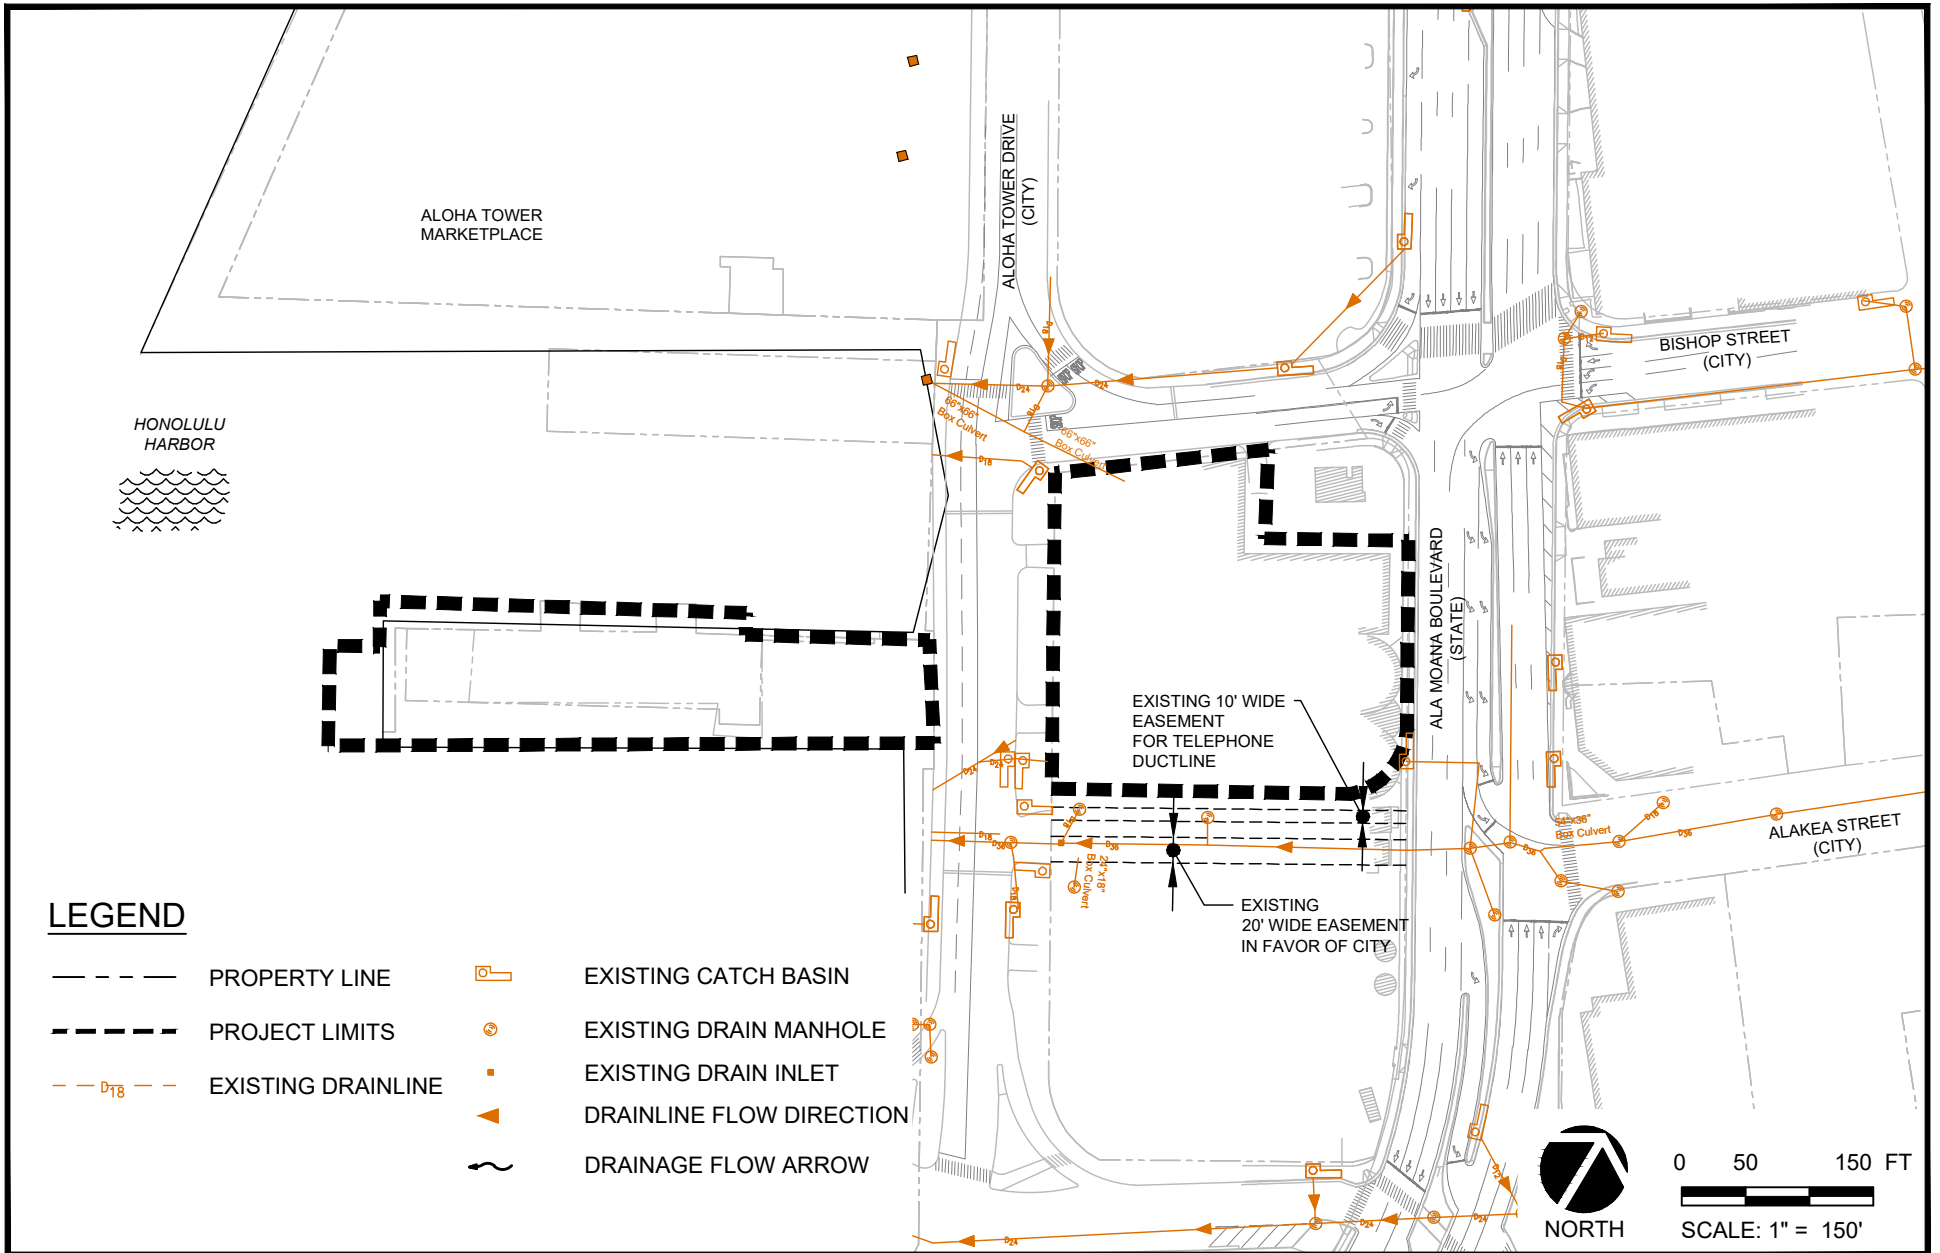

FIGURE 4-1

EXISTING STORM DRAINAGE SYSTEM

TRADEWINDS GARDEN AND GLASS | HONOLULU, O'AHU, HAWAII

4.1.2 Project Requirements

Drainage runoff rates for the proposed improvements are determined herein based on the CCH DPP, Storm Drainage Standards, dated August 2017. Any increase in runoff due to the proposed improvements will need to be retained onsite to ensure that the project will not have any adverse effects on downstream properties.

In addition, it is anticipated that drainage improvements will also be required to comply with the City's Rules Relating to Water Quality amended September 2018. Under these rules, projects that disturb more than one (1) acre of land are classified as 'Priority A' projects.

Priority A projects are required (unless determined to be infeasible) to:

- Incorporate appropriate Low Impact Development (LID) site design strategies to the "maximum extent practicable" (MEP).
- Incorporate appropriate Source Control BMPs to the MEP.
- Retain on-site by infiltration, evapotranspiration, or harvest/reuse as much of the water quality volume (WQV) as feasible with appropriate LID Retention Post-Construction Treatment Control BMPs.
- Biofilter any portion of the WQV that is not retained on-site with appropriate LID Biofiltration Post-Construction Treatment Control BMPs.

If it is determined to be infeasible to retain and/or biofilter the Water Quality Volume, the City rules require the project to:

- Treat (by detention, filtration, settling, or vortex separation) and discharge with appropriate Alternative Compliance Post-Construction Treatment Control BMPs, any portion of the WQV that is not retained on-site or biofiltered.
- Retain or biofilter at an offsite location, the volume of runoff from a non-tributary drainage area equivalent to the difference between the project's WQV and the amount retained on-site or biofiltered.

Appropriate BMP measures include but are not limited to: infiltration basins and trenches, subsurface infiltration systems, dry wells, bioretention basins, permeable pavement, green roofs, vegetated bio-filters, enhanced swales, detention basins, sand filters, vegetated swales, and buffer strips.

4.1.3 Proposed Improvements

Drainage runoff patterns from the proposed development will generally remain unchanged allowing rainfall runoff to be collected via existing onsite drain inlets, drain manholes, and underground piping with rainfall eventually flowing offsite into the Honolulu Harbor.

The final drainage improvements will be determined during the design phase of the project and maintain the existing discharge pattern to the city drainage system. As required by the Storm Drainage Standards, DPP, CCH, dated August 2017, storm water quality measures will be installed to treat the water quality volume.

4.2 Sanitary Sewer System

4.2.1 Existing Conditions

The existing offsite wastewater collection system in the vicinity of Pier 7 and the HECO Power Plant is operated and maintained by the CCH. There is an existing 8-inch sewer main running along Aloha Tower Drive and the 20-foot-wide Easement "B" (City) from south to north located between the HECO Power Plant property in the Alakea Street extension. This 8-inch sewer main then connects to an existing 28-inch sewer main along Ala Moana Boulevard and is ultimately treated at the Sand Island Wastewater Treatment Plant (WWTP). There are two 6-inch laterals connecting to the existing HECO Power Plant, one of which connecting off of Aloha Tower Drive to the east and the other within the easement to the south. There is one 6-inch lateral from the Maritime Museum connection to the 8" main within Aloha Tower Drive.

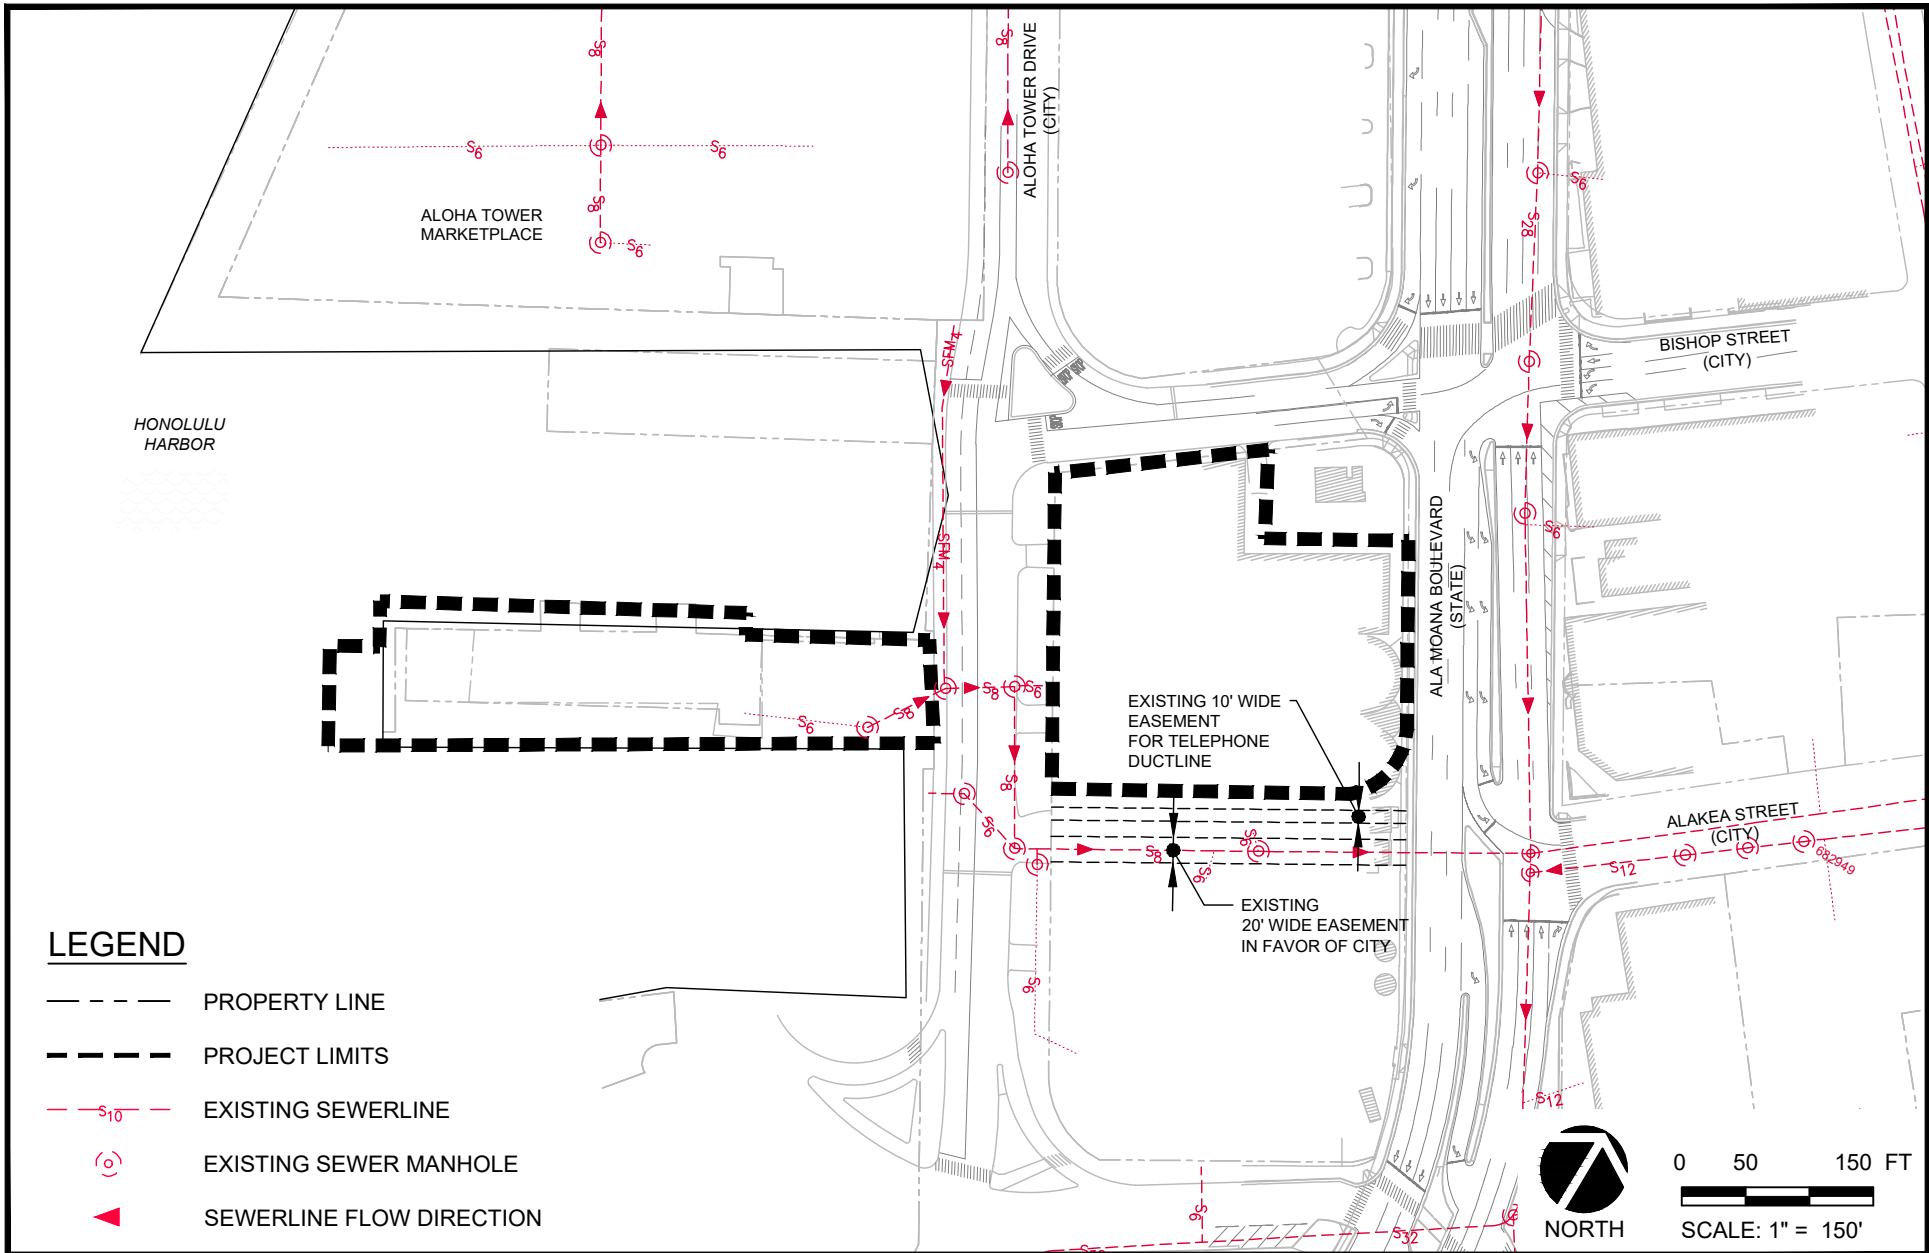

FIGURE 4-2
EXISTING SANITARY SEWER SYSTEM

TRADEWINDS GARDEN AND GLASS | HONOLULU, O'AHU, HAWAII

4.2.2 Connection to the City and County Sewer System

The Department of Planning and Permitting's (DPP) Wastewater Branch (WWB) reviews and approves sewer connection applications for developments which require sanitary sewer service. On March 27, 2024, a sewer connection application (SCA) based on the proposed program was approved by WWB indicating that the existing City sewer system is adequate to support the proposed project (See Appendix A). The approved SCA (Application No. 2024/SCA-0298) will be valid for a 2-year period and is set to expire on March 27, 2026.

Proposed Program Information		
Facility	Area (sf)	Quantity
Museum / Garden / Gallery	41,000	85 Employees
Restaurant	4,500	792 Seats per day
Retail	5,000	30 Employees

With the approval of the SCA, complete construction plans will be submitted by the design team, reviewed, and approved by WWB within two (2) years. Construction is required to commence within one (1) year after approval of plans. An updated or revised sewer connection application could be submitted to request an extension, if required for project completion. However, extension or approval of the updated SCA is subject to agency review and is not readily ascertained.

4.2.3 Proposed Improvements

Sewage flows from the proposed development will be collected by existing sewer lines within the site and are expected to connect to the existing 6-inch laterals along Aloha Tower Drive and within the easement in the HECO Honolulu Power Plant property. Improvements to the existing sanitary sewer system will be determined through correspondence with WWB. Upgrades to existing sewer line sizes and alignments will need to be determined during the design phase.

4.3 Water Supply System

4.3.1 Existing Conditions

Water for domestic use is provided to the project site and surrounding vicinity through the CCH Board of Water Supply (BWS) municipal water system (See Figure 4-3). The offsite BWS water system in the vicinity of the project site consists of a 12-inch main running along Aloha Tower Drive, Bishop Street, and Ala Moana Blvd and an 8-inch main running through the utility easement on the HECO Honolulu Power Plant property. The existing Pier 7 is served by a 1-1/2-inch DC meter (M/N#15060319) off the 12" main within Aloha Tower Drive. The existing HECO Honolulu Power Plant project site is served by three existing connections all served from an existing 12-inch main. The connections are located along Aloha Tower Drive, Bishop Street, and Ala Moana Blvd. The connection along Aloha Tower Drive is served by a 1-1/2-inch meter (M/N#2006100341), the Bishop Street connection is served by a 4-inch meter (M/N#03124104), and the Ala Moana Blvd connection is served by a 2-inch meter (M/N#2207100279).

There are six fire hydrants in the vicinity of the project site with one located on Aloha Tower Drive fronting Pier 7, two directly across the project site along Bishop Street and Ala Moana Blvd, one located on the north side of Richards Street, and two on the westbound side of Ala Moana Boulevard. All fire hydrants tap off the existing 12-inch main and are denoted as M00015, M00081, M00016, M02757, M00020, and M03052 (See Figure 4-3).

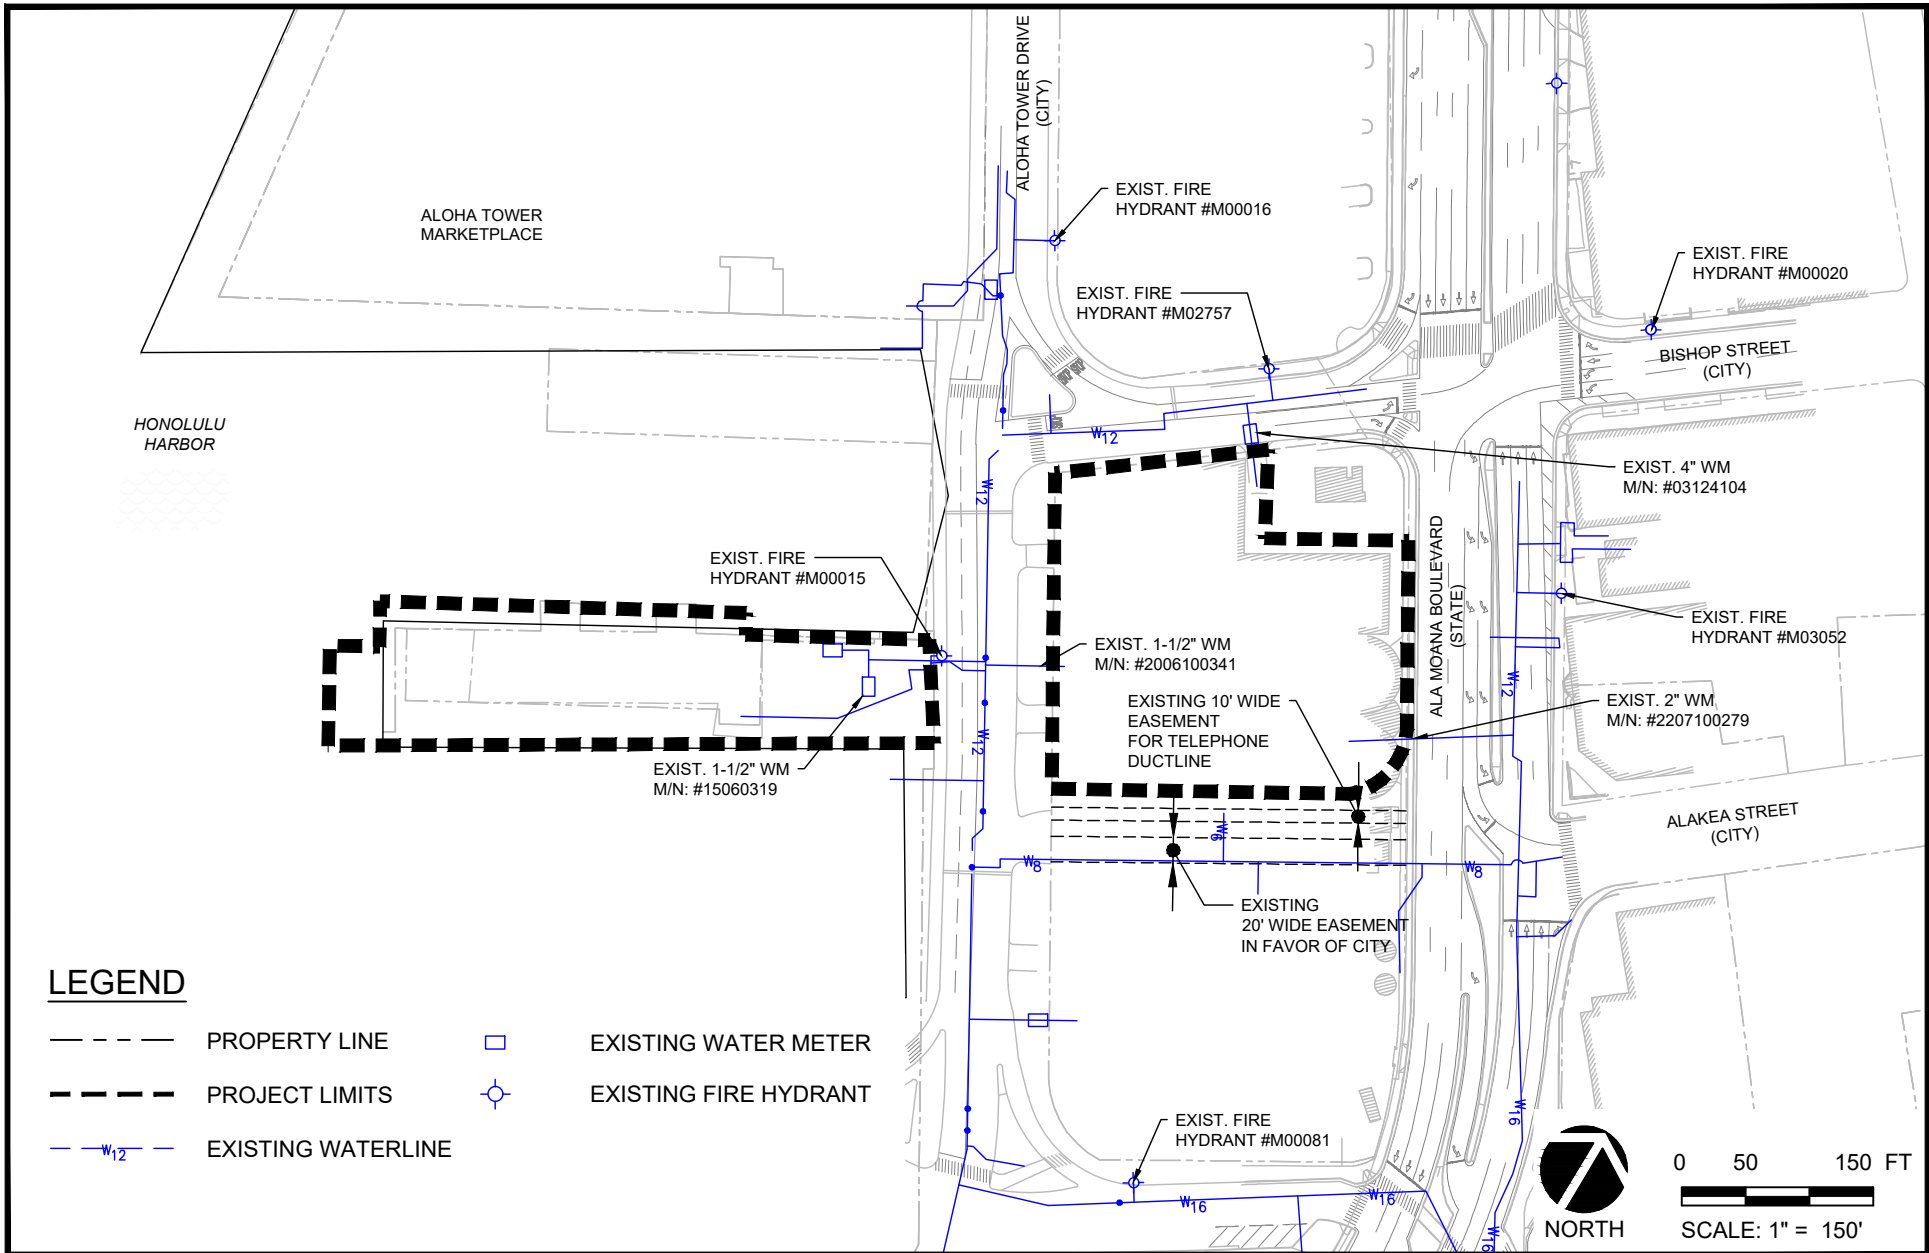

FIGURE 4-3
EXISTING WATER SUPPLY SYSTEM

4.3.2 Connection to Board of Water Supply System

On March 14, 2024, a letter was submitted to the BWS requesting information on the availability of water for the project and water pressure information for fire hydrants in the vicinity of the project site. This initial letter was based on programming for the proposed development and the estimated average daily water demand shown below (See Appendix B):

<u>Proposed Program Information</u>				
Facility	Zoning Designation	Area (sf)	Gal / day / sf	Avg. Daily Demand (gpd)
Museum, Restaurant, Retail, Garden, Gallery	Commercial	50,500	120 gpd / 1000 sf	6,060 gpd
			Total	6,060 gpd

On March 28, 2024, the BWS responded stating that the existing water system is currently adequate to accommodate the proposed industrial redevelopment. BWS record information indicates the water supply systems along Aloha Tower Drive, Ala Moana Boulevard, Bishop Street, and Richards Street have a calculated fire flow capacity of 4,000 gallons per minute. The final decision on the availability of water will be confirmed when the building permit application is submitted for approval, pending evaluation of the water system conditions at that time on a first-come first-served basis.

4.3.3 Proposed Improvements

The Tradewinds Garden and Glass proposes to use existing connection(s) for domestic and fire protection water services for the proposed project site. Improvements to the existing water system will be determined through correspondence with the BWS. Actual line sizes and routings will need to be determined during the design phase.

4.4 Natural Gas

4.4.1 Existing Conditions

Record drawings indicate there is an existing 4" gas main that runs between Pier 7 and the Honolulu Power Plant along Aloha Tower Drive.

4.4.2 Proposed Improvements

Gas is anticipated in the development of the Tradewinds Garden and Glass project and will connect to the existing 4" gas main.

APPENDIX B

Request Letter for Adequacy Inquiry and Pressure Data submitted March 14, 2024

Water Availability Response Letter from BWS dated March 28, 2024

WILSON OKAMOTO
CORPORATION
INNOVATORS • PLANNERS • ENGINEERS

10815-01
March 14, 2024

City and County of Honolulu
Board of Water Supply
Customer Care Division
630 South Beretania Street
Honolulu, HI 96843

Attention: Mr. Daniel Koge
Subject: Tradewinds Garden and Glass

Dear Mr. Chun:

Wilson Okamoto Corporation is the civil engineering consultant for the Garden Art (LLC), which proposes the development and construction of the new Tradewinds Garden and Glass. The project site will be located in Honolulu at 171 Aloha Tower Drive and at 170 Ala Moana Boulevard, the site of the abandoned Hawaii Maritime Center and units 5 and 7 of the HECO Honolulu Power Plant. The project will replace the existing Pier 7 and HECO Honolulu Power Plant with the new Tradewinds Garden and Glass. The project site is approximately 2.43 acres identified by Tax Map Keys: (1) 2-1-001:057, 058 and (1) 2-1-014:006 (See attached TMK Map). The project site is bounded by the Aloha Tower to the west, Ala Moana Boulevard to the north and east, and Honolulu Harbor to the south.

At this time, we would like to get your assistance in determining the adequacy of the existing BWS storage and water distribution system in the vicinity of the project site to support the proposed project. Descriptions of the projected average daily water demand are as follows:

Proposed Program – Tradewinds Garden and Glass

Facility	Zoning Designation	Area (Proposed Square Feet)	Gal / day / sf	Avg. Daily Demand (gpd)
Museum, Restaurant, Retail, Garden, Gallery	Commercial	50,500 sf	120 gal / 1000 sf	6,060 gpd

In addition to your review of the existing water system adequacy, we would like to obtain pressure and flow information for the existing fire hydrants located in the vicinity of the project site. The hydrant numbers are M00015, M00081, M00016, M02757, M00020, and M03052 (See attached BWS system maps).

March 28, 2024

Mr. Ty Matsunami
Wilson Okamoto Corporation
1907 South Beretania Street, Suite 400
Honolulu, Hawaii 96826

Dear Mr. Matsunami:

Subject: Your Letter Dated March 14, 2024, Regarding Availability of Water for Tradewinds Garden and Glass off Aloha Tower Drive, Tax Map Key: 2-1-001:057 & 058 and 2-1-014: 006.

Thank you for your letter regarding the proposed Pier 7 and Honolulu Power Plant revitalization project.

The existing water system is currently adequate to accommodate the proposed industrial redevelopment. However, please be advised that the existing Honolulu water system capacity has been reduced due to the shut-down of the Hālawā Shaft pumping station as a proactive measure to prevent fuel contamination from the Navy's Red Hill Bulk Storage Tank fuel releases. The final decision on the availability of water will be confirmed when the building permit application is submitted for approval, pending evaluation of the water system conditions at that time on a first-come first-served basis. The Board of Water Supply (BWS) reserves the right to change any position or information stated herein up until the final approval of the building permit application.

We continue to request 10% voluntary water conservation of all customers until new sources are completed and require water conservation measures in all new developments. If water consumption significantly increases, progressively restrictive conservation measures may be required to avoid low water pressures and disruptions of water service.

Presently, there is no moratorium on the issuance of new and additional water services. Water distributed via the BWS water systems remains safe for consumption. The BWS is closely monitoring water usage and will keep the public informed with the latest findings. Please visit our website at www.boardofwatersupply.com and www.protectoahuwaterr.org for the latest updates and water conservation tips.

When water is made available, the applicant will be required to pay our Water System Facilities Charges for resource development, transmission, and daily storage.

Mr. Ty Matsunami
Page 2
March 28, 2024

Water conservation measures are required for all proposed developments. These measures include utilization of nonpotable water for irrigation using rain catchment, drought tolerant plants, xeriscape landscaping, efficient irrigation systems, such as a drip system and moisture sensors, and the use of Water Sense labeled ultra-low flow water fixtures and toilets.

The proposed project is subject to BWS Cross-Connection Control and Backflow Prevention requirements prior to the issuance of the Building Permit Applications.

The construction drawings should be submitted for our approval, and the construction schedule should be coordinated to minimize impact to the water system.

The Board of Water Supply has suspended fire flow tests on fire hydrants as a water conservation measure. However, you may use the following calculated flow data for Fire Hydrant No. M00015, M00016, M00020, M00081, M02757, and M03052:

<u>Fire Hydrant Number</u>	<u>Location</u>	<u>Static Pressure (psi)</u>	<u>Residual Pressure (psi)</u>	<u>Flow (gpm)</u>
M00015	Aloha Tower Drive	75	64	4,000
M00016	Aloha Tower Drive	75	63	4,000
M00020	Bishop Street	75	65	4,000
M00081	Richards Street	75	65	4,000
M02757	Bishop Street	75	64	4,000
M03052	Nimitz Highway	75	64	4,000

The data is based on the existing water system, and the static pressure represents the theoretical pressure at the point of calculation with the reservoir full and no demands on the water system. The static pressure is not indicative of the actual pressure in the field. Therefore, to determine the flows that are available to the site, you will have to determine the actual field pressure by taking on-site pressure readings at various times of the day and correlating that field data with the above hydraulic design data.

The map showing the location of the fire hydrants is attached.

The on-site fire protection requirements should be coordinated with the Fire Prevention Bureau of the Honolulu Fire Department.

If you have any questions, please contact Barry Usagawa, Water Resources Division at (808) 748-5900.

Very truly yours,

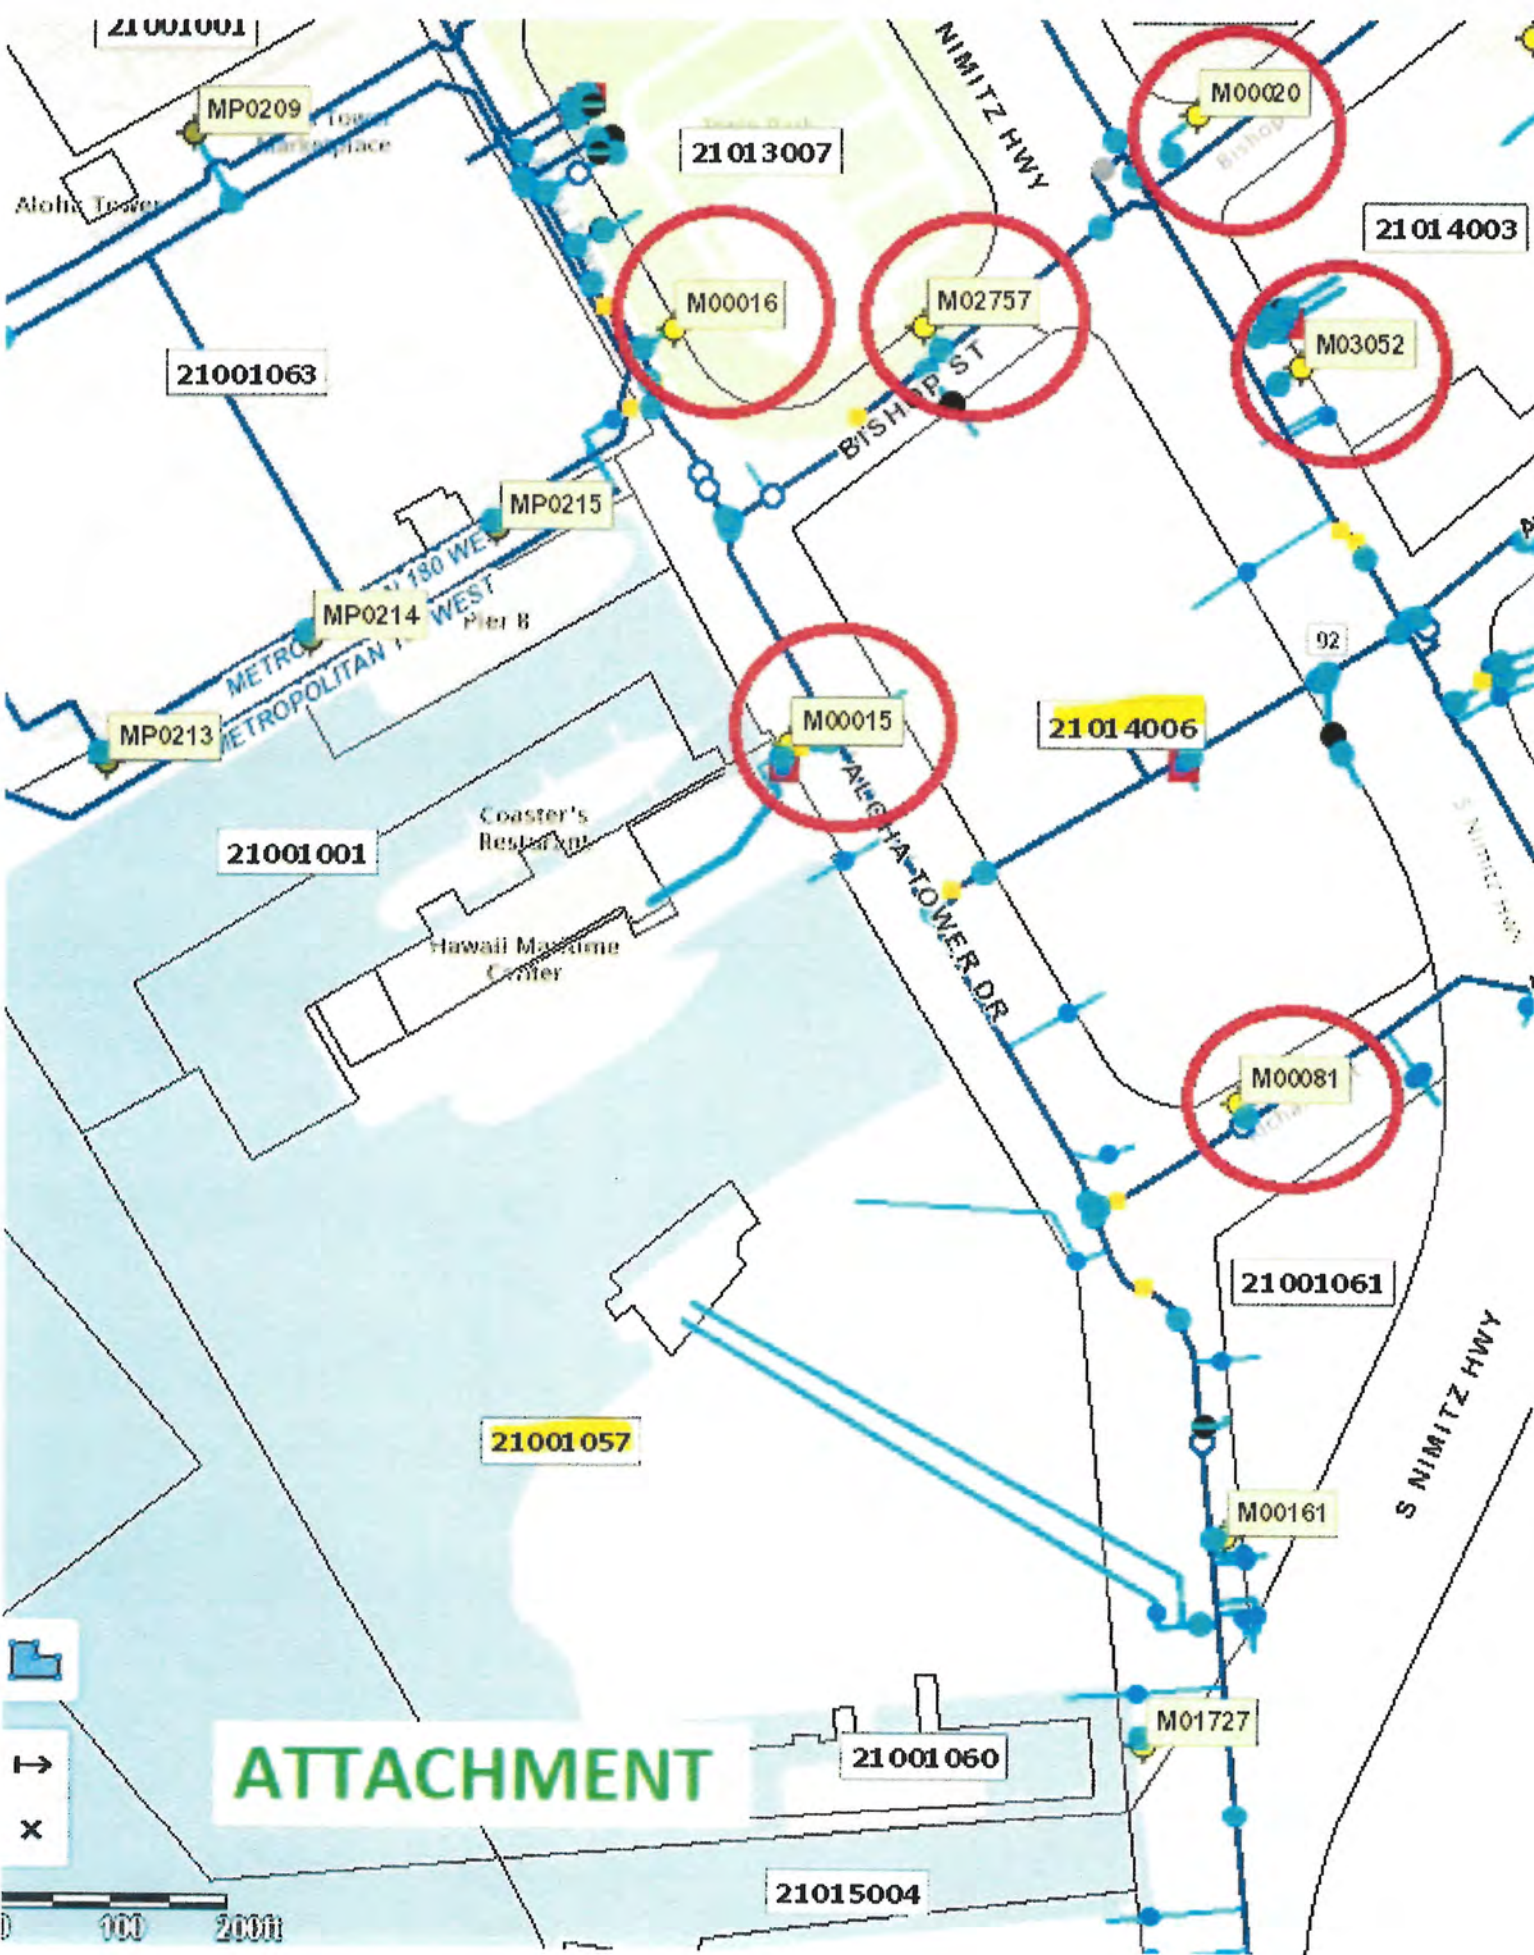

ERNEST Y. W. LAU, P.E.
Manager and Chief Engineer

Early Consultation Comments and Response Letters

United States Department of the Interior

FISH AND WILDLIFE SERVICE
Pacific Islands Fish and Wildlife Office
300 Ala Moana Boulevard, Room 3-122
Honolulu, Hawai'i 96850

Subject: IPaC generated official species list for the Pacific Islands Fish and Wildlife Office

Dear Action Agency or Applicant:

The Pacific Islands Fish and Wildlife Office (PIFWO) is transitioning to the Information for Planning and Consultation (IPaC) online portal, <https://ipac.ecosphere.fws.gov/> for federal action agencies and non-federal agencies or individuals to obtain official species lists, including threatened and endangered species, designated critical habitat, and avoidance and minimization measures to consider in your general project design. IPaC has been used by continental USFWS offices to provide official species lists and avoidance and minimization guidance since 2017. Using IPaC expedites the process for species list distribution. Obtaining a species list in IPaC is relatively straightforward and takes minimal time to complete. Step by step instructions are included below.

Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of your species list should be verified after 90 days. New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change the species list. Verification can be completed by visiting the IPaC website at regular intervals during project planning and implementation. An updated list may be requested through the IPaC system by completing the same process used to obtain the initial species list.

We hope this process provides efficiencies to our partners in obtaining a species list. For federal action agencies, it also opens additional IPaC functionality that the PIFWO office is still working on, such as the use of Determination Keys for informal section 7 programmatic consultations. We will let our agency partners know when that functionality becomes available.

If you have questions about a species list obtained through the IPaC system or need assistance in completing an IPaC species list request, please contact the Service at 808-792-9400 or via email at pifwo_admin@fws.gov. We appreciate your efforts to conserve listed species across the Pacific Islands.

Instructions for Action Agencies and partners to obtain an official species list in IPaC

- Navigate to <https://ipac.ecosphere.fws.gov/>
- You can get an unofficial species list without logging in. However, if you want an official species list you will need to log in first using your Login.gov account. If you don't have an IPaC account, they are easy to create.

The screenshot shows a 'Log in' dialog box with a close button (X) in the top right corner. The main heading is 'Log in'. Below this, there are two sections: 'LOGIN.GOV LOGIN' and 'IPAC LOGIN'. The 'LOGIN.GOV LOGIN' section contains the text: 'You can use your Login.gov profile as your IPaC account. You will need to allow IPaC to read your basic profile information.' Below this text is a button labeled 'LOG IN WITH LOGIN.GOV'. The 'IPAC LOGIN' section contains a link: '> Why do I need an IPaC account?'

Select Log in with Login.gov and sign in using your email and password.

The screenshot shows a sign-in form with the following elements: a label 'Email address' above a text input field; a label 'Password' above another text input field; a checkbox labeled 'Show password' to the right of the password field; a blue button labeled 'Sign in' below the password field; a white button labeled 'Create an account' below the 'Sign in' button; and a link labeled 'Sign in with your government employee ID' at the bottom.

If you have a PIV or CAC card, you can sign in using that method as well.

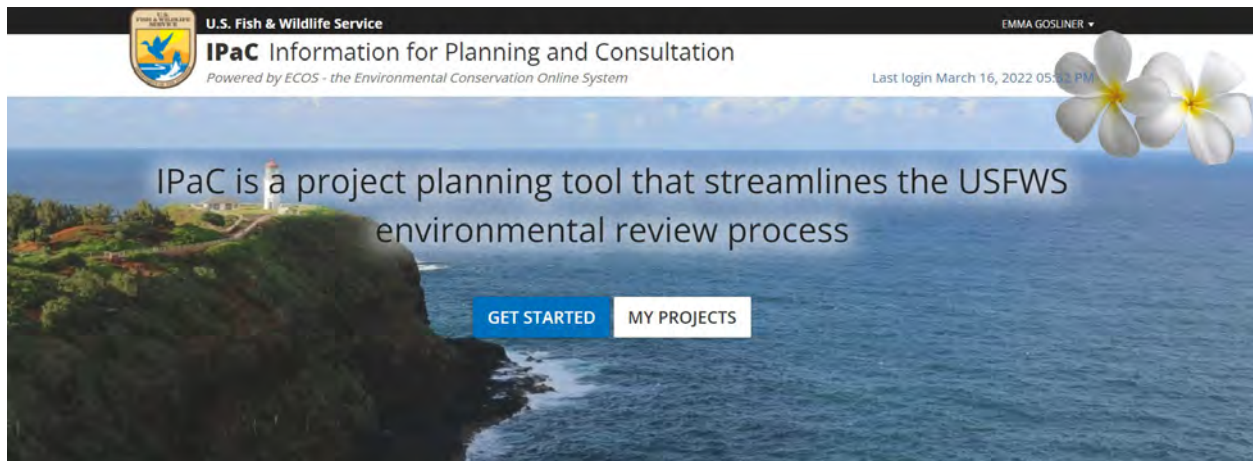

Sign in with your PIV or CAC

Make sure **you have a Login.gov account** and **you've set up PIV/CAC** as a two-factor authentication method.

Insert your PIV/CAC

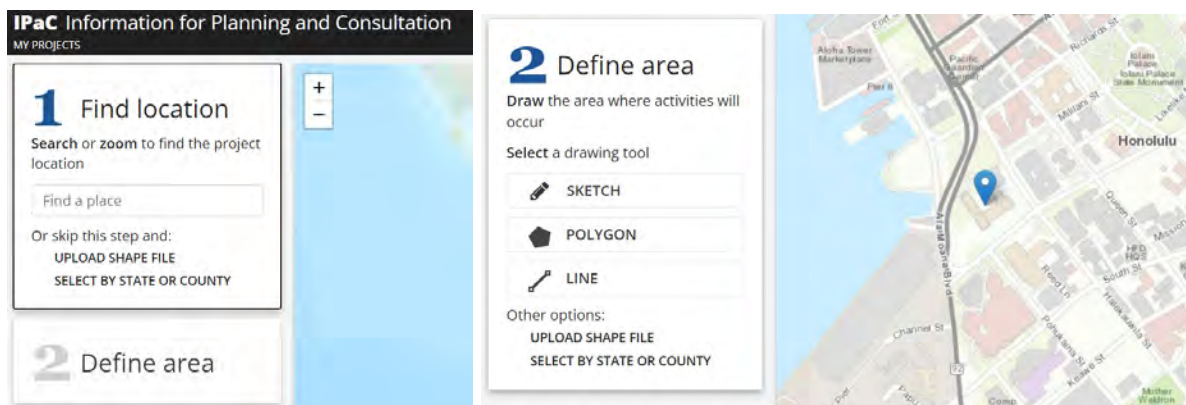

[Cancel](#)

- Once you log in, select “Get Started”.

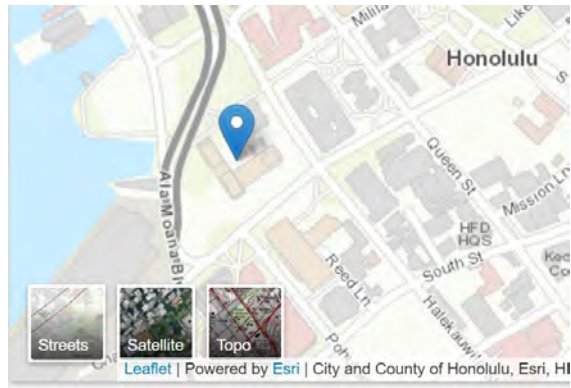

The image shows the IPaC landing page. At the top, there is a navigation bar with the U.S. Fish & Wildlife Service logo, the text "U.S. Fish & Wildlife Service", and the user name "EMMA GOSLINER". Below this is the main header "IPaC Information for Planning and Consultation" with the subtext "Powered by ECOS - the Environmental Conservation Online System". A date stamp "Last login March 16, 2022 05:33 PM" is visible. The main content area features a scenic background image of a coastline with a lighthouse. Overlaid on this image is the text "IPaC is a project planning tool that streamlines the USFWS environmental review process". At the bottom of this section are two buttons: "GET STARTED" (highlighted in blue) and "MY PROJECTS".

- Define the action area: Identify the location of the proposed action by uploading an existing shapefile or by entering an address or coordinates of the action area. Once identified on the map, you can manually draw the action area using the drawing tools.

The image displays the "Define area" step of the IPaC interface. On the left, a sidebar contains a "1 Find location" section with a search box labeled "Find a place" and options to "UPLOAD SHAPE FILE" or "SELECT BY STATE OR COUNTY". Below this is a "2 Define area" section. The main area shows a map of Honolulu with a blue location pin. To the right of the map is a "2 Define area" panel with the instruction "Draw the area where activities will occur". It offers three drawing tools: "SKETCH" (pencil icon), "POLYGON" (pentagon icon), and "LINE" (line icon). Below these are "Other options:" including "UPLOAD SHAPE FILE" and "SELECT BY STATE OR COUNTY".

To help identify your action area you can choose between multiple base maps available.

Press continue when you have finished drawing or uploading the action area location.

- The species information on the page that follows is not official. However, it identifies the project County, local Fish and Wildlife Field Office, species covered under NOAA Fisheries as well as Migratory Bird Treaty Act species. The list can be viewed in Thumbnail or List format.
- Once the species list populates you will see images of the species that may occur on, near, or transgress across your project. Click on SPECIES GUIDELINES on your top right to see Avoidance and Minimization measures to incorporate into your General Project Design Guidelines.

Endangered Species Act Review

[← BACK](#)
[EXIT REVIEW](#)

1 Request an official species list

2 Evaluate determination keys

No Dkeys for project.

3 Analyze project (optional)

4 Download documentation

Step 1: Request an official species list

An official species list is a letter from the local U.S. Fish and Wildlife Service field office that assists in the evaluation of potential impacts of your project. It includes a list of species that should be considered under [Section 7](#) of the Endangered Species Act, a project tracking number, and other pertinent information from the field office.

Does this project require an official species list?

Federal agencies are required to "request of the Secretary of Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action" ([Section 7](#) of the Endangered Species Act).

This requirement applies to projects that are **conducted, permitted, funded, or licensed** by any Federal agency.

YES, REQUEST A SPECIES LIST

SKIP / DOES NOT APPLY

- Fill out the contact information for yourself or your agency. Contractors, state partners, and any other project proponents may request a species list and should be covered using the dropdown menus.

Tell us about the project and your organization or agency

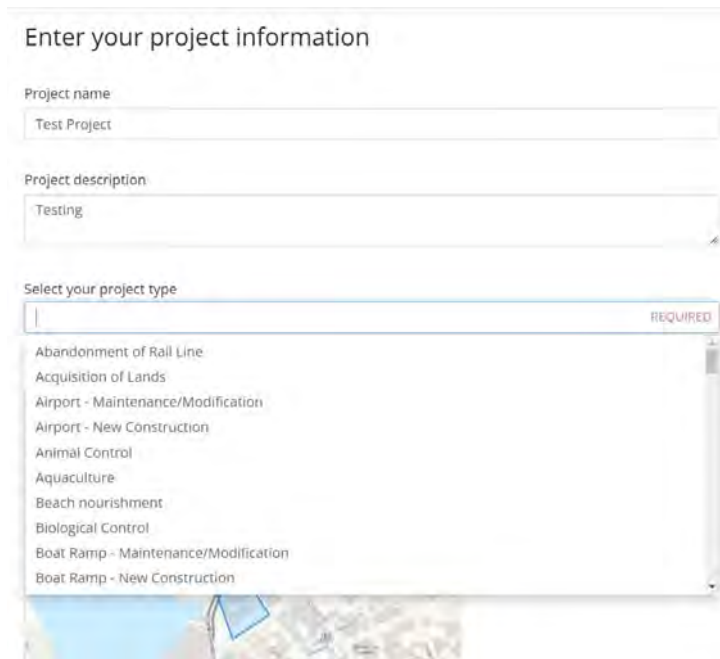

Is this project being conducted, permitted, funded, or licensed by a Federal agency?

- Yes
- No

What kind of organization are you working for directly?

- From the pull-down menu for Classify Type of Project, select the project type that best fits the proposed action.

- Once all required sections are filled out, press **SUBMIT OFFICIAL SPECIES LIST REQUEST**

Location

[SUBMIT OFFICIAL SPECIES LIST REQUEST](#)

- An Official Species List should be generated and available for download in a couple of seconds.
- If you need additional information on a species, click on their name that is hot-linked to their species information page. A brief overview of the species' status, description and critical habitat will appear as well as a link to their ECOS species profile.

A screenshot of a web application interface. On the left is a sidebar with a 'Resources' menu containing 'ENDANGERED SPECIES' (20), 'MIGRATORY BIRDS' (5), 'FACILITIES', and 'WETLANDS' (1). Below the menu is a 'What's next?' section with a 'DEFINE PROJECT' button. The main content area displays information for the 'Liiwi' (*Drepanis coccinea*). It features a photograph of a bright red bird being held. Below the photo, the 'STATUS' is listed as 'Threatened; A species likely to become endangered within the foreseeable future throughout all or a significant portion of its range.' The 'DESCRIPTION' states: 'The liwi is an Hawaiian forest bird in the endemic honeycreeper subfamily of the Fringillidae (finch family). liwi are medium-sized forest birds (total body length is approximately 14 centimeters (cm) (5.5 inches (in)) with bright scarlet feathers, black wings and tail, and a small white patch on the inner secondary flight feathers. The bill is long, deeply'. To the right of the main content is a vertical panel with a photo of a person holding a bird, labeled 'Endangered' and 'Hawaii Akepa (Drepanis coccinea) wherever found'.

Subject: Environmental Assessment Early Consultation Package for
Tradewinds Garden
Honolulu, O'ahu, Hawai'i

Dear Sir/ Madam:

Thank you for your letter in response to the subject Early Consultation Package for the Tradewinds Garden project. We are writing to acknowledge your comments, they have been considered in the preparation of the Draft Environmental Assessment (EA) with regard to meeting content requirements prescribed in Hawai'i Administrative Rules, Title 11, Chapter 200.1, Section 18. A record of your comments, along with this response, are appended to the Draft EA as Appendix H.

We offer the following in response to your letter:

We acknowledge that the Pacific Islands Fish and Wildlife Office (PIFWO) is transitioning to the Information for Planning and Consultation (IPaC) online portal for federal action agencies and non-federal agencies or individuals to obtain official species lists, including threatened and endangered species, designated critical habitat, and avoidance and minimization measures to consider in the general project design. Please note that this has been incorporated into Section 3.5 of the EA.

Please note that the Draft EA has been published and made available for review and comment in the current issue of the State of Hawai'i's Environmental Review Program's (ERP) The Environmental Notice.

We appreciate your participation in the EA review process.

Sincerely,

Keola Cheng
Director – Planning

MEMORANDUM

TO: Brian J. Neilson
DAR Administrator

FROM: Jesse Boord, Aquatic Biologist

SUBJECT: Environmental Assessment Early Consultation Package for Tradewinds Garden

Request Submitted by: Keola Cheng, Director- Planning
TMK: (1) 2-1-014:006, 2-1-001:057 and 58

Location of Project: Honolulu, Oahu, Hawaii

Brief Description of Project:

Wilson Okamoto Corporation is preparing an Environmental Assessment for the proposed Tradewinds Garden located in Honolulu. The proposed site is located at Pier 7 of the Honolulu Harbor and includes units 5 and 7 of the Honolulu Power Plant, further identified as TMK parcels (1) 2-1-014:006, 2-1-001:057 and 58.

The project aims to revitalize and modernize the waterfront by building a contemporary garden and art attraction. The proposed project would involve the use of State land and is therefore subject to the environmental documentation requirements under Chapter 343 HRS.

Comments:

No Comments Comments Attached

Thank you for providing DAR the opportunity to review and comment on the proposed project. Should there be any changes to the project plan, DAR requests the opportunity to review and comment on those changes.

Comments Approved:  Date: Mar 13, 2024
Brian J. Neilson
DAR Administrator

Comments

Sedimentation:

Sedimentation can introduce suspended solids, nutrients, and pollutants into aquatic ecosystems, leading to turbidity, reduced light penetration, and impaired water quality. Implement erosion and sediment control measures such as silt fences, sediment traps, and erosion control blankets to minimize soil disturbance and sediment runoff during construction activities.

Vegetation buffers: Maintain vegetative buffers along coastal areas to stabilize soil, reduce erosion, and filter sediment-laden runoff before it reaches the ocean.

Stormwater management: Implement stormwater management practices such as permeable pavement, vegetated swales, and retention ponds to reduce stormwater runoff volume and pollutant loads.

Monitoring and compliance: Consider establishing monitoring protocols to assess sedimentation levels, water quality parameters, and compliance with regulatory requirements throughout the project lifecycle.

DAR would like to request notification, photo-documentation, and GPS-coordinates for any occurrence where above-average amounts of sediment have entered the water, in order to assess impact, if any.

Protected Marine Species:

In the event that protected species such as the Hawaiian monk seal, other marine mammal, or sea-turtle is observed in close proximity to the construction site, and the activities being conducted may be considered as a "negligent or intentional act which results in disturbing or molesting a marine mammal", contractors should take appropriate action to modify activities in order to avoid disturbance to the regular behavior and activities of the animal. Appropriate action would include but is not limited to ceasing construction activity until the animal leaves the area of its own accord. If a pup is observed in the area, particular caution should be taken including creating a larger buffer between construction and the animals.

All staff working on-site will receive training to recognize the Hawaiian monk seal and sea turtles, as well as learn the necessary procedures to follow if these species are observed.

Any interaction between a protected species and the construction and repair activity proposed should be reported to the NOAA Protected Species Division and State of Hawaii DOCARE:

NOAA Marine Mammal Response Coordinators (Oahu): 808-220-7802

NOAA Sea Turtles (Oahu): Monday-Friday, 7:30am-4pm NOAA National Marine Fisheries Service - PIFSC Marine Turtle Biology and Assessment Program: (808) 725-5730

DAR# AR6580

Comments

Coral:

Do not cause physical damage to coral. Educate all personnel on site about the importance of minimizing any impacts to coral.

Work performed during coral spawning period (May to August) will require monitoring potential sedimentation and turbidity effects to coral eggs and larvae. Work will halt once sedimentation and turbidity surpass a water quality threshold determined by DAR.

Invasive Species:

An Aquatic Invasive Species (AIS) Mitigation Plan will be filed with the Division prior to conducting any activity under this permit. The Plan will include methods and protocols to minimize AIS or disease movement through gear, supplies and activities of the permittee. The permittee must take actions to verify that collection tools have been disinfected before use if previously used in activities in other locations.

The applicant will mitigate the spread of invasive species between areas of activity. Equipment will be inspected and disinfected between conducting activities in different areas, to mitigate the spread of disease or parasitic organisms. All gear deployed must be visually checked for invasive algae/sponges/other organisms and disinfected with 10% bleach solution for 10 minutes before deployment in alternate location if collecting between multiple watersheds/distinct reef areas. If collection gear cannot be bleached, gear must be thoroughly rinsed with fresh water and dried in sun for 24 hours before deployment in alternate location, sterilized with another viable method or alternate sampling gear should be utilized. If sampling disease or anomalous growth specimens, gear should be sterilized between each specimen or new collection gear should be used. The following species remain a concern to the division: Alien invasive algae (*Kappaphycus* spp., *Eucheuma denticulatum*, *Gracilaria salicornia*, *Acanthophora spicifera*, *Hypnea musciformis* and *Avrainvillea amadelpha*), Coral disease (*Montipora* White Syndrome, *Porites trematodiasis*, *Montipora* white syndrome, *Porites* tissue loss syndrome, and *Porites* spp. and *Montipora* spp. tumors, *Montipora* spp. growth anomaly), Orange keyhole sponge (*Mycale armata/grandis*), and snowflake coral (*Carijoa riisei*).

DAR# AR6580

Comments

Erosion/LBSP:

DAR recommends that best management practices for mitigation of erosion and LBSP be followed. The close proximity to aquatic resources should be considered during design and construction. Landscape design and leveling should be such that long term erosion and LBSP are minimized.

During construction these measures would include any type of barrier (e.g. sediment barriers/bags, petroleum absorption diapers, etc.) that limits the amount of sediment or LBSP (e.g. petroleum products, chemicals, debris, etc.) to the maximum extent practicable. DAR recommends that all construction materials be composed of environmentally inert materials to the extent practicable. The Contractor shall consider the weather while performing construction. Some work may be performed during low rain conditions, but all construction would be halted during storm conditions or when storm conditions threaten the watershed.

DAR would like to request notification, photo-documentation, and GPS-coordinates for any occurrence where above-average amounts of sediment or pollution have entered the water, in order to assess impact, if any.

DAR recommends that, where there is the opportunity to employ these erosion control and land-based sources of pollution (LBSP) barrier measures, the Contractor implement the practice of utilizing these (e.g. at any site where there will be excavation or sediment/pollutant producing activities up on top of the bank or in sections that have enough area between the activity and the water-line). These measures would include any type of barrier (e.g. sediment barriers/bags, petroleum absorption diapers, etc.) that limits the amount of sediment or LBSP (e.g. petroleum products, chemicals, debris, etc.) to the maximum extent practicable.

DAR recommends minimizing these incidences of sediment or land based sources of pollution releases in order to avoid a continuous release or buildup of sediment or LBSP in areas of the stream that may result in permanently killing or negatively impacting endemic species located in the lower reaches of the watershed.

DAR should be notified to assess impact should any event that occurs during construction that could negatively impact aquatic resources. Examples of this type of event include but are not limited to excess turbidity from construction and release of liquids such as oil or gas into the water.

DAR# AR6580

Comments

Hydrology and Precipitation:

The utilization of hydrological analyses is an effective and efficient way to determine the appropriate time for construction. Feasibly, construction should occur when the average seasonal flow is low and the probability of high-flow events is also low.

More data on precipitation trends can be found at :

<https://www.weather.gov/wrh/Climate?wfo=hfo>

Light Pollution:

Artificial lighting from construction sites can disorient and confuse marine wildlife such as sea turtles, fish, crabs, and birds. The disruption of their natural rhythms can have long-lasting consequences on their survival and population dynamics.

DAR recommends that construction activities occur during the daylight hours to the extent possible. All outdoor lighting should be fully shielded and pointed downward. Outdoor lighting should be turned off when not necessary, and automatic sensors are recommended.

Seabird fledgeling season occurs during Sept 15th - Dec 15th, and nighttime activity should be halted during this time. Fledglings become easily confused by artificial lighting, which can cause them to crash or land on the ground. Downed fledgelings become easy prey for cats, mongoose, or other predators. If downed or injured fledgelings are observed in the construction area, they should be reported for rescue:

Tradewinds Garden
Tax Map Keys (TMKs): [1] 2-1-014;006, 2-1-001;057 and 58
Honolulu, O'ahu, Hawai'i

Dear Ms. Chang:

On behalf of Garden Art, LLC, Wilson Okamoto Corporation is preparing an Environmental Assessment (EA) for the proposed Tradewinds Garden located in Honolulu, on the island of O'ahu. The proposed Project Site is located at Pier 7 of the Honolulu Harbor as well as Units 5 and 7 of the Honolulu Power Plant and is further identified as TMK parcels [1] 2-1-014;006, 2-1-001;057 and 58.

The Proposed Project aims to revitalize and modernize the waterfront by introducing a contemporary garden and art attraction. The Proposed Project will involve the use of State lands and is therefore subject to the environmental documentation requirements under Chapter 343, Hawai'i Revised Statutes (HRS).

As part of the EA early consultation process, we are soliciting comments you may have on the Proposed Project. A summary of the Proposed Project and associated figures are enclosed, for your review. Please submit comments via email to publiccomment@wilsonokamoto.com, or written comments via mail to:

Wilson Okamoto Corporation

Subject: Environmental Assessment Early Consultation Package for
Tradewinds Garden
Honolulu, O'ahu, Hawai'i

Dear Mr. Neilson:

Thank you for your letter dated March 12, 2024, regarding the subject Early Consultation Package for the Tradewinds Garden project. We are writing to acknowledge your comments, they have been considered in the preparation of the Draft Environmental Assessment (EA) with regard to meeting content requirements prescribed in Hawai'i Administrative Rules, Title 11, Chapter 200.1, Section 18. A record of your comments, along with this response, are appended to the Draft EA as Appendix H.

We offer the following in response to your letter:

Your comments regarding sedimentation are acknowledged. Please note that Sections 3.2.1, and 3.3.1 of the Draft EA discuss mitigation measures with regard to erosion to prevent adverse impacts during construction.

- Your comments regarding vegetation buffers are acknowledged.
- Your comments regarding stormwater management are acknowledged. Please note that Section 3.15.3 of the Draft EA discusses mitigation measures with regard to drainage.
- Your comments regarding monitoring and compliance are acknowledged.
- Your comments regarding protected marine species, corals, and invasive species are acknowledged. Please note that Section 3.5.1 of the Draft EA discusses mitigation measures to prevent adverse effects to protected species.
- Your comments regarding erosion and land-based sources of pollution (LBSP) are acknowledged. Please note that Sections 3.2.1, 3.3.1 and 3.5.1 of the Draft EA discuss

Letter to Mr. Nielson

TMK NO.: (1) 2-1-001:057, (1) 2-1-001:058, (1) 2-1-014:006

Handwritten signature of Dean D. Uyeno in black ink.

Thank you for the opportunity to review the subject document. The Commission on Water Resource Management (CWRM) is the agency responsible for administering the State Water Code (Code). Under the Code, all waters of the State are held in trust for the benefit of the citizens of the State, therefore all water use is subject to legally protected water rights. CWRM strongly promotes the efficient use of Hawaii's water resources through conservation measures and appropriate resource management. For more information, please refer to the State Water Code, Chapter 174C, Hawaii Revised Statutes, and Hawaii Administrative Rules, Chapters 13-187 to 13-171. These documents are available via the Internet at <http://dlnr.hawaii.gov/cwrn>.

Our comments related to water resources are checked off below.

1. We recommend coordination with the county to incorporate this project into the county's Water Use and Development Plan. Please contact the respective Planning Department and/or Department of Water Supply for further information.
2. We recommend coordination with the Engineering Division of the State Department of Land and Natural Resources to incorporate this project into the State Water Projects Plan.
3. We recommend coordination with the Hawaii Department of Agriculture (HDOA) to incorporate the reclassification of agricultural zoned land and the redistribution of agricultural resources into the State's Agricultural Water Use and Development Plan (AWUDP). Please contact the HDOA for more information.
4. We recommend that water efficient fixtures be installed and water efficient practices implemented throughout the development to reduce the increased demand on the area's freshwater resources. Reducing the water usage of a home or building may earn credit towards Leadership in Energy and Environmental Design (LEED) certification. More information on LEED certification is available at <http://www.usgbc.org/leed>. A listing of fixtures certified by the EAP as having high water efficiency can be found at <http://www.epa.gov/watersense>.
5. We recommend the use of best management practices (BMP) for stormwater management to minimize the impact of the project to the existing area's hydrology while maintaining on-site infiltration and preventing polluted runoff from storm events. Stormwater management BMPs may earn credit toward LEED certification. More information on stormwater BMPs can be found at <http://planning.hawaii.gov/czm/initiatives/low-impact-development/>
6. We recommend the use of alternative water sources, wherever practicable.
7. We recommend participating in the Hawaii Green Business Program, that assists and recognizes businesses that strive to operate in an environmentally and socially responsible manner. The program description can be found online at <http://energy.hawaii.gov/green-business-program>.
8. We recommend adopting landscape irrigation conservation best management practices endorsed by the Landscape Industry Council of Hawaii. These practices can be found online at http://www.hawaiiscape.com/wp-content/uploads/2013/04/LICH_Irrigation_Conservation_BMPs.pdf.

9. There may be the potential for ground or surface water degradation/contamination and recommend that approvals for this project be conditioned upon a review by the State Department of Health and the developer's acceptance of any resulting requirements related to water quality.
10. The proposed water supply source for the project is located in a designated water management area, and a Water Use Permit is required prior to use of water. The Water Use Permit may be conditioned on the requirement to use dual line water supply systems for new industrial and commercial developments.
11. The Hawaii Water Plan is directed toward the achievement of the utilization of reclaimed water for uses other than drinking and for potable water needs in one hundred per cent of State and County facilities by December 31, 2045 (§174C-31(g)(6), Hawaii Revised Statutes). We strongly recommend that this project consider using reclaimed water for its non-potable water needs, such as irrigation. Reclaimed water may include, but is not limited to, recycled wastewater, gray water, and captured rainwater/stormwater. Please contact the Hawai'i Department of Health, Wastewater Branch, for more information on their reuse guidelines and the availability of reclaimed water in the project area.
12. A Well Construction Permit(s) is (are) are required before the commencement of any well construction work.
13. A Pump Installation Permit(s) is (are) required before ground water is developed as a source of supply for the project.
14. There is (are) well(s) located on or adjacent to this project. If wells are not planned to be used and will be affected by any new construction, they must be properly abandoned and sealed. A permit for well abandonment must be obtained.
15. Ground-water withdrawals from this project may affect streamflows, which may require an instream flow standard amendment.
16. A Stream Channel Alteration Permit(s) is (are) required before any alteration can be made to the bed and/or banks of a stream channel.
17. A Stream Diversion Works Permit(s) is (are) required before any stream diversion works is constructed or altered.
18. A Petition to Amend the Interim Instream Flow Standard is required for any new or expanded diversion(s) of surface water.
19. The planned source of water for this project has not been identified in this report. Therefore, we cannot determine what permits or petitions are required from our office, or whether there are potential impacts to water resources.
- OTHER:

If you have any questions, please contact Ryan Imata of the Regulation Branch at (808) 587-0225 or Katie Roth of the Planning Branch (808) 587-0218.

July 23, 2024

Mr. Dean D. Uyeno
Acting Deputy Director
Commission on Water Resource Management
P.O. Box 621
Honolulu, HI 96809

Subject: Environmental Assessment Early Consultation Package for
Tradewinds Garden
Honolulu, O‘ahu, Hawai‘i

Dear Mr. Uyeno:

Thank you for your letter dated February 26, 2024, regarding the subject Early Consultation Package for the Tradewinds Garden project. We are writing to acknowledge your comments, they have been considered in the preparation of the Draft Environmental Assessment (EA) with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200.1, Section 18. A record of your comments, along with this response, are appended to the Draft EA as Appendix H.

We offer the following in response to the points raised in your letter:

Comment #1: We recommend the use of best management practices (BMP) for stormwater management to minimize the impact of the project to the existing area’s hydrology while maintaining on-site infiltration and preventing polluted runoff from storm events. Stormwater management BMPs may earn credit toward LEED certification. More information on stormwater BMPs can be found at <http://planning.hawaii.gov.czm/initiatives/low-impact-development/>

Response #1: Your comments are acknowledged. Please note that BMPs for stormwater management have been included in Section 3.2.2 and 3.3.1 of the EA.

Comment #2: We recommend adopting landscaping irrigation conservation BMPs endorsed by the Landscape Industry Council of Hawaii. These practices can be found online at http://hawaiiscape.com/wp-content/uploads/2013/04/LICH_Irrigation_Conservation_BMPs.pdf

Response #2: Your comment is acknowledged and has been passed along to the design team.

Letter to Mr. Uyeno

Page 2

July 23, 2024

Please note that the Draft EA has been published and made available for review and comment in the current issue of the State of Hawai'i's Environmental Review Program's (ERP) The Environmental Notice.

We appreciate your participation in the EA review process.

Sincerely,

A handwritten signature in cursive script that reads "Keola Cheng". The signature is written in black ink on a white background.

Statewide Geographic
Information System

Statewide
Sustainability Program

Thank you for the opportunity to provide comments on your pre-consultation request for the proposed Tradewinds Garden project. The review material was received by our office via memo dated February 13, 2024.

It is our understanding that the proposed action seeks to transform and modernize the Pier 7 area of Honolulu Harbor into a vibrant cultural destination by creating a garden and art center. The project aims to provide new features to this waterfront. This revitalization effort will provide a distinctive space that combines art and education to the Honolulu Harbor. The project will include the development of art galleries, gardens, educational facilities, and related features. This project seeks to attract additional businesses and opportunities to develop the Honolulu Waterfront into a more vibrant urban setting.

The Office of Planning and Sustainable Development (OPSD) has reviewed the submitted material and has the following comments to offer:

1. Coastal Zone Management Act (CZMA), Federal Consistency
The review material notes that the project will utilize the site of the vacant Hawaiian Electric Company (HECO) power substation adjacent to Pier 7. It is not clear if the use of this facility will necessitate federal approvals. Please consult with the appropriate federal authorities on needed federal permitting and approvals. If federal approvals are needed, then the project may be subject to CZMA federal consistency.

OPSD is the lead state agency with the authority to conduct CZMA federal consistency determinations. We recommend that you consult our office on the applicability of CZMA federal consistency.

2. Hawai'i Coastal Zone Management (CZM) Program

The CZM area is defined as "all lands of the State and the area extending seaward from the shoreline to the limit of the State's police power and management authority, including the U.S. territorial sea" under Hawai'i Revised Statutes (HRS) § 205A-1.

Pursuant to HRS § 205A-4, in implementing the objectives of the CZM program, agencies shall consider ecological, cultural, historic, esthetic, recreational, scenic, open space values, coastal hazards, and economic development. As the proposed action will require agency approvals, the Draft Environmental Assessment (Draft EA) should include a discussion on the project's consistency with the policies of the Hawai'i CZM Program, HRS § 205A-2, as amended.

Furthermore, the objectives and supporting policies of the Hawai'i CZM Program serve as the foundation of the enforceable policies of the State of Hawai'i. Disclosure of impacts on CZM objectives and supporting policies as it relates to HRS Chapter 343 requirements, will aid the State in evaluating impacts to the resources of the coastal zone, and mitigation measures on lands involved for this proposed action.

3. Stormwater Runoff, Erosion, and Water Resources

Pursuant to Hawaii Administrative Rules (HAR) § 11-200.1-18(d)(7) – identification and analysis of impacts and alternatives considered; to ensure that nearshore marine resources along the south shore of O'ahu remain protected, the negative effects of stormwater runoff and sediment loading from the proposed project site to Honolulu Harbor and the greater marine ecosystem should be evaluated.

Issues that may be examined include, but are not limited to, project site characteristics in relation to flood and erosion prone areas, vulnerability of the nearshore environment any increase in volume or flow rate of stormwater runoff. Developing mitigation measures for the protection of the water quality and the coastal ecosystem should take this into account, pursuant to HAR § 11-200.1-18(d)(8).

4. Climate Change Adaptation/Sea Level Rise (SLR)

Due to the project site's proximity to the south shore of O'ahu, the long-term viability of Pier 7 and Honolulu Harbor is in question. The Honolulu Waterfront may be vulnerable to coastal inundation and natural hazards associated with SLR. A key hazard to this project site is coastal erosion inundation. To assess the

Mr. Keola Cheng
March 12, 2024
Page 3

potential environmental impacts and vulnerability of this site, we suggest the Draft EA refer to the findings of the Hawai'i Sea Level Rise Vulnerability and Adaptation Report 2017, accepted by the Hawai'i Climate Change Mitigation and Adaptation Commission.

The Report, and Hawai'i SLR Viewer at <https://www.pacioos.hawaii.edu/shoreline/slr-hawaii/> identifies a 3.2-foot SLR exposure area across the main Hawaiian Islands, as a starting evaluation point. The Draft EA should provide a map of at least 3.2-foot SLR exposure area in relation to the project area, and evaluate site-specific mitigation measures, including setbacks from the shoreline or relocation options further inland, increasing the height of the proposed structures to accommodate higher water levels, or related climate change adaptation strategies when feasible.

If you wish to respond to this comment letter, please include DTS202402150913NA in the subject line. Any questions regarding this on Environmental Assessment concerns, please contact Joshua Hekeia on at (808) 587-2845 or by email to Joshua.K.Hekeia@hawaii.gov, or Debra Mendes on federal consistency matters at (808) 587-2840 or by email to Debra.L.Mendes@hawaii.gov.

Sincerely,

Mary Alice Evans,
Interim Director

Subject: DTS202402150913NA
Environmental Assessment Early Consultation Package for
Tradewinds Garden
Honolulu, O‘ahu, Hawai‘i

Dear Ms. Evans :

Thank you for your letter dated March 5, 2024, regarding the subject Early Consultation Package for the Tradewinds Garden project. We are writing to acknowledge your comments, they have been considered in the preparation of the Draft Environmental Assessment (EA) with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200.1, Section 18. A record of your comments, along with this response, are appended to the Draft EA as Appendix H.

We offer the following in response to your letter:

Comment #1: *Coastal Zone Management Act (CZMA), Federal Consistency. The review material notes that the project will utilize the site of the vacant Hawaiian Electric Company (HECO) power substation adjacent to Pier 7. It is not clear if the use of this facility will necessitate federal approvals. Please consult with the appropriate federal authorities on needed federal permitting and approvals. If federal approvals are needed, then the project may be subject to CZMA federal consistency. OPSD is the lead state agency with the authority to conduct CZMA federal consistency determinations. We recommend that you consult our office on the applicability of CZMA federal consistency.*

Response #1: Your comments are acknowledged. Please note that Section 4.1.4 of the EA discusses how the Proposed Project is in conformance with the objectives and policies of the CZM.

Comment #2: *Hawai‘i Coastal Zone Management (CZM) Program. The CZM area is defined as “all lands of the State and the area extending seaward from the shoreline to the limit of the State’s*

police power and management authority, including the U.S territorial sea” under Hawai‘i Revised Statutes (HRS)§ 205A-1.

Pursuant to HRS § 205A-4, in implementing the objectives of the CZM program, agencies shall consider ecological, cultural, historic, esthetic, recreational, scenic, open space values, coastal hazards, and economic development. As the proposed action will require agency approvals, the Draft Environmental Assessment (Draft EA) should include a discussion on the project’s consistency with the policies of the Hawai‘i CZM Program, HRS § 205A-2, as amended.

Furthermore, the objectives and supporting policies of the Hawai‘i CZM Program serve as the foundation of the enforceable policies of the State of Hawai‘i. Disclosure of impacts on CZM objectives and supporting policies as it relates to HRS Chapter 343 requirements, will aid the State in evaluating impacts to the resources of the coastal zone, and mitigation measures on lands involved for this proposed action.

Response #2: We acknowledge your comments. Please note that Section 4.1.4 of the EA discuss the Proposed Project’s conformance with the policies and objectives of the CZM.

Comment #3: *Stormwater Runoff, Erosion, and Water Resources. Pursuant to Hawaii Administrative Rules (HAR) § 11-200.1-18(d)(7) – identification and analysis of impacts and alternatives considered; to ensure that nearshore marine resources along the south shore of O‘ahu remain protected, the negative effects of stormwater runoff and sediment loading from the proposed project site to Honolulu Harbor and greater marine ecosystem should be evaluated.*

Issues that may be examined include, but are not limited to, project site characteristics in relation to flood and erosion prone areas, vulnerability of the nearshore environment any increase in volume or flow rate of stormwater runoff. Developing mitigation measures for the protection of the water quality and the coastal ecosystem should take this into account, pursuant to HAR § 11-200.1- 18(d)(8).

Response #3: Your comments are acknowledged. Please note that Sections 3.2 and 3.3 of the Draft EA discuss mitigation measures with regard to stormwater runoff, erosion and water resources. Additionally, Section 3.5.1 of the Draft EA discusses mitigation measures to prevent adverse impacts to protected species.

Comment #4: *Climate Change Adaptation/ Sea Level Rise (SLR). Due to the project site’s proximity to the south shore of O‘ahu, the long-term viability of Pier 7 and Honolulu Harbor is in question. The Honolulu Waterfront may be vulnerable to coastal inundation and natural hazards associated with SLR. A key hazard to this project site is coastal erosion inundation. To assess the potential environmental impacts and vulnerability of this site, we suggest the Draft EA refer to the*

Dear Mr. Cheng:

Subject: Your Letter Dated February 13, 2024 Requesting Comments on the Environmental Assessment Early Consultation for Tradewinds Garden off Aloha Tower Drive – Tax Map Key: 2-1-001: 057 & 058 and 2-1-014: 006

Thank you for your letter regarding the proposed Pier 7 and Honolulu Power Plant revitalization project.

The existing water system is currently adequate to accommodate the proposed industrial redevelopment. However, please be advised that the existing Honolulu water system capacity has been reduced due to the shut-down of the Hālawā Shaft pumping station as a proactive measure to prevent fuel contamination from the Navy's Red Hill Bulk Storage Tank fuel releases. The final decision on the availability of water will be confirmed when the building permit application is submitted for approval, pending evaluation of the water system conditions at that time on a first-come, first-served basis. The Board of Water Supply (BWS) reserves the right to change any position or information stated herein up until the final approval of the building permit application.

We continue to request 10% voluntary water conservation of all customers until new sources are completed and require water conservation measures in all new developments. If water consumption significantly increases, progressively restrictive conservation measures may be required to avoid low water pressures and disruptions of water service.

Presently, there is no moratorium on the issuance of new and additional water services. Water distributed via the BWS water systems remains safe for consumption. The BWS is closely monitoring water usage and will keep the public informed with the latest findings. Please visit our website at www.boardofwatersupply.com and www.protectohawater.org for the latest updates and water conservation tips.

Mr. Keola Cheng
March 11, 2024
Page 2

When water is made available, the applicant will be required to pay our Water System Facilities Charges for resource development, transmission, and daily storage.

Water conservation measures are required for all proposed developments. These measures include utilization of nonpotable water for irrigation using rain catchment, drought tolerant plants, xeriscape landscaping, efficient irrigation systems, such as a drip system and moisture sensors, and the use of Water Sense labeled ultra-low flow water fixtures and toilets.

The proposed project is subject to BWS Cross-Connection Control and Backflow Prevention requirements prior to the issuance of the Building Permit Applications.

The construction drawings should be submitted for our approval, and the construction schedule should be coordinated to minimize impact to the water system.

The on-site fire protection requirements should be coordinated with the Fire Prevention Bureau of the Honolulu Fire Department.

If you have any questions, please contact Barry Usagawa, Water Resources Division at (808) 748-5900.

Very truly yours,

ERNEST Y. W. LAU, P.E.
Manager and Chief Engineer

Honolulu, HI, 96843

Subject: Environmental Assessment Early Consultation Package for
Tradewinds Garden
Honolulu, O‘ahu, Hawai‘i

Dear Mr. Lau:

Thank you for your letter dated March 11, 2024, regarding the subject Early Consultation Package for the Tradewinds Garden project. We are writing to acknowledge your comments, they have been considered in the preparation of the Draft Environmental Assessment (EA) with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200.1, Section 18. A record of your comments, along with this response, are appended to the Draft EA as Appendix H.

We offer the following in response to your letter:

- We acknowledge that the existing water is currently adequate to accommodate the Proposed Project.
- We acknowledge that the existing Honolulu water system capacity has been reduced due to the shut-down of the Hālawa Shaft pumping station. This has been passed along to the Client team.
- We acknowledge that BWS will make a final decision on the availability of water when the building permit application is submitted for approval.
- We acknowledge that the Proposed Project is subject to BWS Cross-Connection Control and Backflow Prevention requirements prior to the issuance of the Building Permit Applications. This has been incorporated into Section 4.3 of the Draft EA.
- Construction drawings will be submitted to BWS for review and approval.
- We acknowledge that on-site fire protection requirements should be coordinated with the Fire Prevention Bureau of the Honolulu Fire Department. Please note that Chapter 7 of the Draft EA includes a list of those that have been consulted with thus far in the EA process.

Letter to Mr. Lau

July 23, 2024

Page 2

- Please note that we have taken your comments into consideration in preparing the EA and have incorporated them with regards to the water system as it relates to the Proposed Project in Section 3.15.1 of the Draft EA.

Please note that the Draft EA has been published and made available for review and comment in the current issue of the State of Hawai'i's Environmental Review Program's (ERP) The Environmental Notice.

We appreciate your participation in the EA review process.

Sincerely,

Keola Cheng

Dear Mr. Cheng:

**SUBJECT: Pre-Consultation: DRAFT Environmental Assessment
Tradewinds Garden
Garden Art, LLC
Honolulu Harbor Pier 7 & Honolulu Power Plant Units 5 and 7
TMKs: (1) 2-1-014:006 & 2-1-001:057 and 058**

Thank you for notifying us that Wilson Okamoto Corporation is preparing a Draft Environmental Assessment (DEA) for the Tradewinds Garden project on behalf of Garden Art, LLC.

Given that the above-named project is set to be built entirely makai of South Nimitz Highway, the Department of Community Services (DCS) offers this list of seven City properties under its jurisdiction that are located on or near roads approaching the area and the access routes provided by Nimitz Highway and Ala Moana Boulevard:

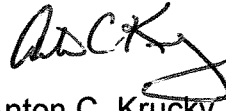

- 1) Loliana Apartments: 565 Quinn Lane
- 2) Kekaulike Courtyards: 1016 Maunakea Street
- 3) Smith-Beretania Apartments: 1170 Nu'uuanu Avenue
- 4) Pauahi Hale: 126 North Pauahi Street
- 5) Residences at Maunakea Marketplace: 1120 Maunakea Street
- 6) Pauahi Kupuna Hale: 167 North Pauahi Street
- 7) River-Pauahi Apartments: 1155 River Street
- 8) Hale Pauahi: 155 North Beretania Street

Mr. Keola Cheng
February 21, 2023
Page 2

DCS leases out (or monitors the leasing of) these properties for the provision of affordable and/or special needs housing. As such, we ask that this project take into consideration the health, safety, accessibility, and long-term wellbeing of people living nearby and/or involved with activities in the surrounding neighborhood.

Thank you for providing us the opportunity to comment on this matter.

Sincerely,

A handwritten signature in black ink, appearing to read 'Anton C. Krucky', with a stylized flourish at the end.

Subject: Environmental Assessment Early Consultation Package for
Tradewinds Garden
Honolulu, O‘ahu, Hawai‘i

Dear Mr. Krucky:

Thank you for your letter dated February 21, 2024, regarding the subject Early Consultation Package for the Tradewinds Garden project. We are writing to acknowledge your comments, they have been considered in the preparation of the Draft Environmental Assessment (EA) with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200.1, Section 18. A record of your comments, along with this response, are appended to the Draft EA as Appendix H.

We offer the following in response to your letter:

We acknowledge that the Department of Community Services (DCS) offers a list of seven City properties under its jurisdiction that are located on or near roads approaching the area and the access routes provided by Nimitz Highways and Ala Moana Boulevard. The Project Team will take into consideration the health, safety, accessibility, and long-term wellbeing of people living nearby and/ or involved with activities in the surrounding neighborhood.

Please note that the Draft EA has been published and made available for review and comment in the current issue of the State of Hawai‘i’s Environmental Review Program’s (ERP) The Environmental Notice.

We appreciate your participation in the EA review process.

Sincerely,

Keola Cheng

SENT VIA EMAIL

Mr. Keola Cheng
publiccomment@wilsonokamoto.com

Dear Mr. Cheng:

SUBJECT: Pre-Consultation – Environmental Assessment (EA)
Tradewinds Garden Project
Pier 7 and Honolulu Power Plant – Honolulu Harbor/Aloha Tower
Tax Map Keys 2-1-001: 057, 058, and 2-1-014: 006

This is in response to your letter, received February 15, 2024, requesting comments regarding the upcoming preparation of an EA. We understand that the objective of the proposed Project is to revitalize Pier 7 of the Honolulu Harbor, which is identified as Tax Map Keys 2-1-001: 057 and 058, and Units 5 and 7 of the Honolulu Power Plant, which is identified as Tax Map Key 2-1-014: 006. More specifically, the improvements include interior modifications to existing facilities to establish a garden and art museum and exterior modifications and enhancements. Our comments are listed below.

- Parcel 006 is located within the Kakaako Community Development District and is under the State's Jurisdiction. Therefore, we have no comments related to this portion of the Project and defer to the Hawaii Community Development Authority.
- Portions of Pier 7 are within the B-2 Community Business District and the Hawaii Capital Special District. Therefore, any proposed uses and exterior modifications should comply with the underlying zoning district and Hawaii Capital Special District design standards and guidelines.
- A Special District (SD) Permit may be required for proposed exterior modifications to the existing buildings located on Pier 7. Pursuant to Revised Ordinances of Honolulu Chapter 21, Table 21-9.1, an SD Permit

Mr. Keola Cheng
March 12, 2024
Page 2

is required for major exterior repairs, alterations, or additions to structures. However, more detailed information regarding the existing structures and proposed work is necessary in order to determine if an SD Permit will be necessary, and whether or not the permit would be a Major or Minor.

Thank you for the opportunity to comment on this proposal. Should you have any questions, please contact Jordan Dildy, of our Urban Design Branch, at (808) 768-8027 or via email at jdildy@honolulu.gov.

Very truly yours,

for 
Dawn Takeuchi Apuna
Director

Subject: Environmental Assessment Early Consultation Package for
Tradewinds Garden
Honolulu, O‘ahu, Hawai‘i

Dear Ms. Takeuchi-Apuna:

Thank you for your letter dated March 12, 2024, regarding the subject Early Consultation Package for the Tradewinds Garden project. We are writing to acknowledge your comments, they have been considered in the preparation of the Draft EA with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200.1, Section 18. A record of your comments, along with this response, are appended to the Draft EA as Appendix H.

We offer the following in response to the points raised in your letter:

Comment #1: *Parcel 006 is located within the Kakaako Community Development District and is under the State’s Jurisdiction. Therefore, we have no comments related to this portion of the Project and defer to the Hawaii Community Development Authority.*

Response #1: Your comments are acknowledged.

Comment #2: *Portions of Pier 7 are within the B-2 Community Business District and the Hawaii Capital Special District. Therefore, any proposed uses and exterior modifications should comply with the underlying zoning district and Hawaii Capital Special District design standards and guidelines.*

Response #2: Your comments are acknowledged. This has been passed along to the design team.

Letter to Ms. Takeuchi-Apuna

July 23, 2024

Page 2

Comment #3: *A Special District (SD) Permit may be required for the proposed exterior modification to the existing buildings located on Pier 7. Pursuant to Revised Ordinances of Honolulu Chapter 21, Table 21-9.1, an SD Permit is required for major exterior repairs, alterations, or additions to structures. However, more detailed information regarding the existing structures and proposed work is necessary in order to determine if an SD Permit will be necessary, and whether or not the permit would be a Major or Minor.*

Response #3: Your comments are acknowledged. This has been incorporated into Section 4.3 of the Draft EA.

Please note that the Draft EA has been published and made available for review and comment in the current issue of the State of Hawai'i's Environmental Review Program's (ERP) The Environmental Notice.

We appreciate your participation in the EA review process.

Sincerely,

Keola Cheng

March 13, 2024

Keola Cheng, Planning Director
Wilson Okamoto Corporation
1907 South Beretania Street, Suite 400
Honolulu, Hawaii 96826

Dear Mr. Cheng:

SUBJECT: Environmental Assessment Early Consultation Package for
Tradewinds Garden
Tax Map Keys (TMKs): [1] 2-1-:014:006, 2-1-001:057 and 58
Honolulu, O'ahu, Hawaii

Thank you for the opportunity to provide written comments regarding the Environmental Assessment Early Consultation Package for Tradewinds Garden; Tax Map Keys (TMKs): [1] 2-1-:014:006, 2-1-001:057 and 58; Honolulu, O'ahu, Hawaii. We have the following comments.

1. Transportation Impact Assessment (TIA). The Applicant should perform a TIA to examine the vehicle, pedestrian, bicycle, and public transit safety, stress, and comfort levels at the nearby intersections and driveways with corresponding improvements to mitigate these impacts by applying Complete Streets principles. The applicant shall discuss the future year growth rate, trip distribution, mode split, and route assignment assumptions used in the TIA.

The forthcoming Kuloloia Downtown rail station (rail station) will be located adjacent to the Project site, and will host numerous multi-modal connections. As such, the TIA must analyze and construct improvements to mitigate the project impacts including, but not limited to, rail access from the Project site, pedestrian/bicycle improvements per the Honolulu Complete Streets Design Manual, O'ahu Pedestrian Plan, O'ahu Bike Plan, and any applicable streetscape plan.

The applicant shall submit all native files (e.g., Synchro, Excel, etc.) for the raw multi-modal counts (in the format specified at <https://geocounts.com/api/format/> and the example file at <https://bit.ly/DTS-count-sample>) and accompanying analyses to the Department of Transportation Services Regional Planning Branch (RPB) at dtsplanningdiv@honolulu.gov. Please refer to the Department of Transportation Services (DTS) TIA Guide for multimodal assessment tools and recommended analyses. The TIA Guide can be found at <http://www4.honolulu.gov/docushare/dsweb/View/Collection-7723>.

2. Parking. A discussion regarding off-street parking and site generated parking demand should be added to this report. The project should consider Transit Oriented Development (TOD) core principals. The January 2017 report, *Trip and Parking Generation at Transit-Oriented Developments Number NITC-RR-767*, concludes that less parking is required than suggested in the *Institute of Transportation Engineers (ITE) Parking Generation Manual* for sites that are dense, mixed use, with low stress pedestrian environments, and adjacent to a high quality transit stop. We recommend the applicant provide the minimum TOD parking ratio, given that the Project falls within a TOD Plan area and is in close proximity to the future rail station.
3. Pedestrian and Bicycle Improvements.
 - i. Shared Use Paths. The Applicant shall construct sidewalks fronting the Project site consistent with the proposed Harbor Promenade and Aloha Tower Path Shared Use Path projects (Project IDs RD-24 and 1-68 in the 2019 O'ahu Bike Plan, respectively.)
 - ii. Kuloloia (Downtown) rail station. The forthcoming rail station will be located adjacent to the Project site and will host numerous multi-modal connections. As such, the applicant must construct sidewalk and pedestrian access improvements allowing for better and safer access to/from the forthcoming rail station.
 - iii. Sidewalks. All internal Project sidewalks/pedestrian paths and those fronting the Project site (excluding Shared Use Paths) shall have a minimum of 5-foot, 8-foot preferred, pedestrian clear zone separate from the furniture and utility zone. Sidewalks shall incorporate the standards of the Honolulu Complete Streets Design Manual, including the placement of street furniture such as landscaping, signage, and lighting, which is intended to provide added protection for pedestrians.

New sidewalks, curb ramps, curbs, and gutters must meet current Americans with Disabilities Act standards.

- iv. Installation of lighting; pedestrian-oriented green infrastructure, trees, or other greening landscape consistent with the Complete Streets furniture zone; and trash receptacles per the Honolulu Complete Streets Design Manual, O'ahu Pedestrian Plan, and any applicable streetscape plan.

4. Transit Improvements.

- i. Require the developer, management entity, or owners' association to adopt (i.e., be responsible for litter removal, cleaning and maintenance of bus stop shelter, benches and floor area) any future bus stops fronting the Project site at no cost to the City.

5. Transit Oriented Development. We suggest the following multi-modal mitigation measures be completed with the Project:

- i. Include a description of how the Project will promote, encourage, and monitor transit use by its employees and visitors.
- ii. The management entity should inform employees and visitors of vanpool, car share, and bikeshare programs to promote alternate modes of transportation.
- iii. Provide employees with subsidized transit passes.

6. TheBus Stops. The Project is in close proximity to TheBus Stop #1281, as such, we have the following comments.

- i. Air quality during construction may be unhealthy for bus riders waiting at TheBus Stop #1281, which is adjacent to Pier 7, if it's not closed or relocated. As such, the Applicant shall implement appropriate air quality mitigations.
- ii. If the Project affects Aloha Tower Drive and Nimitz Highway, TheBus Stop #1281 may need to be closed or relocated for the duration of the work. TheBus Routes 60 (Honolulu-Kaneohe-Haleiwa), 65 (Honolulu-Kaneohe-Ahuimanu), 67 (Honolulu-Kailua-Waimanalo), and 88A (North Shore Express) may need to be detoured. Advanced notification/coordination with the Department of Transportation Services (DTS) - Transportation Mobility Division (TMD) and O'ahu

Mr. Keola Cheng, Planning Director
March 13, 2024
Page 4

Transit Services, Inc. will be needed, contact DTS-TMD at
TheBusStop@honolulu.gov.

- iii. If TheBus Stop #1281 is closed, the nearest eastbound bus stop that is served by TheBus Routes 60, 65, 67, and 88A is TheBus Stop #1282 (Ala Moana Boulevard + Opposite Punchbowl Street) and is approximately 1300-feet east of TheBus Stop #1281. Americans with Disabilities Act (ADA) accessibility will need to be maintained between Aloha Tower and TheBus Stop #1282 to accommodate the current users of TheBus Stop #1281 (average daily weekday ridership is 120, average daily Saturday ridership is 150, and average daily Sunday ridership is 96).
7. Street Usage Permit. A street usage permit from the DTS should be obtained for any construction-related work that may require the temporary closure of any traffic lane, sidewalk, bicycle lane, or pedestrian mall on a City street.
8. Neighborhood Impacts. The area representatives, neighborhood board, as well as the area guests, businesses, emergency personnel (fire, ambulance, and police), O'ahu Transit Services, Inc. (TheBus and TheHandi-Van), etc., should be kept apprised of the details and status throughout the project and the impacts that the project may have on the adjoining local street area network.
9. Disability and Communication Access Board (DCAB). Project plans (vehicular and pedestrian circulation, sidewalks, parking and pedestrian pathways, vehicular ingress/egress, etc.) should be reviewed and approved by DCAB to ensure full compliance with Americans with Disabilities Act requirements.

Should you have any questions, please contact Greg Tsugawa, of my staff, at (808) 768-6683.

Very truly yours,

J. Roger Morton
Director

10815-01

Mr. Roger J. Morton
Department of Transportation Services
City and County of Honolulu
711 Kapi'olani Boulevard, Suite 1600
Honolulu, HI 96813

Subject: Environmental Assessment Early Consultation Package for
Tradewinds Garden
Honolulu, O'ahu, Hawai'i

Dear Mr. Morton:

Thank you for your letter dated March 13, 2024, regarding the subject Early Consultation Package for the Tradewinds Garden project. We are writing to acknowledge your comments, they have been considered in the preparation of the Draft EA with regard to meeting content requirements prescribed in Hawai'i Administrative Rules, Title 11, Chapter 200.1, Section 18. A record of your comments, along with this response, are appended to the Draft EA as Appendix H.

We offer the following in response to the points raised in your letter:

Comment #1: *Transportation Impact Assessment (TIA). The Applicant should perform a TIA to examine the vehicle, pedestrian, bicycle, and public transit safety, stress, and comfort levels at the nearby intersections and driveways with corresponding improvements to mitigate these impacts by applying Complete Streets principles. The applicant shall discuss the future year growth rate, trip distribution, mode split, and route assignment assumptions used in the TIA.*

The forthcoming Kuloloia Downtown rail station (rail station) will be located adjacent to the Project site, and will host numerous multi-modal connections. As such, the TIA must analyze and construct improvements to mitigate the project impacts including, but not limited to, rail access from the Project site, pedestrian/bicycle improvements per the Honolulu Complete Streets Design Manual, O'ahu Pedestrian Plan, O'ahu Bike Plan, and any applicable streetscape plan.

The applicant shall submit all native files (e.g., Synchro, Excel, etc.) for the raw multi-modal counts (in the format specified at <https://geocounts.com/api/format/> and the example file at <https://bit.ly/DTS-count-sample>) and accompanying analyses to the Department of Transportation Services Regional Planning Branch (RPB) at dtsplanningdiv@honolulu.gov. Please refer to the Department of Transportation Services (DTS) TIA Guide for multimodal assessment tools and recommended analyses. The TIA Guide can be found at <http://www4.honolulu.gov/docushare/dsweb/View/Collection-7723>.

Response #1: Your comments are acknowledged. Please note that Section 3.11 discusses recommendations based on the Traffic Impact Report (TIR) as it relates to vehicle, pedestrian, bicycle, and public transit safety.

Comment #2: *Parking. A discussion regarding off-street parking and site generated parking demand should be added to this report. The project should consider Transit Oriented Development (TOD) core principals. The January 2017 report, Trip and Parking Generation at Transit-Oriented Developments Number NITC-RR-767, concludes that less parking is required than suggested in the Institute of Transportation Engineers (ITE) Parking Generation Manual for sites that are dense, mixed use, with low stress pedestrian environments, and adjacent to a high quality transit stop. We recommend the applicant provide the minimum TOD parking ratio, given that the Project falls within a TOD Plan area and is in close proximity to the future rail station.*

Response #2: Your comments are acknowledged.

Comment #3i: *Pedestrian and Bicycle Improvements. Shared Use Paths. The Applicant shall construct sidewalks fronting the Project site consistent with the proposed Harbor Promenade and Aloha Tower Path Shared Use Path projects (Project IDs RD-24 and I-68 in the 2019 O'ahu Bike Plan, respectively)*

Response #3i: Your comments are acknowledged. These comments have been passed along to the design team.

Comment #3ii: *Kuloloia (Downtown) rail station. The forthcoming rail station will be located adjacent to the Project site and will host numerous multi-modal connections. As such, the applicant must construct sidewalk and pedestrian access improvements allowing for better and safer access to/from the forthcoming rail station.*

Response #3ii: Noted. Your comments have been passed along to the design team.

Comment #3iii: *Sidewalks. All internal Project sidewalks/pedestrian paths and those fronting the Project site (excluding Shared Use Paths) shall have a minimum of 5-foot, 8-foot preferred, pedestrian clear zone separate from the furniture and utility zone. Sidewalks shall incorporate the standards of the Honolulu Complete Streets Design Manual, including the placement of street furniture such as landscaping, signage, and lighting, which is intended to provide added protection for pedestrians.*

New sidewalks, curb ramps, curbs, and gutters must meet current Americans with Disabilities Act standards.

Response #3iii: Your comments are acknowledged. These comments have been passed along to the design team.

Letter to Mr. Morton

Page 3

July 23, 2024

Comment #3iv: *Installation of lighting; pedestrian-oriented green infrastructure, trees, or other greening landscape consistent with the Complete Streets furniture zone; and trash receptacles per the Honolulu Complete Streets Design Manual, O‘ahu Pedestrian Plan, and any applicable streetscape plan.*

Response #3iv: Your comments are acknowledged. These comments have been passed along to the design team.

Comment #4: *Transit Improvements. Require the developer, management entity, or owners' association to adopt (i.e., be responsible for litter removal, cleaning and maintenance of bus stop shelter, benches and floor area) any future bus stops fronting the Project site at no cost to the city.*

Response #4: Your comments are acknowledged and have been passed along to the Applicant.

Comment #5i: *Transit Oriented Development. We suggest the following multi-modal mitigation measures be completed with the Project: include a description of how the project will promote, encourage, and monitor transit use by its employees and visitors.*

Response #5i: Your comments are acknowledged.

Comment #5ii: *The management entity should inform employees and visitors of vanpool, car share, and bikeshare programs to promote alternate modes of transportation.*

Response #5ii: Your comments are acknowledged. Please note that the TIR has made note of this and is included in Section 3.11 of the EA.

Comment #5iii: *Provide employees with subsidized transit passes.*

Response #5iii: Your comments are acknowledged and have been passed along to the Applicant.

Comment #6i: *TheBus Stops. The Project is in close proximity to TheBus Stop #1281, as such, we have the following comments. Air quality during construction may be unhealthy for bus riders waiting at TheBus Stop #1281, which is adjacent to Pier 7, if it's not closed or relocated. As such, the Applicant shall implement appropriate air quality mitigations.*

Response #6i: Your comments are acknowledged. Please note that Section 3.8 of the EA discusses mitigation measures related to air quality.

Comment #6ii: *If the Project affects Aloha Tower Drive and Nimitz Highway, TheBus Stop #1281 may need to be closed or relocated for the duration of the work. TheBus Routes 60 (Honolulu-Kaneohe-Haleiwa), 65 (Honolulu-Kaneohe-Ahuimanu), 67 (Honolulu-Kailua-Waimanalo), and 88A (North Shore Express) may need to be detoured. Advanced notification/coordination with the Department of Transportation Services (DTS) - Transportation Mobility Division (TMD) and O‘ahu Transit Services, Inc. will be needed, contact DTS-TMD at TheBusStop@honolulu.gov.*

Response #6ii: Your comments are acknowledged.

Comment #6iii: *If TheBus Stop #1281 is closed, the nearest eastbound bus stop that is served by TheBus Routes 60, 65, 67, and 88A is TheBus Stop #1282 (Ala Moana Boulevard + Opposite Punchbowl Street) and is approximately 1300-feet east of TheBus Stop #1281. Americans with Disabilities Act (ADA) accessibility will need to be maintained between Aloha Tower and TheBus Stop #1282 to accommodate the current users of TheBus Stop #1281 (average daily weekday ridership is 120, average daily Saturday ridership is 150, and average daily Sunday ridership is 96).*

Response #6iii: Your comments are acknowledged.

Comment #7: *Street Usage Permit. A street usage permit from the DTS should be obtained for any construction-related work that may require the temporary closure of any traffic lane, sidewalk, bicycle lane, or pedestrian mall on a City street.*

Response #7: Your comments are acknowledged. Please note that this has been added to Section 4.3 of the EA.

Comment #8: *Neighborhood Impacts. The area representatives, neighborhood board, as well as the area guests, businesses, emergency personnel (fire, ambulance, and police), O'ahu Transit Services, Inc. (TheBus and TheHandi-Van), etc., should be kept apprised of the details and status throughout the project and the impacts that the project may have on the adjoining local street area network.*

Response #8: Your comments are acknowledged. Please note that Chapter 7 includes a list of those that have been consulted with thus far in the EA process.

Comment #9: *Disability and Communication Access Board (DCAB). Project plans (vehicular and pedestrian circulation, sidewalks, parking and pedestrian pathways, vehicular ingress/egress, etc.) should be reviewed and approved by DCAB to ensure full compliance with Americans with Disabilities Act requirements.*

Response #9: Your comments are acknowledged. This has been passed along to the design team. They will ensure that the Proposed Project plans are reviewed and approved by DCAB to ensure full compliance with the American with Disabilities Act requirements.

Please note that the Draft EA has been published and made available for review and comment in the current issue of the State of Hawai'i's Environmental Review Program's (ERP) The Environmental Notice.

We appreciate your participation in the EA review process.

Honolulu, Hawaii'i 96826

Dear Mr. Cheng:

Subject: Environmental Assessment Early Consultation Package
Tradewinds Garden
Honolulu, O'ahu, Hawaii'i
Tax Map Keys: 2-1-014: 006, 2-1-001: 057 and 058

In response to your letter dated February 13, 2024, regarding the abovementioned subject, the Honolulu Fire Department (HFD) reviewed the submitted information and requires that the following be complied with:

1. The fire department access roads shall be in accordance with National Fire Protection Association (NFPA) 1; 2018 Edition, Section 18.2.3.
2. A fire department access road shall extend to within 50 feet (15 meters) of at least one exterior door that can be opened from the outside and that provides access to the interior of the building. (NFPA 1; 2018 Edition, Section 18.2.3.2.1.)
3. Fire department access roads shall be provided such that any portion of the facility or any portion of an exterior wall of the first story of the building is located not more than 150 feet (46 meters) from fire department access roads as measured by an approved route around the exterior of the building or facility. (NFPA 1; 2018 Edition, Sections 18.2.3.2.2 and 18.2.3.2.2.1, as amended.)
4. An approved water supply capable of supplying the required fire flow for fire protection shall be provided to all premises upon which

Mr. Keola Cheng
Page 2
February 22, 2024

facilities, buildings, or portions of buildings are hereafter constructed or moved into the jurisdiction. The approved water supply shall be in accordance with NFPA 1; 2018 Edition, Sections 18.3 and 18.4.

5. Submit civil drawings to the City and County of Honolulu's Department of Planning and Permitting and route them to the HFD for review and approval.

The requirements above are required by the HFD. This project may have additional requirements to be met as determined by other agencies.

Should you have questions, please contact Battalion Chief Jean-Claude Bisch of our Fire Prevention Bureau at 808-723-7151 or jbisch@honolulu.gov.

Sincerely,

CRAIG UCHIMURA
Assistant Chief

Subject: Environmental Assessment Early Consultation Package for
Tradewinds Garden
Honolulu, O‘ahu, Hawai‘i

Dear Mr. Uchimura:

Thank you for your letter dated February 22, 2024, regarding the subject Early Consultation Package for the Tradewinds Garden project. We are writing to acknowledge your comments, they have been considered in the preparation of the Draft Environmental Assessment (EA) with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200.1, Section 18. A record of your comments, along with this response, are appended to the Draft EA as Appendix H.

We offer the following in response to your letter:

Comment #1: *The fire department access roads shall be in accordance with National Fire Protection Association (NFPA) 1; 2018 Edition, Section 18.2.3.*

Response #1: Your comments are acknowledged. These comments have been passed along to the design team.

Comment #2: *A fire department access road shall extend to within 50 feet (15 meters) of at least one exterior door that can be opened from the outside and that provides access to the interior of the building.*

Response #2: Your comments are acknowledged. These comments have been passed along to the design team.

Comment #3: *Fire department access roads shall be provided such that any portion of the facility of any portion of an exterior wall of the first story of the building is located not more than 150 feet*

Letter to Mr. Uchimura

Page 2

July 23, 2024

(46 meters) from fire department access roads as measured by an approved route around the exterior of the building or facility. (NFPA1; 2018 Edition, Sections 18.2.3.2.2 and 18.2.3.2.2.1, as amended)

Response #3: Your comments are acknowledged. These comments have been passed along to the design team.

Comment #4: *An approved water supply capable of supplying the required fire flow for protection shall be provided to all premises upon which facilities, buildings, or portions of buildings are hereafter constructed or moved into the jurisdiction. The approved water supply shall be in accordance with NFPA 1; 2018 Edition, Sections 18.3 and 18.4.*

Response #4: We acknowledge that the approved water supply shall be in accordance with NFPA 1; 2018 Edition, Section 18.3 and 18.4

Comment #5: *Submit civil drawings to the City and County of Honolulu's Department of Planning and Permitting (DPP) and route them to the HFD for review and approval.*

Response #5: Civil drawings will be submitted to the DPP and HFD for review and approval as noted in Section 4.3 of the EA.

Please note that the Draft EA has been published and made available for review and comment in the current issue of the State of Hawai'i's Environmental Review Program's (ERP) The Environmental Notice.

We appreciate your participation in the EA review process.

Sincerely,

Keola Cheng

Dear Mr. Cheng:

This is in response to your correspondence of February 13, 2024, requesting input for the Early Consultation for the proposed Tradewinds Garden to be located at Pier 7 of the Honolulu Harbor.

Based on the information provided, the Honolulu Police Department does not have any comments at this time. As the project progresses, the HPD recommends that the developer works with the Neighborhood Board, as this project may increase visitors to the area, and calls for police service(s).

If there are any questions, please call Major Paul Okamoto of District 1 (Central Honolulu) at (808) 723-3327.

Sincerely,

A handwritten signature in black ink that reads "Glenn Hayashi". The signature is written in a cursive style with a prominent "G" and "H".

RE: Early Consultation for Environmental Assessment for Tradewinds Garden

Aloha mai kākou,

Thank you for the opportunity to provide comments as part of the Early Consultation for the Environmental Assessment for Tradewinds Garden, a proposed project located at Pier 7 of Honolulu Harbor and at Units 5 and 7 of the Honolulu Power Plant.

As a supporter of public art, I appreciate that the project proposes to establish a garden and art museum, gallery space, a hot shop for observing glass art creation, a bookstore area, and a bar and restaurant for both kama'āina and visitors. Expanding access to the arts, public access to greenspace, and amenities along the Honolulu Harborfront are welcomed goals.

I suggest that the following be considered as part of the Environmental Assessment:

1. Because the project is adjacent to office buildings and residential apartment towers, I hope that the Environmental Assessment thoroughly discusses ways to safely mitigate hazardous materials that may be disturbed during the renovation of the old Honolulu Power Plant, and reduce fugitive dust and construction noise.
2. Because the project involves the use of State lands, I recommend that the Economic Impact section make an explicit mention that Chapter 104 prevailing wages will be required for construction laborers and mechanics involved on the project. Prevailing wages are important to ensure that our local construction workers can make it in the middle class here in the islands.
3. The waterfront between Piers 6 and 7, and Piers 7 and 8 is home to a small colony of corals and tropical fish. While the total amount of wildlife present in the area is relatively small, the corals and fish are special because they are so immediately visible to visitors and others who pass through the area. Their presence is both an educational opportunity and a tourist attraction. Please consider how best to minimize disruption to marine wildlife and, after project completion, to enhance and protect the marine wildlife that makes their home in the area.

4. In addition to mentioning the Honolulu Arts District as a surrounding use, please consider adding in a mention of Honolulu's Historic Chinatown as a surrounding use which can be complemented by the project. Honolulu's Chinatown is full of history, culture, and small businesses, all of which have been shaped by their proximity to Honolulu Harbor over the years.
5. Please consider impacts of the project to Irwin Memorial Park, which is required to remain in park use as per its deed. Additional foot traffic in the area will hopefully be positive for this park and will hopefully encourage better maintenance of the park.
6. The proposal for a raised crosswalk, traffic table, and sidewalk bulbs between Pier 7 and the Honolulu Power Plant is welcomed from a pedestrian safety perspective. Please work with the Department of Transportation Services to ensure that the crosswalk will not negatively impact bus operations at Bus Stop 1281. Please also coordinate with the Department of Transportation Services to ensure that these improvements will not impact future bus service, especially rail-to-bus or bus-to-rail transfers that may happen at the future rail Kuloloia Skyline station.
7. As construction of the project is intended to take place between 2024 and 2026, and rail construction in the area may extend as late as 2031, please coordinate with HART to minimize disruption to the proposed museum and retail space.

Subject: Environmental Assessment Early Consultation Package for
Tradewinds Garden
Honolulu, O‘ahu, Hawai‘i

Dear Councilmember Santos-Tam:

Thank you for your letter dated March 5, 2024, regarding the subject Early Consultation Package for the Tradewinds Garden project. We are writing to acknowledge your comments, they have been considered in the preparation of the Draft Environmental Assessment (EA) with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200.1, Section 18. A record of your comments, along with this response, are appended to the Draft EA as Appendix H.

We offer the following in response to your letter:

Comment #1: *Because the project is adjacent to office buildings and residential apartment towers, I hope that the Environmental Assessment thoroughly discusses ways to safely mitigate hazardous materials that may be disturbed during the renovation of the old Honolulu Power Plant and reduce fugitive dust and construction noise.*

Response #1: We acknowledge that due to the project’s proximity to office buildings and residential apartment towers, ways to mitigate hazardous materials, reduce fugitive dust and construction noise shall be discussed in the EA. Please note that Sections 3.8, 3.9, and 3.10 of the EA discuss mitigation measures with regards to air quality, hazardous materials, and noise.

Comment #2: *Because the project involves the use of State lands, I recommended that the Economic Impact section make an explicitly mention that Chapter 104 prevailing wages will be required for construction laborers and mechanics involved on the project. Prevailing wages are important to ensure that our local construction workers can make it in the middle class here in the islands.*

Response #2: Your comments are acknowledged.

Comment #3: *The waterfront between Piers 6 and 7, and Piers 7 and 8 is home to a small colony of corals and tropical fish. While the total amount of wildlife present in the area is relatively small, the corals and fish are special because there are so immediately visible to visitors and others who pass through the area. Their presence is both an educational opportunity and a tourist attraction. Please consider how best to mitigate disruption to marine life, and after project completion, to enhance and protect the marine wildlife that makes their home in the area.*

Response #3: We acknowledge that the waterfront between Piers 6 and 7, and Piers 7 and 8 is home to a small colony of corals and fish. Please note that Section 3.5 of the EA discusses mitigation measures to prevent adverse effects to protected species.

Comment #4: *In addition to mentioning the Honolulu Arts District as a surrounding use, please considering adding a mention of Honolulu's Historic Chinatown as a surrounding use which can be complimented by the project. Honolulu's Chinatown is full of history, culture, and small businesses, all of which have been shaped by their proximity to Honolulu Harbor over the years.*

Response #4: We acknowledge that the project is within the vicinity of Honolulu's Historic Chinatown. Please note that this has been incorporated into Section 1.2 of the EA.

Comment #5: *Please consider impacts of the project to Irwin Memorial Park, which is required to remain in park use as per its deed. Additional foot traffic in the area will hopefully be positive for this park and will hopefully encourage better maintenance of the park.*

Response #5: Your comments are acknowledged.

Comment #6: *The proposal for a raised crosswalk, traffic table, and sidewalk bulbs between Pier 7 and the Honolulu Power Plant is welcomed from a pedestrian safety perspective. Please work with the Department of Transportation Services to ensure that the crosswalk will not negatively impact bus operations at Bus Stop 1281. Please also coordinate with the Department of Transportation Services to ensure that these improvements will not impact future bus service, especially rail-to-bus or bus-to-rail transfers that may happen at the future rail Kuloloia Skyline Station.*

Response #6: Your comments are acknowledged. This has been passed along to the Applicant. They will coordinate with DTS to ensure that proposed pedestrian improvements will not impact future transportation services.

Letter to Councilmember Santos- Tam

Garden Art LLC Comment

Brittany Hopkins <brhopkins@hpu.edu>

Tue 3/12/2024 7:15 PM

To:Public Comment <publiccomment@wilsonokamoto.com>

Aloha Keola,

We are very excited and supportive of this Proposed Project and the planned revitalization of the space in keeping with the Aloha Tower project area master plan. With one of the central objectives of the project being to serve as an educational resource, we hope there are opportunities to partner with Garden Art, LLC from an academic standpoint.

As you're aware, Hawaii Lifestyle Retail Properties, LLC (HLRP) holds a long-term ground lease interest in several adjacent parcels, including Aloha Tower Drive and connecting roadways and also controls and manages various parking areas currently serving the Aloha Tower Marketplace. Accordingly, the project planning elements will require close coordination with HLRP.

We look forward to the opportunity to work with Garden Art, LLC and the planning team to review early on any specific plans that are on/about Aloha Tower Drive or those that may impact parking, sidewalks, roadways and traffic flow.

Mahalo,

Out of the office notice: March 13 – March 19

**Re: Tradewinds Garden and Glass – Contemporary Garden and Art Attraction
Environmental Assessment - Early Consultation**

Dear Mr. Cheng:

The Hawai'i Community Development Authority ("HCDA") received a letter from Wilson Okamoto Corporation, dated February 13, 2024, requesting comments as part of the Environmental Assessment ("EA") early consultation process for a proposed contemporary garden and art attraction located at Pier 7 of Honolulu Harbor as well as Units 5 and 7 of the Honolulu Power Plant on Tax Map Keys: 2-1-014: 006, 2-1-001: 057 and 058, respectively.

The HCDA has reviewed the provided early consultation package, and we have the following comments:

1. Figure 3, Surrounding Uses, shows "Our Kaka'ako Neighborhood" as one of important historical and cultural landmarks. If this is supposed to be delineating the HCDA's Kaka'ako district, the boundaries are incorrect. Otherwise, it is not clear what "Our Kaka'ako Neighborhood" is supposed to signify.
2. On page 5, the following statement is made: "The Project Site also lies near the Our Kaka'ako neighborhood which is approximately 0.5 miles to the east. Our Kaka'ako is a community consisting of nine city blocks within the Kaka'ako neighborhood, centered around art. It showcases a collection of local and global artists' original murals with the global of sharing creativity, beautifying the community, and bringing people together." This statement needs to be clarified to note that what is being referenced is the area planned by the Kamehameha Schools Master Plan and not the Kaka'ako community development district controlled by the HCDA.
3. The redevelopment of the Honolulu Power Plant parcel needs to follow the Makai Area Rules administered by the HCDA.
4. The proposed redevelopment should consider the Aloha Tower Special District Development Guidelines. Although some of these guidelines have been superseded by more recent legislation and rulemaking, some of the guidelines relating to urban design, edge treatments circulation, and streetscape treatments are still salient.

5. The proposed redevelopment should also include discussion regarding pedestrian circulation, links between downtown and the waterfront area, site design, and street edge treatment. As noted in the Aloha Tower Special District Development Guidelines, "site design should show attention to pedestrian needs and scale, with appropriate sidewalk, bench, shade and planning treatment."
6. There should be more discussion regarding the exterior improvements. The redevelopment should entertain on how to mitigate the "blank walls" at the street level through various design solutions such as fenestration and creating more of a relationship between the buildings and the street level.
7. There should be discussion regarding parking and circulation for alternate modes of transportation.
8. Please note that the Honolulu Authority for Rapid Transportation (HART) has a Section 106 mitigation commitment to prepare nomination forms for listing the Leslie A. Hicks Power Plant on the State and National Register of Historic Places. Your project could potentially be eligible for Historic Preservation Tax Credits, and this should be explored in more detail.
9. Site planning and design efforts should consider impacts to and possible synergies with the adjacent Irwin Park, which is also listed on the State Register of Historic Places. Note that HART has also prepared a cultural landscape report for Irwin Park, which could inform planning and design efforts.

Thank you for giving us the opportunity to comment. Should you have any questions regarding this matter, please contact Ms. Sery Berhanu, AICP, of our Planning and Development section, at (808) 594-0330 or by email at sergut.berhanu@hawaii.gov.

Sincerely,

Craig K. Nakamoto
Executive Director

Subject: Environmental Assessment Early Consultation Package for
Tradewinds Garden
Honolulu, O'ahu, Hawai'i

Dear Mr. Nakamoto:

Thank you for your letter dated March 18, 2024 regarding the subject Early Consultation Package for the Tradewinds Garden project.

We are writing to acknowledge your comments and to inform you that they have been considered in the preparation of the Draft EA with regard to meeting content requirements prescribed in Hawai'i Administrative Rules, Title 11, Chapter 200.1, Section 18. A record of your comments, along with this response, have been produced and appended to the Draft EA as Appendix H.

We offer the following response to your letter:

Comment #1: Figure 3, Surrounding Uses, shows "Our Kaka'ako Neighborhood" as one of the important historical and cultural landmarks. If this is supposed to be delineating the HCDA's Kaka'ako district, the boundaries are incorrect. Otherwise, it is not clear what "Our Kaka'ako Neighborhood" is supposed to signify.

Response #1: Your comment is acknowledged. Please note that this has been revised in Section 1.2 of the EA to highlight the Our Kaka'ako by Kamehameha School community as a surrounding use. Additionally, HCDA's Kaka'ako Community Development District is discussed in further detail in Section 4.2.6 of the EA.

Comment #2: On page 5, the following statement is made: "The Project Site also lies near the Our Kaka'ako neighborhood which is approximately 0.5 miles to the east. Our Kaka'ako is a community consisting of nine city blocks within the Kaka'ako neighborhood, centered around art. It showcases a collection of local and global artists' original murals with the goal of sharing creativity, beautifying the community, and bringing people together." This statement needs to be

Letter to Mr. Nakamoto

clarified to note that what is being referenced is the area planned by the Kamehameha Schools Master Plan and not the Kaka‘ako community development district controlled by the HCDA.

Response #2: Your comment is acknowledged. Please note that this has been revised in Section 1.2 of EA.

Comment #3: *The redevelopment of the Honolulu Power Plant parcel needs to follow the Makai Area Rules administered by the HCDA.*

Response #3: Your comment is acknowledged. Please note that this has been added to Section 4.2.6 of the EA.

Comment #4: *The proposed redevelopment should consider the Aloha Tower Special District Development Guidelines. Although some of these guidelines have been superseded by more recent legislation and rulemaking, some of the guidelines relating to urban design, edge treatments circulation, and streetscape treatments are still salient.*

Response #4: Your comment is acknowledged and has been passed along to the design team.

Comment #5: *The proposed redevelopment should also include discussion regarding pedestrian circulation, links between downtown and the waterfront area, site design, and street edge treatment. As noted in the Aloha Tower Special District Development Guidelines, “site design should show attention to pedestrian needs and scale, with appropriate sidewalk, bench, shading, and planning treatment.”*

Response #5: Your comment is acknowledged. Please note that Section 2.1 of the EA discusses the project vision as it relates to pedestrian circulation, street edge treatments and overall site design.

Comment #6: *There should be more discussion regarding exterior improvements. The redevelopment should entertain on how to mitigate the “blank walls” at the street level through various design solutions such as fenestration and creating more of a relationship between the buildings and the street level.*

Response #6: Your comments are acknowledged and have been passed along to the design team.

Comment #7: *There should be more discussion regarding parking and circulation for alternate modes of transportation.*

Letter to Mr. Nakamoto

To:Public Comment <publiccomment@wilsonokamoto.com>;Keola Cheng <KCheng@wilsonokamoto.com>

Cc:Nagata, Sarah <Sarah.Nagata@hawaiianelectric.com>;Kuwaye, Kristen <kristen.kuwaye@hawaiianelectric.com>

Dear Mr. Cheng,

Thank you for the opportunity to comment on the subject project. Based on this initial project description, Hawaiian Electric Company has no preliminary objection to the project. As this is the first initial public notice in the process, there is much more coordination with Hawaiian Electric Company that will be necessary. Listed below are some of our initial comments. We appreciate your efforts to keep us apprised of the subject project in the planning process. As the proposed Tradewinds Garden project comes to fruition, please continue to keep us informed.

- EV Charging Station project for State Dept. Of Transportation is planned for the parking stalls just outside of the Makai side of the Honolulu Power Plant building.
- It is recommended the developer secure the project area to prevent the general public from accessing restricted Hawaiian Electric Company property.
- There is a reburial preservation area located within the proposed project site. Continued cultural descendants access to the burial preserve must be provided.
- Further discussion with Hawaiian Electric on access points to cooling water tunnels recommended
- Further discussion on fuel trench from fuel oil tanks on property recommended
- Further discussion on the existing waste water treatment plant and associated service lines recommended
- Further discussion on existing water lines, electrical circuits and above and below ground level infrastructure on property recommended
- Until all agreements between the developer and Hawaiian Electric have been mutually agreed upon and executed, we will need continued access for maintenance of our facilities.
- Developer shall contact Hawaiian Electric Company as early possible for information related to, premise condition, service load, design, access, and other pertinent details.

Please contact me at 808-772-2135 should there be any questions.

Honolulu, O‘ahu, Hawai‘i

Dear Rouen Liu:

Thank you for your letter dated April 3, 2024, regarding the subject Early Consultation Package for the Tradewinds Garden project. We are writing to acknowledge your comments, they have been considered in the preparation of the Draft Environmental Assessment (EA) with regard to meeting content requirements prescribed in Hawai‘i Administrative Rules, Title 11, Chapter 200.1, Section 18. A record of your comments, along with this response, are appended to the Draft EA as Appendix H.

We offer the following in response to your letter:

Comment #1: *EV Charging Station project for the State Department of Transportation is planned for the parking stalls just outside of the Makai side of the Honolulu Power Plant building.*

Response #1: Your comment is acknowledged and has been passed along to the design team.

Comment #2: *It is recommended the developer secure the project area to prevent the general public from accessing restricted Hawaiian Electric Company property.*

Response #2: Your comment is acknowledged and has been passed along to the Applicant. The Applicant will ensure that the project area is secured to prevent public access to the Hawaiian Electric Company (HECO) property.

Comment #3: *There is a reburial preservation area located within the proposed project site. Continued cultural descendants access to the burial preserve must be provided.*

Response #3: Your comment is acknowledged.

Letter to Rouen Liu

Comment #4: *Further discussion with Hawaiian Electric on access points to cooling water tunnels recommended*

Response #4: Your comment is acknowledged and has been passed along to the Applicant.

Comment #5: Further discussion on fuel trench from fuel oil tanks on property recommended.

Response #5: Your comment is acknowledged and has been passed along to the Applicant.

Comment #6: Further discussion on the existing wastewater treatment plant and associated service lines recommended.

Response #6: Your comment is acknowledged and has been passed along to the Applicant.

Comment #7: Further discussion on existing water lines, electrical circuits and above and below ground level infrastructure on property recommended.

Response #7: Your comment is acknowledged and has been passed along to the Applicant.

Comment #8: Until all agreements between the developer and Hawaiian Electric have been mutually agreed upon and executed, we will need continued access for maintenance of our facilities.

Response #8: Your comment is acknowledged and has been passed along to the Applicant.

Comment #9: Developer shall contact Hawaiian Electric Company as early possible for information related to, premise condition, service load, design, access, and other pertinent details.

Response #9: Your comment is acknowledged and has been passed along to the Applicant.

Please note that the Draft EA has been published and made available for review and comment in the current issue of the State of Hawai'i's Environmental Review Program's (ERP) The Environmental Notice.

We appreciate your participation in the EA review process.

Sincerely,

Keola Cheng

Director – Planning
